PRINTED BY
GEORGE RUSSELL & CO.,
61 Beekman Street, N. Y.

PUBLISHERS' ADVERTISEMENT.

THE "CABINET ATLAS AND DESCRIPTIVE GEOGRAPHY" is designed to supply an intermediate place between the larger and more elaborate works of the same description heretofore issued by the Publishers, and the higher class of school treatises; and the editors to whom its compilation has been intrusted (with this main object in view) have endeavored so to combine interesting information on natural science, history, and other pertinent matters with the more strictly geographical details as to produce a *readable book*—one in which the dignity of science and the easy colloquy of ordinary life are blended, and in which the various subjects treated upon are presented with fidelity and a genial diction. The work, indeed, is presented as an instructive manual, divested of the dry and forbidding features which have been too wont to characterize the branch of literature to which it belongs.

Among the attractive features of the work the maps, plans, and pictorial illustrations occupy a prominent place. They are to the eye what the text is to the understanding—giving locality and form to objects and completing description which, without such aid, would fail as a vehicle for exact representation. In the compilation and selection of these the greatest care has been taken to adopt nothing of the merely imaginary, and hence whatever has been admitted truly illustrates its subject. In execution they are clear and beautiful, and reflect the greatest credit on the advanced state of art in America.

In relation to the maps, the Publishers would further state that a valuable improvement has been introduced into their construction, by drafting them on a series of easily convertible scales—all having been drawn so that an inch of space represents distances of 25, 50, 100, 200, or some other readily compared number of miles; and hence by ordinary attention the reader will have little trouble in acquainting himself with the relative distances and extent of countries and places exhibited on the varying projections of the several maps. The profile views of surface elevation are also drawn on a uniform scale.

The Publishers would also state that a greater attention has been paid to Physical Geography than is usual in works of this description; and that in the introductory chapter the great truths of the science are plainly developed, and a correct knowledge of cause and effect in the economy of nature fully set forth. This portion of the work has been based on the excellent treatise on the same subject found in the Atlas of Milner and Petermann, recently published in London.

Another feature not common to works of this description, but yet of essential value and intimately connected with all national and social organizations, will be found in these pages. In this we refer to the elaborate statements of the "weights, measures, and moneys" appended to the descriptions of the several countries, and the equivalents of which in French metrical and United States values have been accurately calculated.

With these and many other improvements, and containing the most recent information and statistics, the Publishers believe the work herewith issued to be the most accurate and complete ever published in this or any other country. They believe it will meet the requirements of the age; and therefore commend itself not only to families for whose reading it is specially designed, but also to the merchant, statesman, editor, and to students generally. It is neither too elaborate for the one nor yet too deficient in substantial details and statistical matters as to be devoid of interest to the other.

NEW YORK, *October* 1, 1858.

TABLE OF CONTENTS.

PAGE

INTRODUCTION—Definitions—*Land and its Phenomena:* Continental Masses—Island Masses—Mountains and Valleys—Plateaux and Table-lands—Plains and Lowlands—Fissures and Caverns—Glacial Formations—Volcanoes—Earthquakes—Land Slips and Gradual Displacements, etc.—*Water and its Phenomena:* Springs—Rivers—Lakes—The Ocean—Oceanic Movements—Action of Water upon the Land.—*Atmosphere and its Phenomena:* Currents of the Atmosphere—Atmospheric Moisture—Atmospheric Temperature—Isothermal Lines.—*Electrical Phenomena.—Plants: their Kind and Distribution.—Animals: their Kind and Distribution.*—MAN: ETHNOGRAPHY. *With* 138 *Illustrations* 9–26

NORTH AMERICA, Descriptive Geography of—American Arctic Lands—Russian America.—*British America:* Hudson's Bay Company's Territories—Canada—New Brunswick—Nova Scotia—Prince Edward's Island—Newfoundland—Bermuda Islands.—*French* Fishery Islands.—*United States of America:* Maine—New Hampshire—Vermont—Massachusetts—Rhode Island—Connecticut—New York—New Jersey—Pennsylvania—Delaware—Maryland—District of Columbia—Virginia—North Carolina—South Carolina—Georgia—Florida—Alabama—Mississippi—Louisiana—Texas—Ohio—Indiana—Michigan—Illinois—Wisconsin—Iowa—Minnesota—Dacotah—Nebraska—Kansas—Indian Territory—Arkansas—Missouri—Kentucky—Tennessee—Oregon—Washington—California—Utah—Sierra Nevada—New Mexico—Arizona.—*United States of Mexico.*—British Honduras.—*States of Central America:* Guatemala—San Salvador—Honduras—Nicaragua—Costa Rica, etc. *With* 202 *Illustrations* 27–172

WEST INDIA ARCHIPELAGO—*Santo Domingo:* Hayti and Dominica.—*Spanish West Indies:* Cuba—Porto Rico.—*British West Indies:* Bahamas—Jamaica—Trinidad—Tobago—Grenada—St. Vincent—St. Lucia—Barbadoes—Dominica—Montserrat—Antigua—St. Christopher—Nevis—Barbuda—Anguilla—Virgin Islands, etc.—*French West Indies:* Martinique and Guadalupe, etc.—*Dutch West Indies:* Curaçoa, etc.—St. Eustatius, Saba, St. Martin, etc.—*Danish West Indies:* St. Thomas, St. John, Santa Cruz, etc.—*Swedish West Indies:* St. Bartholomew. *With* 13 *Illustrations* 173–183

SOUTH AMERICA, Descriptive Geography of—New Granada—Ecuador—Venezuela—Guayana—Brazil—Peru—Bolivia—Chilé—Argentine Confederation—Buenos Ayres—Paraguay—Uruguay—Patagonia—Falkland Islands, etc. *With* 41 *Illustrations* 184–212

EUROPE, Descriptive Geography of—*United Kingdom:* England and Wales—Scotland—Ireland—Isle of Man and Channel Islands—Colonies and Dependencies.—*Western Europe:* France or the French Empire—Andorré—Spain—Portugal—Belgium—Holland—Denmark.—*Central Europe:* Prussia—Germany—Bavaria—Saxony—Hanover—Wurtemburg—Baden—Hesse—Brunswick—Saxon Duchies—Principalities of Mechlenburg—Nassau—Oldenburg—Duchies of Anhalt—Principalities of Schwartzburg—Principalities of Hohenzollern—Lichtenstein—Waldeck—Principalities of Reuss—Hanse Towns or Free Cities: Lubec—Bremen—Frankfort—Hamburg—Austrian Empire—Switzerland—Italy and Italian States: Austrian Italy—Sardinia—Monaco—Parma—Modena—Tuscany—Papal States San Marino—Two Sicilies—Maltese Islands.—*Eastern Europe:* Norway—Sweden—Russia in Europe—Russian Empire—Turkey in Europe—Ottoman Empire—Greece—Ionian Islands. *With* 108 *Illustrations* 213–303

ASIA, Descriptive Geography of—Russian Asia—Turkish Asia—Arabia or Arabistan—Turkestan or Independent Tartary—Iranistan or Persia—Afghanistan—Herat, Cabool, and Kandahar—Beloochistan—Hindoostan.—*British Possessions in Hindoostan:* Bengal—Northwest Provinces—Oude—Punjab and Trans-Indus—Madras—Bombay—Protected or Subordinate States—Nepaul and Bootan—Ceylon—Other Indian Islands.—*Farther India or Indo-China:* Burmah—Siam—Anam—Lao—British Possessions, etc.—*Chinese Empire:* China Proper—Manchuria—Mongolia—Ili—Tibet—Corea—Japan, etc. *With* 77 *Illustrations* 304–346

AFRICA, Descriptive Geography of—*Region of the Nile:* Egypt—Nubia—Abyssinia.—*Northern Africa:* Barbary States—Morocco—Algeria—Tunis—Tripoli—Barca, etc.—Sahara or the Desert—Soudan or the Country of the Blacks—Senegambia and Sierra Leone.—*Coast of Guinea:* Liberia—Maryland-in-Liberia.—*Southern Africa:* Maritime Region of the West—Maritime Region of the East—Interior Tableland—South Africa—Cape Colony.—*Islands of Africa:* Madagascar—Comoro Islands—Bourbon or Re-Union—Mauritius—Socotra—Cape Verde Islands—Fernando Po—Ascension—St. Helena, etc. *With* 51 *Illustrations* 347–378

OCEANICA, Descriptive Geography of—*Malaysia:* Sumatra, etc.—Java, etc.—Borneo—Soo-loo Archipelago—Philippines—Celebes—Moluccas.—*Australasia:* Australia or New Holland—New South Wales—Victoria—South Australia—Western Australia—North Australia—Van Diemen's Land—New Zealand—Papua or New Guinea—Admiralty Island, New Ireland, New Britain, etc.—New Caledonia—Norfolk Islands, etc.—*Polynesia:* Bonin Islands—Ladrones or Marianne Islands—Caroline Islands—Marshall Islands—Gilbert or Scarboro' Islands—Hawaiian or Sandwich Islands—Feejee Islands—Tonga or Friendly Islands—Navigator or Samoan Islands—Kermadic Islands—Hervey or Cook's Islands—Society or Georgian Islands—Low Islands or Paumotu Group—Pitcairn Island—Austral Islands—Marquesas or Washington Islands, etc. *With* 19 *Illustrations* 379–395

PHYSICAL GEOGRAPHY.

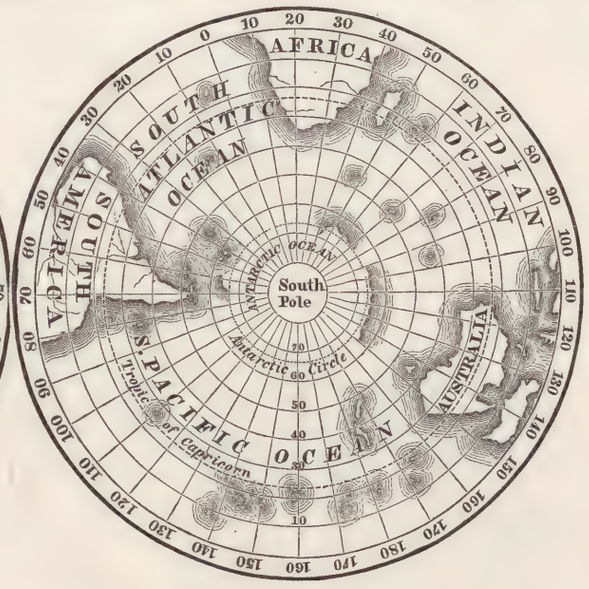
INTRODUCTION.

PHYSICAL GEOGRAPHY treats of the natural features of the terrestrial superficies, the arrangement of the inorganic matter composing the globe of the earth, the phenomena of the atmosphere, and the distribution of organic life. The limits of this department of science are not strictly defined. The connection is so direct and intimate with the domains of astronomy, geology, botany, and zoology, which, indeed, may be considered as only subdivisions of the vast subjects embraced by it, that to trespass upon them is unavoidable in prosecuting this branch of inquiry.

2. The surface of the earth consists of unequal portions of land and water. The area of the dry land to that of the water is as *ten* to *twenty-eight*. The fluid portion of the surface thus predominates, occupying nearly three fourths of the entire superficies of the globe.

3. The solid and fluid portions of the surface are very unequally distributed—land predominating in the northern and occurring in comparatively insignificant force in the southern hemisphere. Supposing the quantity of land in the northern hemisphere to be represented by *forty-four*, the amount in the southern will be equal to only *sixteen*, or, more definitely, there are

LAND HEMISPHERE.



WATER HEMISPHERE.

one hemisphere, and its antipodes (a small island to the southeast of New Zealand) as the center of the other, the inequality in the distribution of the components of the surface will strikingly appear. The first will include nearly all the superficial land, and the other, excepting Australia, a part of South America, and some islands, will be oceanic. This preponderance of land in the northern hemisphere indicates the superior intensity of the causes of elevation in northern latitudes at a remote geological epoch.

5. Large continuous masses of land are termed Continents. There are two examples: the Eastern Continent, which includes Asia, Africa, and Europe, and the Western Continent, which includes North and South America. The

NORTHERN HEMISPHERE.

SOUTHERN HEMISPHEEE.

44,000,000 square miles of land in the northern and only 16,000,000 in the southern hemisphere.

4. Assuming the globe to be divided, not in the line of the equator, but in that of the meridian of Teneriffe, the quantity of land and water in the two divisions is still very unequal, land predominating in the eastern half, while the western is specially oceanic. But if London be taken as the center of terms "eastern" and "western" refer to the meridian of the Ferro Isles, from which longitude was formerly reckoned.

6. The rank of a continent has been assigned by some geographers to Australia; but it is so far inferior in extent to either of the other masses as to be more correctly placed in the class of islands. Australia, however, with the innumerable islands of the Pacific and Indian oceans, ranks, after Europe, Asia, Africa, and America, as a fifth grand division of the globe, under the title of Oceanica.

7. On modern maps there is also laid down what is styled the Antarctic Continent, but it has not as yet been positively ascertained that the land surface near the south pole is continuous. In the opposite hemisphere Greenland *may be* the projection of an Arctic Continent, extending around the north pole. The probability, however, is that these masses are insular.

8. The smaller portions of land, surrounded by water, are termed Islands. They are true continents in miniature, as the great masses are everywhere

ISLAND, OR LAND SURROUNDED BY WATER.

engirdled by the ocean. A considerable number of islands closely clustered is called an Archipelago.

PENINSULA—ISTHMUS—CAPE.

9. A part of a continent running out into the sea, so as to be nearly insu-

lated, being connected with the mainland by a small portion of its own circuit or a narrow neck, is named a Peninsula, signifying "almost an island." The peninsular form, indeed, is a very common feature of the land, and almost all peninsulas follow a southerly direction. This rule applies to Scandinavia, Spain, Italy, Greece, Africa, Arabia, India, Malacca, Cambodia, Corea, and Kamtschatka in the Eastern Hemisphere, and to South America, California, Florida, Alaska, and Greenland(?) in the Western Hemisphere. The peninsulas of Yucatan and Jutland are the chief exceptions. The cause of this singular fact remains in obscurity.

10. A narrow neck of land connecting two large masses is denominated an Isthmus, as the Isthmus of Suez, which unites Asia and Africa, and the Isthmus of Panama, joining North and South America.

11. Inferior projections of the land into the water are variously named Capes, Promontories, Points, and Headlands.

12. The continuous fluid which environs the land constitutes, properly speaking, a vast single ocean; but it is conveniently distributed into partial oceans, which are named after their localities. A smaller extent of water, especially if it penetrate far into the interior of a continent, is termed a Sea. Of such the Mediterranean, the Baltic, and Black seas are examples. The more partial intrusion of the ocean or sea into the land is characterized as a Bay or Gulf, as the Bay of Biscay and the Gulf of Mexico. A narrow passage connecting two seas together or a bay with the main ocean is styled a

BAY AND STRAIT.

Strait, as the Strait of Gibraltar, by which the Mediterranean and the Atlantic are connected.

13. A large inland body of water, not connected with the ocean, or only communicating with it by means of a river, is termed a Lake. The Caspian Sea, a true lake, the largest in the world, owing to its size and saltness has been dignified with the name of Sea.

THE LAND AND ITS PHENOMENA.

THE horizontal profile of the land, as seen in traveling through a comparatively level country, and the vertical profile as exposed by the side of mountains, ravines, and sea-cliffs, exhibit a great variety of substances, formations, or rocks differently arrayed.

15. The perforations of the miner extend but a little way below the surface. But in consequence of formations having been tilted up by the action of subterraneous disturbing forces, so as to be brought to or near the surface, the geologist has obtained a knowledge of the structure of the globe to the depth of about ten miles.

16. It belongs to the chemistry and mineralogy of geology to examine the composition and internal structure of rocks, while geography deals with their external aspect; yet a brief reference to these topics will not be out of place. Of fifty-four elementary or simple substances, that is, those which are incapable of further analysis, sixteen form by their various combinations nearly the whole of the matter yet known to enter into the composition of the globe. These are as follows, arranged into three classes according to their amount—the first of each class being the most abundant.

a. Six metalloids or the bases of earths and alkalies—silicum, aluminum, potassium, sodium, magnesium, and calcium.

b. Two metals proper—iron and manganese.

c. Eight non-metallic substances—oxygen, hydrogen, nitrogen, carbon, sulphur, chlorine, fluorine, and phosphorus. The metallic substances mentioned united with oxygen form the great mass of rocks consolidated or unconsolidated.

17. The elementary substances are rarely found by themselves in nature but combined with each other as binary or ternary compounds, forming the simple minerals, of which eight or nine constitute the great mass of all known rocks. The important minerals are quartz, feldspar, mica, hornblende, carbonate of lime, talc, chlorite, augite, serpentine. Oxyd of iron is also very common.

18. Sometimes the simple minerals exist in large independent masses, as quartz and carbonate of lime; but in general two, three, or four are united to form a rock. Frequently the mineral constituents of a mass have been so much ground down previous to consolidation as to make the rock appear homogenous, as shale and clay-slate.

19. The manner in which the ingredients of rocks are arranged exhibits several varieties:—granular, as in granite; fibrous, as in asbestos; porous, as in pumice-stone; and laminar, as in mica-slate. The laminar structure presents many diversities—horizontal and inclined, contorted, zig-zag, etc. The varieties of lamination, which is almost entirely confined to sedimentary rocks, result from the different circumstances under which deposition has taken place in quiet or troubled waters, upon a horizontal or steep shore, and whether subject to lateral or vertical pressure.

20. The formations which constitute the solid matter of the globe accessible to man are divisible into the four grand classes of Plutonic, Volcanic, Metamorphic, and Aqueous rocks, terms referring to the mode in which they have been produced.

21. The "Plutonic" rocks are of igneous origin. They consist of crystalline masses, which while in a melted state were gradually cooled and consolidated at an immense depth under enormous pressure, and then upheaved by the elastic force of internal heat. But frequently the upheaving must have taken place before complete consolidation, as we find them protruded into cracks and fissures of superincumbent formations. Granite and its varieties, with some porphyries, belong to this class. They have no organic remains.

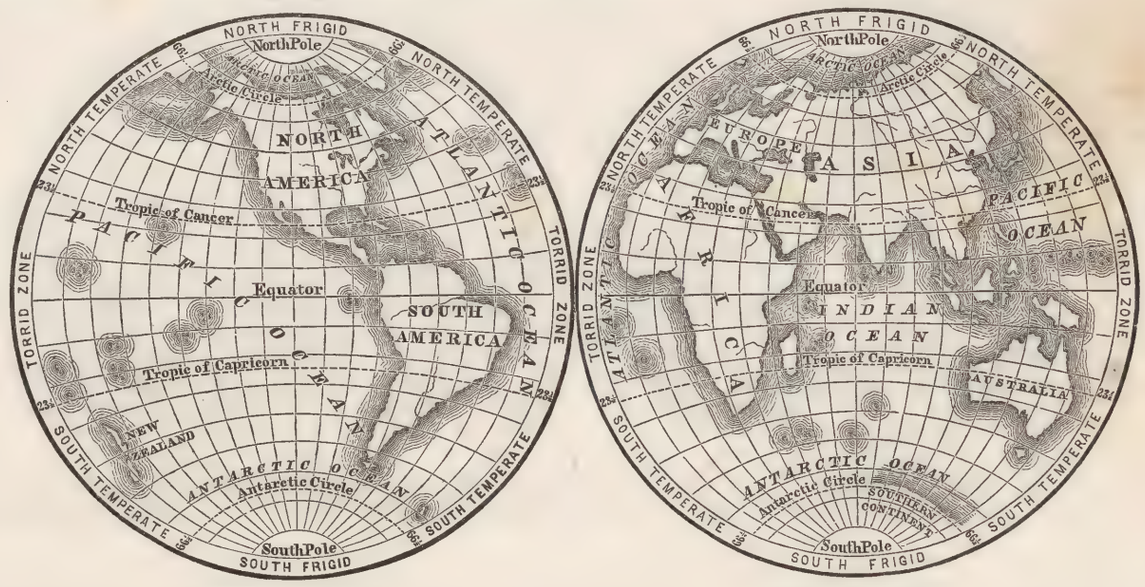
22. The "Volcanic" rocks, due likewise to the action of fire, are the produce of ancient volcanic eruptions. They have not been elaborated like the plutonic in the deep recesses of the earth, but for the most part solidified at or near the surface, with a less degree of pressure—a circumstance that has had a marked effect upon their appearance and structure. They have also a more diversified character, the volcanic fire having fused different kinds of strata in its outbursts. The basalts, green-stone, trachytes, and various porphyries belong to this class. They are frequently called trappean or trap rocks. No fossils are found in these formations.

23. The "Metamorphic" rocks are of sedimentary origin, but having been in contact with the plutonic while in a state of igneous fusion they have been altered in their texture, and crystallized by the action of intense heat. The gneiss, mica-schist, and part of the clay-slate systems belong to this division Like the two first-named formations these rocks are also non-fossiliferous.

24. The "Aqueous" rocks are those which are entirely due to the action of water, having either been deposited as a sediment by its mechanical agency in connection with gravity, or as chemical precipitates from solution. Formations of this class constitute by far the greater portion of the exposed crust of the globe. They all contain organic remains—fossils—and form three divisions called primary, secondary, and tertiary, subdivided into systems and groups. The primary and part of the secondary series are sometimes called Paleozoic, indicating the fact that the formations so named contain the fossil remains of the earliest formed animals.

25. The order of succession in the metamorphic and aqueous rocks is invariably maintained, or, in other words, while many members of a group and entire systems may be wanting, whenever they do occur they are found to occupy the same relative position. Thus if the old red sandstone is at the surface, the carboniferous system is not the under-lying formation. Chalk beds are never found below the coal measures, or the coal measures below rocks of clay-slate; but either chalk or coal may occur immediately above the slate, the intermediate formations being wanting.

26. The igneous rocks, plutonic and volcanic, exhibit generally amorphous or irregular masses without divisional structure, but broken by fissures, the summits being dome-shaped, globular, or deeply serrated ridges in the form of needles. The metamorphic and aqueous rocks, on the contrary, are disposed in the form of beds, layers or strata, both horizontal and inclined at all angles to the horizon. The plains and low portions of the earth are occupied almost universally by stratified rocks. They appear also in elevated districts and on the flanks of mountainous regions. Strata vary in thickness from a few inches to many yards and fathoms.



27. The general conclusion obviously indicated by the preceding fact is, that the rocks of fusion or the unstratified masses which constitute the basis of the crust of the earth have been repeatedly erupted through and into the stratified formations, at different epochs of critical action among the subterranean agencies of heat. Hence the various dislocations of the stratified rocks, their disturbed and inclined positions, their upheaval above the deep in which they were deposited, and frequent elevation along the flanks and on the crests of high mountain ranges, which commonly have igneous masses for their nuclei or axes. The force exerted by the elastic vapors, which the earth incloses in the elevation of mountains, however vast, immeasurably yields to the power indicated in the upheaval of the general surface of the land to its far inferior altitude.

CONTINENTAL MASSES.

28. The great Eastern Continent extends through upward of 200 degrees of longitude—from Cape Verde (17° 30′ west), the most westerly point of Africa, to East Cape (190° east), the eastern extremity of Asia. It embraces upward of 200 degrees of latitude, from North East Cape (78° north), in Siberia, to Cape Lagullas (35° south), the southern extremity of Africa.

29. The superficial area of this mass of land is estimated at about 33,000,000 square miles. It has a maritime coast-line of more than 60,000 square miles, and attains its greatest elevation in Central Asia, reaching the enormous height of 29,002 (Gahoorishanka) feet above sea-level, the culminating point of the globe. The greatest depression is the shores of the Dead Sea, which at water-level is 1,200 feet below the Mediterranean.

30. Of the three divisions of the Continent, Europe comprises somewhat less than one eighth of the entire area, Africa more than a third, and Asia more than half. Africa is more than three times, and Asia more than four times the size of Europe.

WESTERN HEMISPHERE. EASTERN HEMISPHERE.

31. The southwestern member of the Continent (Africa) is in many respects diverse from the other portions. Externally, a comparatively unbroken coast-line, and internally, deficient water communication, with the preponderance of sandy deserts, mark the contrast. Asia and Europe exhibit repeated examples of deeply indented shores, and both are plentifully supplied with great river systems and fertile soil; and each has a large central protuberance or nucleus—the Himalayas of Asia and the Alps of Europe—bifurcated at its extremities, the spine of the respective masses, and following the same general direction and composed of the same granatoid rocks and crystalline schists, and flanked by the same recent sedimentary formations. The narrow gorges opened by nature, which admit of the passage of the chains, and serve as thoroughfares to commerce, have precisely similar features, and are only more formidable in the Himalayas. The great tertiary and alluvial valley north of the Alps answers to Toorkistan and Mongolia. Piedmont and the plain of Lombardy are miniature likenesses of the basins of the Indus and the Ganges; and the vast igneous district of Hindoostan has its correspondent in the volcanic zone of Italy. The southern peninsulas of the two regions are also obvious analogues—Spain and Arabia, Italy and Hindoostan, the Morea and Malacca.

32. The Western Continent extends through upward of 130 degrees of longitude, from Cape San Roque (35° west), the most easterly projection of South America, to Cape Prince of Wales, in Behring Strait (168° west), the most westerly point of North America. It embraces upward of 120 degrees of latitude, from Point Barrow (72° north), in the Arctic Ocean, to the Strait of Magalhaens, 54° south.

33. The superficial area of America is about 15,000,000 square miles, and the sea-coast a linear extent of 40,000 miles. The greatest elevation is 25,000 feet above the level of the sea, but more than 4,000 feet below the culminating point of the Eastern Continent. The longest line that can be traced passes from Point Barrow along the Rocky Mountains, and the Cordilleras of the Andes to the Strait of Magalhaens, a distance of about 10,000 miles.

34. A striking dissimilarity appears in the general contour of the two continents. In the Eastern the prevailing direction of the land is east and west; in the Western it is perfectly opposite, being north and south. The forces that raised the two masses seem to have acted at right angles to each other—in the direction of the equator in the Old, and of the meridian in the New World.

35. The Western Continent exhibits a simpler outline than the Eastern. Its maritime coast has a less proportion of irregularities or indentations, no interruption of consequence occurring on the side toward the Pacific, except at California. The eastern sea-board of South America is also comparatively entire.

36. Granite appears to be the base or skeleton of both continents, but while it occurs at a great elevation in the Old World, forming some of the highest points of the Alps, it occupies a subordinate position among the rocks of the American mountain chains. The inferior and predominant formations of the Cordilleras are immense amorphous masses of porphyritic, basaltic, and trachytic rocks, for the most part of comparatively recent date. These volcanic products constitute a great portion of the chain and form its loftiest summits, while in the Eastern Continent they occur in inferior force, and never at great elevations.

37. The two continents, however, have some points of resemblance. Both terminate pyramidally toward the south. Their limits to the north have nearly the same latitude—that of 70° generally; and an important member of each is almost isolated, a narrow isthmus connecting Africa with Asia, and uniting the Americas. Descending to detail, we find the northerly projection of the peninsula of Jutland, in Europe, repeated in that of Yucatan, in America, the only important exceptions to the southerly directions of peninsulas; and the remarkable crevices or fiords of the Norwegian shore are repeated on the coast of southern Chile and western Patagonia.

38. Comparing the two sides of the Atlantic basin, a mutual adaptation to unite may be observed in the advancing and retreating configuration of the land masses. Thus the great convexity of western Africa is opposite to the indentation of the Gulf of Mexico, and the convexity of the Brazilian shore is opposite the indentation of the Gulf of Guinea. The bold conception has been entertained from this peculiar outline, that the two continents once formed an undivided territory which some great convulsion separated, creating the Atlantic valley, into which the ocean poured.

39. The mean height of continents or their elevation above the sea-level, supposing the respective masses to be equally distributed, is a subject investigated by Humboldt with somewhat surprising results. He finds the mean height to depend not so much on the longitudinal mountain chains, "those culminating points or domes which attract the curiosity of the vulgar," as on the gentle but extensive and compact swellings of the plains and the development of the table-lands. Thus it is calculated that the Pyrenees would produce upon the whole of Europe scarcely the effect of six feet, and

the Alps about 22 feet, while the plateau of Spain, an inferior elevation, but more compact, would produce an effect of 76 feet. If the vast range of the Andes were pulverized, and spread equally over the eastern plain of South America, its effect would be to raise the surface only about 518 feet. Omitting Africa, which is comparatively unknown, the final results obtained are an elevation above the level of the sea—for Europe of 670 feet, North America 750 feet, South America 1,130 feet, and Asia 1,150 feet, or a mean elevation of the whole of 920 feet.

ISLAND MASSES.

40. Islands rarely occur solitarily surrounded by a wide expanse of ocean, but usually form groups and archipelagoes contiguous to some main shore. Solitary islands are commonly small and of volcanic origin, as Helena, Ascension, etc. A few islands placed at no great distance from one another, or a principal island surrounded by others of smaller size, constitute a group;

ISLAND OF ST. HELENA.

and several islands varying in their extent and distance, but in the same general locality, an archipelago. Groups and archipelagoes have frequently detached or outlying members, which are sometimes called "Sporades" or scattered islands.

41. Some islands are simple accretions of sand; while others are tracts more or less extensive, evidently, from their geological characteristics, erupted portions of adjacent continental masses. A vast number are volcanic, either at present the scenes of fiery convulsion or proclaiming the past activity of the tremendous element by their igneous masses and crater-form outlines. Coralline islands are the work of organic beings which exist in inappreciable numbers chiefly in the tropical seas, the Indian and Pacific oceans.

42. Of the islands which have once formed portions of continents, there are numerous examples. The geological affinity between southern England and northern France is obvious, and no one can doubt that they were once united by an isthmus, through which the sea has cut a passage and formed the Strait of Dover. And so with the Grecian archipelago, and so the Japanese Islands, and with the Indian archipelago—each of which has geological relation to its adjacent continental mass. Their continuity has been interrupted by violent oceanic invasion, and the portions intermediate between the present continental and insular shores become submerged.

43. Volcanic Islands, though widely distributed, are chiefly found in the Indian and Pacific oceans, forming three great zones, each extending several thousand miles. The formation of new islands by submarine volcanic action is a phenomenon of the present era. Some of these remarkable creations have either entirely disappeared by subsidence or remain as shoals, slightly depressed below the surface of the ocean, while others have continued permanent. An instance in point is Graham Island.—In July, 1831, a column of water was seen rising from the sea like a waterspout, followed by a dense steam and an island, which gained the height of 200 feet and a circuit of three miles. Toward the close of the year it gradually subsided, and now forms a dangerous shoal.

GRAHAM ISLAND, COAST OF SICILY.

44. Coralline Islands consist of the agglutinated skeletons of departed races of polypi, composed of carbonate of lime secreted from the ocean, cemented into hard calcareous rock, and within a certain range of the living organisms, adding by their growth to the superstructure

45. The coral insects can not exist if left dry, or at a greater depth than from 25 to 30 fathoms. All the coral above the water-surface is dead, and likewise all below the depth ascertained to be the limit of coral life. The fact of its occurrence hundreds of feet below this limit, with the general phenomena of the formations, is beautifully explained by the theory that the foundations upon which the insects or polyps originally began to build have been in course of subsidence. This view is confirmed by the circumstance that the lines of volcanic activity in the Indian and Pacific oceans, or the areas of elevation, are in general remote from the spaces occupied by the coral-working insects, the supposed areas of subsidence.

46. Coralline formations are distributed into the four great classes of lagoon islands to which the native name of "Atolls" is generally applied, encircling reefs, barren reefs, and fringing reefs.

a. Lagoon Islands or Atolls consist of a belt of coral circling a lagoon or vacant space of the ocean. The coral above the surface is usually not more than a quarter of a mile in breadth, and so low that it would not be perceptible at a short distance but for its vegetable clothing of cocoa-nuts and palms. The lagoons themselves vary in extent from a few acres to many square miles. Bow Atoll is 30 by 6 miles across; Rimsky Atoll 54 by 20 miles, and one of the Maldive Atolls is 88 miles by 10 or 20 miles. The Atolls are variously circular, oval, and irregular in shape, and occur solitary or in groups, but usually in elongated archipelagoes. Dangerous Archipelago, east of the Society Islands, is an assemblage of 80 or more atolls; the Low Archipelago, to the

LAGOON ISLAND OR ATOLL.

north, an ellipse, 840 miles in its longer and 420 miles in its shorter axis, and the Caroline Archipelago, north of New Guinea, comprises 60 groups of atolls about 1,000 miles in length. Between the extreme limits of the Carolines west and those of the Low Archipelago east there is a linear space of ocean extending upward of 4,000 miles in which the islands are for the most part atoll-formed.

b. Encircling Reefs differ only from the atolls in having one or more islands within the central expanse. The coral belt is commonly at the distance of two or three miles from the inclosed shore. Otaheite, the principal of the Society group, is a fine example; an island rising in mountains 7,000 feet high surrounded by a lagoon like an enormous moat from half a mile to three miles broad, which is separated from the outlying ocean by a reef of coral. The coral, both in the case of atolls and encircling reefs, has openings or channels in its circuit by which ships enter the lagoons, where they find excellent harborage.

c. Barren Reefs extend in straight lines in front of the shores of a continent or of a large island, frequently at a considerable distance from the land. New Caledonia has a reef of this kind 400 miles long; but the grandest example of coral formation existing is the great Australian reef. Externally, it starts up with little inclination from a fathomless ocean, stretches upward of a thousand miles along the coast, varies in breadth from 200 yards to a mile, and in distance from the shore from 20 to 70 miles. The inclosure is everywhere navigable. The Florida Reefs are of this class.

d. Fringe Reefs are mere ribbons of coral, inclosing no lagoons, but immediately lining the shore.

CORAL REEF AND ISLAND.

47. In a few instances islands have been registered as existing in certain parts of the ocean, which subsequent navigators have failed to find. Saxenburg Island and Isle Grande, both placed in the South Atlantic, are examples. Either the precise localities have not been revisited, or the supposed discoverers were deceived by the land-like appearance of low clouds and icebergs. A simple incident occurred during Ross' Antarctic expedition. This was the sudden appearance of what seemed to be an island in a spot occupied a few hours before by an iceberg, upward of 100 feet high, the whole of the summit being perfectly free from snow. It seems that the berg had turned over, unperceived from the ships, exposing to view a new surface covered with earth and stones, the mass still slightly oscillating from the effects of the capsize.

MOUNTAINS AND VALLEYS.

48. Mountains, to which we are largely indebted for sublime and savage or beautiful and picturesque scenery, are the higher protuberances of our planet. Those of the first class reach the height of 10,000 feet and upward above the level of the sea, those of the second class ranging between that height and 4,000 feet, and those of the third class from thence to 2,000 feet. The inferior elevations are styled hills and slopes, or are mere undulations of the land.

MOUNTAIN AND VALLEY.

49. The optical impression, made by the elevations of the surface, is that of the earth being an irregular body and not a sphere. But the highest mountain known, rising to 29,002 feet (Gahoorishanka), is only about one 5,000th part of the earth's greatest circumference, and one 1,600th of its axis. A grain less than one twentieth part of an inch in thickness would therefore represent it upon an artificial globe of 21 feet in circumference.

50. Though nothing appears at first sight more arbitrary and unsystematic than the contour of mountains, there is everywhere a certain general correspondence between their external aspect and internal structure. The productions of the animal and vegetable kingdoms vary with the climate, but the mineral masses present everywhere distinctive peculiarities of natural configuration; while blunt cones with craters indicate volcanoes, a series of peaks

CRATER OF VESUVIUS.

like a saw denotes dolomites, a form of magnesian limestone; rounded heads characterize calcareous rocks; triangular points, slates or quartziferous schists; needles, crystalline schists; capacious twistings and crumplings, serpentines and trachytes; pyramidal forms, phonolites; thin and dark-looking walls intimate the presence of basalts or traps, and rocks broken up by exposure into roundish masses are granites or grits.

51. The highest known mountain of the globe is Gahoorishanka, Chingohamari or Mt. Everest, in Asia. It belongs to the Himalaya range, and is situated in the eastern part of Nepaul. Its summit is 29,002 feet above the sea-level. In the same range are Kunchinjinga and Dhawlagiri, both more than 28,000 feet in height, and which were until recently considered the highest mountains of the globe. The loftiest mountains in the other four grand divisions are—in South America, Aconcagua, one of the Chilean Andes, 23,944 feet; in North America, Mt. St. Elias, the culmination of the Coast Range in Russian America, 17,900 feet; in Africa, Mount Kilimandjaro, supposed to be 20,000 feet; and in Europe, Mont Blanc, 15,750 feet. In 1854-5 Hermann and Robert Schlagentweit ascended the Ibi-Gamine, in the Central Himalayas, 22,260 feet in height, that being an altitude never before attained by man in any part of the world.

52. Mountains seldom occur completely free and insulated, that is, on plains remote from other masses. The exceptions are chiefly volcanic, as Mount Egmont in New Zealand. Nor are they often found in groups with

MOUNT EGMONT.

no connection apparent between their bases. The common arrangement is for a series of neighboring mountains to rise into each other, forming parallel ridges, a number of which constitute a grand chain. The central ridge has usually the boldest development and the greatest elevation; and the extremities of a chain are generally low heights, its culminating points being toward the center. Secondary lines of mountains branch off from the main chain at various angles.

53. From its frequent occurrence, it seems to be a general law for chains of mountains to have very steep declivities on one side and gradual slopes on the other. The Andes present a steeper face toward the ocean than toward the mainland of the continent, and the Alps descend much more abruptly toward Italy than toward Switzerland.

54. Chains of mountains, though making many curves and angles, generally correspond in their prevailing direction to the line of greatest length in the continent or district in which they are situated. The chain of the Andes,

prolonged in North America, extends through the longest line of the Western Continent, and the chain which, with only a few breaks, stretches from the southwest coast of Europe to the northeast coast of Asia, comprising the Pyrenees, Alps, Balkans, Taurus, Caucasus, Hindoo-Koosh, Himalayas, etc., traverses the Eastern Continent. The course of secondary chains, as the Apennines in Italy, the Dovre-Field in Scandinavia, the Ghauts in Hindoostan, etc., corresponds with the greatest length of those peninsulas.

55. Chains parallel in their course, or having identity of general direction though remote from each other, being separated by arms of the sea, straits, or valleys, by igneous deposits, secondary or tertiary basins, exhibit correspondence in geological structure. Thus all chains having an eastward direction closely resemble each other in geological constitution; and north and south chains throughout both continents consist of similar ancient and transition formations, igneous deposits, metalliferous veins, and some dependent secondary strata.

56. Those mountain chains which run in the direction of the parallels of latitude or east and west, are found to mark much more striking differences, not only in the fauna and flora of the globe but among nations, than those which follow the direction of the meridians, or a north and south direction. In both Americas, where the meridional direction characterizes all the chief chains, there is only one copper-colored race, although the continent stretches through more climatic zones than Europe and Africa, or than Asia and Australia united. On the other hand, in the Eastern Continent comparatively feeble latitudinal barriers are the sources of great physical and national distinctions.

PASS IN THE ANDES.

57. Chains of mountains are variously intersected by valleys, which form two leading classes, termed longitudinal and transverse, from their position in relation to the course of the main elevations. The longitudinal valleys separate parallel ridges of a chain, and follow its general direction; the transverse valleys cut the ridges at right angles to it.

58. The transverse valleys admit chiefly of high mountain chains being crossed. In such elevated sites they are narrow and frightful gorges styled passes or gates, because of communication being maintained through them. The passes of the Andes and those of the Himalaya are scenes of great magnificence—often of appalling gloom and peril.

59. Both longitudinal and transverse valleys, but more commonly the latter, have very often written upon their sides a plain record of their origin. They exhibit not only a continuation of the same strata, but salient and reentering points so exactly corresponding as to proclaim their formation by the breakage of the general mass during its upheaval. Hence they are styled Valleys of Dislocation. Sometimes there has been upheaval without fracture, but with more effect at particular points, causing intervening depressions, which are termed Valleys of Undulation. Valleys of Denudation are those which appear to have been formed by the action of water upon soft and practicable strata; but there is little doubt that most valleys, from the grand rents of mountain ranges to the wide and gently sweeping hollows of the general surface, are mainly due to internal causes of disturbance—their external physiognomy being subsequently modified by atmospheric and aqueous agencies.

60. A great depression, embracing many thousand square leagues, marks the surface of western Asia, of which the Caspian Sea and Lake Aral form the lowest part, but which extends far into the interior of the continent, and is supposed to be intimately connected with the upheaval of the Caucasus, the Hindoo-Koosh, and the plateau of Persia.

PLATEAUX AND TABLE-LANDS.

61. An extensive mass of elevated land, with comparatively level sites, comes under the denomination of Plateau or Table-land. It may have various undulations of hill and vale, be traversed by mountain ridges, and serve as a platform for lofty peaks. But its prevailing character is that of a highly raised region, on which there is a considerable area of plain surface, the whole presenting either gradual slopes or abrupt acclivities, and sometimes terrace-faced sides, to the adjoining lowlands.

62. The plateau of Bolivia or Upper Peru, remarkable for its elevation, stretches along the top of the main mass of the Andes, between the gigantic mountain knots of Cuzco and Polon north and south, and between the Cordillera Real and the Cordillera of the coast east and west. The serrated ridges and smoking cones of these boundaries rise to nearly double the height of the inclosed area. The territory of which these are the enormous ramparts exhibits a varied surface, and extends longitudinally 500 miles, with a width of from 30 to 60 miles, and comprises an area of 150,000 square miles, upward of twice the size of all New England. Less extensive and elevated is the table-land of Quito, being only 200 by 30 miles, but not less grandly situated and engirdled by magnificent heights—Pichincha, Cotopaxi, Antisana, Cayambi, Chimborazo, rising from 16,000 to 22,000 feet above sea-level.

63. The plateau regions of Central Asia, however, are the most extensive on the face of the globe; but more properly the great upheaval might be considered as forming one vast plateau, comprising different systems of table-lands. Between the chains of the Thian-chan and the Kuen-lun mountains,

TABLE-LAND OF MEXICO.

and stretching from thence in a northeast direction to the extremity of Mongolia, is the vast district called Gobi, Shamo or Han-hai, a "naked desert," a "sea of sand," or "dry sea." Its mean elevation is 4,000 feet, or double that of Spain; for while toward the wall of China it rises to 5,800 feet, it sinks to 2,400 in the central region. The length is given at about 2,000 miles, with a breadth of from 200 to 300 miles. Shingle, yellow sand, and gravel form the surface, mostly overgrown with rank grass, except in the middle, where there is a belt of naked sand 20 miles across, shifting with the wind.

64. The other principal plateaux of the world are those—of Santa Fé de Bogota 8,700 feet above the sea, of Mexico 7,500 feet, of Abyssinia 6,000 and 7,000 feet, of South Africa 6,400 feet, of Popayan 5,760 feet, of Persia 4,000 feet, of Mysore 3,000 feet, and of Spain 2,250 feet. The plateaux of Bogota and Popayan are in the Andes, and surrounded by rocky walls and lofty culminations. The Mexican plateau covers the whole interior of Mexico. In Africa the table-land extends from Abyssinia to the Cape of Good Hope, and probably covers also the greater portion of the continent southward of the equator. The Persian plateau leaves only a very narrow border of lowland along the Persian Gulf, the Indian Ocean, and the Caspian Sea. The whole of India between the Ghauts is one vast table-land.

65. The plateau of Central Asia is walled in to the west by the Bolor chain (Cloudy Mountains), which forms toward the middle the remarkable region of Pamir, a radiating point in the hydrographical system of Asia, long ago correctly described by Marco Polo as a high table-land. This district, locally called Bam-i-duniah, "Roof of the World," is the source of the Oxus, and forms the water-parting between its basin, that of the Indus and other principal rivers.

PLAINS AND LOWLANDS.

66. Plains are discriminated from table-lands by being very little elevated above the sea; in some instances depressed below its level Geographically the term is applied to an extent of country generally level as compared with mountainous districts, however the superficies may gently wave or prominently undulate, be studded with low hills, traversed by valleys, or intersected with deep ravines. In this sense plains constitute by far the greater portion of the earth's surface, and are the sites of its highest culture, greatest cities, and most numerous population.

67. Plains, while possessing certain features in common, have characteristic peculiarities. With a view to illustrate their differences of natural condition they may be considered under their respective local denominations, as landes, heaths, and puszta, steppes, deserts, llanos, selvas, pampas, savannahs or prairies, barrens, and pine-barrens.

68. Plains, for the most part infertile, known by the name of landes, occupy a large portion of northern Germany and to the extremity of Jutland. They are sandy tracts, sometimes entirely naked, but more generally covered with pines or coated with the *erica vulgaris*, which gives them the name of heaths. Fertile districts, swamps, and stagnant pools intermingle with them. In France extensive landes occur between the Gironde and the Pyrenees, vast sandy downs and levels, either wholly barren or clothed with heaths and pines, interspersed with marshes, and at distant intervals with meadows and

LLANO OF SOUTH AMERICA.

cultivated fields. The great plains of the middle Danube, occupying the interior of Hungary, locally called puszta, indicate the country to have once been the bed of an inland sea or lake. They consist of tracts of rich black loam, with districts of deep sand, susceptible of cultivation, but for many miles not a tree, shrub, stone, or living creature is to be seen, the monotony being alone varied by the sand hillocks shifting with the wind.

69. The Russian term "Steppe" is applied to the series of extensive plains which occupy southeastern Europe and northwestern Asia. If the word implies dry and parched, it is only partially applicable to the districts it denotes. The steppes have in fact no uniform character except that of being great lowland levels. Some are richly cultivated, while others are incapable of cultivation from various causes, either an excess of moisture or of drouth or the abundance of salt. Some are barren sands; others are studded with low saline plants; others are covered with plants of the families of the compositæ and leguminosæ, and others have a luxuriant gramineous clothing, woods intermingling with the pasture lands.

70. The tracts of bare sand, gravel, rocky slates, flints, and silicious stones, which form deserts, properly so called, condemned to eternal sterility, though not unknown in the New World, are so predominant in the Old as to form a marked distinction between the two regions. They stretch in a nearly continuous zone of almost irretrievable desolation from the Atlantic Ocean through the north of Africa, and through central Asia toward the Pacific. Depressions of varying extent occur, called oases, where there are wells and springs, nourishing groves of date-trees, acacias, ferns, and grasses—fertile spots which serve as resting-places to the caravans that traverse the wilderness.

TRAVELING IN THE DESERT.

71. In South America a sandy desert called the Gran Chaco occurs west of the river Paraguay; a true salt desert under the name of Las Salinas also lies farther west, and a shingle desert extends for 800 miles through eastern Patagonia. In North America, at the head of the affluents of the Missouri, a large tract of rock, sand, and gravel has received the name of the American Desert; and a large portion of the great California basin is a sandy region without any outlet to the ocean for the few streams which, coming from the hills, are lost in their courses or in small lakes. But the Old World is emphatically the region of deserts, which occupy an extent of its surface considerably exceeding the whole superficies of Europe.

72. The plains of Venezuela and New Granada in South America, chiefly on the left of the Orinoco, are termed llanos or level fields. Often in the space of hundreds of square miles the surface does not vary a single foot A gentle wind or a slight rise of the great river reverses the current of its tributaries. These plains are studded here and there with solitary palms, and undergo remarkable changes in appearance. In the wet season they are inundated for hundreds of miles; afterward, upon the subsidence of the waters, they are clothed with beautifully green verdure; and when the season of drouth returns, the grass crumbles into dust, and a dismal desert meets the eye.

73. The plains of the Amazon, called Selvas or forests, form another division of the South American lowlands, covered with primeval woods, interspersed with clear grassy spaces and marsh lands. This zone of woods is estimated to comprise upward of 2,000,000 square miles, of which at least one half is woodland, the remainder being occupied by the waters and the open tracts.

74. The Indian term Pampas, signifying flats, designates the third great region of South America. It extends about 1,800 miles south from the selvas, and from the Atlantic Ocean to the foot of the Andes; and consists of treeless plains, which are in some instances sandy or saline wastes, but mostly immense beds of alluvium, covered with a strong growth of tall grass, lucern, thistles, and gaudy flowers, presenting also vast lagoons and swamps.

PRAIRIE SCENE IN NORTH AMERICA.

75. The central part of North America, from the Gulf of Mexico to the Arctic Ocean, may be called a continuous plain. In the southern part of this tract on both sides of the Mississippi, but principally on the west, the Savannahs or prairies occur, apparently boundless meadows. Some of these are heathy or bushy prairies, where there are springs nourishing, besides grass, small shrubs, grapevines, and an infinite variety of flowers. Dry prairies, the most common, have neither wood nor water, and no vegetation but grass, weeds, and flowers. These are also called rolling prairies, from their wavy surface. Other prairies are moist and well-watered, abounding in pools without issue, left by the floodings of the rainy season, and producing tall, rank grass.

76. The Barrens or barren grounds, near the Alleghany and Rocky Mountains, resemble the prairies in being grassy and treeless, but are more elevated and dry. The pine barrens, situated on the south coast of the United States, and also in the interior, are monotonous tracts of sand covered with gigantic pine-trees.

FISSURES AND CAVERNS.

77. Deep narrow fissures, yawning chasms, and great chambered cavities, common in mountainous districts, are either monuments of the violent action that has shaped the external envelope of the earth, or of the extensive changes produced by slow erosion operating through long ages.

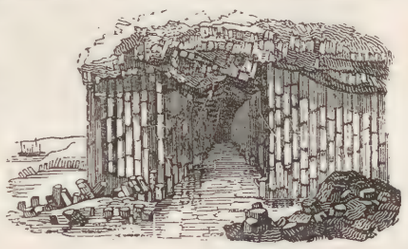
Entered according to Act of Congress in the Year 1850 by J.H. Colton & Co. in the Clerks Office of the District Court of the United States for the Southern District of New York

78. Clefts are frequently the beds of streams, sometimes arched over by a portion of the rock which was not rent by the convulsions that seem to have produced the fissures, forming a kind of natural bridge. At Iconozo in South America, on the route from Santa Fé de Bogota to Popayan, a chasm of immense profundity is crossed by a natural arch 48 feet in length, 39 feet in breadth, and 318 feet above the stream Summa Paz, which passes through it. Sixty-four feet below this bridge there is a second composed of dislodged masses of rock, which have so fallen as to support each other. The dark abyss below is haunted by nocturnal birds, whose doleful cries increase the frightfulness of the spot. Another celebrated curiosity of this kind is the natural bridge that passes over Cedar Creek, in Virginia, at the height of 210 feet above the water.



NATURAL BRIDGE, VIRGINIA.

79. Caverns, properly so called, are perforations open to the daylight at one extremity, with lateral entrances on the sides of mountains, either presenting a single vacuity or a series of spacious chambers, connected by narrow winding passages, which often descend far below the level of the entrance.

80. True caverns are not found in the older rocks, granite, gneiss, and slate, but vertical fissures of unknown depth are not uncommon. Grand examples of cavern construction occur in ancient and modern volcanic masses. It marks also the gypsum of the new red sandstone system and the sandstone, but is so characteristic of the mountain limestone that the rock is sometimes called "cavern limestone."

81. From the beds of hard mud which forms the floors of many dry caverns and the streams that still run through others, it may be inferred that such cavities are due, at least to some extent, to the solvent and mechanical power of water.

FINGAL'S CAVE, SCOTLAND.

82. Fissures of rocks occur containing osseous breccia (a mixture of red loam, pieces of stone, and bones), and ossiferous caves, in which, buried in mud or covered with calcareous deposits, the separated bones of extinct species of quadrupeds have been found perfectly preserved, but in various conditions, water-worn and gnawed.

83. The temperature of caverns, where the roofs are massive and the openings narrow, shows little diversity, being below that of the mean of the surrounding atmosphere; but there are some which exhibit the apparent anomaly of being coated with ice in summer which melts in winter. The summer freezing in these moist caverns may be referred to evaporation withdrawing the warmth from the inclosed air and producing a degree of cold below the freezing-point.

84. Some caves, situated in volcanic regions, exhale hot and sulphurous vapors, and others are remarkable for the development of irrespirable gas.

MAMMOTH CAVE, KENTUCKY.

85. Wind caverns are inexplicable phenomena. — From a blowing cave in the Alleghany Mountains a hundred feet in diameter, the current of air is so strong as to keep the weeds prostrate to the distance of sixty feet from its mouth. But the most extraordinary example is the great cavern of Ouybe, of unknown extent, in Central Asia. The tempests that rush from it are sometimes so violent as to carry off everything on the road, and throw them into an adjoining lake. The wind coming from the interior of the earth is said to be warm in winter, and so dangerous that caravans often stop for a whole week till the tempests have subsided.

GLACIAL FORMATIONS.

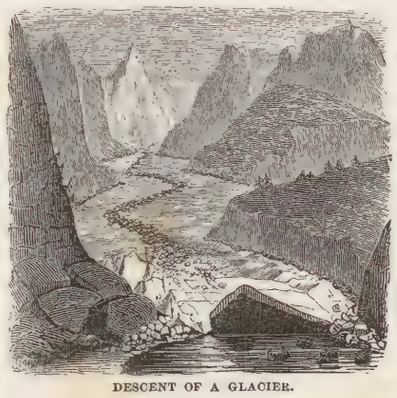
86. In high northern and southern latitudes, and in certain elevations in all latitudes, snow and ice occur on the surface of the globe as a permanent envelope. The causes of this physical condition, with its details, are reserved for the meteorological section, but some general remarks will here be expedient. In countries which are immediately polar, even on sites that are at the sea-level, snow is permanent, but at a much lower latitude in the southern than in the northern hemisphere. Receding from the poles toward the temperate zones it maintains firm hold of comparatively inferior elevations, while totally disappearing from the lowlands before the temperature of summer. Equidistant from the poles and equator, or in latitude 50, it is only permanent on mountains of considerable altitude, the lowest limit being about 8,500 feet. In equatorial districts the lowest limit of permanence rises to about 16,000 feet.

87. Apart from the region immediately polar, the principal fields of permanent snow are: in Europe, the Scandinavian Mountains, the Alps, and the Pyrenees; in Asia, the Caucasus, the Himalaya (abode of snow), Kuen-lun, and Altai chains; in Africa, the Greater Atlas range; and in America, the Andes and higher parts of the Rocky Mountains, and the Coast Range. Iceland, in the North Atlantic, is also within the region of permanent snow.

88. The snows accumulated on the tops and steep acclivities of mountains are frequently precipitated by their own weight into the adjacent valleys, rooting up forests in their course, tearing away fragments of rock, filling up the beds of streams, converting them into fresh channels, occasioning destructive floods, and sometimes burying men, cattle, and whole villages fathoms

SNOWY REGIONS OF THE ALPS.

deep beneath the mass. The volume put in motion in the first instance may be small; but, dislodged at a high elevation, it increases as it descends to a prodigious magnitude by forcing off other masses in its path. These avalanches are not merely fatal to life and property immediately in their way, but the air, suddenly compressed by the velocity of their descent, rushes off with the force of a tornado, and plays havoc with every object in the vicinity.



89. Glaciers, masses of true ice, are remarkable appendages of the snow-fields, as intimately related to them as a stream to a spring or as an icicle to a snow-covered roof. Their external aspect is that of a frozen torrent depending upon the flanks of mountains and extending from the higher summits into the lower valleys. Originating in the regions of eternal frosts they descend below the line of perpetual snow to the warm cultivated grounds, where, though continually wasted, they are never destroyed, being constantly replenished from the icy world above.

90. The size of glaciers sometimes amounts to 15 and 20 miles in length and 3 miles in breadth; the thickness at the lower end varying from 80 to 100 feet. Their extent obviously depends upon the extent of the snow-fields of which they are offsets, and on the size and slope of the subjacent valleys. The larger masses exhibit a steep ascent at the lower extremity; they then slope gently with a surface more or less broken and undulating, and again become highly inclined toward the surface.

91. The general contour of glaciers is either canal-shaped, oval-shaped, or basin-shaped, according to the form of the valleys into which they protrude. The ice, when viewed in small pieces, is commonly white, like river-ice; but that of the entire mass exhibits every variety of blue tinge, from the slightest cerulean to the deep hue of the lapis lazuli. The blue frequently passing into green is the deepest in the crevasses. No language can describe the beautiful effect of the different blue and green tints contrasting with the pure white snow at a higher level.

92. The descending march of glaciers, imperceptible to the eye, is evident from the permanence of the masses, though in the act of constant dissolution; but direct proofs of this progress have been accumulated in abundance, and the rate of motion has been ascertained. Experiment has demonstrated their constant and certain motion, and not by fits and starts, though with variations as to the rate, which depend upon the seasons; thawing weather and a wet state of the ice conducing to its advancement, while cold, whether sudden and prolonged, checks its progress. The movement is the fastest in summer, by day and during great heats; the slowest in winter, by night and during severe frosts.

93. The most recent theory to explain glacial motion, that of Prof. Forbes, is the best supported. Stiff and altogether rigid as the mass appears, he conceives, from careful observation of the interior structure and other circumstances, a glacier to be an imperfect fluid or a viscous body, which is urged down slopes of a certain inclination by the mutual pressure of its parts. He compares it to a thick mortar or the contents of a tar-barrel poured into a sloping channel, the central parts of which would move faster than the outer edges. Bold and startling as this hypothesis appears, it best answers to observed phenomena, and seems the more probable the more it is examined.

DESCENT OF A GLACIER.

94. Glaciers by their motion break off masses of rocks from the sides and bottoms of their valley courses, and crowd along everything that is movable, so as to form large accumulations of debris in front and along their sides. The edges also receive the huge fragments variously shattered by their fall, that are disintegrated by atmospheric causes; a process going on to a great extent in elevated regions. These superficial accumulations are called moraines.

95. The base of glaciers, usually thickly set with fragments of rock, pebbles, and coarse sand firmly frozen into the icy mass, acts as a huge rasp to the underlying mass, scratching and striating their surfaces in moving over them; or as a smoothing and polishing instrument, if the earthy materials in the ice are finely comminuted.

96. The preceding facts are of great interest and importance in a geological point of view. They have been adduced to explain the phenomena of erratic blocks of smoothed, striated, and crushed surfaces, which appear both contiguous to and far remote from the region of existing glaciers.

97. Existing glaciers occur largely in Spitzbergen and in Greenland, where, descending to the sea-level, detached masses constitute the icebergs of the Arctic Ocean, and are drifted into the Atlantic. They are not known in South America within the tropics, though the Andes rise far above the snow-line. This is owing to the excessive steepness of the peaks, a feature unfavorable to their formation; but they appear in southern Chile and Patagonia. In Asia they are found on the northern side of the Himalayas, and in the Kuen-lun, Thian-chan, and Altai. Their existence in the Caucasus and Ural Mountains is uncertain. In Europe they occur scantily in the Pyrenees, largely in Norway, but principally in the Alps, where, independent of the Grisons, the area of the ice is estimated at 1,500 square miles, from 80 to 600 feet in thickness.

VOLCANOES.

98. The term Volcano denotes a peculiar class of mountains emitting from their summits or sides molten mineral masses, with columns of flame, smoke, and ashes. A conical figure, with a cauldron-like hollow at the summit, denominated the crater or cup, is their general physiognomy.

99. Volcanic mountains are either continuously active or intermittent or extinct. The frequency of eruptions with their character appears to have a marked relation to their height. Stromboli, a comparatively low mound, has been uninterruptedly active from the dawn of authentic history, a permanent fiery beacon to the sailors of the adjoining seas, but very rarely violent. The lofty cones Etna, Peak of Teneriffe, Tunguragua, and Cotopaxi have on the contrary varying intervals of rest, in some instances amounting to centuries. Extinct volcanoes are those which have plainly once been the outlet of fire and igneous products, but whose activity has for ages been suspended. Some of these may really belong to the intermittent class now experiencing a long fit of dormancy.

MOUNT VESUVIUS.

100. By far the greater number of volcanic vents are situated in close proximity to the sea, either in islands, in chasms, more or less on the coast, or at the foot of such chasms. This fact, in connection with the occurrence of submarine eruptions, has often been cited in behalf of the chemical theory of volcanoes, or the hypotheses of subterranean oxydation, which refers them to the infiltration of the waters of the sea into ravines containing incandescent materials which form the fuel of eruptions. There are, however, important exceptions to the proximity of volcanoes to the sea or to any sheet of water—some in the New World, but the most remarkable in Asia.

101. Of all the postulates for a general theory of volcanoes, the simplest and best founded, supported by the temperature of the earth increasing with

POPOCATAPETL.

the depth in every parallel of latitude, and by the great extent of rock once fused beneath our feet, is the igneous fluidity of the interior of our planet, a

vast sea of melted rock underlying the cooled and solidified crust which may remain at rest for ages beneath enormous areas, but is liable to be locally excited and uplifted by the force of compressed vapor. Volcanic vents remind us in this view of intermittent springs.

102. Volcanoes may be characteristically distributed into the two great classes of central and linear systems. A central system consists of several vents grouped around a principal cone, which serves for a common point of eruption, as those of the isles of Palma, Lancerote, and Gran Canaria in relation to the Peak of Teneriffe; or they are arranged in an expanded area, as in Iceland. A linear system consists of several vents extending in one direction at no great distance from one another, apparently the apertures of some great longitudinal fissure, as volcanoes of America and the Asiatic isles.

103. Among the specialties of volcanic action may be enumerated eruptions of mud, the fires of Bakou, the fire-hills and fire-springs of China, and the geysers of Iceland.

THE GEYSERS OF ICELAND.

EARTHQUAKES.

104. Earthquakes and volcanic eruptions are undoubtedly phases of the same phenomena. The concussions so named are by far the most frequent and violent in countries which surround or lie between volcanic districts, but the shocks are most severe in places distant from active volcanic sites, the vents of the latter acting as a kind of safety-valve to the elastic force which, when pent up, agitates the crust of the earth in effecting disengagement.

105. No phenomena are so terrible in their effects or so fatal to life as earthquakes. The volcano gives timely notice of an explosion; but the earthquake commences without the slightest warning; shocks follow in quick succession, and almost at the same instant a vast extent of country is involved in disaster from the oscillation.

106. The movements of the ground during an earthquake are described as consisting of a series of tremulous vertical, horizontal, or rotary vibrations, rapidly following each other, sometimes occurring singly or taking place together. They are either linear as to the direction of the concussions, or the shocks are propagated in circles and great ellipses, gradually decreasing in intensity with the distance from the focal points.

ROCK FISSURE.

107. The phenomena of earthquakes comprise the permanent displacement of large areas of land by elevation and subsidence, the opening of extensive fissures, great oceanic waves, and a train of varying incidents dependent upon the sites and strength of the concussions.

108. Though unable to trace the intimate connection of earthquakes, volcanoes, thermal and hot springs, the disengagement of mephitic vapors, steam, and inflammable gas, it is impossible to doubt their direct relationship and mutual dependence upon one grand phenomenon—a prevailing high temperature in the interior of the earth at an unknown depth below the surface. Thermometrical experiments made in mines show that at a certain depth the thermometer rises and goes on rising proportionally as the depth increases.

LAND SLIPS AND GRADUAL DISPLACEMENTS.

109. The dislodgment of mountain masses which fall a heap of ruins into the subjacent valleys, or simply slide to a lower level without entire derangement, is not uncommon with certain stratified formations of a loose and solvent texture. Though the work of a few moments as to the proper catastrophe, the preparing process for the event extends through a series of ages. It is in general due to the solvent power of water percolating by rents and fissures to a stratum of soft sandstone, limestone, or conglomerate, the base of other strata, and gradually carrying away its material.

110. In addition to examples of permanent displacements of land arising from convulsive movements, certain districts appear to be subject to slow elevation or subsidence or to both alternately.

111. On the coast of Norway, from the Naze to the North Cape, and on that of Sweden, along the whole west shore of the Gulf of Bothnia, raised beaches, former sea margins (100, 200, and even 600 feet above the present level of the ocean), chronicle a process of elevation which is still going on at an estimated rate of four feet in the course of a century, the maximum of the upheaving power lying in north Lapland, and gradually falling off toward the south. On the contrary, south Sweden is sinking. West Greenland also exhibits gradual depression.

112. Raised beaches and submarine forests, the monuments of elevation and of subsidence, occur more or less in all maritime countries, although in historic times these may not have been visited by violent earthquakes, and are far from the vents of igneous activity; and there is reason for the general conclusion that while certain parts of the crust of the earth are subject to paroxysmal disturbances, it undergoes gradual expansion and contraction also—in some cases both alternately; the whole phenomena depending mainly upon different conditions of interior temperature.

THE WATER AND ITS PHENOMENA.

WATER, one of the most important and abundant substances in nature, is found in each of the three forms which bodies are capable of assuming — vaporous, fluid, and solid. Water is essentially a compound of two gases, hydrogen and oxygen, in the proportion of one part of the former to eight parts of the latter. It seldom, however, occurs in a state of perfect purity, but variously impregnated.

114. The water of wells, rivers, springs, marshes, and lakes is for the most part fresh, containing no appreciable amount of saline matter. A fluid covering of this description composes a large portion of North America, its lakes comprising more than half the amount of fresh water on the face of the earth.

115. The whole amount of fresh water compared with the whole aqueous portion of our planet is utterly insignificant. The universal ocean is salt. In their density or amount of saline impregnation the waters of the ocean vary in different zones. Those of the southern hemisphere exceed those of the northern in saltness, while those of the Atlantic are in excess of those of the Pacific. At the equator and at the poles the density is also inferior, arising from the copious equatorial rains and the melting of the polar ice; and at the same point of the ocean the density is least at the surface, owing to the rains. The fresh water is the lighter, and slowly commingles with the salt water. At the mouths of great rivers the same phenomenon is observed, and inland seas which receive rivers are commonly less salt than the main ocean. The Mediterranean, however, is an exception; its waters are four times salter than those of the Atlantic—a fact attributable to excessive evaporation.

116. The origin of the saline quality of oceanic water is a physical question involved in obscurity. We merely know that various salts and immense masses of rock-salt are constituent parts of the terraqueous system, a large quantity of which has come in contact with the ocean and been dissolved by its waters. The saline ingredients render sea-water more buoyant than fresh and consequently better adapted for navigation, while a larger area is preserved from being ice-bound.

117. Besides the ocean, salt water has an extensive distribution on land, in lakes and springs, the salts occurring in a far more concentrated state than in the sea. They are common in America, Europe, and Africa, but the table-lands of western and central Asia with the adjoining steppes constitute the great salt water lake district of the globe.

118. Water appears in other mineralized forms in many localities, constituting acidulous, chalybeate, sulphureous, and silicious springs, some of which are known to have preserved their peculiar character from very early historic times. Acidulous springs are found at Carlsbad, Seltzer, Spa, and Pyrmont; Chalybeate in most iron regions; Sulphureous at Saratoga, in Virginia, at Aix-la-Chapelle, Harrowgate, etc., and silicious in Iceland, India etc.

119. Water appears at the surface of the globe at every temperature, from the freezing to the boiling point. The mean temperature of ordinary springs is lower than that of the atmosphere of the place where they occur, if the water is derived from high-lying levels, as is commonly the case; but if it has penetrated deep into the earth it acquires a temperature from that circumstance which increases with the depth.

120. Thermal or hot waters issue from great depths to which they have descended from the surface, and from which they are returned by hydrostatic pressure, variously affected by differing contact with the heated rocks of the interior. The hottest permanent springs known are those of the Fejee Islands, which, according to Wilkes, have a temperature of 200° to 210° Fahr. Those of Bath, in England, never exceed 117°. The Hot Springs in Bath County, Va., have a temperature of only 106°, and those of Arkansas a temperature of 110° to 150° Fahr.

121. The mean temperature of the ocean at the surface diminishes from within the tropics as the latitude increases. Banks diminish the temperature of the sea, and the difference is the greater the greater the shallow. The oceanic warmth-equator, however, does not coincide with the geographical equator, but runs, for the most part, on the north of it, the ocean in the northern hemisphere being warmer than in the southern. At one point in the Gulf of Mexico the line of the greatest heat is situated in 28° north latitude.

122. The waters of the globe exhibit various hues, which depend on a variety of circumstances. The ocean absorbs all the prismatic colors except that of ultramarine, which is reflected in every direction. This is its true color in general when seen apart from atmospheric influence, modified by depth; but every gleam of sunshine, passing clouds, winds, shoals, and sand-banks affect its tints. Particular parts of the ocean show peculiar colors. The sea is white in the Gulf of Guinea, and black amid the Maldive Islands. Variously purple, red, and rose-colored waters occur in the higher parts of the Mediterranean, in the Vermilion Sea or Gulf of California, the Red Sea, and in tracts along the coasts of Chile, Brazil, and Australia. Green water appears in the Persian Gulf, off the Arabian coast, and in connection with the deepest blue of the Arctic Ocean. These tints are occasioned by differently colored animalcules, which swarm in countless myriads in the tracts in question.

123. The phosphorescence of the ocean, a magnificent and imposing spectacle, when the waves scintillate with bright green sparks, or exhibit a long line of fire flashing in a thousand directions, is mainly caused by minute organic beings which are phosphorescent while alive, a property retained by the gelatinous particles with which certain tracts of the deep are thickly charged—their dead and dismembered relics. At the same time a disturbed electrical condition of the atmosphere may be most favorable to the existence of the phenomenon.

124. Lake waters in mountain districts are frequently very transparent and of the finest azure hue, like the Lake of Geneva and the Great Bear Lake; others are intensely green, as the Lake of Zug, and others are of various hues and shade. These all depend on impregnation. River waters exhibit a similar diversity, and from the same causes; and the different hues may, in the case of shallow waters, depend on the character of their beds.

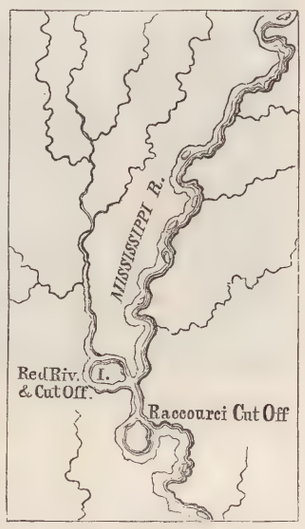
SPRINGS.

125. The rains and melted snows are partly drained from the surface of high ground into rills and streams, or returned again to the atmosphere by evaporation, or devoted to the purposes of animal and vegetable life. But a large portion is received into the soil by minute absorption or percolates through cracks and fissures in the rocks, pursuing a downward course till arrested by clays and impermeable strata, when the water accumulates and is forced by hydrostatic pressure to find its way again to the surface, occasioning the phenomena of natural springs. Artificial springs, called Artesian wells, from the province of Artois, in France, the ancient Artesium, where they have long been in use, are constructed upon the principle of the natural.

126. Some springs are perennial and constant, discharging a great volume of water, and a few show no diminution in the seasons of longest drouth. These are quite independent of the last showers that fall, through primarily derived from rain and melted snow, which originate bodies of water in subterranean reservoirs so vast as not to be exhausted before they are replenished.

127. Other springs are intermittent, depending entirely upon the prevailing character of the seasons. They gush abundantly after heavy rains, flow feebly, and consequently fail in continued dry weather. Reciprocating springs, or those which ebb and flow at short intervals, with somewhat of a character of periodicity, are rare; but to this class belong the Ebbing and Flowing Well of the Peak, and the far-famed Pool of Siloam. These operate on the principle of the syphon, the flow taking place only while the water of the reservoir is raised to the vertex of the arch, and ceasing when the supply fails and until renewed.

128. Rivers have their origin in springs, a number of which commonly unite their waters to form a stream, so that it is difficult to single out the head fountain; or they flow from lakes, or have their source in the melting of glaciers, ice, and snow. They are important auxiliaries to civilization as means of communication between inland nations, and channels of commerce, rendered vastly more efficient since the discovery of steam navigation, which overcoming the power of the current admits of the most rapid floods being readily ascended.



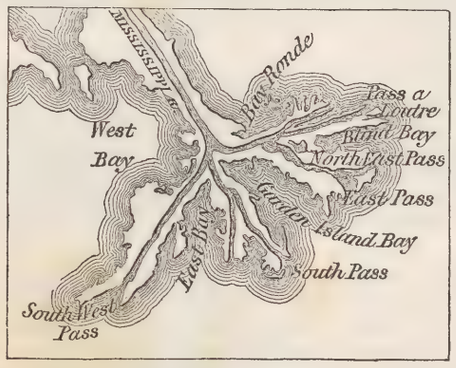
RIVERS.

129. Rivers are either oceanic or continental. Oceanic rivers are those which flow into the sea. The Arctic Ocean receives several grand contributions, the Obi, Yenesei, and Lena from Asia, and the Mackenzie from America, rivers of the first class, but impaired in their utility by their lower courses being almost constantly encumbered with ice. The Indian Ocean has principal rivers in the Ganges, Brahmaputra, Irawady, Indus, and Euphrates, and the Pacific Ocean has the Columbia and Colorado from America, and the Amour, Yang-tse-kiang, Hoang-ho, etc., from Asia. But the Atlantic receives the mightiest rivers in the globe—from America, the St. Lawrence, Mississippi, Orinoco, Amazon and La Plata; all the leading rivers of Europe except the Dwina, and the Nile, Senegal, and Niger from Africa. Continental rivers are those which never reach the ocean, but disembogue in lakes that are unconnected with it, or are absorbed and lost in sandy deserts. There are many instances of these in the deserts of Utah, and in the more extensive desert tracts of Asia and Africa.

RIVER SCENE, UPPER MISSISSIPPI.

130. The hydrographical region of a principal river or its basin includes, besides the bed actually occupied by the water, the whole of the declivities from which its tributaries descend, or the entire country drained, which is defined by an imaginary line passing through the sources of its feeders. Each affluent and each rill flowing into it has a basin peculiar to itself, defined in the same manner, their united areas constituting the basin of the grand stream. The greatest river basins are in America; the least in Europe.

WINDINGS OF THE MISSISSIPPI.



131. The country which divides one basin from another is called the water-parting or watershed, the drainage from thence being in different directions, of which the ridge of a house-roof affords a rough illustration. This is sometimes a lofty range of mountains; but very commonly a water-parting has no great elevation, a slight convexity sufficing to separate one river basin from another or produce distinct systems of drainage.

132. Where the water-partings are low, rivers are largely united in civilized countries by canals, promoting navigation; or as in America, boats and barges are carried over the intervening portage. But there are examples of river basins so running into each other as for water communication to subsist naturally between two primary streams. The most remarkable instance of this kind is the canal of Cassiquiare, which connects the basins of the Orinoco and Amazon.

133. The course of rivers is in general very tortuous—an apparent disadvantage, as it increases the time necessary for their navigation; but hereby a larger area is furnished with means of intercommunication, and that velocity of the current prevented, which would greatly impede or render navigation altogether impracticable.

134. The form of the channel, the slope of the bed, and the volume of water are the elements upon which the velocity of rivers depends. If the banks offered no obstruction, and the molecules of water were not checked by friction with the sides and bottoms of the bed, the accelerating force of gravity would convert gently flowing streams into irresistible torrents perfectly impassable from opposite banks.

135. The alluvial soil transported by great streams is gradually deposited as the current slackens. When the coasts are flat, and the quantity of solid matter brought down is considerable, deltas are formed at their mouths (called

MOUTHS OF THE MISSISSIPPI.

after their resemblance to the Greek letter Δ), consisting of river deposits silently accumulating through ages, and cutting up the main stream into branches. The Ganges, the Nile, the Mississippi and others have large deltas. They are also formed in the same manner, but upon a smaller scale, at the junction of an affluent with its primary, and of a river with a lake.

136. Many rivers have no deltoid formations, owing to not traversing alluvial plains, or to lofty coasts lying around their confluence with the ocean, or strong lateral sea-currents bearing off the sediment to distant parts of its own bed. They empty themselves by a single channel, broad, deep, and unobstructed. This circumstance gives importance to many rivers of inferior order, as the Hudson, the Tagus, and the Thames.

137. Rivers are subject to changes of level, which are either irregular or periodical, according to the nature of the producing cause. The irregular alterations are the effect of casual heavy rains, which temporarily convert insignificant streams into vast floods. A strong opposing wind will also dam up a river so as to materially elevate its surface The St. Lawrence, which is alike unaffected in its level by rains or drouth, is raised by an easterly wind, and thus also a strong wind blowing from the Gulf of Finland acts as a dam to the Neva.

138. Periodical changes in the level of rivers are diurnal, semi-annual, and annual. The daily changes are the result of the tides. The semi-annual and annual variations distinguish the rivers of tropical regions, and are the effect of seasonal changes which occur at exactly opposite periods north and south of the equator.

139. A slope of one foot in 200 in the bed of a river renders it unnavigable; a greater inclination produces a rapid; and one still greater, approaching the perpendicular, a cataract. Rapids occur in most principal rivers, the navigation being carried on by the transport of barges along the banks, or by artificial canals, but in some instances they are surmounted, as in case of the Rapid of Richelieu in the St. Lawrence, by aid of the tide. Cataracts exhibit either the singular perpendicular descent of a mass of water or a series of descents, according as the change from a higher to a lower level is effected at once or by several precipices. They depend for their sublimity upon the height of the falls, but mainly upon the magnitude of the volume of water.

140. Rivers depend for their magnitude upon various elements, the length of their course, the extent of their basins, the rain-producing character of the climate, and connection with mountains covered with eternal snow. The Mississippi, following the Missouri branch, which ought to be the name of the united streams, has the longest course of any river of the globe; but the Amazon stands at the head of rivers, draining by far the largest area of country, and rolling the greatest volume of water to the ocean.

FALLS OF ST. ANTHONY.

141. Some peculiarities of rivers remain yet to be noticed. The effect of the junction of two great streams is not always an expansion of surface, but sometimes a contraction, the depth of the channel and the velocity of its current being increased. The Mississippi is upward of a mile, and the Missouri half a mile wide at their confluence, but from thence to the mouth of the Ohio the medium width of the united waters is only three fourths of a mile. The Nile is remarkable for not receiving a single branch between its junction with the Tecazze and the Mediterranean, a distance of 1,500 miles—a fact without parallel elsewhere. Some rivers temporarily disappear in swamps and underground channels, having in the latter case in many instances scooped their way through obstructing rocks. The Rhone, soon after coming within the French frontier, has a subterranean course for about a quarter of a mile, and the Guadiana is lost for about seven leagues in sandy and marshy grounds. Powerful streams, meeting with strong oceanic currents and tides, frequently occasion a violent disturbance of the waters, as the effect of the collision and strife for the mastery. When the tide ebbs in the Amazon, the river pours forth its liberated flood with increased force and velocity, and meeting nearly at right angles with the sea-current from Cape San Roque, an enormous wave is created, the "prororoca" of the Indians, from the agitation of which fishermen and navigators fly in dismay. A similar phenomenon occurs at the embouchure of the Garonne, and a like cause forms the terrific "bore" of the Hooghly off the mouth of the Ganges.

LAKES.

142. The inland waters which pass under the denomination of "Lakes" are most numerous, as well as upon the largest scale, in the high northern latitudes. Some expanses, lifeless and in general small, occupy the highest mountain passes; larger sheets are found on the lower table-lands; but the most extensive are on the great plains of the globe. A space of nearly 17,000 feet extends between the highest, the Sir-i-kol, and the lowest, the Dead Sea.

LAKE OF KILLARNEY.

143. Four great systems of lakes are traceable: two in the Old World and two in the New—the latter the grandest of all.

A system of lakes, commencing in Great Britain, extends through Norway and Sweden along the south coast of the Baltic, through Finland, north Russia, north Siberia to Behring's Strait. The most important lakes of this system are Saimas in Finland, Wener in Sweden, Onega and Ladoga in Russia.

A second system extends principally north of the mountain spine of the Old World, and includes the lakes of the Pyrenees, Alps, Apennines, Bavaria and Austria, and western and central Asia. The Caspian Sea, the largest lake of the globe, belongs to this band, and also lakes Aral and Baikal.

A third system comprises the great North American masses of fresh water, with their dependencies, which are continuous, connected by rivers—Superior, Huron, Michigan, Erie, and Ontario. The different levels of these lakes mark the descent of the country and the inclination of the connecting rivers. The surface of Lake Superior is 627 feet above the level of the sea;

LAKE NICARAGUA.

lakes Huron and Michigan, 595 feet; Lake Erie, 565 feet, and Lake Ontario, 230 feet.

A fourth system, northwest of the third, extends from the Lake of the Woods to the icy shores of the Arctic Ocean, including lakes Winnipeg, Arthabaska, Great Slave, and Great Bear.

Independent of these systems, there are vast numbers of lakes in both North and South America; some of considerable extent occur in Africa; others in China, as the celebrated "Mer des Etoiles" or Sea of Stars—the mysterious sources of the Hoang-ho.

144. Water of lakes is derived either from rivers or sub-aqueous springs. They are for the most part affected by seasonal changes, in some instances spreading out into extensive inundations, followed by corresponding reduction of surface. The depth of lakes varies from a few feet to probably 3,000 feet. It affords a striking instance of deep indentation in the solid matter

THE DEAD SEA.

of the globe, that while the surface of the Caspian Sea is 83 feet below that of the Black Sea, its bed at one place near the middle descends upward of 2,800 feet below that level, or has a total depression of 2,883 feet below the level of the ocean. It also appears that while the surface of Lake Superior is 627 feet above that of the Atlantic, its bed descends 573 feet below it; while Lake Ontario, with a surface elevation of 231 feet, descends in its bed upward of 1,569 feet below its level.

145. A four-fold classification may be made of lakes founded upon their physical differences. Some have no apparent affluents or outlets; such commonly occupy hollows, extinct volcanic craters, and depend on sub-aqueous springs to supply the waste occasioned by evaporation. Others have outlets, but no apparent affluents, deriving their supplies from subterranean sources. A third class have both affluents and outlets—the common arrangement—and a fourth class receive affluents, but have no outlets. Lakes of the last-named class are rare, but the great inland salt waters of the Caspian, Lake Aral, and the Dead Sea belong to it. Their waters are carried off by evaporation.

146. Some lakes exhibit the phenomena of floating islands, anomalous undulations, and other striking peculiarities. The Lake Zurich is distinguished annually by the appearance of a very minute vegetation upon its surface, exhibiting what is called the flowering of the waters.

THE OCEAN.

147. The waters which continuously environ the continental and island masses form a single ocean, but are conveniently divided into several great sections, an arrangement facilitated by the irregular distribution of the solid and fluid portions of the surface. Thus we have the Arctic, Atlantic, Indian, Pacific and Antarctic ocean basins.

THE OCEAN.

148. The Arctic Basin surrounding the North Pole is bounded by the northern shores of America, Asia, and Europe; and in the spaces between the two continents the astronomical line of the Arctic Circle is usually considered as its limit. The principal branches of this ocean are Baffin's Bay, the White Sea, the Sea of Kara, the Gulf of Obi, and Behring's Strait.

149. The Atlantic Basin lies between America on the west, and Europe and Africa on the east, and has the Polar Circles for its north and south limits. Its branches are the Gulf of St. Lawrence, the Caribbean Sea and Gulf of Mexico, and the estuary of the La Plata in America; the Baltic Sea, the

THE ATLANTIC OCEAN.

German Ocean, the Mediterranean and Black seas, and the Gulf of Guinea in the Old World.

150. The Indian Basin has for its boundaries, Africa on the west, Persia and Hindostan on the north, the Sunda Isles and Australia on the east, and the Antarctic Ocean on the south. Its chief branches are the Red Sea, the Persian Gulf, and the Bay of Bengal.

151. The Pacific Basin is inclosed between America on the east, and Asia, the Sunda Isles, and Australia on the west, and the Polar Circles on the north and south. The principal arms of this basin are the Sea of China, the Yellow Sea, the Sea of Japan, the Sea of Okhotsk, the Gulf of California, and the Bay of Panama.

152. The Antarctic Ocean is confined between the Antarctic Circle and the South Pole.

153. The Arctic Ocean is closed to navigation in its higher latitudes by eternal frosts; but as the Arctic winters vary in severity, the ice formation varies correspondingly. Hence some navigators have found an open ocean, where to others it has presented an impassable barrier at the same period of

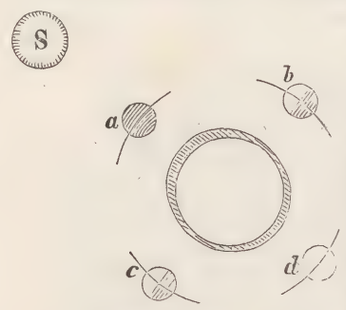
SCENE IN THE ARCTIC OCEAN.

a different year. In summer, when the whalers pursue their perilous occupation at a high latitude, the waters, though open, are by no means clear, but exhibit immense icy masses floating to and fro, fraught with peril to the voyager, which are drifted by the winds and currents far from the sites of their origin, some perishing by collision, and others reaching the heart of the Atlantic, where they are dissolved in its warmer waters.

154. Some variations of level are observed between different sections of

the universal ocean. This is the effect of local winds and currents, and chiefly occurs in land-locked seas.

155. The bed of the oceanic waters exhibits similar irregularities to those which mark the surface of the dry land--abrupt eminences, gentle slopes, and deep depressions—and hence the various depths of the fluid, now beyond the reach of the sounding line, or a thin stratum scarcely concealing the sand-bank from the eye of the navigator. Off a low, level, and sandy shore, the sea is in general shallow for a considerable distance, and very deep close to a bold, towering coast. But near to islands of coral formation, which are so little elevated as not to be visible at any great distance, the Pacific Ocean frequently shows profound depths. Within a mile and a half of Keeling Island no bottom was found with a line of 7,200 feet, plainly proving it to be the crest of a lofty submarine mountain, with sides steeper than those of the most abrupt volcanic cones.



156. The pressure exerted by the ocean, increasing with the depth, must be enormous in its more profound depths. Even at the depth of 120 feet the same amount of sea-water will be reduced in bulk by compression from 20 to 19 solid inches. In the Arctic Sea, where the specific gravity of oceanic water is at its minimum, its pressure on a square inch of surface is estimated to be 2,809 pounds at the depth of 7,600 feet.

OCEANIC MOVEMENTS.

157. The ocean is subject to the three general movements of waves, tides, and currents, the causes of which are independent. The wave movement is of an inconstant and transitory character, occasioned by winds; and that of the tides is regular and periodic, while the currents are the result of various circumstances, and, permanently flowing, resemble great rivers in the sea.

158. Waves arise from the action of the atmosphere, the lower stratum of which is in contact with the surface of the ocean, and when agitated by winds, disturbs the equilibrium of the water in proportion to the intensity and duration of the force exerted. The progressive motion of the undulations produced appears like an onward flow of the water, but in reality there is merely a rise and fall, except in the case of long-continued storms, which occasion a superficial current. At a comparatively small depth (say 200 feet) the ocean is tranquil when furious tempests are agitating its surface.

159. The theory of tides, so far as it depends on astronomical causes, is based chiefly on the attraction of the moon, strengthened or weakened by the influence of the sun, according to the relative position of the two bodies. Twice every day, or in the interval between successive returns of the moon to the meridian of a given place, which is 24 hours 50¼ minutes, the sea flows and ebbs, but much less toward the poles than within the tropics, the latter zone being more directly exposed to the lunar attraction. The influence of the planets is also modified by their varying distances from the earth.

TIDE DIAGRAM.

160. The innumerable islands, coral reefs, and submarine table-lands of the Pacific are impediments to tidal phenomena, while the Atlantic is disqualified for originating a great wave or tide, owing to its form and direction —that of a narrow, meridional canal. Accordingly, it has been ascertained that the seas to the south of Australia form the grand center from which the tidal action radiates. A high water ridge being raised, and receiving an impulse in the direction of the acting luminaries—that is, westward in the apparent lunar and solar path but trending north toward the tropics, the region of the direct line of their attraction—it expends its force in displacing a contiguous mass of fluid, similarly raising it, and in like manner the undulation is prolonged with immense velocity from the scene of its origin. It travels at the rate of 1,000 miles an hour in the deep and open southern ocean, but with a much less velocity in shallows and near land, owing to obstruction from the shores and bed of the sea. The propagation of a tidal wave is not a transference of water, but the motion of an undulation. There is no perceptible advance in the profound open sea, only an alternate rise and fall of the surface; but a flow of water takes place over shoals and near land.

161. The oceanic currents, permanent but of unequal force, are the effect of winds, of differences of temperature between different parts of the ocean, of the melting of polar ice, of variations of atmospheric pressure, and other minor circumstances. Drift currents are due to the action of permanent or prevailing winds upon the surface water, by friction impelling it to leeward, until meeting with some obstacle, such as land or sand-banks, its progress is arrested, and an accumulation of the water produced. In such circumstances a drift current gives rise to a stream current, carrying off the collected waters to restore the equilibrium of the surface of the ocean.

162. No ocean is so remarkable for the variety of its currents as the Atlantic, which seems chiefly to arise from the variegated outline of its shores. They are also the most accurately known, its waters having been most subject to scientific navigation and investigation. The origin of the main series is at the Cape of Good Hope, and from thence almost a complete circuit of the coasts appears to be made.

163. The great sea streams have offsets, in some instances occasional, due to transitory causes, or there is a change in the set of a current. There are also strong currents produced by tidal action, encumbered by narrow channels and projecting coasts. These local currents sometimes meet from opposite quarters, and cause a whirlpool, like the long celebrated maelstrom on the coast of Norway, occasioned by the meeting of the tidal currents round the islands of Lofoden and Maskoe.

164. Oceanic currents have exerted an important influence in the past history of the globe, and are necessary to its occupation by the human race. The productions of the vegetable kingdom have been widely diffused by the transport of seeds from one region to another. In like manner animals have been transported involuntarily to a fresh home on floating ice; and canoes, with men and women, driven out to sea by strong winds, have got entangled in its powerful streams, and been borne to lands before without human tenant. Materials drifted across the Atlantic to the Azores strengthened Columbus in his design to navigate it, and led to the gates of the New World being opened. The currents carry the warm water of the tropics to the polar regions, to moderate the cold, and bear the cold water of the poles to the tropics, to moderate the heat. It is the warmth of the Gulf Stream conveyed to the northwest of Europe that renders the climate so mild, clothing British Isles in evergreen robes, when in the same latitudes the shores of Labrador are encased in ice.

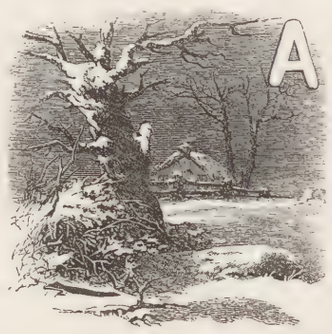
165. Without waves, tides, and currents the ocean, charged with an immense amount of decomposing animal and vegetable matter, would become a stagnant, fetid pool, give off noxious exhalations, infect the whole atmosphere, and reduce the habitable parts of the earth to the condition of a desert waste.

ACTION OF WATER UPON THE LAND.

166. Mere rain is a powerful agent of disintegration, and in course of time largely alters the contour of the most solid masses subject to its action. The tremendous showers which fall upon the plateau of Abyssinia, originating the floods of the Nile have given a peculiar shape to its projections, in process of further change. Some are flat, thin, and square, in form of a hearth-stone or slab, scarcely seeming to have base sufficient to resist the winds; others are like pyramids, obelisks, and prisms; and some—the most extraordinary of all—resemble pyramids pitched upon their points, the base being uppermost. The torrents discharged from the clouds have been for ages

DISINTEGRATED ROCKS.

skeletonizing the country, dismantling the larger masses of the softer deposits, wearing away also the granitic rocks, and carrying away the soil of Ethiopia, strewing it along the valley of the Nile and the shores of the Mediterranean.



167. Springs and rivers officiate largely in either chemically corroding rocks and soils, or mechanically forcing particles asunder, transporting them to fresh sites by their currents; but river floods sweep before them immense blocks, and plow their way through obstructions in their course. The deltas, which owe their origin to deposition from the rivers, are continually increasing by the constant supply of sediment. Instances, the ever-extending deltas of the Mississippi, Nile, and Po.

168. The action of the ocean by its waves and breakers upon abrupt coasts, especially when composed of yielding materials, is very powerful in wearing them away and preparing detritus for currents to convey to distant parts of its own bed. Within the memory of man extensive losses of land have thus been brought about, and acres have been sown and reaped which are now the property of the sea.

169. While the ocean thus encroaches upon the land to diminish its quantity, it tends in some instances to increase it. Where the coast is low and the bottom sandy, the waves carry the sand forward, which becomes dry land at every reflux of the tide; and as the habitual direction of the wind upon the sea, the loose particles are further conveyed inland, forming hillocks around stones and bushes, which increase into sand-hills, and are called "dunes" or downs. This is a destructive gift from the ocean, converting fertile districts into sterile wastes. The coast of France from Brittany to the Pyrenees presents vast undulating tracts of sand, the gift of the Atlantic on the advance inland.

170. The waters tend in general to reduce the high grounds and raise the low; to equalize the level of the land by the transport of matter torn from the more elevated parts to inferior sites; as well as perhaps to contract the habitable area of the globe by transference of its material to the floor of the ocean; but this tendency of aqueous action is sufficiently counterbalanced by the upheaving force which operates upon the solid crust of the earth, and keeps up a due proportion between the areas of its dry and fluid portions.

ATMOSPHERE AND ITS PHENOMENA.

ATMOSPHERE is that stratum of gaseous matter which everywhere surrounds the earth, and is maintained at its surface by the force of gravity. Unlike the land and water, it is imperceptible to the touch, unless in agitation, and only visible when its aqueous particles are collected in clouds and vapors. Some of the most marvelous phenomena of nature have their source and seat in this fluid envelope. It performs also the most important functions in the economy of terrestrial existence: for upon its chemical constitution all organic life absolutely depends, nor is its mechanical agency as indicated by winds and temperature less essential to the development and preservation of vegetation and animal life.

172. This remarkable fluid consists of dry air and the vapor of water. The air is essentially composed of oxygen and nitrogen in definite proportions—gases which are highly injurious when inhaled separately. In 100 measures of pure atmosphere there are 20 or 21 volumes of oxygen, and 80 or 79 of nitrogen. But it is never absolutely pure; and under ordinary circumstances contains not only aqueous vapor, but also a small but varying quantity of carbonic acid gas. In all regions, at all altitudes, and at all times the atmosphere yields the same chemical result.

173. It was surmised by the ancients that air had no weight, nor was the verification to the contrary proved until the early part of the 17th century. The atmosphere, it is now known, exerts a pressure or weight of about 15 pounds in the square inch of the earth's surface, which is equal to the weight of a column of mercury one inch square and 30 inches high, or a column of water of the same base and 34 feet high. The barometer, a simple instrument invented by Toricelli, pupil of Galileo, demonstrates this fact.

174. The atmosphere is in a high degree elastic, or possesses the property of occupying less space under the influence of certain forces, and returning to its original volume when the influence is withdrawn. Hence its density is not uniform, but diminishes from below upward, because the lower portions are compressed by the circumambient air. The height of the atmosphere is not known, but it is supposed to extend to about fifty miles; yet by far the greater portion of it is within 15 or 20 miles of the earth's surface, and at a much less distance it becomes so rarefied as to be incapable of supporting life.

175. It is naturally colorless. Its prevailing blue arises from the rays of the red extremity of the spectrum freely passing through it while the blue rays undergo the greatest reflection. The hue of the sky, however, presents all imaginable shades, from deep blue in the zenith to paler tinges and complete whiteness toward the horizon. This is owing to the blue tints on the zenith being darkened by the deep black of inter-planetary space, and heightened toward the horizon by the white vesicles of fog and vapor which occur in the greatest abundance in that direction.

CURRENTS OF THE ATMOSPHERE.

176. The varying attraction of the sun and moon occasions in the aerial ocean an alteration in the heights of vertical columns of air or atmospheric waves analogous to tidal phenomena; but the agitations most familiar or the winds are chiefly owing to changes in the temperature of a portion of the air and in the quantity of water which it holds in a state of vapor. The equilibrium of the atmosphere being broken, the particles of air are set in motion to restore the balance: and as the deranging causes act with varying intensity, the winds or currents created are diverse in power.

177. To indicate the direction of the winds, the horizon is divided into various equal parts, and each current receives the name of the point of the horizon from whence it flows. But there are currents the direction of which no point of the horizon will indicate; for miners have long been familiar with very strong ascending gusts before and during violent tempests. The explanation of these phenomena is that storms are almost always preceded or accompanied by a great fall of the barometrical column. The atmospheric pressure becoming less, the air in the bowels of the earth expands and ascends to the surface.

178. Currents frequently move in contrary directions at different elevations. This is apparent from the course of the clouds divergent from the one indicated by the vane, and from the higher clouds passing in an opposite direction to those below them.

179. The velocity of winds is open to sensible observation by the force exerted upon our own, or the impression made upon light, pliable objects. When traveling at the rate of one mile an hour, the motion is scarcely perceptible: at 5 miles it is a gentle, pleasant wind, at 10 miles a brisk breeze, at 30 miles a high wind, at 50 miles a storm, at 80 miles a hurricane, and at 100 miles a hurricane carrying trees and buildings before it. Winds are commonly strongest in mountainous districts, owing to the obstacles presented by the surface, which determine the aerial accumulations escaping in furious local currents through the valleys and gorges. In a similar manner, when the bed of a river becomes narrow or impeded with rocks, violent currents are produced in all directions.

CALM AT SEA.

180. Permanent breezes prevail within the tropics, called Trade Winds, which maintain nearly the same direction and rate throughout the year. They are termed from their direction being from northeast in the northern hemisphere, and from southeast south of the equator, the Northeast and Southeast Trades, but both blow more decidedly from the east as the equator is approached. Between them is a zone styled the Region of Calms, in which a thick, foggy air prevails, with frequent sudden and copious rains, attended by thunder and lightning.

181. The trade winds may be readily explained. The regions bordering on the equator are the hottest on the earth. In consequence of rarefaction the air there ascends and flows over the colder masses on either side toward the poles, from which a colder atmosphere moves to supply its place. Thus two currents are created in each hemisphere, an upper and a lower, but flowing in opposite directions; and if the earth did not rotate on its axis, the direction of the lower current in the northern hemisphere or trade wind would be from north to south, and in the southern from south to north. The earth, however, rotates from west to east, and the atmosphere surrounding it partakes of this rotatory motion. Yet in proceeding from the poles to the equator the masses of air flow from regions where the rotatory motion of the surface is less to where it is greater; and unable to acquire the new velocity at

once, they are deflected toward the west just in proportion as they do not keep up with the surface toward the east. Hence, instead of being north and south winds, which they would be were the earth at rest, they become northeast and southeast winds.

182. The trade winds would blow regularly round the entire globe within

DIAGRAM OF TRADE WINDS.

80° of the equator on each side, but the uneven surface and unequal temperature of the land divert and derange them. Thus, on the African side of the Atlantic, within a considerable distance of the land, they are not experienced at all, but contrary westerly winds prevail. This is owing to the rarefaction of the air over the hot desert of Sahara, which creates a current of colder air blowing toward the shore. The Pacific Ocean has regular trade winds with the Atlantic; but in the Indian Ocean they are interrupted by the monsoons. They are also experienced on equatorial lands which exhibit extensive levels, as in the basin of the Amazon, where a constant breeze is found blowing from its estuary to its sources at the foot of the Andes.

183. Where the northeast and southeast trade winds approach each other they tend to produce a purely eastern breeze; but this is not perceptible, because the horizontal motion of the air is neutralized by the vertical motion consequent upon excessive heat and rarefaction. Here is the Region of Calms, in which there would be an almost perfect calm but for the great evaporation and violent rains which disturb the equilibrium of the atmosphere, and occasion sudden storms and squalls. This zone, separating the trade winds of both hemispheres, is entirely north of the equator, extending about six degrees in width at a mean.

184. Periodical winds, or those winds which regularly prevail at a certain time of the year or of the day, belong to various districts of the globe. The monsoons of the Indian Ocean, the Etesian winds of the Mediterranean, and the land and sea breezes are of this class.

185. Throughout the year nearly two winds are sweeping the surface of the Indian Ocean and adjoining land, and in different localities. From November to March a northeast wind reigns north of the equator, while at the same time a northwest wind blows south of the equator. From the middle of April to the end of September, north of the equator, a southwest wind blows, and at the same time a southeast wind south of the line. These are the "monsoons," a term derived from the Malay "moussin," signifying a season. They last respectively about five months, there being two months in the year in which no monsoon is experienced. The changes of the monsoons are effected in these intervals in which calms and light breezes alternate with gales, hurricanes, and thunder-storms.

186. The northeast and southeast monsoons may be regarded as trade winds explicable on the same principle, but counteracted for a certain time by causes which produce winds from a different quarter, or the southwest and northwest monsoons. The former from the southwest prevails coincidently with Bengal, Siam, and adjacent countries receiving their maximum of heat, occasioning a flow of cold air toward the region of rarefaction, while the latter from the northwest is coincident with the sun being vertical south of the equator, when the sandy plains of Australia are powerfully heated and the colder atmosphere is set in motion in that direction.

187. Etesian winds, signifying annual or seasonal, are those which blow strongly from the north in the Mediterranean in the summer. The immense desert of Sahara, south of the Mediterranean, deprived of water and composed of sand and flints, becomes very highly heated under the influence of an almost vertical sun, and currents are created from the colder atmosphere of the north. Periodical currents, called "Northers," blow from September to March in the Gulf of Mexico, sweeping over the central plains of North America from the polar regions. Similar currents occur also on the coast of Brazil, from northeast in the spring and from the southeast in autumn.

SAND-STORM IN THE DESERT.

188. Land and sea breezes depend on the daily heating and cooling of the land surface. The breeze from the sea, especially within the tropics, commences a few hours after sunrise, gradually increases till mid-day, attains its maximum force between 2 and 3 P. M., afterward dying away to a perfect calm at sunset. Soon after the breeze from the land commences, and continues until the morning, for at night the land rapidly cools while the sea retains its normal temperature. Around spacious lakes, for the same reasons, there is a breeze from the lake by day and toward it by night.

189. Variable winds prevail in the middle and high latitudes, the same wind seldom lasting for several successive days. Their prevailing direction depends on a variety of causes, as position north or south of the equator and the distance of localities from it, also on the topography of the district, its proximity to the sea, etc. There are no instances of constant or periodical winds in extra-tropical countries.

190. Winds may be further discriminated by certain physical properties derived from the regions from which they proceed. Thus at New York the east winds blow from the sea, and are much more moist than the west, which traverse the continent. The atmospheric currents are also variously hot or cold, as they come from highly heated deserts and warm climates, or from snow-capped mountains, ice-bound seas, and high latitudes in general. South of the Alps the north winds are very cold and frequently very violent, owing to the contrast between the snow-covered mountains and the elevated temperature of the Mediterranean. The same cause, the perpetual Alpine snows, renders the south wind so piercing in the valley of the Rhone. The burning deserts of Africa and Asia are the countries where hot winds occur in force; but in India, covered with luxuriant vegetation, in Chile, the llanos of the Orinoco, Spain, Sicily, Italy, and Australia winds of a very high temperature are frequent. The Simoom of the deserts of Arabia, Syria, and Persia; the Khamsin of Egypt; the Harmattan experienced over Senegambia and Guinea, and the Sirocco of Italy and Sicily are all referable to the heated sand deserts in which they have their birth. The Solano, the hot wind of Spain, is referred to the plains of Andalusia.

SIMOOM.

191. Storm-winds result from a very considerable disturbance in the equilibrium of the atmosphere, arising principally from a rapid condensation of vapor. When they occur upon a great scale, electricity is powerfully developed with the precipitation of immense quantities of rain. Barometric oscillations indicate their approach. They are generally observed at the period of the greatest heat of the day; but in the interior of continents and in mountainous countries nocturnal storms are by no means uncommon.

192. Tropical storms frequently exhibit terrific violence, tearing up forests, leveling solidly built houses, and human life has been largely sacrificed in the war of elements. They are variously termed hurricanes, tornadoes, and typhoons; seldom occur nearer the equator than 8° or 10°, or beyond the tropics, and are most tremendous in the vicinity of continents and islands. It appears from recent investigations that these are to be regarded as great whirlwinds, the meeting of two opposite winds producing the whirling motion, and it is moreover affirmed that the rotatory motion is in opposite directions, as they occur north or south of the equator. It is further ascertained that northern hurricanes travel in an oblique direction from the equator toward the poles. The West Indies, the Indian Ocean, and the Chinese Sea are the three great hurricane regions.

193. In the middle and high latitudes storms are commonly far less extensive and violent than in tropical districts. There are, however, local storm regions where the winds often blow with the fury of the hurricane, as in the Gulf Stream, the vicinity of Cape Horn, and the territory of the Argentine Republic. In the latter locality the "Pamperos" or southwest winds, which originate among the snows of the Andes, rush with such incredible velocity over the level pampas as to carry everything movable before them.

194. The winds perform a grand and important part in the economy of nature. They moderate the severity of polar climates by bringing to them the heat of the tropics; promote the fecundation of flowers by agitating the branches of plants, at the same time diffusing the productions of the vegetable kingdom by the transport of pollen and seeds to great distances; and but for the aerial currents rain would be confined to maritime countries, the interior of continents becoming arid deserts. They serve also to renew the air of cities where causes of vitiation largely operate, and prevent that stagnation of the atmosphere which tends to deteriorate physically and mentally the human race.

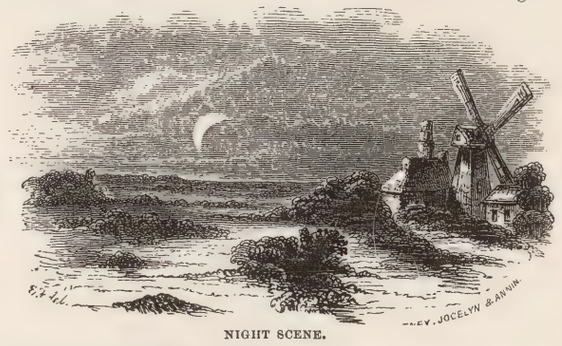
ATMOSPHERIC MOISTURE.

195. Water placed in a vessel in the open air sensibly diminishes, or, in other words, it evaporates. In like manner evaporation transpires, only on a grander scale, from the great reservoirs on the earth's surface, the oceans, lakes, and rivers, as well as from the moist ground, subject to diurnal and local variations, because depending mainly on temperature.

196. The amount of moisture in the air is an element on which the life of animals and plants as much depends as on temperature; and the character of the landscape, with the development of disease, is greatly influenced by its hygrometrical condition. The amount varies in different regions and at different seasons. As resulting from the action of heat on water, the quantity of vapor diminishes from the equator to the poles. It decreases also as we pass from coasts into the interior, the temperature being the same, because in one situation water is abundant and in the other scarce.

197. The capacity of the air to receive vapor depends on its temperature, and is invariable in its extent at the same temperature. When as much has been taken up as from its temperature it is capable of receiving, the air is said to be saturated, and any further supply is resolved into a fluid condition or floats in a state of cloud and mist. When, too, the atmosphere is saturated, the least decrease of temperature is followed by the precipitation of moisture. Hence arise the different hydro-meteoric forms, as mist, cloud, rain, snow, hail, dew, and hoar frost.

198. Mists and fogs are formed when the air is saturated, and generally when the moist soil or the water of lakes and rivers is warmer than the air, the vapors from which are immediately condensed. Mists differ in no respects from clouds, except in position, being on the surface of the earth, instead of being suspended at a height in the atmosphere. Travelers on the summits of high mountains frequently remark upon the fog intercepting their view, while the inhabitants of valleys below speak of clouds clothing the mountain slopes and crests.



199. Clouds are masses of visible vapor-like mists, occurring at a distance from the surface of the earth, floating under the direction of the winds, exhibiting an endlessly diversified outline, a varying density, and appearing at different elevations. The denser clouds are usually formed toward noon, when the vapors are raised up by the ascending currents of air, and then condensed by the lower temperature of the upper regions.

200. Notwithstanding the varied disposition of clouds, they may be classified under a few principal types. The following three primary forms are those which are noticed by the spectator:

Cirrus or Curl Cloud.—The Cirrus is composed of white, thin filaments, variously disposed, in the form of woolly hair, a crest of feathers, or slender network. These clouds are known in Germany under the name of "Windsbœume" or wind-clouds. Their appearance often precedes a change of weather—rain or wind in summer, frost or thaw in winter.

Cumulus or Stacken Cloud.—This modification of cloud, usually under the direction of surface winds, presents itself in the form of a vast hemispherical heap of vapors resting on a horizontal base. Hence its name "Cumulus," a heap or pile, and "Stacken Cloud," masses of vapor stacked into one enormous fabric. This may be called the summer-day cloud, from its frequent occurrence at that season, resembling a mountain of snow when lighted up by the beams of the sun. It usually begins to form early in the morning, enlarges as the day advances, attains its greatest magnitude at high day, decreases as the sun declines, and breaks up toward sunset.

Stratus or Fall Cloud.—This cloud consists of horizontal bands contiguous

NIGHT SCENE.

to the surface of the earth. It belongs to the night, forming at sunset and disappearing at sunrise.

201. To the above primary varieties four transition or composite forms are added, and are as follows:

Cirro-Cumulus or Sonder Cloud.—This name designates the feathery accumulated cloud, familiarly known as fleecy, intermediate between cirrus and cumulus. It consists of small orbicular patches, arranged in extensive beds, the component parts being quite distinct or asunder.

Cirro-Stratus or Wane Cloud.—Bands of filaments more compacted than those of the cirrus compose this cloud, lying inclined or disposed in horizontal strata. It is sometimes seen cutting the sun on the moon's disc with a dark line.

Cumulo-Stratus or Twain Cloud.—Two or more cumuli united together

1—1. Cirrus. 2—2. Cirro-Cumulus. 3. Cumulus. 4. Nimbus. 5. Stratus.

and resting on a common stratum form this cloud, the most magnificent variety of which often exhibits a copper tinge, indicating a highly electrical condition of the atmosphere, and precedes a thunder-storm. The cumulo-stratus is often seen cut by the cirro-stratus.

Nimbus or Rain Cloud.—Any of the preceding modifications may pass over into the actual rain cloud, first exhibiting a great increase of density and a bluish-black tone of color, then putting on a lighter shade or gray obscurity, and becoming fringed at the edges.

THUNDER-STORM.

202. The clouds are most frequently higher within the tropics than in the temperate zones, and in the temperate zones they are commonly higher in summer than in winter. The cirri are the highest clouds, and frequently range from 3 to 5 miles above the earth.

203. Composed of vesicular vapors, the suspension of clouds aloft seems extraordinary, since they are specifically heavier than the medium in which they float. These vesicles, indeed, are constantly, but slowly on account of the resistance of the atmosphere, falling. But in descending they soon reach warmer strata, which are not saturated, where they dissolve and are lost to view, while at the same time new vesicles are formed above. Thus the component parts of a cloud are often slowly descending, and yet the cloud appears to be suspended in the air, its lower limits being continually dissolved and the upper renewed; and the ascending currents of heated air also exert a force directly opposed to the fall of clouds. Hence the mighty masses of clouds (cumuli) attain their greatest elevation about noon, but toward evening, as the temperature declines and the ascending current becomes feeble, these clouds descend and are again dissolved on reaching the lower and warmer regions of the atmosphere.

204. Rain is produced by the continued condensation of vapor, its vesicles becoming larger and heavier, separate globules merging together forming actual drops of water, which are precipitated toward the earth. Rain may have begun to fall, and yet not reach the ground, being resolved again into invisible vapor on arriving at strata removed from the point of saturation. For the same reason rain-drops may become smaller in their descent, a portion being evaporated, and less rain arrive at the general surface than at a certain height. Usually the drops increase in their descent, bringing with them the low temperature of the upper regions and condensing on their surface the vapor in the lower and warmer strata of the atmosphere. Hence a rain-guage placed on the ground will collect a larger quantity of water in a given time than another placed at some height above it, the drops increasing by the condensed vapor added to them in the space between the two points.

205. Instances of rain without clouds are by no means rare. They may occur when the equilibrium of the atmosphere in its upper regions is intensely disturbed by very cold and warm currents coming into collision, condensing the vapors into water without going through the transition state of vesicular vapor.

206. The contents of a single shower of rain vary greatly in different localities and at different periods at the same place. It is stated that when the quantity of rain that falls per diem exceeds three centimetres (less than an inch) the low plains of Europe are soon inundated. In excessively rainy seasons, especially when harvests are blighted, the ignorant are apt to infer a deterioration of climate. But on comparing different years, the annual amount of rain, like mean temperature, is remarkably stable.

207. The laws in relation to the distribution of rain may be summed up briefly as follows:

a. It decreases in quantity from the equator toward the poles; because heat, the cause of vapor, diminishes.

b. It decreases from the coast to the interior; because the land supplies a less quantity of vapor than the sea.

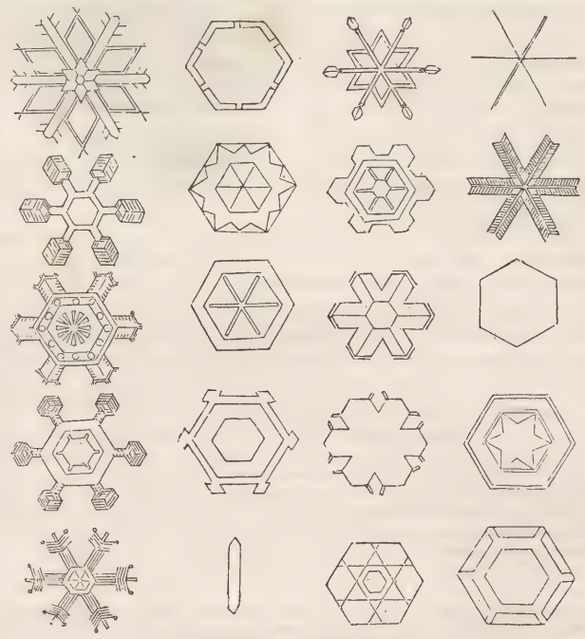
c. It decreases in the temperate zones on the eastern coast as compared with the western, because the latter are first exposed to the western winds, which blow from the ocean and discharge their moisture upon them. But within the tropics on eastern coasts as compared with western, because of their exposure to the trade winds.

4. More rain falls in mountainous regions than in level districts; because mountains arrest the course of the clouds, and a condensation of vapor ensues from collision with their cold summits.

208. There are extensive tracts of the globe in which rain is unknown; in some districts it falls periodically, and in others precipitation may be said to be constant.

209. The "Rainless Regions" of the New World comprise portions of California and Guatemala, the Mexican table-land, and the coast line of Peru; and those of the Old World comprehend an immense territory, stretching from Morocco through the Sahara, a part of Egypt, Arabia, and Persia

SNOW-STORM.



into Beloochistan, with another great one commencing north of the Hindoo-Koosh and Himalayas, including the table-land of Tibet, the desert of Gobi, and a portion of Mongolia. In these tracts there is either no rain at all or only a very small quantity, and so seldom occurring as to be quite an exception.

210. The "Regions of Periodical Rain" are within the tropics, and have seasons of extreme humidity alternating with excessive drouth. The duration of the rainy season differs in different districts, but lasts generally from three to five months. North of the equator the rains fall during the northern declination of the sun, and commence south of the equator with its southern declination. The only exception to this rule is India, where the rainy and dry seasons are regulated by the monsoons.

211. The "Regions of Constant Precipitation," in which rain falls irrespective of times and seasons, are extra-tropical; except the Zone of Calms, a narrow belt between the periodical rains of the northern and southern hemispheres, in which heavy showers occur almost daily.

212. Snow is nothing more than the frozen visible vapor of which the clouds are composed. Minute crystals of ice having been formed, they are enlarged by the condensation and freezing of vapor, and, merging together, constitute flakes which increase in size during the period of their descent. Snow falls to the ground when the temperature of the atmosphere down to the earth's surface is sufficiently cold; but if the lower strata of air are too warm, it melts in traversing them, and then we have rain below while it snows above. Hence snow is never seen at the level of the sea within the torrid zone, and it becomes more abundant with the decrease of temperature toward the poles.

213. The structure of snow-flakes exhibits an endless diversity of regular and beautiful forms, probably amounting to some hundreds. It will be seen, however, from the annexed engraving, that all are essentially referable to a

VARIOUS FORMS OF SNOW-CRYSTALS.

regular hexagonal star, and consequently snow-flakes belong to the hexagonal system of crystals, It has also been observed that flakes which fall at the same time have generally the same form; but if there be an interval between two consecutive falls of snow, the forms of the second are different from those of the first, although always alike among themselves.

214. The limits of snow-falls at the level of the sea in the northern hemisphere are generally the parallel of 30° in America, which cuts the southern part of the United States; 43° in the middle of the Atlantic, and 36° in the Old World. For some distance above these limits its appearance is rare and brief. The whole of America north of the Gulf of Mexico and the whole of Europe are included in the snowy region; but it becomes more abundant the farther the locality from the ocean. In February, 1836, a fall of snow occurred at Canton, in latitude 23° north, a fact without precedent in the memory of the oldest Chinaman.

215. Hail is one of the most obscure problems in meteorology. It no doubt often consists simply of rain-drops more or less suddenly frozen by exposure to a temperature below the freezing-point. Yet hailstones are not transparent ice, but have usually an opake, snowy nucleus, resembling a granule of sleet, sometimes coated with alternating layers of snow and ice. Sleet seems to be the germ of hail changed in form and increased in size during its descent in the atmosphere. The great difficulty, however, is that during fine seasons and the hottest days such intense cold should be suddenly produced as the phenomenon of hail indicates; and that certain countries, as some parts of France, should be annually ravaged by considerable falls of opake ice, from which adjacent localities are almost wholly free. These are circumstances which have not been yet satisfactorily explained, though probably dependent upon electricity, which is almost always powerfully developed during hail-storms.

216. Dew, the moisture precipitated during the night in the form of minute globules on the surface of plants and other bodies, is the effect of these bodies being cooled by nocturnal radiation several degrees below the temperature of the air in contact them. Chilled by the cold embrace, the aerial particles are no longer able to support the same quantity of humidity in the state of transparent elastic vapor, and a portion is deposited. It is precisely the same phenomenon occurring on a great scale as the precipitation of vapor on a bottle of wine taken from the cellar, or a decanter of water fresh filled from the well and brought into a heated room.

217. Dew is produced for the most part on calm and serene nights. The reason is that only in the absence of clouds is the radiation of the earth's heat toward the sky conducted so powerfully as to cool it sufficiently below the temperature of the superincumbent air. When the heavens are overcast, the heat radiated, which would otherwise go off into free space, is returned by the clouds to the earth, and thus the necessary decrement in its temperature is prevented. There is no dew, however, when the sky is cloudless, if the wind is brisk, because the air in contact with the soil suffers displacement before it can be cooled to the dew point.

218. Dew is formed most abundantly on objects perfectly exposed to the sky, for whatever acts as a shelter impedes radiation. Hence there is less dew in cities, and plants placed under a tree are much less moistened than the grass in the middle of a field; and moreover dew is deposited much sooner and more abundantly on certain objects than on others, because all bodies have not the same capacity for radiating heat. Plants are sooner bedewed than the earth, and in general objects of open texture sooner than solid bodies.

219. Dew is most abundant in maritime countries. In the interior of continents the air has not the amount of humidity requisite for its production, except near great lakes and rivers. It forms most copiously in the spring and autumn, because in these seasons there is the greatest difference in the temperatures of day and night. The average annual quantity is estimated at a depth of one seventh of the annual amount of rain precipitation.

220. The preceding remarks show the inaccuracy of the popular expressions of the dew falling or rising. It is simply deposited; it may be, upon an under surface which nothing by falling can touch, or upon a side surface which nothing by falling or rising can reach.

221. The dew point is the degree of the thermometer at which the vapor of water present in the atmosphere, on being exposed to a decrease of temperature, begins to be precipitated. It is the same as the point of saturation.

222. Hoar frost is the ice of dew. When objects upon which the vapor of water is precipitated are cooled below 32° Fahr. (the freezing-point) the vapor can no longer be deposited in a fluid state, but in the form of icicles.

ATMOSPHERIC TEMPERATURE.

223. On observing the temperature of a place as registered by a thermometer, it is found to be constantly fluctuating through a certain range above and below a mean standard. By the temperature of a place meteorologists always mean, unless it is otherwise expressed, that of the air near the earth's surface as indicated by a thermometer efficiently protected from every kind of foreign influence.

224. The temperature of the day in the middle latitudes is at its minimum a short time before sunrise, and attains its maximum about 2 o'clock in the afternoon, somewhat later in summer and earlier in winter. In hot climates on the sea-coast the maximum temperature frequently occurs before the culmination of the sun, because about noon a fresh breeze sets in from the sea and lowers it.

225. Temperature in equatorial regions is distributed tolerably equally over the whole year, owing to the days and nights being equal; but in the middle and high latitudes, where the length of the day varies greatly, it takes a wide range above and below the annual mean. But in general the mean annual temperatures vary very little. In the middle latitudes the greatest heat occurs in July, and the greatest cold in January, and the mean temperature of the year is very nearly approximated by the mean mensal temperatures of April and October.

226. The Warmth Equator or the line of the highest mean annual temperature is not coincident with the geographical equator, but lies almost wholly to the north of it. It passes along the coast of New Granada and Venezuela in South America, intersects Africa from the Gulf of Guinea to the Abyssinian shore of the Red Sea, and cuts through the extremities of the Arabian, Indian, and Malay peninsulas. The line only occurs south of the geographical equator in the space between 150° west longitude in the Pacific Ocean and the Sunda Isles. The greatest mean annual temperature (87° 3′ Fahr.) hitherto observed occurs at Massouah, in Abyssinia, in latitude 15° 36′ north. The minimum equatorial annual mean (81°) occurs at several places.

227. Passing from the tropics toward the poles the temperature declines gradually, but much more rapidly in the New World than in the Old (except under the eastern meridians of Asia), as shown in the following table:

Latitude.	Temp. of the New World.	Temp. of the west part of the Old World.	Difference.
30°	66° 92	70° 52	3° 60
40°	54° 50	63° 14	8° 64
50°	37° 94	50° 90	12° 96
60°	23° 72	40° 64	16° 92

The lowest mean annual temperature or greatest cold hitherto noticed, 1° 49′ Fahr., was observed at Melville Island, latitude 70° 47′ north.

228. From the rapid decline of temperature in America and eastern Asia as compared with Europe, it is inferred that the lowest temperature does not coincide with the geographical poles; but that not many degrees distant, and under meridians nearly at right angles with that which passes through the west of Europe, there are two points of the greatest cold. This idea, started by Sir David Brewster, has been adopted by Humboldt, Dalton, and generally. The position of these remarkable points Brewster conceives to be in 80° north latitude and 95° east, and 100° west longitude. The mean temperature of the eastern or Siberian pole is supposed to be + 1°, and of the western or American pole — 3° 5, the American pole being thus 4° 5 colder than the Siberian.

229. The southern hemisphere is generally considered to be colder than the northern; but this only appears to be true in relation to its higher latitudes. Through the whole torrid zone, and up to about the 40th parallel south, the temperature of the two hemispheres exhibits little or no discordance. Beyond this limit toward the south pole the cold rapidly increases. The great difference is attributable to the direction of the oceanic currents, which bring from the polar regions immense masses of ice into very low latitudes, which they are enabled to do through an uninterrupted sea, while in the northern hemisphere the land almost incloses the Arctic Ocean.

230. The subject of subterranean temperature, a difficult point of inquiry, has been examined in natural excavations, mines, and Artesian wells with some general results of interest.

231. The effect of solar influence descends to a certain depth below the surface, and within that limit the temperature fluctuates with the periodical superficial fluctuations. The depth varies with the latitude, being least within the tropics, not much exceeding a single foot, but amounting to 25 feet at Paris, and in several Prussian mining establishments to from 27 to 63 feet—much depending upon the nature of soils and rocks.

232. Throughout the entire globe a stratum of invariable temperature is met with, which neither solar influence from above nor internal heat from below affects; and this temperature is proved to differ little from the mean annual temperature of the country at the surface. For more than half a century the oscillations of the thermometer in the caves of the Observatory at Paris have not exceeded the 33d part of a degree.

233. Below the stratum of invariable temperature the causes of internal heat perceptibly elevate the thermometer, and proportionably as the depth increases. The ratio of the increase is affected by the nature of the formations, and therefore varies. It is estimated, however, at about 1° Fahr. in every 45 to 52 feet. It is clear, then, either of these ratios being adopted, that at a very trifling distance below the surface, compared with the earth's semi-diameter, the hardest substances must be in a molten state.

234. The temperature of the medium in which the earth moves or of interplanetary space has not escaped the attention of philosophers. It is generally supposed not to differ much from — 58°, which is 90° below the freezing-point of water; and to have but feeble influence upon the lower strata of the atmosphere. The temperature of celestial space, as above given, is much inferior to the degree of cold which may be produced artificially, which amounts to — 91° or 123° below the freezing-point.

CLIMATE.

235. The "first" determining circumstance to be considered among the causes which produce variations in climate is the position of a country in relation to the sun or its latitude.

236. The calorific action of the sun is the most powerful when in the zenith of the observer, and hence toward the equator we have the greatest comparative amount of heat and the warmest climates, because at some point or other within the tropics the mid-day sun is always vertical above the heads of the inhabitants. It follows also that heat generally diminishes with the increase of distance from that line, because as we recede from it toward the poles the mid-day height of the sun becomes less and less, till his rays are too oblique to prevent nature from being chained in eternal ice and render it capable of supporting vegetable life.

237. The time during which the sun is above and below the horizon is also an important element of climate. When the days are long, the continued solar action causes a powerful accumulation of heat, and, the nights being short, but little of this heat is radiated. The effect, of course, is opposite in inverse circumstances. Under the equator, the days and nights being of equal length throughout the year, no great differences of temperature or seasonal contrasts are experienced. There is but little variation also in the length of the day within the tropics. But in mean and high latitudes the inequality becomes great; and the long days coinciding with the northern declination of the sun when the solar rays fall less obliquely, and the short days with his southern declination when the opposite takes place, alternations of excessive heat and cold or great seasonal contrasts are produced.

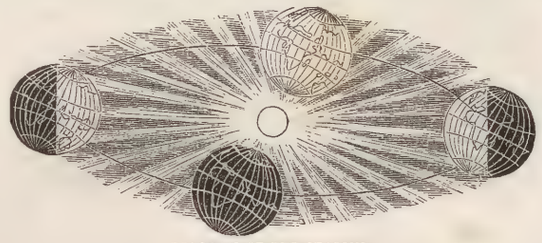


DIAGRAM OF THE SEASONS.

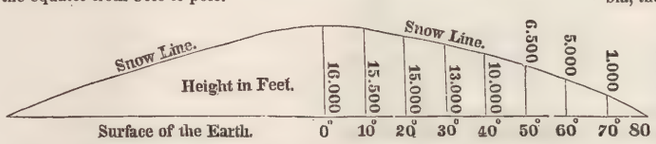
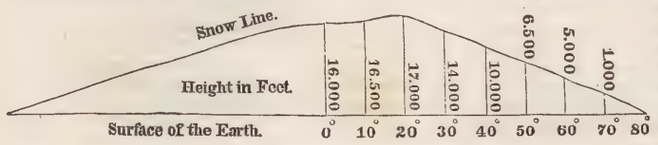


The farther from the equator the more unequally is temperature diffused throughout the year, and winter and summer in more violent contrast.

238. Supposing the globe to have a perfectly level surface, either of land or water possessing the same character, the decrement of heat from the equator to the poles would coincide with the parallels of latitude, so that all places under the same parallel would have the same climate. But actual circumstances are far different from the postulate; and hence a "second" determining cause of climate is the elevation of the surface.



239. It is a well-ascertained fact that the temperature of the air decreases with its height. This arises from the atmosphere not being heated by transmitting the rays of the sun, but receiving its heat solely from the warmed surface of the earth, and chiefly by actual contact. Hence its temperature becomes lower with its distance from the general mass of the globe. Another reason is its tenuity increasing with its elevation, the temperature of rarefied air being less raised by a given amount of heat than that of the same portion of air when compressed.

240. In general the temperature decreases 1° for about every 352 feet; but the rate varies with the latitude, the season, and even the hour of the day. The decrease is greater in summer than in winter; more sensible in the afternoon than in the morning, and is affected by the presence or absence of atmospheric electricity, moisture, etc.

241. In every latitude, therefore, there is a limit in the atmosphere where the thermometer never rises above 32° Fahr., and consequently where ice and snow remain in a solid form. This limit, called the snow-line or line of constant congelation is the highest in the torrid zone, where the heat is the greatest. It rises to about 16,000 feet near the equator, and from thence descends gradually in the form of a curve toward the poles, till it reaches the surface at about 80° north, and at a lower latitude in the southern hemisphere. The diagram represents this line forming the arc of an ellipsoid passing over the equator from pole to pole.

This diagram, however, but very distantly answers to this important line in the atmosphere. Though oscillating with the surface in high latitudes, and occurring at a considerable elevation in the horizon, it does not form a regular curve in its descent, but exhibits various inflexions, suddenly rising and falling in several districts, owing to their physical peculiarities. Thus in the Bolivian Andes, between 14° and 20°, the line of perpetual snow is higher than in the equatorial regions of the chain, and higher than in its Mexican prolongation at the same latitude in the northern hemisphere. Making allowance for this exception, the diagram should not exhibit a continuous curvature, but be corrected as follows:

A remarkable sudden fall of the Andean snow-line occurs farther south, exhibiting a difference in elevation of 9,000 feet within a distance of only 10° of latitude. This great flexure is attributed to the fact of the southern Cordillera (43°) being covered with forest trees dripping with moisture, indicating a clouded sky and little heat in summer, while in central Chile no rain falls for the seven summer months, the sky is generally clear, and the climate hotter.

242. The line of perpetual snow sometimes varies in equal latitudes, because the summers are warmer in the interior of continents than on the coasts. Thus, though the Pyrenees and the Caucasus are under the same parallel, the snow-line varies to the extent of 2,100 feet. An important distinction is also of frequent occurrence on opposite sides of mountains. Thus the snow-line is much higher on the north side of the Himalayas than on the southern side; and thus with the Scandinavian chain the line is lowest toward the sea and highest toward the land. In such cases the phenomenon results from a greater or less radiation of heat from the adjacent surfaces.

243. It is obvious, therefore, that countries which are at different elevations, though in the same latitude, must have different climates; and that in the same country there may be great diversity of climate co-existing, according as the surface is more or less elevated. Hence, while the tropical valley or plain is oppressively hot and loaded with luxuriant vegetation, the tropical mountain, rising a few thousand feet above it, is as cold and as bare of vegetation as any polar island. Successive zones characterized by a different flora mark the climatic variations resulting from a change of level. Thus in Mexico, where there are low coasts, high table-lands, and mountains covered with eternal snow, there are distinct and well-defined physical districts. The *tierras calientes* (hot regions), which include the coast country, east and west, below the height of 2,000 feet, have a mean temperature of about 77° Fahr., and here bananas and the sugar, indigo, and cotton plants flourish luxuriantly. The *tierras templadas* (temperate regions), between 2,000 and 5,000 feet, have a mean temperature from 68° to 70°, and produce oaks, cypresses, and fern trees; and the cultivated cereals of temperate climates are first encountered. In the tierras templadas (cold regions), above the height of 5,000 feet, the air is still genial to the elevation of 8,000 feet, but beyond the climate becomes rigorous, fruits are not matured, oaks and wheat disappear, and pines occur. Above the regions of forests there is a region of stunted pines, and still higher up a region of Alpine plants, and at a greater height only a few lichens appear.

VIEW IN MEXICO.

244. A "third" cause of climatic variations in equal latitudes is found in the position of countries being marine or continental. The ocean is not so rapidly heated nor so soon deprived of heat as the land, and hence its temperature is more uniform than that of inland districts. The currents which sweep over it transfer the same character to some extent to the shores within their range, and in the same ratio affect their climates, making them more equable. On the sea-side the winters are mild and the summers cool as compared with inland places, where the winters are cold and the summers hot. Another cause contributing to the same effect is the immense evaporation from the sea, producing a frequently overcast sky along its shores. The clouds temper the solar influence in summer and check radiation in winter.

245. The circumstances above stated have a marked effect on vegetation. On the south coast of England, where the winter is not colder than at Florence, the camelia and fuchsia live through it in the open air; and in the northeast of Ireland the myrtle thrives as well as in Portugal, 15° farther south. On the other hand, at Yakutsk, in Siberia, where the mean annual temperature is less than 14° Fahr., and the winter temperature is considerably under zero, the subsoil remaining constantly frozen at the depth of three feet, wheat and rye are raised owing to a hot summer; while in Iceland, where the mean annual temperature is very much higher, none of the cereals are raised, owing to the cool summer not allowing them to ripen.

246. Lines drawn through places of like summer temperature are termed isotheral, signifying equal summer; and lines connecting places of like winter temperature are called isochimenal or equal winter lines.

247. The prevailing winds of a country form a "fourth" determining cause of its climate, because bringing with them a part of the properties of the quarters from whence they come and the surface over which they have passed. In a calm state of the atmosphere the effect of one region upon the temperature of another contiguous to it is probably small; but its colder or warmer air is transferred to the adjoining locality, with the wind blowing in that direction, and the thermometer falls or rises. At Bagdad and at Bushire, under the influence of the south wind, heated by the burning sands of Arabia, the thermometer sometimes rises to 125°, and indicates the same degree of heat in Upper Egypt when the wind blows from the Desert.

248. The soil of a country and the aspect of a place are also important constituents of a climate. A surface consisting of sand admits of a higher degree of heat than clayey and compact soil, and bare grounds than pasture lands. The effect of aspect is most strikingly seen in mountainous districts where, as a general law, vegetation ascends in the northern hemisphere to a higher limit on the southern than on the northern declivities; and *vice versa* in the southern hemisphere.

249. Considerable deviations from the usual climatic state sometimes occur, spreading over wide districts; but it has been remarked that no instance can be cited of a deviation extending to an entire hemisphere, so that it is highly probable, as before observed, that the same quantity of heat is always distributed over the earth's surface, although unequally. These peculiar atmospheric states are more frequently propagated in a meridional than in a parallel direction, opposite conditions existing under opposite meridians. The Danes have observed that unusually moderate winters in Iceland correspond to intense cold at Copenhagen. Generally speaking, the same deviations occur in Europe and Asia, the opposite in America, or Asia and America are in opposite climatic conditions, while Europe is unaffected by either extreme. The more marked deviations from the usual range of heat occur more frequently in winter than in summer.

250. While the general temperature of the globe appears to have suffered no perceptible change during the historic era, there is strong reason to suppose that the climatic condition of particular districts has undergone some gradual alterations. The climate of western Europe seems to have acquired a more genial character, seasons of intense cold occurring at more distant intervals than formerly; and in the settled portions of North America the climate is perceptibly milder than when first occupied. The clearing of forests and the extinction of bogs and morasses have doubtlessly had a powerful influence to this end.

ISOTHERMAL LINES.

251. Isothermal Lines, as traced on a map, connect all points having the same *observed* mean annual temperature. Hereby is afforded a distinct view of the actual distribution of heat as distinguished from *latitudinal* heat, were the latter not modified by the various influencing causes of climate, and the curves in connection with the geographical outline exhibit also in what the modifying causes originate, as seas, mountains, etc.

252. Near the equator the isothermals exhibit no great divergence; but at a distance farther and farther from it north and south their inflections become remarkable, ranging in their circuit round the earth through 20° and 25° of latitude. On account of these great variations of heat, consequent on local causes, it is impracticable to define zones of climate by astronomical lines or by lines of latitude; nor can these be demarked with any degree of exactitude otherwise than by isotherms or zones of equal temperature. Attending only to the isotherms, five climatic zones may be discriminated—the hot, warm, temperate, cold, and frigid.

253. The Hot Zone is bounded on each side of the Warmth Equator by the isotherm of 80° Fahr. It includes the north extremity of Australia, the islands and peninsulas of southern Asia, the middle regions of Africa, and the northern half of South America, with Central America and the southern islands of the Columbian Archipelago. In this region at the sea-level frost and snow are unknown. Vegetation is luxuriant and perennial in the well-watered districts; but in the Old World burning deserts of sand prevail, altogether barren where moisture is wanting.

SCENE IN THE HOT AND WARM ZONES.

254. The Warm Zone lies between the isotherms 80° and 70°, and includes in the northern hemisphere Mexico, Cuba, and Florida, northwest and northern Africa (except a portion of the Barbary States), northern Arabia, almost the whole of Persia, northern India, Burmah Siam, and southern China, and the greater part of the Philippine Islands. The characteristics of this region are much the same as those of the Hot Zone. It embraces a vast area of bare rock and barren sand; but in districts favored by a sufficient supply of moisture, vegetation is luxuriant.

255. The Temperate Zone is bounded by the isotherms of 70° and 80° Fahr., and includes a large section of North America and central Asia, Iceland, almost the whole of Europe, and a small strip of northern Africa. In its southern portion we have the northern limit of the Region of Palms, and the principal districts of the cultivation of the vine. Its northern boundary in Europe nearly corresponds with the most northern limit of the cultivation of barley and rye and the appearance of trees. In America its southern section includes the great planting regions of the United States. In this zone man has in all ages attained the highest development of his powers, and the most civilized nations have been located in it.

SCENE IN THE TEMPERATE ZONE.

256. The Cold Zone is between 30° and 10° Fahr., and includes the countries around Hudson's Bay, most of Labrador, Greenland, Spitzbergen, Nova Zembla, part of Lapland, and part of north Russia, and the most considerable portion of Siberia. Through a great part of this region the soil at a varying depth remains permanently frozen, even in latitudes in Asia as low as that of London; but to a varying extent the surface is thawed by the powerful temperature of a brief summer, so that most of the cereals ripen, and harvests of wheat, barley, and rye are gathered above subterranean sheets of eternal ice. Larch and some pines exist on the southern border of this zone. Recent inquiries, indeed, have demonstrated that the larch survives even where the ground is perpetually frozen.

SCENE IN THE COLD AND FRIGID ZONES.

257. The Frigid Zone is bounded by the isotherm of 10° Fahr. It includes the countries in America north of Hudson's Bay and a section of northern Asia. The isothermal lines of America and Asia in these high latitudes, however, are not consecutive, but entirely separate, surrounding the two poles of maximum cold, neither of which coincides with the pole of the earth's diurnal motion. It is supposed also that two similar poles exist in the southern hemisphere, but observations are wanting to verify the fact. The effect of cold upon vegetation is most apparent in this zone. The larch and birch pass within its limits, but they are stunted in form and soon disappear.

ELECTRICAL PHENOMENA.

258. Of electricity in itself we know nothing more than that it is a mighty imponderable agent, called simply for convenience a fluid; invisible when in a latent state, apparently universally diffused, and capable of penetrating the pores or even the substance of matter. It may be roused from a neutral condition and made visible, displaying tremendous energies by a variety of causes, as heat, friction, and chemical action; but we are totally ignorant of the reason why these causes elicit it. In meteorology, however, we have merely to deal with it as developed in the atmosphere, its phenomena, effects, and distribution.

259. There are two kinds of electricity, each having peculiar properties: but whether there are really two different electricities, or one electric fluid which displays peculiar properties according to its amount, is a point upon which philosophers are not agreed. Bodies in one electric state attract and in another repel each other. The electricity in the former case is called "vitreous" or *positive;* in the latter, "resinous" or *negative.* Bodies having positive and negative electricity in equal diffusion, or in a state of equilibrium, neither attract nor repel. This is their ordinary or normal condition.

260. When the equilibrium is destroyed, and the two electricities are par-

tially separated by friction, heat, or chemical action, their peculiar powers become manifest. Two bodies charged with the same kind of electricity mutually repel; and two bodies charged with different kinds mutually attract. In the case of two neighboring bodies differently yet highly electrified, the one body imparts a portion of its electricity to the other, which returns an equal quantity of its antagonist element, and the derangement is equalized—the normal state restored. The two electricities coalesce with immense rapidity, causing a flash and an explosion, upon which the electric fluid returns to a latent and neutral condition, till a fresh derangement in the distribution is produced.

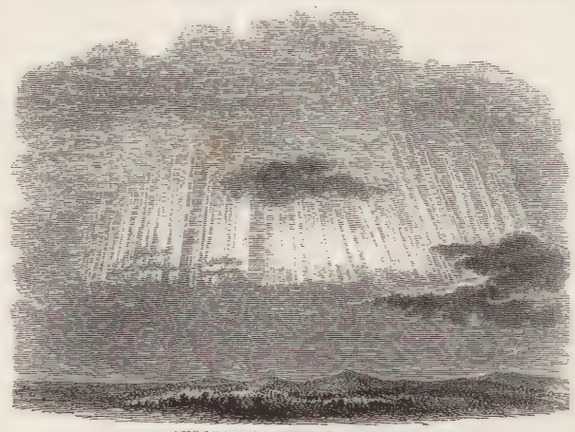
261. Though, strictly speaking, there is no known substance perfectly impervious to electricity, and which offers no resistance to its passage, there is a certain class of substances through which it passes with greater facility, as metals, water, the animal body, etc., than through others, as glass, silk, atmospheric air, etc. The former substances are therefore styled "conductors"—the latter, "non-conductors." In conductors it is impossible for electricity to accumulate unless they are surrounded by non-conductors. They are then said to be insulated.

262. While the earth itself is always charged with negative electricity, the atmosphere in a cloudless and clear state of the sky is almost invariably found to be positively electric. But its electricity varies in intensity, being greater in winter than in summer, during the day than by night, and subject also to a kind of diurnal flux and reflux. From sunrise, when the atmospheric electricity is feeble, it increases for two or three hours and attains its maximum. It declines toward the middle of the day, and attains its minimum in the afternoon. It then advances sensibly till about sunset, and attains a second maximum, usually equaling that of the morning, but lasting a shorter time, after which it decreases slowly through the night. These regular oscillations can only be traced in calm and serene weather.

263. While masses of visible vapor or clouds are good conductors of electricity, they are yet capable of electrical accumulation, because capable of being insulated, the air in proportion to its dryness being one of the most complete non-conductors known. M. Peltier, from observations and experiments made at Paris, has drawn the conclusion that all gray and slate-colored clouds are charged with negative, and all the white, rose, or orange-colored clouds are charged with positive electricity If two clouds in these states approach within a certain distance, the effect is an accumulation of their respective electricities on the sides that are nearest to each other. When the accumulation becomes intense the resistance of the intervening and insulating atmosphere is overcome, and an interchange takes place—there is a flash and detonation caused by the union of the two electric forces, or lightning and thunder. The same interchange frequently takes place between a cloud and the earth with the same phenomena.

264. Lightning in its course follows the best conductors, attaching itself principally to metals, and after metals to damp substances; but inferior conductors may be chosen, which present to the fluid the most direct route to the earth. Hence objects raised above the surface, whether good or bad conductors, are peculiarly exposed to the stroke of lightning, as steeples, houses, trees (especially solitary ones), the masts of ships, animals in the midst of a plain, and men on high points. Other circumstances being equal, there is greater safety on a non-conducting than on a conducting surface.

265. Coincidently with Franklin's celebrated discovery of the electric nature of lightning the means were suggested by him of protecting edifices from its ravages by conductors in direct communication with the ground, presenting to the fluid an easier passage than that offered by the materials of the building. For this purpose metallic rods are used, slightly projecting above an edifice, the object being not to invite the electricity, but to carry it off innocuously in case of an attack; and experience has shown that such a conductor is able to protect a circle having a diameter of about 20 yards. The same means are employed with success to protect ships.



266. Thunder is the report of the electric discharge, heard at varying intervals after it arises from the violent displacement of the air by the fluid in its passage, and its rush back into the partial vacuum created. The rolling of the sound is due partially to reverberation and in part to the report from different points in the track of the lightning reaching the ear in succession. Thunder follows the lightning because sound travels slower than the luminous sensation; the noise makes its deep impression rather by its volume than by its intensity. The loudest thunder can scarcely be heard at the distance of ten miles, and is less intense, therefore, than the report of heavy artillery.

267. Lightning without thunder, usually termed heat lightning, perfectly harmless, is often observed after sunset and during the night. By some it is attributed to the air being humid, and therefore favorably disposed for the conduction of the electricity, occasioning very frequent but weak discharges, so that no report is heard, and the flash is invisible by day because of its feebleness. Others regard these lights as reflections of the lightnings of storms situated below the horizon, no thunder being heard because of the distance. There are numerous other phenomena due to electricity and owing to its simple communication in a strong degree. It becomes visible in the form of pale-colored flames quivering on the extremities of bodies which are non-conductors or insulated conductors, as the points of spears and other military weapons, the manes and tails of horses, the top-masts and yard-arms of ships, etc. In showers of rain and snow the drops have been observed to be luminous, owing to a strong charge of electricity in the air. Mariners' Light or St. Elmo's Fire, often remarked by the ancients, is a phenomenon of this description. These phenomena, however, are so various as to preclude individual description.

268. Electricity sympathizes generally with light and heat in its geographical distribution, diminishing from the equator to the poles. Hence it is within the tropics that thunder-storms are the most frequent, and at the same time the most violent. The coast line of Peru, however, where it never lightens nor thunders, is a remarkable exception. The comparative number of storms becomes less and their tone more subdued as we recede from the equator. In polar latitudes electrical explosions are seldom heard, and in some places are entirely unknown.

269. Magnetism, which extends its influence over every part of the earth's surface, was long supposed to be related to electricity, from the fact of lightning often rendering steel magnetic, and disturbing the magnetic needle, so that in thunder-storms a ship's compass has frequently been seriously injured. The two forces are now known to be identical or rather but different forms under which the same power manifests itself. The phenomena of terrestrial magnetism are of infinite importance to science, and especially to the science of navigation, but must be studied in special treatises on the subject.

270. The meteoric display occasionally seen in the heavens, the Aurora Borealis or Australis, the northern or southern lights, as the case may be, is

AURORA OF LOWER LATITUDES.

unquestionably of electro-magnetic origin, for it may be artificially imitated by passing a current of electricity through an exhausted receiver; violent disturbances of the magnetic needle precede and accompany its appearance, and light has been evolved by magnetic power. In the course of the day, says Humboldt, on which the lights are to appear, irregular horary movements of the magnetic needle usually indicate an interruption of equilibrium in the distribution of the terrestrial magnetism. When this disturbance has attained a great intensity, the equilibrium of the distribution is restored by a discharge accompanied with an evolution of light. The splendid phenomenon of colored northern lights is the act of discharge, the conclusion of a magnetic storm. In the same way as in the electrical storm, lightning indicates the restoration of the disturbed equilibrium in the distribution of electricity.

271. Auroral displays are very diversified, not only at different periods, but the same exhibition usually shifts through a succession of phases. Sometimes only flickering lights are seen streaming up from beneath the horizon toward the zenith; but in the more perfect and gorgeous appearances of high latitudes there is generally a dark segment, sometimes black or of a deep gray, passing to violet, surmounted by a luminous arc of a brilliant white color, passing slightly to blue, and occasionally a second arc concentric with the first, their culminating points being in the magnetic meridian. The arc seldom remains stationary for more than a few minutes, but extends itself laterally, or rises and falls or breaks in various places or bends in convolutions like a ribbon exposed to the wind, while rays of almost every hue—the

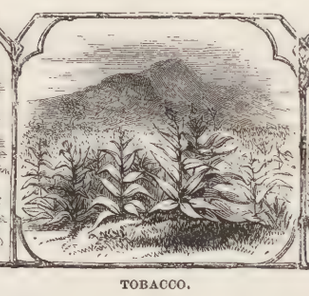
AURORA OF HIGH LATITUDES.

"merry dancers" of the polar sky—are incessantly darting from it toward the zenith. In certain districts auroral appearances seem to observe a secular period, being frequent through a certain cycle, and becoming as rare through another. By day, and even in bright sunshine, owing to their intensity, the aurora has been frequently observed in the north.

272. While the magnetic and electrical storms have one phenomenon in common—the evolution of light—the sphere of the latter is comparatively contracted, while that of the former embraces vast areas, extending sometimes to entire continents. This is indicated by the magnetic needle showing disturbance at the same time at widely remote points, and by isolated auroræ being observed simultaneously at far distant stations. The aurora australis has been seen through a wide range of latitude as far south as 45° in the southern hemisphere; while the aurora borealis has been seen as high as 51° in the northern hemisphere.

273. The auroral lights, to us merely objects of curiosity and fascination, are of great practical utility to the natives of high latitudes, relieving their dreary winter night and compensating for the long-continued absence of solar illumination.

ORGANIC LIFE—PLANTS AND ANIMALS.



Having examined the solid, liquid, and aeriform parts of the terrestrial globe, the next subject to be treated upon are those innumerable living or organized beings which exist upon its surface, and which range themselves under two great heads—Plants and Animals.

SUGAR-CANE AND RICE.

COTTON.

TOBACCO.

TEA.

COFFEE.

INDIAN CORN.

PLANTS—THEIR KIND AND DISTRIBUTION.

274. Vegetation occurs over the whole globe, and under the most opposite conditions. There is only one state which appears to be fatal to its existence—the entire absence of humidity. Plants flourish in the bosom of the ocean as well as on land, under the extremes of cold and heat in the polar and equatorial regions, on the hardest rocks and the soft alluvium of the plains, amid the perpetual snow of lofty mountains and in springs of the temperature of boiling water, in situations never penetrated by the solar rays as well as in positions freely exposed to light and air. But these diverse circumstances have different families, species, and genera.

275. The known number of species in the vegetable kingdom has been gradually enlarged by the progress of maritime and inland discovery; but owing to great districts of the globe not having yet been explored by the botanist, the interior of Africa and Asia with sections of America and Oceanica, it is impossible to state the exact amount. Only 1,400 different species were known to the Greek and Roman botanists; Linnæus enumerated 8,800 species; Humboldt 38,000; De Caudolle 56,000; Lindley 86,000, and Hurds 89,000. The whole number now known to the botanist may number perhaps 100,000 species, and even this vast diversity may not have exhausted the objects of inquiry.

276. Vegetable forms are divided into two great classes, which differ materially in their structure—Cryptogamous Plants: those which have no flowers properly so called, as mosses, lichens, fungi, and ferns; and Phænogamous or flower-bearing Plants. The last-named class is again divided into—Endogenous Plants, which have stems increasing from within, also called Monocotyledons, from having only one seed-lobe, as the numerous grasses, lilies, and the palm family; and Exogenous Plants, which have stems growing by additions from without, also called Dicotyledons from the seed consisting of two lobes, the most perfect, beautiful, and numerous class, embracing the forest trees and most of the flowering shrubs and herbs.

277. The Cryptogamous Plants afford the most numerous examples of wide diffusion. A lichen indigenous in Cornwall is also a native of the West Indies, Brazil, St. Helena, and the Cape of Good Hope; while 38 lichens and 28 mosses are common to Great Britain and Australia, though the general vegetation of the two districts is remarkably discordant. Some species of the endogenous plants are also widely distributed, the "phleum alpinum" of Switzerland occurring without the slightest difference at the Strait of Magalhaens, and the quaking grasses of Europe in the interior of South Africa. But only in very few instances are the same species of exogenous plants met with in regions far apart from each other; and generally speaking, in passing from one country to another, a new flora is encountered.

278. In equinoctial and tropical countries, where a sufficient supply of moisture combines with the influence of light and heat, vegetation appears in all its magnitude and glory. Its lower orders—mosses, fungi, and confervæ are very rare. The ferns are aborescent. Reeds ascend to the height of a hundred feet, and rigid grasses rise to forty feet. The forests are composed of majestic leafy evergreen trees bearing brilliant blossoms, their colors finely contrasting, scarcely any two standing together being of the same species. Enormous creepers climb their trunks; parasitical orchidæ hang in festoons from branch to branch, and augment the floral decoration with scarlet, purple, blue, rose, and golden dyes. Of plants used by man for food or as luxuries or for medicinal purposes occurring in this region, rice, bananas, dates, cocoa-nut, cacao, bread-fruit, coffee, tea, sugar, vanilla, Peruvian bark, pepper, cinnamon, cloves, and nutmegs are either characteristic of it as principally cultivated within its limits or entirely confined to it.

279. Tropical families and forms successively vanish with an increase of distance from the equator, and new phases of vegetation mark the transition from hot to temperate climates. Vividly green meadows abounding with tender herbs replace the tall rigid grasses which form the impenetrable jungle; and instead of forests composed of the towering evergreen trees, woods of the deciduous class appear, which cast their leaves in winter and hybernate in the colder season—the oak, ash, elm, maple, beech, lime, alder, birch, and sycamore. The cultivation of the vine becomes characteristic with the perfection of the cereal grasses and a larger portion of herbaceous animals and cryptogamous plants.

280. Receding farther from the equator, magnificent forests of the fir and

pine tribe prevail, as in North America, in the central parts of Russia, on the southern shores of the Baltic, and in Scandinavia. But some of the cereals are no longer cultivable, and several timber trees common to the temper-

BANANA AND COCOA-NUT.

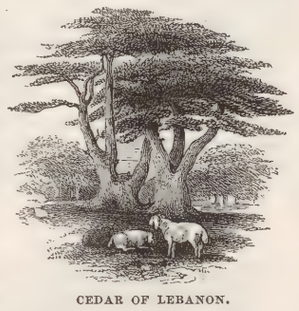
ate zone do not reach its northern limits. Gradually all ligneous vegetation disappears entirely as high latitudes are approached, the woods having first dwindled to mere dwarfs in struggling with the elements, hostile to that state which nature destined them to assume. The limit of the forests is a sinuous line running along the extreme north of the Old World, and extending from Hudson's Bay (lat. 60°) to the Mackenzie River (lat. 68°), and thence to Behring's Strait in the New World. The dwarf birch (betula nana), a mere bush, is the last tree found on drawing near the eternal snow of the pole. In the polar zone some low flowering annuals, as saxifragi, ranunculi, gentians, chickweeds, etc., flourish during the brief ardent summer; a few perennials also accommodate themselves to the rigorous climate by spreading laterally, never rising higher than four or five inches from the ground; till finally no

PINE FOREST.

development of vegetable life is met with but lichens and the microscopic forms that color the snow.

281. Thus distinct vegetable regions are observed on passing from the equator to the poles through different climatic zones, defined as to their limits by the isothermal curves and not by the parallels of latitude. Similar changes of vegetation mark a perpendicular transit through varying climates. A succession of plants appears on the tropical mountains which rise above the snow-line, corresponding to those which are encountered in mean and high latitudes. The higher the ascent the more does the number of the phænogamous class diminish in proportion to the cryptogamous, till only members of the latter class are found whose farther progress upward is arrested by the everlasting snow.

282. There are many plants which can accommodate themselves to the most diverse climates and localities; and therefore ascend from the plains close to the boundary of vegetable life on the highest mountains. But it is the general law in these cases for such plants to be singularly modified in appearance and anatomical structure as they ascend. The spring gentian is one of the exceptions which is found unaltered at all heights in the Pyrenees.



283. The preceding references to different climatic states are, however, perfectly inadequate to explain the phenomena of vegetable distribution. While an analogy is often observable between the plants of different regions under corresponding circumstances of latitude, elevation, and soil, the species are generally found to be different; and usually the botanical character of countries not widely apart from each other is totally different, though under the same parallels.

CACTUS.

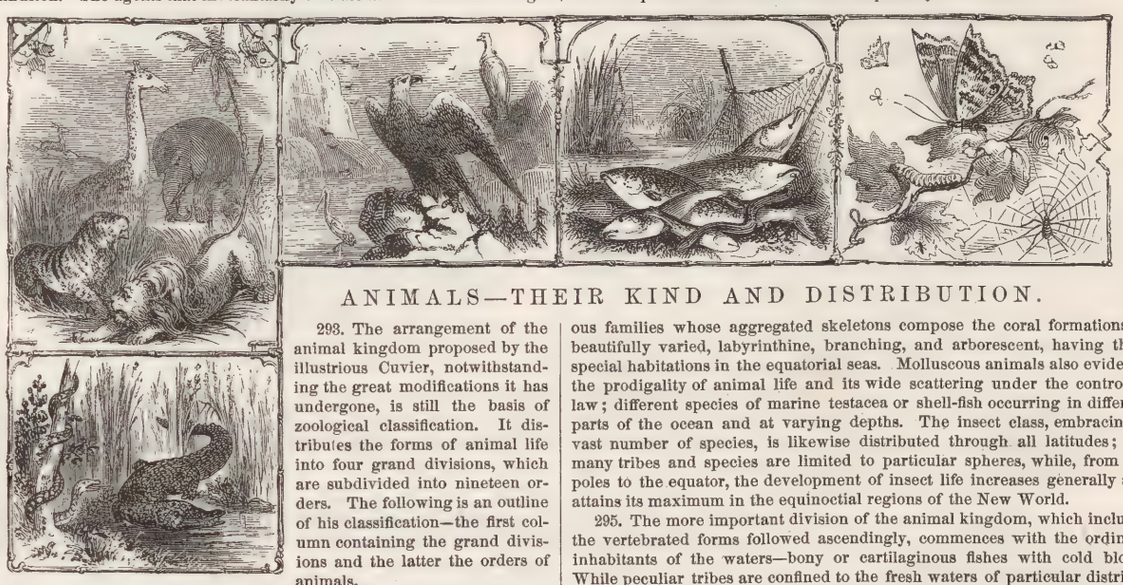
284. Some plants are entirely confined to one side of the earth. The beautiful genus erica or heath, of which there are upward of 300 species, occurs with breaks over a narrow surface extending from a high northern latitude to the Cape of Good Hope. But the whole continent of America does not contain a single native specimen; nor has a "peonia" been found in it, except a solitary one to the west of the Rocky Mountains. On the other hand America contains many families, as the cacti, which are not found naturally in the Old World.

285. And again, some plants occur in a single specific locality, frequently a contracted area and nowhere else. The beautiful "disa grandiflora" is limited to a spot on the top of the Table Mountain at the Cape of Good Hope; and the celebrated Cedar of Lebanon appears to be restricted in its spontaneous growth to the Syrian Mountains. The small island of St. Helena has an indigenous flora with a few exceptions different from that of the rest of the globe.

CEDAR OF LEBANON.

286. Mountain chains of no great breadth very commonly divide a totally distinct botany. There is a marked difference in the vegetation on the Chilean and opposite side of the Andes, though the climate as well as the soil is nearly the same and the difference of longitude very trifling. In North America two completely different classes of vegetation appear on the two sides of the Rocky Mountains. A variety of oaks, palms, magnolias, azaleas, and magnificent rhododendrons occur on the eastern side, all of which are unknown on the western, the region of the gigantic pine.

287. The distinct vegetation possessed by various parts of the globe has led to its division into botanical kingdoms or phyto-geographical regions, named in general after the genera that are either peculiar to them or predominant in them. The arrangement of M. Schouw, which is usually adopted, discriminates twenty-five great provinces of characteristic vegetation upon the surface of earth.



288. The phenomena of botanical geography and the facts of geology are mutually illustrative. The existing dry land having been upheaved above the waters at different epochs, it may be reasonably inferred that each portion on its emergence received a vegetable creation in harmony with its position. The ultimate constitution of the general surface into different botanical kingdoms would hence follow, each of which has preserved its primitive features, while adjoining and even far distant foci have to some extent intermingled their respective products, under the control of the natural agencies of diffusion. The agents that involuntarily officiate in the diffusion of vegetable products are the atmosphere, the water, and many animals; and plants capable of extended naturalization and serviceable as articles of food or luxury have been widely disseminated by the human race in their migrations.

289. The cerealia or corn plants afford the most striking example of the agency of man in their diffusion over the world. These important grasses known to the ancients—wheat, barley, oats, and rye—were the gifts of the Old to the New World. They are also importations into Europe; but the loose reports of the ancients and the diligent researches of the moderns alike leave us in ignorance of their native seat. Probability points to the conclusion that they have spread from the neighborhood of the great rivers of western Asia, the primitive location of the human family; and it is not impossible that in that imperfectly explored district or farther east in the Tartarian table-land some of the cereals may yet be found growing spontaneously. The first wheat sown in North America consisted of a few grains accidentally found by a negro slave of Cortez among the rice taken for the support of his army. In South America the first wheat was brought to Lima by one of the early colonists, a Spanish lady, Maria d'Escobar. An ecclesiastic, José Rixi, was the first to sow wheat in the neighborhood of Quito.

290. Maize or Indian corn has been dispersed in the Old from the New World; and also a more important product, the potato, the use of which now extends from the extremity of Africa to Lapland. In Chile, the native country of the plant, it occurs at present in a wild state. The Spaniards imported it into Spain, and from thence it was communicated to Italy. It was first made known in England at a subsequent period from Virginia, having been received there from the Spanish colonists in South America, as it is not a native of intervening Mexico.

291. The grapevine, so extensively spread over Europe, is probably not indigenous in any part of it. It chiefly owes its diffusion in Europe to the Romans, who received it from the Greeks, to whom it most likely came from the country between the Black and Caspian seas. The Romans introduced most of the finer European fruit-trees, some from Africa, as the pomegranate, but the great majority from western Asia, as the orange, fig, cherry, peach, apricot, apple, and pear. A variety of the plum, the Damson or Damascene, came from the neighborhood of Damascus during the Crusades; and the name of the Damask-rose points to the importation of the plant from the same quarter into Europe. Most, if not all, of these have been naturalized in America, having been imported along with its present people.

292. The ocean as well as the land has different botanical regions; and changes of the vegetation are observed with the depth analogous to the variation of terrestrial plants with the height. Marine vegetation seems to have its vertical extent determined by the sub-aqueous range of light which varies with the power of the sun and the transparency of the water.

ANIMALS—THEIR KIND AND DISTRIBUTION.

293. The arrangement of the animal kingdom proposed by the illustrious Cuvier, notwithstanding the great modifications it has undergone, is still the basis of zoological classification. It distributes the forms of animal life into four grand divisions, which are subdivided into nineteen orders. The following is an outline of his classification—the first column containing the grand divisions and the latter the orders of animals.

VERTEBRATA or *Vertebrated Animals*—having a vertebral column, which, with its termination, the skull, incloses and protects the brain and spinal cord, the central organs of the nervous system.	1. Mammalia—animals which produce their young alive and for a time suckle them. 2. Aves or birds, with warm blood. 3. Reptilia—reptiles, with cold blood. 4. Pisces—fishes, with cold blood.
MOLUSCA or *Molluscous Animals*—animals of a soft texture and no skeleton, having the muscles attached to the skin, which produces in many species stony coverings or shells.	5. Cephalopoda (heads furnished with feet)—cuttle-fish, nautilus, etc. 6. Pteropoda (wing-like feet)—clio, the chief food of the whale, thyalæ, etc. 7. Gasteropoda (creeping on the belly)—slug, snail, limpet, whelk, etc. 8. Acephala (headless)—oyster, muscle, etc. 9. Brachiopoda (arm-like feet)—bivalve shells. 10. Cirrhopoda (thread-like feet)—barnacle, etc.
ARTICULATA or *Articulated Animals*—animals consisting of a number of articulated joints or rings, soft or hard, supplying the place of a skeleton.	11. Annelida—worm, leech, etc. 12. Crustacea—crab, lobster, shrimp. 13. Arachnida—spider, scorpion. 14. Insecta—insects of various families.
RADIATA or *Radiated Animals*—animals which in many instances have their organs arranged like rays proceeding from a center; also called zoophytes or plant-animals from the resemblance of some families to vegetable forms.	15. Echinodermata (εχίνος, spiny, and δερμα, the skin)—star-fish, sea-urchin, etc. 16. Entozoa (εντος, within, and ζωον, an animal)—intestinal animals, as the tape-worm, etc. 17. Acalephæ (ακαλήφη, a nettle)—medusa or sea-nettle, etc. 18. Polypi (πολυς, many, and πους, a foot)—sea-anemone, coral, madrepore, etc. 19. Infusoria—microscopic animals.

294. The animal kingdom corresponds with the vegetable in the exuberance and wide diffusion of its inferior organisms. Infusoria occur in numbers which baffle the power of arithmetic to express or the mind to conceive, living in every variety of situation—in the bed and waters of the ocean, in stagnant pools, in the mud of rivers and deltas, in marsh grounds, in animal and vegetable juices, in rain, snow, ice, boiling springs, and in peat-earth, twenty feet below the surface soil. Zoophytes occupy the oceanic waters in vast profusion, from the equator to the highest latitudes; the polypi of various families whose aggregated skeletons compose the coral formations so beautifully varied, labyrinthine, branching, and arborescent, having their special habitations in the equatorial seas. Molluscous animals also evidence the prodigality of animal life and its wide scattering under the control of law; different species of marine testacea or shell-fish occurring in different parts of the ocean and at varying depths. The insect class, embracing a vast number of species, is likewise distributed through all latitudes; but many tribes and species are limited to particular spheres, while, from the poles to the equator, the development of insect life increases generally and attains its maximum in the equinoctial regions of the New World.

295. The more important division of the animal kingdom, which includes the vertebrated forms followed ascendingly, commences with the ordinary inhabitants of the waters—bony or cartilaginous fishes with cold blood. While peculiar tribes are confined to the fresh waters of particular districts, each large basin of the ocean appears to have its distinct genera and species.

296. The carp and perch types appear in almost all the rivers of the temperate zone. The electric eel inhabits the rivers and pools of equinoctial America; the "silurus electricus" the rivers of Africa, and the "torpedo" the Mediterranean Sea. Sharks roam in the deep, open oceans of warm climates. Sturgeons occupy land-locked waters. The cod dispersed through the North Atlantic congregate chiefly upon its banks. Flying-fish are principally inter-tropical, their most active enemies, the "coryphanæ" (gilt-heads), observing the same limits. Almost all the fish of the Caspian Sea are specifically distinct from those in all other waters. Several kinds of fish, as the herring, tunny, etc., are eminently social and migratory, and annually leave the ocean for shallow water in vast shoals for the purpose of spawning or in search of food.

BOA CONSTRICTOR.

COBRA DE CAPELLO.

297. Reptiles (tortoises, lizards, serpents, and frogs), the next order, occupy the lowest rank among terrestrial vertebrata. They diminish in number, magnitude, and noxiousness from the equator to the poles; and have their maximum development in the equatorial regions of South America. Each family is represented in the two hemispheres, but not a single species appears to belong to both. Of the serpent tribe, rattlesnakes of four species are exclusively American; the larger boas are so likewise, while the pythons are African and Asiatic. Of crocodilians,

consisting of three genera, the crocodile proper is distributed in the Old and New worlds, but the species differ; the alligator or cayman is confined to America, and the gavial is limited to the great rivers of India. No living

CROCODILE.

crocodilian has ever been known in Europe; and excepting the Marianne Islands, all the reptile tribes are entirely wanting in the island groups of Oceanica. Very few reptiles reach the north boundary of the temperate zone, taking the isotherm of 50° Fahr. for its limit. Frogs and salamanders go the farthest north.

298. Birds, the members of the succeeding order, have a more perfect

CONDOR.

organization; and being endowed with the power of rapid locomotion, several species are wide geographic rangers. This is the case with the house-sparrow, common crow, gosshawk, jay, raven, osprey or fishing eagle, cliff-swallow, and others. But the majority of species are restricted by geographical laws to particular districts, and have in many instances a very local existence. The far-famed birds of paradise are confined to New Guinea and the neighboring islands; the condor never leaves the Andes of South America; the great eagle remains among the ridges of the Alps; paroquets are chiefly inter-tropical; the albatross is seen skimming the surface of the ocean on approaching the 40th parallel; the common grouse, the yellow and pied wagtails, and the English starling are alone known in Great Britain. These are only a few examples of limited distribution. The most beautiful varieties of birds are found within the tropics; where also the number of species and individuals is greatest, except in the instance of two families, the swimmers and waders, which in both respects are the most numerous in higher latitudes. Birds are distributed into the six orders of rapaces or birds of prey, scansores or climbers, oscines or songsters, gallinaceæ or gallinaceous birds, from gallina a fowl, grallatores or waders, and natatores or swimmers.

OSTRICH.

299. Mammalia or mammals stand at the head of brute animal creation, and are distributed into eight great groups. They differ vastly in appearance and habits but correspond in the particular of suckling their young. The groups with some of their types are as follows:

a. Quadrumana or four-handed animals—monkeys, apes.

b. Carnivora or flesh-eaters—mole, glutton, civet, bear, hyena, cat—in which last tribe the sanguinary development is at its height in the lion and tiger, sea-otter, etc.

c. Marsupialia or pouched animals—opossum, kangaroo, wombat.

d. Rodentia or gnawers—beaver, porcupine, squirrel, jerboa.

e. Edentata or toothless animals—sloth, armadillo, ornithorynchus.

f. Pachydermata or thick-skinned animals—elephant, rhinoceros, hippopotamus, zebra, tapir.

g. Ruminantia or ruminant animals (chewing the cud)—camel, ox, goat, sheep, deer, antelope, giraffe.

h. Cetacea or whale tribes—whale, dolphin, narwhal, seal, porpoise.

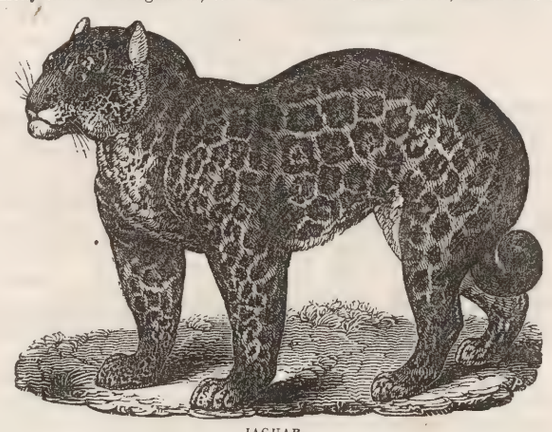
300. The first group has no representatives in North America, Australia, or Oceanica, nor is it represented in Europe, except on the Rock of Gibraltar, whose inaccessible heights have long been occupied by a race of monkeys identical with the Barbary ape. The region of the four-handed mammals extends in the New World from Central America through the intervening districts to the pampas of the Argentine country; and in the Old World it includes the whole of Africa, exclusive of Egypt, the south of Asia, and the Indian Archipelago.

301. The monkey tribe contains 170 species, exhibiting wide differences in form, size, color, and habits. There is no species common to the two continents, and but very few are common to Africa and Asia. Peculiar genera have for the most part contracted geographical limits. In the Old World there are 72 species tailed and seven tailless. The baboons, the most numerous of the tailed families, are principally located in Africa; the gibbons or long-armed apes, a tailless genera, are exclusively Asiatic. The station of the interesting tailless family of orang-outang, "the man of the woods," is both African and Asiatic, but entirely local, and the individuals are rare. The red species appears in Borneo, Sumatra, and Malacca; the black on the Guinea coasts. In America there are 91 species, none tailless, and all more gentle, but having a more decided animal appearance than their congeners of the Eastern Continent. They are divided into two classes, the sapajous and the sagouins, according as they have or have not prehensible tails. Distinct from the apes, but belonging to the quadrumana, is the makis tribe. It occurs in Asia, but the type, the genus "lemur," is entirely confined to Madagascar and the opposite African coast. The lemurs, remarkable for bounding elasticity, boa-like tails, and inoffensiveness, live in troups upon the trees, and apparently supply the place of the monkeys, none of which have yet been observed within their special limits.

302. Carnivorous animals of one or other kind are spread over the whole globe, as their natural food exists in every accessible region; but there are certain limits to which whole races are confined, while the different genera and species are confined to narrower bounds. Two tribes of the "digitigrada"

ST. BERNARD DOGS.

WOLF.



may be noticed—the dog (canis) and cat (felis) tribes. The dog, properly so called, domesticated by man, has attended him everywhere, his faithful companion and friend; but there are two remarkable instances of dogs in a wild state, the dhole of India and the dingo of Australia. The jackal, the characteristic dog of Africa, ranges through its entire north to India, and from Abyssinia to the Caspian Sea. The wolf is more widely distributed—in America from beyond the Arctic circles to near the Isthmus of Panama, and —in the Old World from the same northern limit to Egypt, Arabia, and India, and from Spain on the west to the eastern shores of the continent, not, however, occurring in India beyond the Ganges. But of all the members of the

JACKAL.

dog tribe, omitting the domesticated, the fox is the most extensively diffused, from the highest northern latitudes through great part of Europe, Asia, Africa, and America. The various species are provincial. The red fox, distinct from the European, inhabits the forest districts of North America; the black fox the Siberian woodlands, and the white fox the polar regions.

303. Europe has no representative of the feline tribe in a wild state except the cat and the lynx. The wild cat occurs in most of its woody countries, and is found also in northern Asia, India, and South Africa. It has no representative whatever in Australia and Oceanica. But the tropical regions of both continents are occupied by powerful animals of the class—lions, tigers, leopards, and lynxes, some of which extend far into the middle latitudes. The African lion is found through the whole of that vast peninsula, excluding the Lybian Desert, the Nile countries, and some adjacent districts; the Asiatic lion, specifically distinct, has much smaller domain, stretching from Persia into India; the American lion (puma), a widely different animal, ranges from Patagonia to the northern lakes. The tiger is exclusively Asiatic, occupying the southeastern countries, with the islands of Sumatra and Java, appearing westward in Persia and northward in the vicinity of Lake Baikal. The leopard and panther, two closely related animals, if not specifically the same, chiefly inhabit Senegambia, the oases of the Great Desert, India and its

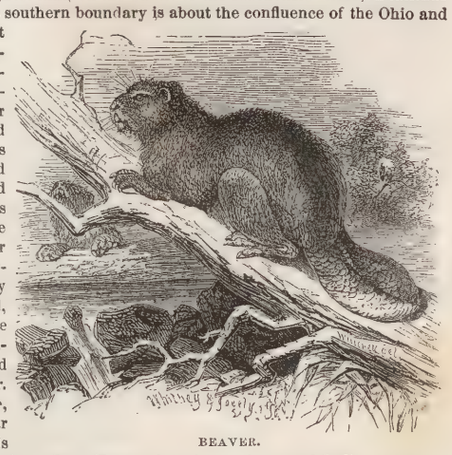
JAGUAR.

islands. The jaguar, sometimes called the American panther, a distinct animal, is peculiar to the southern part of the continent, and is principally found in Brazil and Paraguay. Lynxes are common to both hemispheres, but the species are different.

304. Hyenas, martens, skunks, otters, and civets represent other tribes of the family of digitigrades or animals walking on the toes only. The striped hyena is found in nearly the whole of Africa and in the southern countries of Asia, extending to the chains of the Caucasus and Altai; the spotted hyena is entirely African. The marten tribe is represented in each grand division of the world; but the more important species, on account of their furs, the ermine and sable, have their province in the northern parts of the two continents. Otters haunt most of the rivers, lakes, and coasts of Europe and America; but two species of the sea-otter, the most valuable of the fur-bearing animals (lutra marina and lutra phocula), are peculiar to the extreme northeastern shores of Asia and the northwestern shores of America, and the intervening islands.

305. Of carnivora belonging to the family of "plantigrades" (animals supported in walking on the entire sole of the foot), the most important is the bear (ursus) tribe. The European brown bear, which still haunts the recesses of the Alps and Pyrenees, is distributed through the entire north from Norway to Kamtchatka, and appears in Japan. The American black bear inhabits all its densely wooded districts from Carolina to the Arctic Sea and from the Atlantic to the Pacific. The grizzly bear, the most formidable species, has a much smaller province, consisting of the Rocky Mountains and a portion of the eastward territory. The polar bear occupies the icy zone, sometimes extending its excursions southward to the shores of Hudson's Bay and Labrador, and appears also on the northern coasts of Asia and Europe. Abyssinia, Syria, Tibet, and Sumatra have each different species.

WHITE OR POLAR BEARS.



306. None of the marsupials (quadrupeds furnished with a pouch in which the females carry their young while very small and imperfectly formed) appear on the Eastern Continent. America has one family, the opossums, spread from the northern United States to the south of the Plata. But the group specially characterizes the fauna of Australia, the Moluccas, and New Guinea, constituting in that region one of the best defined zoological kingdoms on the surface of the globe. The "rodentia" or gnawers, named from the manner in which they file or gnaw their food with their front teeth, are very extensively diffused, the muridæ or rat tribe, which comprises more than half the species in the group, having the greatest geographical range. The "edentata" or toothless animals, characterized by the absence of front teeth peculiarly, belong to Central and South America, and only occasionally occur in the southern regions of the Old World.

307. Of marsupial, the typical animal, the kangaroo, is found in all the explored parts of the Australian Archipelago, and in one instance in Java.

KANGAROOS.

Among rodents the beaver is the most interesting, and ranges in the northern and temperate regions of the northern hemisphere. The North American beaver has its highest limit on the banks of the Mackenzie River, in latitude 68° north, and its southern boundary is about the confluence of the Ohio and Mississippi: east and west it extends from the Atlantic to the Pacific. The beaver of the Old World inhabits the rivers between 36° and 67°, and is found in the Obi and its tributaries. The little beaver or musk-rat of America is a generically distinct animal, but, along with the true beaver, is incessantly pursued by man for its fur. The porcupine, another peculiar rodent, extends from Spain through southern Europe into Afghanistan and India.

BEAVER.

308. Of edentata the sloth and armadillo are exclusiveiy American, the former inhabiting the dense forests from Mexico to Rio Janeiro, and the latter the open plains and pampas south of the Orinoco. The great ant-eater, the largest of all the toothless animals, is distributed from the pampas to the north of the Orinoco. Among the edentata of the Old World the pangolius or scaly ant-eaters are common to Africa and Asia. Australia has the porcupine ant-eater, so named from its covering of spines, and the ornithorynchus,

apparently restricted to the southeast, the most singularly formed of all mammals, having a compressed muzzle resembling the bill of a duck and webbed feet.

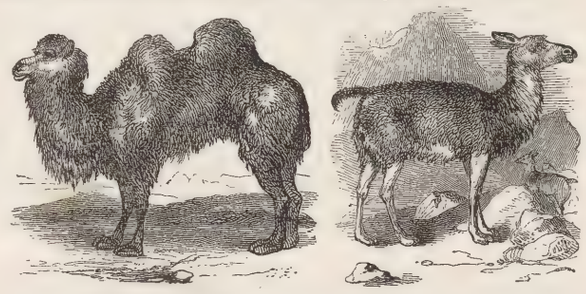
309. The "pachydermata" or thick-skinned group comprises the largest and most powerful of all land animals, with some of the most useful as domesticated by and for the use of man. It includes two species of elephants: the Asiatic, which ranges south from the foot of the Himalayas and into the Malay Archipelago, and the African, of smaller size, ranging from the northern boundaries of Cape Colony to Senegal and Abyssinia; seven species of the rhinoceros, four of which belong to Africa and three to Asia, but none of which are common to both regions—all having nearly the same range as the elephant but in Java the elephant is wanting, while the rhinoceros occurs; and three species of the hippopotamus or river-horse, confined to the rivers and lakes of Africa. The New World has no animal of

HIPPOPOTAMUS. ELEPHANT.

any kind comparable to the huge pachyderms of the Old. The tribe of tapirs is common to both, two species of which are located in South America and one in Sumatra, Borneo, and Malacca.

310. The remaining important tribes of the pachydermatous form are those of the horse and the hog. The Horse, properly so called, now diffused in a domestic state over the whole civilized world, can not be traced to its native country. At present it runs wild on the table-lands of central Asia, supposed by some to be the primeval home of the tribe; but more probably this is simply an instance in which the descendants of a domestic race have returned to the wild state. In the same way the animal introduced into America from Europe by the Spaniards now roams wild in immense herds over its vast plains. The ass, a member of the equine tribe, was perhaps domesticated at an earlier period than the horse. There are several species wild occurring in the countries between northeastern and southwestern Asia, as the koulau of the Tartars and the djiggetai of the Moguls. Though hardy in many respects, the ass does not support cold so well as the horse, and hence it is that the ass of the warm regions so surpasses his congeners on approach to the zone of cold. The quagga, belonging also to the equine family, and also the gnu and zebra, are peculiar to Africa, and are found

HORSE.



GNU OR HORNED HORSE.

from Abyssinia and Guinea southward to Cape Colony. The individuals of each associate in troops, but the two do not herd together.

311. There are no swine (sus) indigenous in America; but a cognate genus, the peccary, of two species, occur in South America; and since the introduction of the domestic hog it has run wild, and forms large herds in the Western World. Another cognate genus, the wart-hog, is peculiar to Africa. Of true swine there are several species distributed over the islands contiguous to southern Asia, and also found in the adjacent continental parts; but the best known species, the European wild boar, has the most extensive range. It occurs generally through the Old World, from France eastward to the Asian shores of the Pacific, but is not found in Spain, Italy, and Persia. Its farthest northern limit is in Asia, at about the 60th parallel.

312. The group of "ruminants," characterized in their internal structure by four stomachs for the purpose of chewing the cud, comprehends various tribes, remarkable for elegance of form and utility to man as articles of food and as beasts of burden in climates of the most extreme heat and cold, viz.: camels, llamas, giraffes, deer, antelopes, goats, sheep, and the ox.

313. The region of the camel (camelus) extends from the Canary Isles through northern Africa, Arabia, Syria, Asia Minor, Persia, northwestern India, the southern districts of Tartary to the frontiers of China. There are two species, the Bactrian camel, distinguished by two hunches or humps on the back, and the Arabian camel with only one, of which the dromedary is a fleet variety. The camel is alone found in a domesticated state. The Bactrian species has been said to run wild in the great Desert of Gobi.

BACTRIAN CAMEL. LLAMA.

314. Llamas (anchenia), of which there are three species, represent in the Western World the camels of the East, which they greatly resemble, but are smaller and without humps. They are entirely South American, and principally found on the west side of the Andes.

315. The giraffe (camelopardalis), so remarkable for their height, peculiar form, swan-like necks, timidity, and gentle manners, are exclusively African. There are at least two species, the north African giraffe, inhabiting Nubia, Abyssinia, and the countries around Lake Tchad, and the south African giraffe, which extends from the borders of Orange River probably into the central regions.

316. The deer family (cervus) includes all those ruminants which are furnished with solid horns or antlers. The family and species are numerous and of great importance. The elk or moose-deer, a gigantic animal, with broad, solid, and very heavy antlers, belongs to the northern regions of both

ELK OR MOOSE-DEER.

continents. The reindeer, however, is more capable of enduring cold than the elk, and hence occupies the highest latitudes. Its congener in America is the caribou, which occupies the whole country north of the latitude of Quebec. The other more prominent members of this family are the fallow-deer, the common stag or red deer, and the roebuck. The musk-deer, characterized by the absence of true antlers or horns, and a secretion of musk, belongs to western Africa and southern and central Asia, but of different species in each region. The genuine musk-deer is a denizen of central and southeastern Asia.

317. Africa, deficient as to the deer tribes, is peculiarly the land of the antelope, the most numerous in species of any race of ruminants, differing widely in size, color, habits, and station. A few court the shade of the forests; some inhabit the lofty table-lands; but the greater number roam over the plains in troops. The gazelle, long celebrated for its large, mild, and dark eyes, is found in Egypt, Barbary, and through all the country bordering on the Desert. Of two European antelopes, one is the chamois, so remarkable for its agility, dwelling on the highest ridges of the Pyrenees and Alps, the Carpathian and mountains of Greece, the Caucasus and the Taurus.

318. Goats (capra) are mountain dwellers. The ibex inhabits the highest ranges of Europe; the penang is found on the wildest points of the Caucasus

SHEEP.

and the inhospitable hills of Persia; the goat of Cashmere occupies the declivities of the Himalayas and the upland plains; the jaal goat belongs to the Sinaitic Mountains, those of upper Egypt and Abyssinia; and the Rocky Mountain goat is attached to the loftiest and least accessible summits of that range. The parent stock of the common domesticated goat is unknown.

319. Sheep (ovis) in their wild state, like goats, are chiefly denizens of mountain districts. The greatest number of species occurs in Asia. The argali, with enormous horns, is found throughout northern Asia, and the American argali, a Rocky Mountain sheep, inhabits the range and the ridges which intersect the country to the Pacific between the 40th and 68th parallels. The mouflou occupies the heights of Corsica, Sardinia, Crete, Cyprus, and other islands of the Greek Archipelago. It is quite uncertain from what race the domestic breeds are descended.

320. The bovine or ox (boo) family includes the largest and most powerful of all ruminants. The common ox, a native of the Old World, now living as

CATTLE.

far north as the 64th parallel, and in Lapland even under the 70th, appears to have sprung from the warmer parts of the temperate zone; and probably descends from the urus of the ancients, an extinct race, but described by Cæsar as inhabiting the great Hercynian Forest. The other most famous members of this family are—the Brahming bull (humped), a sacred animal in most parts of India; the gayal, an Asiatic species (differing from the ox, which has thirteen pairs of ribs, by having fourteen) inhabiting the lower members of the Himalaya range, and occurring both wild and domesticated; the yak, the mountaineer of central Asia, living amid the eternal snows on the table-land of Pamir, 15,000 feet above the sea; the buffalo of India, now domesticated in southern Europe and northern Africa, and that of southern Africa, a much more formidable animal. The bison is common to both continents, but differing in species. While the ox has thirteen pairs of ribs, the European bison has fourteen and the North American species fifteen pairs. Both species are remarkable for their daring energy. The European bison or auroch is a forest animal, while the American bison, or, as it is erroneously called, buffalo, is an animal of the open plains—the first is nearly extinct in Europe, but it is still found in the countries around the Black and Caspian seas; and the latter, though still numerous, is rapidly diminishing. The musk-ox, so called from the odor of its flesh, is peculiar to North America, and is only found above the 60th parallel.

BISON OR BUFFALO.

321. The "cetacea," animals of the whale kind, form the last group of mammals. Popularly considered as fishes, and resembling them in external appearance and habitat, they have the internal structure, vital functions, and mode of production of land quadrupeds. There are several families, chiefly occupying the seas of high latitudes, comprehending the whales, properly so called, with narwhals (sea-unicorns), porpoises, and grampuses.

322. In former ages whales were frequent in the Mediterranean and along the European coasts of the Atlantic. In the latter locality the modern whale fishery was commenced; but at present it is very rarely, and as an animal astray, that one of these huge monsters appears in such a low latitude. The common black whale, the chief object of the pursuit of man, has largely left these seas during the present century and gone farther north. The spermaceti whale or cachelot is a much more ranging animal than its congener, and is found in both the Atlantic and Pacific. The white whale occurs in all the polar seas. In the Antarctic Ocean, into which man has seldom intruded, whales of various kinds occur in great numbers, and to that quarter of the globe the attention of whaling adventurers is now strongly directed. The narwhal is located near the polar ice; the common porpoise is plentiful throughout the Atlantic and in the estuaries of its coasts on both sides; the grampus ranges through the northern ocean.

WHALE FISHING.

323. All the cetacea noticed above are carnivorous, but there are three genera which are exclusively herbivorous—the manatus or sea-cow, halicore, daughter of the sea or sea-lass, and stellerus, a name derived from Steller, the first person who observed and described the animal. The manatus occurs in some of the tropical rivers of western Africa, but ascends in far greater numbers those of South America, the Orinoco and Amazon, occurring also in shallow bays among the West India Islands. The halicore or dudong has

its head-quarters in the Asiatic Archipelago, and the steller in the North Pacific, where it occurs on both coasts.

324. Seals and walruses form a distinct family in Cuvier's group of carnivora, but are frequently classed with the cetaceous animals. The number of seal species is very considerable. They inhabit the frozen and higher parts of the temperate zone in both hemispheres, some species being local, but the common seal is widely distributed. The ursine seal or sea-bear is found exclusively in the North Pacific toward Behring's Strait, and the lion seal or sea-lion occurs on the northeast shores of Asia; while the walrus or morse, of which but one species is known, is more decidedly confined to the high latitudes.

SEA-LIONS.

325. It appears from the phenomena of animal distribution that the globe may be divided into the following great zoological kingdoms, each of which is characterized by the exclusive possession of certain forms:

a. The Arctic Region, comprehending the northern parts of America, Asia, and Europe, and the district from thence to the pole, to which the same animals are common, but strikingly different from those of other latitudes.

b. The North Temperate Region, in which the species are often identical in Europe and Asia, though more frequently differing, while they are all peculiar in America, which possesses also some distinct genera.

c. The Region of Inter-tropical Asia, with the Archipelago, characterized by huge pachyderms and an intense development of the feline tribe.

d. The Region of Inter-tropical and South Africa, to which entire genera of pachyderms and ruminants are confined, with a vast variety of species of the latter race.

e. The Region of Inter-tropical and South America, distinguished by the

TROPICAL FOREST.

prevalence of edentata, the occurrence of various genera of other tribes which are peculiar to it, and the absence of every species common to the Eastern World.

f. The Region of Australia, remarkable for the feeble development of mammalia, with one exception—that of the marsupials, to which almost all the land mammals belong.

326. The Antarctic Regions, as far as they have yet been explored, appear to have no land animals, contrary to what is the case in the opposite dark and outer boundary of the earth. The Arctic Zone is tenanted by white bears, reindeer, wolves, the polar hare and Arctic fox, some of which seek no southerly migration to avoid the long, rigorous winter. But no terrestrial quadrupeds have hitherto been observed on the south polar shores. The oceanic birds, albatrosses, penguins, and petrels, occur in great numbers, with seals reposing on the ice and whales spouting in all directions in the open water.

327. Inter-tropical and the adjoining countries strikingly contrast with other latitudes in being peculiarly the home of carnivora of the feline tribe—lions, tigers, leopards, panthers, lynxes, and jaguars, of which the comparatively small and feeble wild-cat is the only representative in the northern regions. The same remark applies to the viverrine or civet tribe, of which the genet is the only European example; and also to the hyenas, with their allied races. On the contrary the canine tribes—wolves and foxes, excepting the jackal, and the marten tribe—weasels, stoats, ferrets, pole-cats, and others, are most abundant in middle and high latitudes. But of all the land carnivora, comprising upward of five hundred species, the proportion of species in tropical and temperate regions is nearly as three to one.

AFRICAN LION.

328. Contrasting the carnivora of the Western and Eastern hemispheres, we find a much smaller proportion of those that are useful to man in the former than in the latter. The llama, vicuña, some sheep, and dogs comprise all the important contributions made by America to the domestic stock of animals, which are vastly inferior to the domesticated races it has received from the Old World. In point also of size, courage, and power the land animals in the New World are inferior to those of the Old World. Especially is this the case limiting the comparison to the southern parts of the two continents, South America and Africa.

329. The conclusion deducible from the facts of zoological geography is parallel to that drawn from the circumstances of vegetable distribution, namely: that certain tribes of the animal creation were originally placed in particular regions, and have since remained attached to them, or to some extent been dispersed according as their powers of locomotion, their capacity to endure change of climate, and the absence of physical obstacles to migration have enabled them to wander.

330. Insects of various kinds, some in vast numbers, are often encountered far out at sea, on a voluntary cruise, or blown off from the shore; and have no doubt frequently been compelled by the winds to establish themselves in new countries. The same agency has operated in the dispersion of birds. The oceanic currents minister to the same end: the white bear has repeatedly made the passage from Greenland to Iceland on the drifting ice; and wolves and foxes have been met with far away from the shore on great floating ice-fields. A deficiency of food in one district and its abundance in another has not been without its influence in altering the station of some animal tribes.

331. Man also has largely contributed voluntarily and involuntarily to extend the sphere of various races, diffusing the domestic tribes through the civilized world, and planting them on lonely islands as a source of supply to future visitors. Nor can the practice be too highly recommended of introducing the plants and animals that are serviceable to man on shores that are destitute of them but capable of sustaining them. It is an easy method of

MIGRATION OF MAN AND ANIMALS.

conferring a benefit of unknown importance. In this way countries far apart enjoy blessings denied by nature, and have conferred upon them the sources of a wealth and happiness to which they had been strangers.

332. But man on the other hand has immensely restricted or modified the natural sphere of many animals both of the useful and dangerous class. The Asiatic lion, now confined to the country beyond the Euphrates, once occupied Palestine, Syria, Asia Minor, Macedonia, and Thrace. The aurochs, of which only a remnant lingers in the Lithuanian forests, formerly roamed in numbers through the woods of Gaul and Germany. The bear, the beaver, and the wolf have had their habitat in Britain. The presence of civilized man in America has had a similar marked influence upon the natural boundaries of the brute creation. The bison once inhabited the Carolinas, and indeed existed through nearly the whole extent of the United States. But as the settler has pushed westward the animal has lost part of his old domain, and now is only found on the plains beyond the Mississippi. The limits of the fur-bearing animals have undergone a similar alteration, and it is obvious that these races must ultimately disappear before the persevering pursuit of the hunter.

MAN—ETHNOGRAPHY.

333. Man is properly separated from all other members of the animal kingdom, and regarded as forming an order by himself, comprising a single

TYPES OF MANKIND.

species, but exhibiting many varieties. The most inferior specimen of the human race is to be discriminated from any mere animal immensely greater than the change which species can be supposed to have undergone in the longest period of time and under the influence of the most varied circumstances. The diversities of mankind are quite compatible with the idea of their descent from a single stock, for they are precisely diversities of the same nature with those which we know arise from species under control of external causes.

334. Linnæus placed man in the order of "quadrumana" or four-handed animals; but the human hands and feet are totally different in structure and fitted for different uses. The hand of man is also so far superior to that of the

SCENE IN THE SAVAGE STATE.

quadrumanous tribes in its mechanism and adaptations as to render their classification together inappropriate. Accordingly Cuvier constitutes of man the single order of "bimana," for he alone is two-handed. The characteristics of the species are, according to Bleumenbach—"Erect, two-handed, unarmed, rational, endowed with speech; a prominent chin; four incisor teeth above and below; all the teeth equally approximated; the canine teeth of the same length as the others; the lower incisors erect.

335. Owing mainly to the flexibility of his constitution, although obtaining much artificial aid, man can exist under the greatest climatic extremes. The Esquimaux endure the cold between the parallels of 70° and 80°; African negroes, and other nations, Asiatic and American, subsist under the burning sun of the equator; while the inhabitants of temperate climates, accustomed to an intermediate temperature, have borne the rigors of the highest accessible latitude and the fiercest heat of the torrid zone. The human frame can also adapt itself to very different states of the atmosphere as to density, though with a varying capacity in different individuals.

336. Nor is man confined to the use of any particular kind of food; but

SCENE IN THE CIVILIZED STATE.

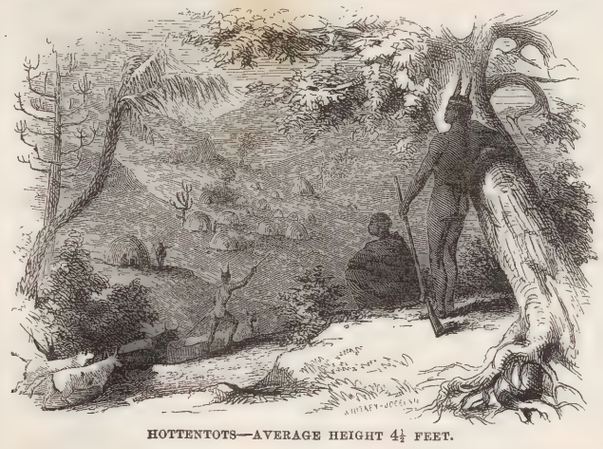
subsists in different situations with equal facility on very varied diet. Vegetables are the chief aliment of the nations within the tropics; animal food of the polar tribes; while both, in no great disproportion, contribute to support the inhabitants of temperate climates. Man is thus adapted to a very wide geographical range, and fitted to occupy physically discordant regions. In high latitudes, where a mantle of snow covers the ground through the greater portion of the year, and where vegetation is very scanty, entire hordes live on fish and seals; toward the equator, where vegetation flourishes most, vast numbers thrive with no other articles of subsistence than cocoa-nuts, bananas, yams, and rice. In the intermediate districts, the special region of the cereals, and where animal food can as readily be procured, a mixed diet obtains.

337. Few countries of the globe have been discovered without an indigenous human population. Among the principal are Spitzbergen, Nova Zembla, Iceland, Madeira, St. Helena, the Falkland Isles, Kerguelen's Land, the Antarctic Lands, and the African Sahara excepting its oases. Respecting the aggregate number of individuals, the estimates made are necessarily approximations merely, and are very discordant. From the best authorities the total number of the human race is from 1,000 to 1,200 millions, more or less; and distributed as follows:

North America	42,000,000	Europe	280,000,000	Malaysia	24,000,000
South America	20,000,000	Asia	680,000,000	Australasia	3,000,000
American Islands	4,000,000	Africa	80,000,000	Polynesia	2,000,000

—and in all civilized states, and probably as a general rule throughout the world, the numbers are constantly increasing, but at varying rates. On the contrary, it is a well-ascertained fact that modern civilization is fatal to the indigenous nations with which it comes in contact. Where are now the red men of America? But few, compared with their original numbers, exist, and their lands are occupied by the stranger.

338. The leading physical differences observable among mankind refer to varieties of strength, stature, proportion of the limbs, texture of the skin, character of the hair, color, and the form of the skull.



339. Both barbarous and civilized nations exhibit the diversities of physical power which are found in individual families; but contrary to popular opinion, upon comparing the two together, the result of experiment shows the savage to be inferior to the civilized man in muscular energy and capacity of endurance, though some of his bodily powers and senses, as the eye and ear, are remarkably vigorous. During a voyage to Australia, M. Peron obtained

with the dynamometer, an instrument contrived to exhibit the measure of strength in the arms and loins of the parties subjected to trial, results thus:

	Arms.		Loins.	
17 natives of Australia	50.8	kilogr's.	10.2	kilogr's.
12 natives of Van Dieman Land	50.6	"	—	"
56 natives of the island of Timor	58.7	"	11.6	"
17 Frenchmen attached to the expedition	69.2	"	15.2	"
14 Englishmen of New South Wales	71.4	"	16.3	"

—and it may here be remarked that the first transportation of negroes to the New World arose from the Spaniards finding the aborigines so much weaker than themselves as to be quite unable to endure the labor of the mines.

340. While members of the same nation and family exhibit considerable divergencies from the average height, there are examples of tribes departing generally from the ordinary standard as to stature. Among the natives of the New World the Esquimaux, Nootka Sound dwellers, Fuegans, and Peruvians are diminutive; the Cherokees, Caribs, and Patagonians are tall. In the Old World the Lapps and Samoiedes are below the standard height of Europeans, and the Hottentots and Bosjesmen are far inferior to the stature

HOTTENTOTS—AVERAGE HEIGHT 4½ FEET.

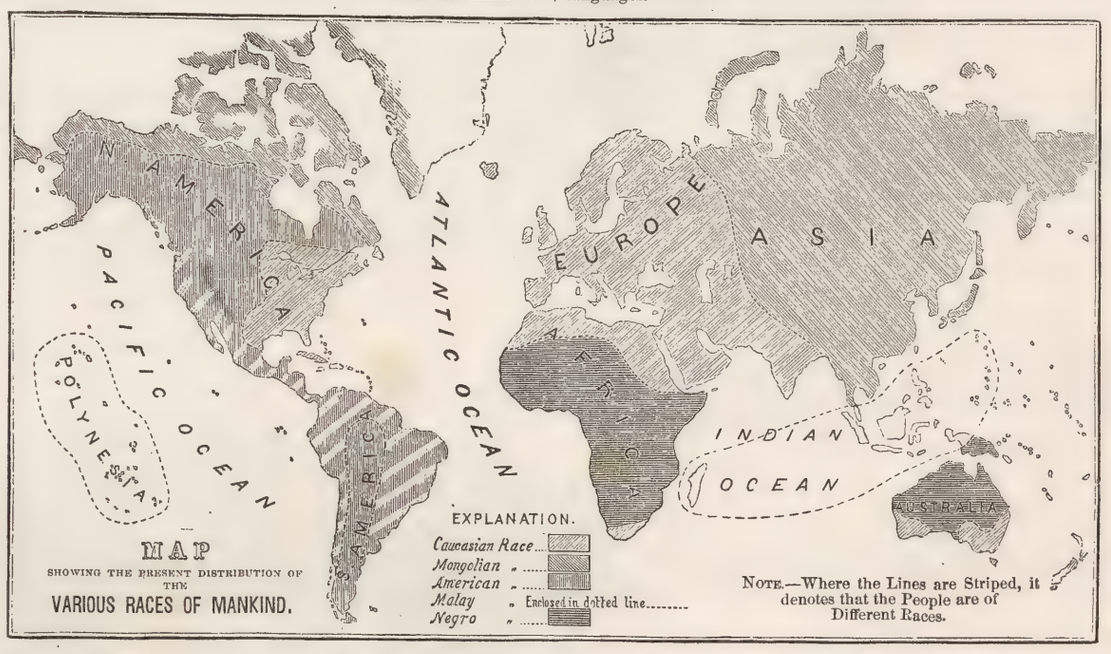
of the Kaffirs. Among the tallest men not more than one in 10,000,000 attain 6 feet 8 inches, nor is one in the same number of less stature than 3 feet 11 inches. The average height of Englishmen is 5 feet 7½ inches, and of Frenchmen 5 feet 3 inches. Among the Bosjesmen 4½ feet is given as the average height of the men and 4 feet of the women. The Patagonians average 6 feet, and very frequently exceed it. Compare the Shetland pony with the tall-backed horse of Flanders, and the Bantam fowl with the gigantic Shanghae.

341. Diversities occur with reference to the proportional size of parts of the bony skeleton, the texture of the skin and hair. Thus examples are common in the negro tribes of the broad, flat foot, projecting heel, "cucumber shin," and of the greater length of the forearm measured in proportion to the upper arm and the height of the body. The skin is also softer and more velvety, a characteristic of some of the South Sea Islanders. The hair has likewise that peculiar character which has led to the African nations being styled in general "woolly-haired," fine, wiry, and crisp, while that of the Mongolian tribes is strong, straight, and scanty, and that of Europeans soft, long, and flowing. But these characters are only variations which may be observed within the limits of any single race.

342. Complexional differences, however, form the most obvious of those distinctions which exist among mankind, and have been most relied on as evidencing a descent from different original stocks. Omitting exceptional cases, there is a correspondence maintained between the coloring of the skin, eyes, and hair, which renders their mutual dependence upon some pigmentary matter highly probable. Light hair is very generally in alliance with light blue or gray eyes; but the hues of the hair and of the skin have an analogy which is almost invariable, the fair and transparent skin, which frequently assumes a ruddy tint, being connected with light hair, and the dark-complexioned skin with black hair. Dr. Pritchard discriminates three principal varieties of the human species, according to the color of the hair—the "melanic" or black-haired variety; the "xanthous" or yellow-haired, and the "leucons" or white variety, as instanced in albinos.

NATIVES OF PATAGONIA—AVERAGE HEIGHT 6 FEET.

343. But various considerations decisively show that the distinctions of color exhibited by the human race are perfectly independent of diversity of origin as the cause, and have sprung up in the species under the influence of purely local circumstances. The color is not a permanent character. Thus we find the xanthous variety making its appearance in melanic tribes, and this occurs among the most swarthy, as the negroes of Senegal; and the Jews furnish a remarkable instance, those long settled in Malabar and Cochin China being so black as not to be distinguishable by complexion from the native inhabitants, and the ordinary Jewish complexion in Poland and Germany is florid, with blue eyes and red hair. Among the Hindoos, also, whose territory greatly differs from the secondary ranges of the Himalayas to the low, level plains of Bengal, the discrepancies of color are very great—some being actually fair, others little darker than the people of southern Europe, and others as black as negroes.



344. Anatomical investigation, indeed, proves the true skin to be similar in all nations. The pigmentary substance upon which varieties of color depend is apart from it, seated in the cells of the epidermis or scarf skin; and our own experience shows that this coloring matter may be temporarily generated so as to tinge in a marked manner the fairest complexion under temporary exposure to the more direct and heating rays of the sun. Hence the "freckle," which appears in summer, and the change which we describe as becoming "tanned" or sun-burned, manifest on those parts of the body exposed to more intense solar influence, as the face and hands; while the general frame, being covered, retains its fairness. And the argument against the unity of mankind, founded upon differences of color, is completely exploded by the consideration that varieties of hue quite as strongly marked occur in brute animals of the same species.

345. The last important physical diversity apparent among mankind refers to the form of the skull, which very remarkably varies, presenting several well-defined shapes, distinctive of great groups of the human population. Bleumenbach founded his celebrated classification of mankind chiefly upon the diverse conformation of the cranium. The division is in five varieties—the Caucasian, Mongolian, Malay, Ethiopian, and American. But this classification, though still often retained, has been rendered largely inapplicable by the advance of ethnographical knowledge. The varieties of cranial conformation have been reduced by Dr. Pritchard to three leading types, viz.—the oval or elliptical, the narrow or elongated, and the broad or pyramidal.. The oval or elliptical form, termed also symmetrical, is that in which the forehead is full and elevated and the face small and distinguished by the regularity and evenness of the features. The narrow or elongated form, suggesting the idea of compression at the two sides, called prognathous, has its distinctive character in that forward prominence of the jaws which gives a peculiarly ferocious and animal character to the countenance. The broad or pyramidal form derives its peculiar character from the great lateral prominence of the cheek-bones and the rapid narrowing of the forehead at its highest part.

346. But while there are certain great groups of nations exhibiting differences of cranial formation, each variety appears with widely different degrees of development in its respective group; and entire tribes and families supply evidence of craniological change, which harmonizes the unity of the species with the fact of its diversity. It is probable that the numerous distinctions between civilization and barbarism, with great climatic contrasts, originate mainly the structural differences in the human race. Near a thousand years ago, the Maygars, a race of northern Asiatics, were expelled from their native region, and exchanged a rigorous for a more genial climate by planting themselves in Hungary, abandoning at the same time their nomadic habits for a settled mode of life; and in the interval of ten centuries their cranial conformation has undergone a change from the pyramidal to the elliptical, and they are not now recognizable from regular Europeans. A similar alteration has been observed in the case of many negroes associated with the whites in the West Indies and America, without their having been any intermixture of race. It is also so of the lower animals: descendants from a common stock, the domesticated breeds are easily distinguishable from their congeners running wild.

347. While the physical differences of mankind are not only consistent with the anatomical phenomena exhibited by known species, their unity is strongly confirmed by a common conformity to the same physiological laws. There is a wide distinction between man and the animals that make the nearest approach to him, in point of longevity, the extreme term of the orang-outang being estimated at not more than 30 years; but the capacity for long life is not greater in one tribe of the human race than in another, nor is there any difference as to its average duration under equal circumstances as to climate, food, clothing, habitation, and the sanitary aids which civilization furnishes. That the average duration of life should be much inferior among the barbarous races, as compared with the civilized, is adequately explained by a precarious mode of life, physical hardships, ignorance of remedies in sickness, and of the habits favorable or adverse to vitality.

348. The same general coincidence prevails with reference to other physiological characteristics, as the age of puberty, the period of gestation, the signs of advancing life, and the diseases to which the human frame is subject, the greater part of which are common to all communities modified by differing climates and local position.

MAP
SHOWING THE PRESENT DISTRIBUTION OF THE
VARIOUS RACES OF MANKIND.

NOTE.—Where the Lines are Striped, it denotes that the People are of Different Races.

349. As far as the psychical properties of the different nations of mankind have been examined, or those intellectual and moral capabilities in which humanity properly consists, the differences are not greater between the races of men than those which appear within the limits of the same race. Examples are not wanting within our own shores of individuals apparently shorn of the high prerogatives of their kind, sunk in stolid ignorance and abandoned to brutal habits, having grown up apart from the means of cultivation; and the case of entire tribes, as the Bushmen of South Africa and the Fuegans

NATIVES OF TIERRA DEL FUEGO.

of South America, is but a parallel one, deriving its more melancholy features from a more complete destitution of improving influences. This may be inferred from the recovery from extreme barbarism exemplified by tribes whose nature has been fairly tested by intellectual, moral, and religious education.

350. The result of modern philological inquiry has been to reduce the languages of the great bulk of mankind, the inhabitants of the Old World to a few great groups, and traces of community are observed in these groups which indicate a derivation from a common stock. In referring different languages to a common family, however, their grammatical affinity and not their lexicographical agreement is the criterion. Keeping in view this distinction, the languages of the Old World have been classed by Chev. Bunsen into the following families:

a. The Indo-European, called also the Japetic and likewise the Iranian, comprising the Sanscrit, Medo-Persic, Teutonic, Græco-Latin, Sclavonic, and Celtic branches, with their derivative dialects.

b. The Syro-Arabic, styled also the Semetic, comprising the Aramæan or Syriac, Hebrew, Arabic, and Ethiopic, with their derivative dialects.

c. The Turanian, called also Ugro-Tartarian, including the languages of northern Asia, of some of the inhabitants of northern Europe, the Lapps and Finns, and probably of the Basques in Spain.

d. The Chinese and Indo-Chinese, or the monosyllabic and uninflected languages.

e. The African languages spoken by the woolly-haired nations within a few degrees north of the equator and all south of that line.

351. The Japetic and Semetic groups are considered as one in essential character. The Semetic tongues, which belong to nations who have remained stationary in semi-civilization, stop short with a tendency toward that system of inflections characteristic of a progressive people, which the Japetic generally develops, and most highly in its Hellenic branch. The Turanian family of languages spoken by most of the nations of Asia exhibits vestiges of original connection with the Japetic; the Malayo-Polynesian languages are, through the Malayan, connected with the Turanian group, and the further prosecution of Chinese philology will probably bring to light indications of relationship to the same stock. It is, however, a striking fact that when the philological discordance among nations is at its maximum, the anatomical difference is at its minimum, and *vice versa*. Thus, while the

distinction between the Chinese and the other languages of central and northern Asia is very marked, their physical conformity to those nations is just as decided. All information, at present scanty, respecting the languages of central and southern Africa, tends to prove that they have sprung from a single stem referable to the common stock of the preceding branches.

352. The languages of the aborigines of the New World are very numerous, and exhibit the very singular phenomenon of great lexicographical discordance, amounting in some instances to having not so much as a single word in common; yet from Cape Horn to the Arctic Ocean they are all connected by the same principle of formation and grammatical structure, analogous to that of the Turanian tongues of Asia.

353. According to Adelung there are 3,664 known languages and dialects in the world. Of these 587 are European, 937 Asiatic, 276 African, 1,624 American, and 240 Oceanic.

354. Modern experience teaches us that the speech of a nation maintaining its geographical site and political status, changes remarkably in a short space of time from purely domestic causes. New words are required in the progress of society, and old ones become obsolete. The English of Chaucer and Wickliffe is unintelligible to the general reader; that of Spenser is scarcely less obscure; and a glossary is a common appendage to the works of Shakspeare.

355. But this modification of the vocabulary forms no case parallel to the phenomenon presented by different languages. Yet as, notwithstanding their variations, the English, German, Dutch, Danish, and Icelandic are branches from the Teutonic stem; as we certainly know, with greater divergencies, that the Teutonic, Celtic, Sclavonic, Græco-Latin, Zend, and Sanscrit constitute a single family (the Indo-European), having been developed from a common original at a remote era; there is no difficulty in conceiving of the great linguistic families, with still wider divergencies (the Indo-European, Semetic, Turanian, etc.), having originated from a common source at a still remoter period; and in the more primitive ages of the world, when mankind, few in numbers, dispersed themselves in detached bodies, losing all traces of each other, making varied progress, and encountering different experiences, it is easy to understand that the diversifying process with reference to language would be proportionably active.

356. It may be concluded, therefore, with rigorous certainty, that no specific difference exists among mankind, but an immense number of varieties. It is impossible to account for their occurrence otherwise than in a very superficial manner. The causes will probably ever remain enveloped in mystery, along with those of similar variations in single families and analogous phenomena in the animal kingdom. Owing to varieties existing with very unequal degrees of development, one passing gradually into another, no accurate classification of the species can be made according to characteristic differences; an approximation to such an arrangement is all that can be done. The following is the most approved:

1. Iranian or Caucasian.
2. Turanian or Mongolian and Malay.
3. Americans.
4. African Negro.
5. Hottentot Negro.
6. Oceanic Negro.

357. The Iranian nations correspond to the Caucasian of Bleumenbach, and the west Asiatic of others. The name is derived from Iran, the ancient and proper appellation of the great plateau of modern Persia, included between the rivers Tigris and Oxus. The class comprises nearly all the Asiatics within a line extending generally from the mouth of the Ganges, along the Himalaya Mountains, the course of the Oxus, intersecting the Caspian Sea, and following the chain of the Caucasus to the Euxine; also all the north Africans above the 20th parallel; almost all the inhabitants of Europe; and of course the European colonists settled in various parts of the globe. This vast section of the human family comprehends at present, and has ever done since the date of authentic history, the most perfectly formed, vigorous, and intellectual of mankind. The Egyptians, Hindoos, Assyrians, Babylonians, Medo-Persians, Greeks, Romans, and Arabs successively represented the civilization of by-gone times, founded mighty monarchies, and obtained paramount influence in the world—a heritage which has descended to the western Europeans and the offshoots from them in America and other parts of the world.

358. Owing to India and the Atlantic Ocean being geographical boundaries of the Iranic nations, they are frequently styled Indo-Atlantic. Their bond of union is a common physical conformation, which may be generally stated as follows: large cranium, beautifully shaped small head, oval face, expanded forehead, small mouth, regular features, and symmetrical shape; hair fine and copious; color not characteristic, since the complexion is of all shades—fair and florid, olive, swarthy, and jet black. This configuration appears most perfectly developed in the Greeks, ancient Persians, and some others; least so in the ancient Celts.

359. The Turanian nations correspond to Bleumenbach's Mongolian and Malay races. The denomination is derived from Turan, the Persian name applied to the wide and extensive plains of Tartary, and all the countries of Asia beyond the Oxus, as distinguished from the table-land of Iran. But nations apart from these geographical limits are included in this division. The principal are as follows: in Asia, the Tungusian, Mongolian, Turkish, Tibetan, Chinese and Indo-Chinese races, with the hyperborean tribes spread along the inclement shores of the Arctic Ocean, as the Samoiedes, Tschuktschi, Kamtchatkans, and Aleutian islanders, chiefly ichthyophagi or fish-eaters; in Oceanica, the Malayo-Polynesians, scattered through the various groups of the Pacific, exhibiting wide diversities, but supposed to have sprung from an Indo-Chinese germ; in Europe, the Turks, Magyars, and Tschudic races, the latter extending from Lapland and the White Sea along the Ural Mountains to the borders of the Caspian; and—in America, the Esquimaux and other related tribes closely resembling the hyperboreans of the Old World.

360. These nations are characterized generally by the pyramidal form of the skull, a peculiarity derived from the great lateral prominence of the cheek-bones and the rapid narrowing of the forehead at its highest part. The face is larger in proportion to the size of the skull than in the European, and round instead of oval. The eyes are small, deep, and obliquely set; hair scanty; complexion, a sallow or yellow olive; stature, commonly below the European standard. But many tribes depart widely from one or more of these characters, while conformable to the rest. The Samoiedes, Tungusians, and other northern Asiatics have a dirty brown or swarthy color; the Mantchoo Tartars in China, and some of the Chinese themselves, approximate to a fair and even florid complexion; and various tribes have the hair and beard long and bushy.

361. In Europe, the Turks, a settled race, have become widely different from the nomadic Turkish clans of central Asia, corresponding to the physical character of the great bulk of the Europeans. The same correspondence is also observable among the Magyars of the higher class, while the mass of the people retain the conformation of their ancestors with some modification. The Lapps, Finns, and other Tschudic races of northeastern Europe exhibit very decidedly the characters of the Turanian division of mankind.

362. The negro nations occupy Africa from the parallel of 20° north to the borders of Cape Colony, and have been largely planted in the West Indies, the United States, the Spanish Main, and Brazil by forcible transportation. The peculiar physiognomy of the negro—skull compressed laterally, and forward prominence of the jaws; low, narrow, and slanting forehead; large eyes, thick lips, and prominent cheek-bones; woolly or crisp hair; black complexion—is most apparent in the natives of the coast of Guinea. Many tribes diverge remarkably in conformation and color. High foreheads, light brown complexion, and reddish hair are frequently met with among the Kaffirs, though there is no reason to doubt their connection with the proper negro races.

363. The Hottentots and Bushmen, the latter a degraded caste of the former, inhabit the high table-land of southern Africa and the basin of Orange River. Though usually classed with the negroes, they are very discordant from their type, having the skull decidedly pyramidal, with obliquely-set eyes, yellowish complexion, spare hair, and other characters strikingly accordant with those of the central and northern Asiatics.

364. The Oceanic negroes, resembling the African in various features, and the Alfourous, are islanders of the Indian and Pacific oceans, forming tribes either associated with the Malayo-Polynesians or entirely separate. They comprise—1st, the negroes of the Indian seas—races of puny stature, woolly hair, black or nearly so, with features strongly akin to those of the Guinea coast natives—found in the Andaman Isles and the Philippines; 2d, the Papuans inhabiting New Guinea, the islands and archipelagoes around Australia, of puny stature and sooty hue, distinguished by their bushy, frizzled hair, growing on the head in separate tufts, described on that account by Dampier as the "mop-headed Papuans;" and, 3d, the Alfourous or Araforas, found in New Guinea, with whom are classed all the natives of Australia, very dark tinged, like the Oceanic negroes, and constituting a variety distinct from them and the Malayo-Polynesians by decided physical differences.

365. The American nations, excluding the Esquimaux and the descendants of European and African colonists, are intimately related to each other, so as to form a single family—the last of the great divisions of mankind, divergent in various respects from the groups of the Old World. Though commonly styled the red or copper-colored race, the cinnamon hue is not universal, some tribes being nearly black, others brown or yellow, and others comparatively fair.

366. The specific identity of mankind by no means solves the problem of their origin—whether they have all sprung from a single pair, or whether duplicates, triplicates, or other multiples of pairs were brought into being in different regions, formed so much alike that there should be no specific difference among them. Some eminent writers conceive that the latter alternative may be held, the first two inhabitants of Eden being regarded as the progenitors only of the race whence sprung the Hebrew family, in harmony with the announcement of the Scriptures. But the theory appears to be antecedently improbable, and it is quite unnecessary to explain the phenomena of the dispersion of the species. Mankind have not, like plants and animals, a constitution adapted simply to particular geographical localities, and there is no great difficulty connected with the idea of their diffusion from the location of a single pair. The New World might readily receive inhabitants from the Old across the narrow strait which separates them; and likewise by the chain of the Japan, Kurile, and Aleutian archipelagoes, a series of stepping-stones extending from China to the northwest coast of America. Canoes, diverted by winds and currents from their course, have borne their occupants into perpetual exile, and contributed to stock remote islets of the ocean with a human population.

TIGER-HUNTING IN INDIA.

NORTH AMERICA

PHYSICAL

The mean temperature of July the hottest month and January the coldest, is shown by Isothermal lines crossing the map thus July 70 ..... January 40 ---- the Figures showing the temperature of Fahrenheit.

The direction of Ocean Currents is shown by Arrows, and the figures attached show the velocity of water for each period of 24 hours in nautical miles.

The names of the chief productions of each country are inserted thus Cotton, Rice &c. The localities where minerals are found, are marked thus Lead, Copper, Gold, &c.

Mountain Chains are represented thus — the broader the line, the greater the elevation. The highest points are marked with circles Volcanoes are distinguished by a black dot in the centre of the circle, elevation given in feet. Table lands and Plateaus are colored Brown. Plains, Valleys and Lowlands, colored Green.

DESCRIPTIVE GEOGRAPHY OF NORTH AMERICA.

1. North America comprehends all that portion of the Western Continent which is situated north of the Isthmus of Panama. It extends from the 8th to and beyond the 80th parallel of north latitude, and from the 15th to the 167th meridian of west longitude. Greenland and the Arctic Archipelago are included within these lines; and together with these and the numerous coast islands, the whole area of this division of America may be estimated at eight million five hundred thousand square miles.

2. But the mainland does not extend northward of the 71st parallel, and its eastern limit is in about 55° west longitude. It is bounded on the north by the Arctic Sea; on the northeast by Baffin's Bay and Davis' Strait, which separate it from Greenland; on the east by the Atlantic Ocean; on the south by the Gulf of Mexico and South America, and on the west by the Pacific Ocean. The extreme northwest of the continent approaches Asia, and is only separated from it by Behring's Strait, which has a minimum width of less than 40 miles.

3. The external line of North America is more irregular than that of South America, and the eastern coasts far more indented with gulfs, bays, and inlets than the western. These irregularities add vastly to its coastage. The Atlantic coast, from Hudson's Strait to the Florida Channel, has an extension of about 4,800 miles; the Gulf coast measures about 4,500 miles, and the Pacific coast about 10,500 miles. The Arctic coast has not been sufficiently examined to determine even its approximate extent, but may be stated to have a length of at least 3,000 miles. Thus, without considering its minor sinuosities, the coast-line of this division of the New World can not be less than 23,000 miles.

4. The Andes of South America terminate or are greatly depressed within the Isthmus of Panama; but another chain, perhaps a continuation, immediately rises, and continues its course between the Caribbean Sea and the Pacific, spreading out in Mexico into extensive table-lands, crowned by elevated volcanic peaks, and continuing in its main line a general north-northwest course, at a much greater distance from the ocean than the Andes of South America. The part of this range within the United States is known by the name of the Rocky Mountains, and in the northwest is sometimes called the Chippewayan Range. The termination of this range is at the Arctic Sea, on the west side of the Mackenzie River; but above 50° north the elevation is inconsiderable. Its whole length is not less than 8,700 miles.

5. The chain which extends from the table-land of Mexico does not run north in a line so regular as the Andes, and in about 22° north it divides into several branches. The most easterly branch, nowhere of great height, is in its northern course broken through by the Rio Grande del Norte, and then takes a northeastern direction, forming the northern part of Texas. In this part of its course it acts as the watershed between the rivers that enter the Gulf of Mexico and the minor affluents of the Red River, a tributary of the Mississippi. This is the range of hills that crosses the Arkansas and appears in Missouri under the name of the Ozark Mountains, running toward the confluence of the Missouri and the Mississippi, and probably continued beyond at a slight elevation toward Lake Superior. The general direction of the Ozarks is parallel to that of the Alleghanies.

6. The main mass, called the Sierra Madre, running north from the plateau of Guanaxuato to the high table-lands of New Mexico, spreads out to a great extent east and west, and contains several parallel chains of mountains, forming longitudinal valleys, like that in which the Del Norte runs. This mountain system in its farther course separates the basin of the Missouri from the waters flowing to the Pacific. From the level of the Mississippi River westward the country rises in irregular terraces and in plains of small inclination, so that the main mass of the Rocky Mountains does not present any remarkable feature of grandeur, at least none corresponding to their actual elevation. But between 36° and 42° there are several points always covered with snow, and the temperature of these elevations is correspondingly depressed. Long's Peak is 12,500 feet high, and Frémont's Peak 13,570 feet.

7. "From the summit of the latter," says Frémont, "we saw on the one side numerous lakes and streams, the sources of the Rio Colorado, which carries its waters through the Californian Gulf to the South Sea; on the other the deep valley of the Wind River, where lie the sources of the Yellowstone, one of the main branches of the Missouri, and far to the northwest we could just discover the snowy heads of the Trois Tétons, which give rise to the true sources of the Missouri, not far from the primitive stream of the Oregon or Columbia, which is known under the name of the Snake or Lewis' River."

8. To the west of the Rocky Mountains there are other chains running parallel with them. Between 34° and 45° north these chains are connected with each other by a remarkable tableland, something like that of the Lake of Titicaca, and named the Great Basin by the explorers. It is a country of some 130,000 square miles, and full of salt lakes, the largest of which is 4,300 feet above the sea-level. None of its rivers find a passage to the sea.

9. The Sierra Nevada of California is wholly distinct from the Rocky Mountains. This chain is prolonged northward beyond the Columbia River, and as far as 47° north, and in its northern section contains the three lofty summits named Jefferson, Hood, and St. Helen, which rise upward of 15,000 feet above the sea. The general height of the Nevada Range far exceeds that of the Rocky Mountains. To this chain belongs, in Russian America, north of 60°, Mount St. Elias, rising to the height of 17,850 feet, and forming the culminating point of North America.

10. The Sierra Nevada of California is parallel to the coast of the Pacific; but between the latitudes 34° and 41°, or between San Buenaventura and the Bay of Trinidad, there runs west of the Sierra a small coast range, the culmination of which is in the Monte del Diablo, 3,674 feet high. In the narrow valley between this coast chain and the Sierra Nevada flow from opposite directions the Sacramento and San Joaquin rivers.

11. The mountain system of the eastern side of the continent, called the Alleghany or Apalachian, stretches from about latitude 34° northward to the banks of the St. Lawrence. As far north as the Hudson its direction is pretty nearly from southwest to northeast. In its southern parts, in Alabama and Tennessee, it is at its greatest distance from the Atlantic, but continually approaches nearer as it runs north, till it is cut through by the Hudson River, where it is also reached by tide-water. Here it takes a turn more to the north, through Vermont and New Hampshire, in which latter State it acquires an elevation, in Mt. Washington, of 6,428 feet. The culminating point of the whole system, however, occurs in North Carolina—Clingman's Peak attaining the height of 6,941 feet.

12. But to form a correct view of the character of this vast continent we must consider the chain of the Rocky Mountains as its chief axis. East of this range lies the great central valley of the Mississippi; its eastern boundary is the Alleghany Mountain system, its southern is the Gulf of Mexico, and its limit northward is the level of the great lakes. From the Rocky Mountains to the Mississippi there is a slope which, as to its length, bears a similar proportion to their heights that the shorter slope from the Alleghany system to the Mississippi bears to

the height of its mountains. The slope from the Alleghanies to the Atlantic is, according to the same law, shorter than that from the Rocky Mountains to the Pacific. And correspondingly the rivers that enter the Atlantic, though in themselves of great importance, are inconsiderable when compared with the great rivers of the Pacific slope and those of the Mississippi valley.

13. When America was discovered, one continuous forest spread from east to west—from the shores of the Atlantic over the Alleghanies, and descended into the great central valley; and from the Gulf of St. Lawrence and the region of the great lakes this uninterrupted mass of vegetation reached to the shores of the Gulf of Mexico. On the highlands, as we advance westward from the Mississippi, are extensive plains or steppes, devoid of trees, parched in summer, and in winter swept by cold northern winds. The spacious and dry plains of Texas and the upper regions of the Arkansas present a character analogous to the high plateaux of the Asiatic continent; and beyond the Ozarks, and stretching along the base of the Rocky Mountains, with an average width of 600 or 700 miles, we find a country which is emphatically called the Desert. The lower portions of the Mississippi valley, with a portion toward the north, are still covered with dense forests. The prairies are found both on the east and the west side of the great river. These are extensive, elevated, and generally irregular tracts, without trees, though sometimes capable of producing them, covered in the spring with gaudy flowers and long, coarse grass, and often forming a deep rich soil. Sometimes on the west side of the Mississippi they exhibit on their surface a salt efflorescence; and incrustations of pure salt covering the ground like ice are seen in the upper valley of the Canadian River, one of the principal tributaries of the Arkansas.

14. The basin of the Mississippi has no mountain barrier on the north. A line of gentle undulations occurs in connected rows between 47° and 48° north, and forms the watershed between Hudson's Bay and the Gulf of Mexico. The highest of these slight elevations attain a height of only 1,500 and 1,700 feet. From the western extremity of Lake Superior, one of the tributaries of which interlocks its sources with a branch of the Mississippi, we have the series of enormous fresh-water lakes—Superior, Huron, Michigan, Erie, and Ontario—collectively covering a surface of little less than 80,000 square miles. These lakes have the outer margins of the basins in which they lie at no very great distance from their shores, as may be inferred from the inconsiderable courses of the streams which they receive.

15. Lake Superior is the highest of these inland seas, being 641 feet above the level of the Atlantic; Huron and Michigan form a separate and somewhat lower basin; Erie a third; and 333 feet below Erie lies Ontario, doubtless once at a much higher level than it now is. The great Falls of Niagara, in the narrow channel that connects Erie and Ontario, show at once

NIAGARA FALLS.

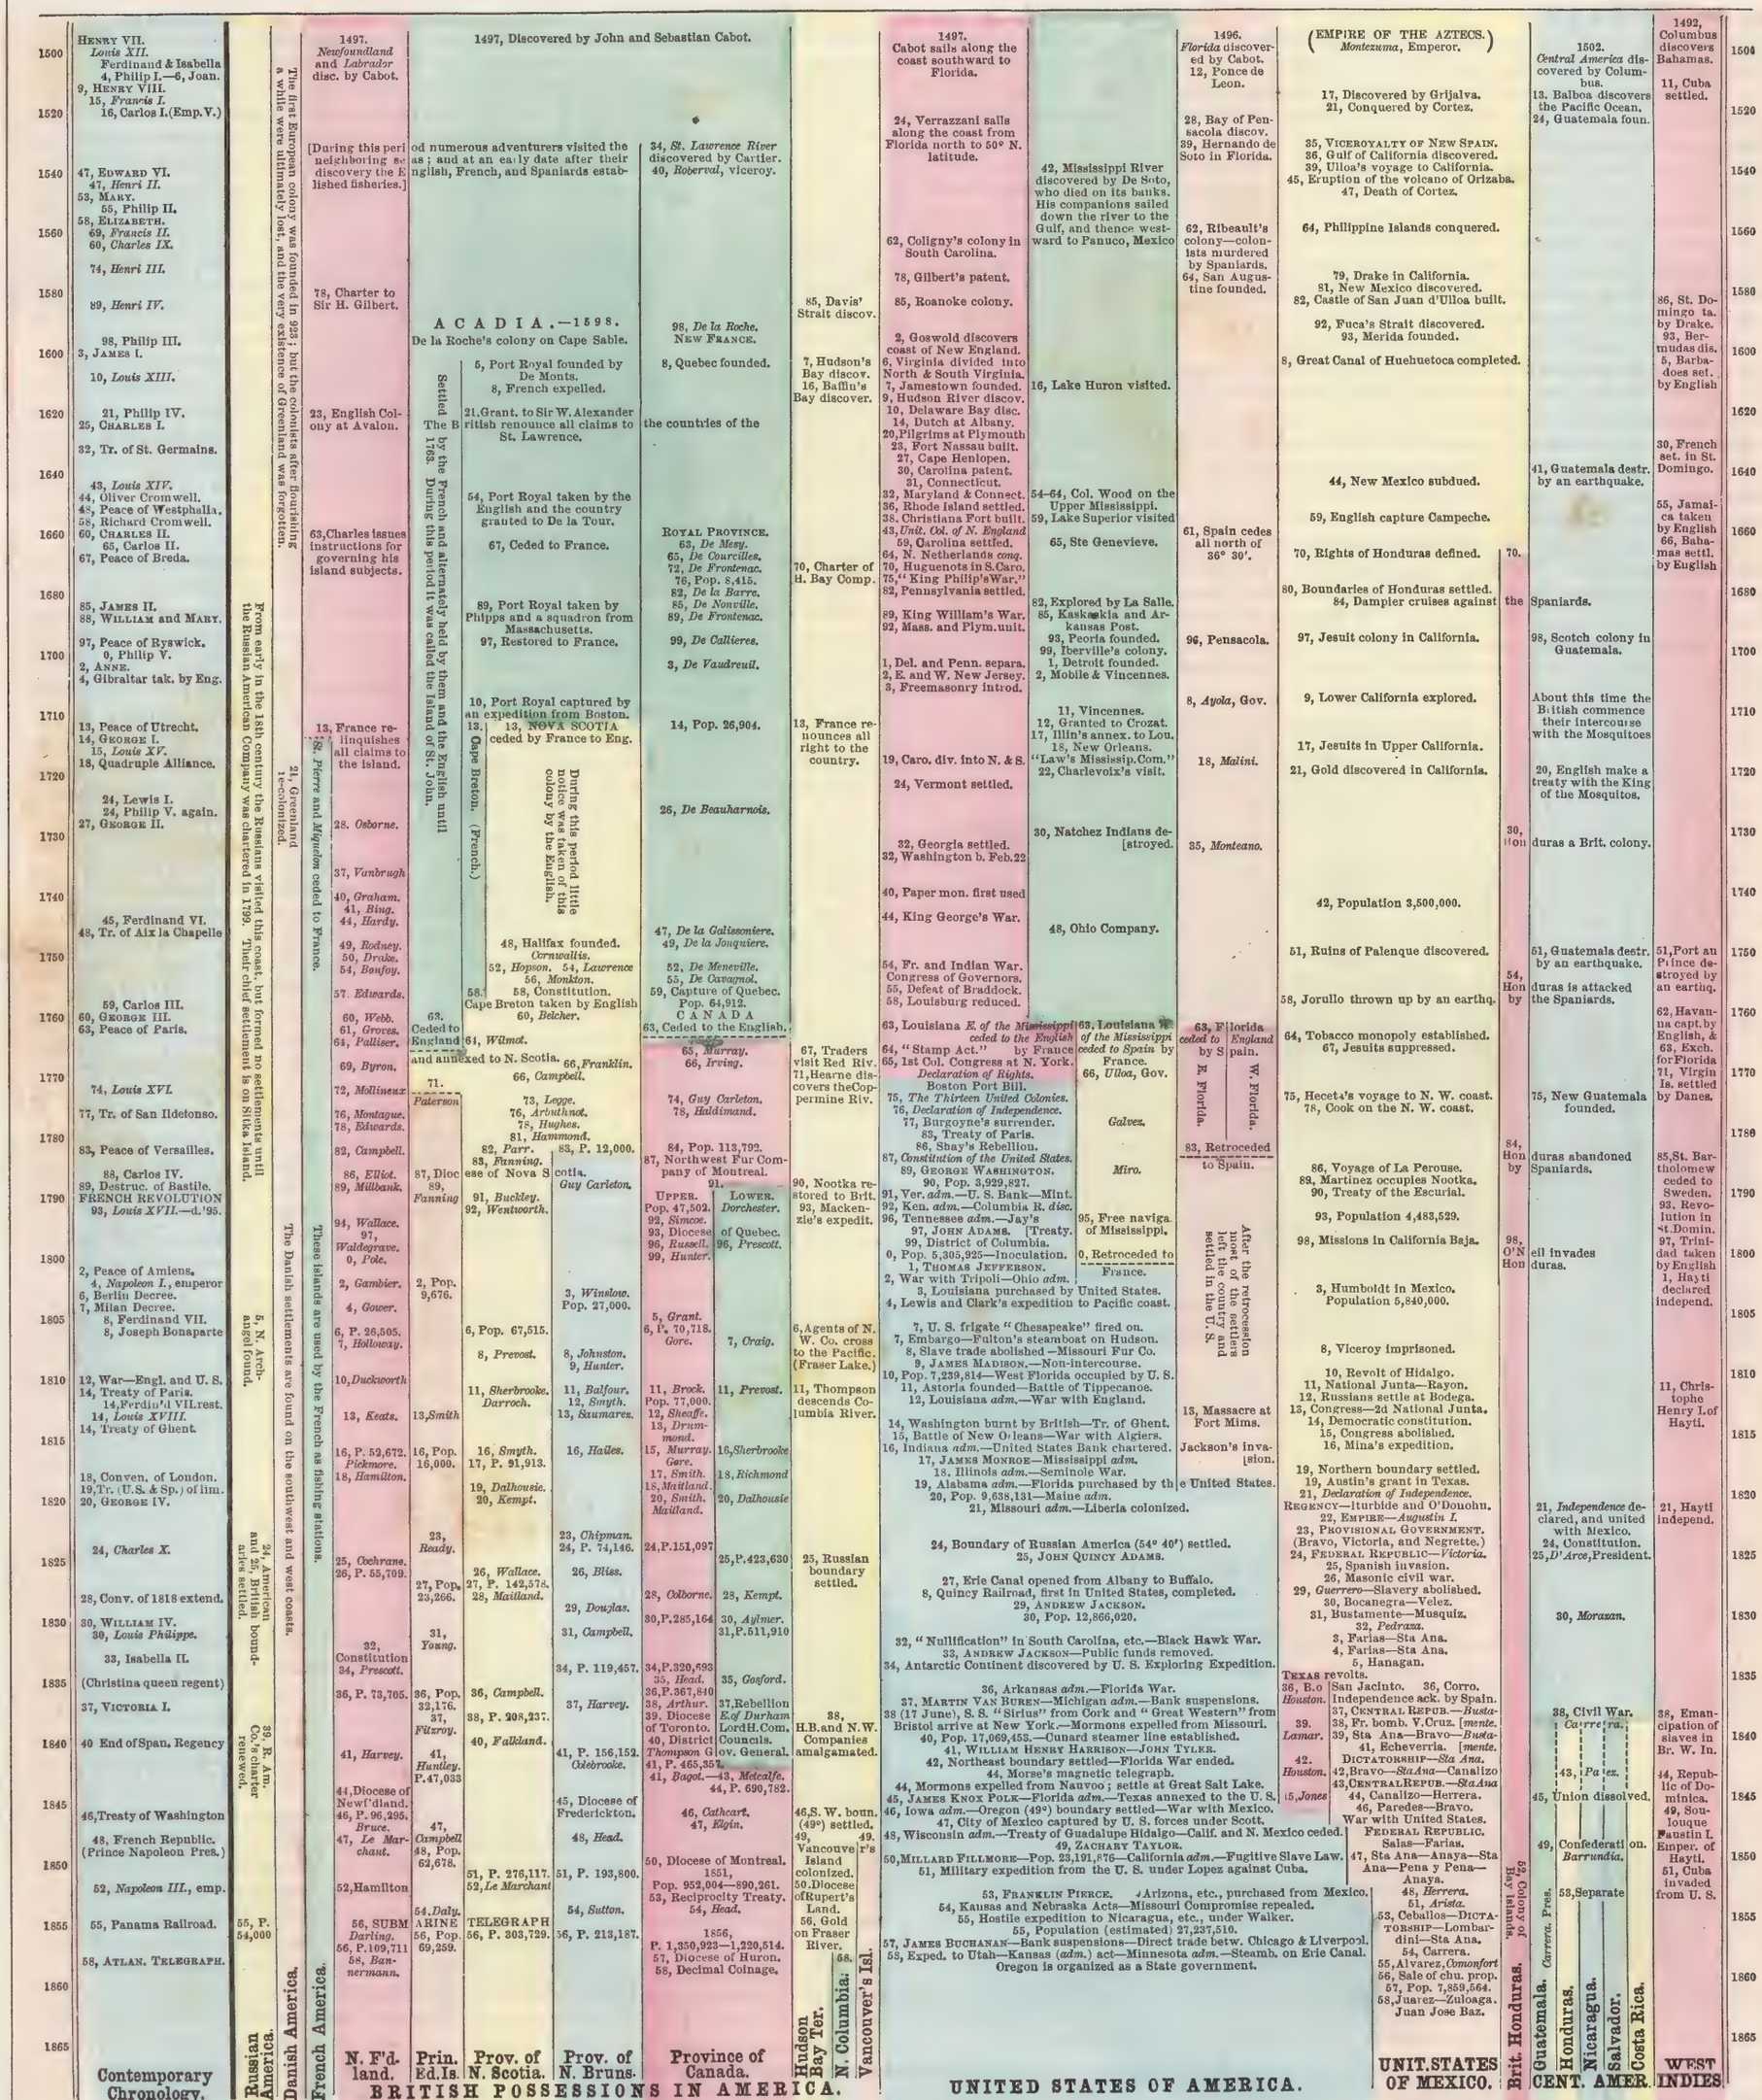
the great difference in the level of these two lakes. The course of the St. Lawrence, it has been remarked, from the eastern extremity of Ontario, has a singular conformity to that of the opposite Atlantic coast, having a general northeast direction. After its exit from the lake it receives, near Montreal, the Ottawa, from the northwest and, increased by numerous smaller streams, enters the Atlantic by a wide bay or gulf.

16. North of the basins of the great lakes we find that the cold regions of the northwest have also their great rivers. The Portage de Prairie, about 150 feet above Winnipeg and Superior, is a swampy district, which at this point forms the dividing line between the waters that flow to the St. Lawrence basin and those that belong to the basin of Lake Winnipeg, the receptacle of numerous streams. The southern branch of the Saskatchawan rises in the Rocky Mountains, near the sources of a branch of the Columbia and the Missouri, traverses 15 degrees of longitude, and falls into Winnipeg, in 53° north. This lake is connected with Hudson's Bay by the Severn and the Nelson rivers. In latitude 56° 41′, and longitude 110° is Methy Portage, upward of 1,500 feet high, and forming part of a range running southwest, which separates the rivers flowing north from those that flow south or east—on the north side is a valley 1,000 feet deep, and a water passage is open, with some interruptions, to Lake Athabasca. The basin of the Mackenzie lies north of the Methy Portage. The Mackenzie is one of the large rivers of the globe, draining an area of about 550,000 square miles; but such is the complicated water-system of this region, with its endless lakes communicating with each other, that it is almost impossible to say what should be considered as the source of this river; but if we consider the Athabasca as its remote branch, the Mackenzie flows through about 16 degrees of latitude into the Arctic Ocean. The sources of Pearl River are much farther to the north; but if its course through Slave Lake be followed into the Mackenzie, the whole course of the stream will be found as long as if we traced it from the more southern branch. East of the Mackenzie, and flowing into the Arctic Ocean, are the Coppermine and Back rivers.

17. A curious resemblance in the water-system of the southern and northern parts of North America are here recognized. The elevated table-land in which the Mississippi and the affluents of Lake Superior rise, divides the continent east of the Rocky Mountains into two parts. The basin of Winnipeg may be considered as a continuation of that of the St. Lawrence, or as part of one high plateau divided into two portions. Down the southern slope the Mississippi flows to the warm regions of the Gulf of Mexico; and down the northern the rival river Mackenzie runs into the Arctic Ocean. The St. Lawrence and the large streams that enter the west side of Hudson's Bay are the great channels that carry off the collected waters of this elevated region of lakes to the Atlantic Ocean.

18. It is a fact well ascertained, that the average temperature on the west coast of North America is higher than on the eastern. In the Oregon valley it is said to be higher than in corresponding latitudes on the Atlantic coast, by an amount equivalent to five or six degrees of latitude, and the winters are also much moister. The general nature of the North American climate, however, may be best understood by what is now known of the United States and the Canadas. The northwest territories east of the Rocky Mountains are cold and inhospitable, and not adapted to the agriculturist. On the eastern part of the continent agriculture has not advanced farther than 51° or 52° north; but the limit of successful cultivation at the present day must not be taken as the limit that can not be passed. The cold within the United States increases as we advance westward on the same parallel, and this is independent of elevation, as is evident from comparing the temperature in the corresponding points on the Mississippi and the Atlantic, and as may be inferred from the same vegetation succeeding in a higher latitude on the Atlantic coast than in the basin of the Mississippi. The climate of Mexico is essentially tropical; but on account of its various altitudes is properly divided into several classes—hot, temperate, and cold, corresponding to the coast regions, the slopes, and the table-land. The same classification obtains in Central America, although the distinctions are not so plainly discernible as in Mexico.

19. A remarkable analogy exists in the structure of the land in North America and in central and northern Europe. Gneiss, mica-schist, and granite prevail over wide areas in the Alleghanies, on the Atlantic slope, and the northern latitudes; and in the high and middle latitudes, the Silurian strata extend over 2,000 miles. Crystalline and Silurian rocks form the substratum of Mexico, for the most part covered with plutonic and volcanic formations and secondary limestone. The Rocky Mountains are mostly Silurian, except the east ridge, which is of stratified crystalline rocks, amygdaloid, and volcanic productions. The coast chain has the same base, with immense tracts of volcanic rocks, both ancient and modern, especially obsidian. In North America volcanic action is almost entirely confined to the coast and highlands along the Pacific.



20. The principal minerals are gold, silver, copper, iron, lead, and coal. The first two are found in great abundance in Mexico; but since 1848 the chief field of gold gathering has been California. Copper is chiefly found in the vicinity of Lake Superior; lead in southwestern Wisconsin, and the neighboring districts in Iowa and Illinois. Coal and iron are extensively deposited—the coal-fields of the United States alone cover an area of 133,000 square miles. The coal is generally bituminous; but anthracite is also met with, and very abundantly in eastern Pennsylvania. There are various other coal-fields of great extent in different parts, including New Brunswick and Nova Scotia on the northeast, Vancouver's Island on the northwest, and the Gulf States in the south. Coal has also been found in California and Oregon. Iron is found in every State of the Union, in Mexico, and Central America; but the chief deposits are in Pennsylvania. Salt is likewise widely diffused.

21. The forests of North America are of vast extent. The northern forests consist chiefly of pines, oak, ash, hickory, red beech, and the lofty Canadian poplar. The prevailing growths of the middle zone are sycamore, chestnut, black walnut, hickory, maple, white cedar, wild cherry, red birch, locust, oak, etc., and the tulip-tree, the pride of the American forest. In the inter-tropical forests the trees attain an enormous growth, and there is found the mahogany and numerous other valuable woods. The Arctic flora is not essentially different from that of Europe and Asia in the same latitude.

22. Maize or Indian corn is the only important farinaceous plant peculiar to the New World. Millet, cocoa, vanilla, copaiba, jalap, sassafras, tobacco, and the cochineal plant, etc., are also indigenous. Wheat, barley, oats, peas, and rice succeed well; the last named in the southern swamps and inundated lands. The same may be said of all the fruit-trees in their peculiar latitudes or thermal zones, such as the orange, lemon, peach, plum, apple, etc.; but the native fruits are mostly of the nut kind. Sugar, coffee, and cotton are among the staple productions of the southern sections; and in the middle and temperate regions the grape and other vines succeed to perfection. The tea-tree and other exotics have been introduced, but as yet with only partial results.

23. The most formidable of North American animals is the grizzly bear, which is peculiar to this country. Its haunts are the Rocky Mountains and the adjacent hilly country from latitude 61° downward into Mexico. The white or polar bear, though not peculiar to America, is found in great numbers on its northern coast, attaining a higher latitude than any other known animal. The bison, or American buffalo, the largest native quadruped, is distributed over a great portion of the temperate regions; its chief haunts, however are the central prairie lands, where it is seen in vast herds. The deer tribe is numerous, and specifically various. The most remarkable is the moose-deer or elk, the most northerly of all the ruminant animals. On the Rocky Mountains are found a race of sheep and another of goats peculiar to these elevated regions. The wolves and dogs of America are numerous, and some of them peculiar. Among the latter are the well-known dog of Newfoundland and the Mackenzie River dog. Foxes are also numerous and in great variety. Beavers, otters, raccoons, opossums, hares,

CHRONOLOGICAL CHART OF NORTH AMERICAN HISTORY.

musk-rats, marmots, squirrels, etc., are among the smaller quadrupeds of North America. The manati is peculiar to intertropical America. Monkeys are confined to the south.

24. The reptile tribes are very numerous throughout the continent, and many of them possessed of the most dangerous poisons. The most noted of this class is the rattlesnake. The cayman is found only in the rivers and lagoons of the south, where it frequently attains a vast size. The bird tribe comprises 471 species, of which 386 are peculiar to North America. The list includes a variety of eagles, vultures, hawks, owls, etc. Wild turkeys are found in vast numbers in the woods of both Americas; and the varieties of water-fowl near the seas and lakes are wonderfully numerous. Insects abound in a thousand forms, many of which are noxious; but before all other countries America is the home of the butterfly. Spiders and centipedes are types of the venomous species, and in this category we may place the mosquito, which in sections renders the country uninhabitable.

25. North America, at the present day, is peopled by three distinct varieties of mankind—the Indians, who are the native American race, and have universally a reddish copper-colored complexion; the negroes, who were originally brought from Africa, and who have multiplied to a vast extent; and the Europeans and their descendants, who are the ruling people throughout the continent. Besides these are the mixed races, as the mulatto, sprung from the union of the European and African; the meztizo, sprung from the European and American; and the zambo, sprung from the American and African. In this connection may also be enumerated the Chinese in California.

26. Throughout America the aboriginal races preserve a wonderful uniformity in their physical organization. The same type is found in both divisions of the continent and through all its zones. They are distinguished from the two other races by the color of their skin and by their long, coarse, and black hair (which is never crisped like that of the African, nor curly, as that of the European sometimes is), as well as by a scantiness of beard. Their senses of sight, hearing, and smell are remarkably acute. In war and the chase they are indefatigable; but they are averse to regular labor. In temperament cold and phlegmatic, they manifest an extraordinary insensibility to bodily pain. They have good natural intellects, and exhibit both grace of delivery and force of language in their public speaking.

NORTH AMERICAN INDIANS AND THEIR PONIES.

27. The most northern parts of the continent, along the shores of the Arctic Ocean and of Baffin's Bay, are scantily peopled by a race called the Esquimaux. They differ in many respects from the Indians, and are probably of Asiatic origin. The Esquimaux are of short stature, lead a wandering life, and subsist chiefly upon fish.

28. North America is politically divided into the Russian, British, Danish, and French colonies; the United States of America, and the United States of Mexico, the States of Central America, etc. The extent, approximate population, etc., of these are as follows:

Divisions.	Area, sq. m.	Popula. (1855).
Arctic Lands: Greenland, etc.	1,000,000	100,000
Russian America	481,276	80,000
Hudson's Bay Territories	2,436,000	100,000
British Colonies	442,388	3,000,000
United States of America	2,936,116	27,500,000
United States of Mexico	829,916	7,750,000
British Honduras, etc	18,600	12,000
States of Central America	160,000	2,019,000
Total	8,304,236	40,561,000

29. The first discoverer of North America was John Cabot, a native of Venice, who, under a patent of Henry VII. of England, sailed from Bristol in 1497, and on the morning of the 14th June came in sight of North America—the coast, it has been conjectured, of Labrador. This was a year before the discovery of South America by Columbus, which took place in May, 1498. In the summer of 1498, Sebastian, the son of John, sailed from England with two ships, and directing his course by Iceland reached Newfoundland. The next adventurer that reached these shores was Cortereal, a Portuguese nobleman, who sailed for and surveyed the coast of Labrador in the last year of the fifteenth century. In a second voyage made shortly afterward he was lost, and subsequently his brother, who sailed in search of him, shared a similar fate; and in 1503 still another expedition, fitted out by the king of Portugal, to ascertain the fate of the two brothers, never returned.

30. In 1512 Sebastian Cabot sailed again for America, with a small squadron. This expedition visited Hudson's Bay. In the same year Florida was discovered by Ponce de Leon. The next name that occurs in the history of American discovery is that of Giovanni Verazzano, a Florentine, who was sent out by Francis I. of France, in 1524, and who surveyed upward of 2,000 miles of coast, comprising the whole of the eastern coast of the United States, with a large portion of that of British America. Verazzano gave the name of New France to the region he had discovered. In a subsequent voyage he and his party were destroyed by the Indians. Ten years after, Jaques Cartier sailed from St. Malo for Newfoundland, the north coast of which he surveyed and minutely described. He performed several other voyages, in one of which he entered the St. Lawrence, being the first European who had done so, and ascended the river as high as Montreal. An attempt was afterward made by Roberval, a nobleman of Picardy, to form a settlement in America, but the attempt was unsuccessful, the only result being a fort, which the French erected near the present site of Quebec, and named Charlesbourg. This fort, however, was the first European settlement formed in that part of America. Roberval sailed on another voyage of discovery some time after, and perished.

31. Previous to this the Spaniards had conquered Mexico, and a desire to extend their dominion in a north direction led to further discoveries in North America. The coast of California was discovered by Ximenes, a pilot, who had been dispatched by Cortez on a voyage of discovery. In 1539 the Gulf of California was first entered by Francisco de Ulloa, another adventurer also sent out by Cortez. The Spaniards performed several subsequent voyages, but none attended by any results worthy of notice until the years 1596 and 1602, when Sebastian Viscaino proceeded along the coast as far as the river Columbia. These discoveries were cotemporary with or followed by those of Davis in 1585, Weymouth in 1602, Knight in 1606, Hudson in 1610, Button in 1612, Bylot and Baffin in 1615, etc.

32. The first in point of time among the more modern voyagers to the coasts of North America were Behring and Tchirikow, both Russians, who were sent out in 1725 by Catherine to survey the north coasts. They made several important discoveries, besides setting at rest the disputed point whether Asia and America were two separate continents. The claims of Russia to the American coast north of 55° are founded on the voyages of these two enterprising seamen. In 1776 Captain Cook, accompanied by Captain Clark, surveyed the northwest boundaries of America, tracing the coast from the 50th parallel, to Cape Prince of Wales, and thence steering northwest till arrested by ice islands in about latitude 70° north. The remaining names associated with American maritime discovery are Meares, Vancouver, Kotzebue, and more recently Ross, Parry, Franklin, Beechy, and Kane. In 1853 the existence of a northern water passage was verified.

AMERICAN ARCTIC LANDS.

1. North and northeast of continental America, and west of Greenland, the Arctic Ocean contains an extensive archipelago. This group of islands, together with Greenland and Iceland, constitute the American Arctic lands.

2. The Arctic Archipelago is separated from Greenland by Davis' Strait, Baffin's Bay, and Smith's Sound, and from the mainland of America on the south by Hudson's Strait and Fox Channel, and a long series of straits, channels, and gulfs extending east to west, terminating at Cape Bathurst. The principal constituents of this archipelago are—Grinnell Land (west of Smith's Sound), North Devon and Parry islands, Baring Island, Victoria Land, Cockburn Island, Cumberland Island, etc. Southampton Island, at the entrance to Hudson's Bay, may also be considered as a member of this group. Grinnell Land is the most northern and latest discovered of these northern lands, and beyond this, according to Dr. Kane, there is open sea, supposed to extend to the pole.

3. Dense fogs and violent storms prevail in these inhospitable regions. Their shores are dismal and dreary, and covered with continual ice and snow; and the entire surface of the sea is beset with fields and masses of floating ice. Winter reigns supreme for eight or nine out of the twelve months of the year, and the only or at least the greatest degree of light the inhabitants enjoy during this protracted season is that which proceeds from the aurora borealis.

4. The Arctic Ocean freezes even in summer, and during the winter months—from September to May—a continuous body of ice extends in every direction. Some of the masses which line the shores extend many miles in length, and present sea fronts of 200 feet or more in height; while ice-fields of vast extent and thickness are frequent, and so closely packed together that no opening is left between them. The icebergs which are seen floating about vary from a few yards to miles in circumference, and rise to many hundred feet in height.

5. Summer scarcely makes any impression on this icy region. It brings, however, a sun

which, during its short reign, never dips below the horizon, and the long night of winter is turned to a short-continuing day of summer. A few lichens and stunted pines may be occasionally seen, but virtually vegetation is extinct; and the only animals inhabiting this region are white bears, seals, etc., with aquatic birds and fish.

6. The history of adventure in the Arctic seas presents a striking disproportion between effort and achievement. All that human daring could do has been done to open up the mysteries of these dreary regions, but hitherto without practical result. The first attempt to explore the polar seas for a northwest passage was made by Captain Hudson in 1607; and during the century following several other attempts were made, but with only partial success. The attempts of Parry and Ross (1817–24) and of Franklin and Beechey (1826) were more successful, and great progress was made in arctic geography. Another expedition under Ross (1829–33) added further to a knowledge of these regions, and finally the expedition under Sir John Franklin sailed in 1845 and—was lost. Several expeditions have since and at various times been dispatched in search of the missing navigator, and among these two from the United States under command of Dr. Kane. On the whole the discoveries have been extensive, but of little if any commercial value, and ultimately (in 1853) it was ascertained that there existed a northwest passage, but that it was impracticable for vessels. The actual state of our geographical knowledge of this region is fully illustrated on the map.

SCENE IN THE ARCTIC OCEAN.

---

7. Greenland lies to the northeast of the continent, from which it is divided by Baffin's Bay and Davis' Strait. Its eastern shores are washed by the Atlantic. Cape Farewell, in latitude 59° 48′, is its most southerly point—how far it extends north has not been ascertained.

8. The whole country is high and rocky, its surface presenting a chaotic assemblage of sterile mountains, bare or covered with ice. The valleys also have the same boreal aspect. A range of lofty mountains traverses its center, dividing it into east and west Greenland. The east shore, above 65°, is an impenetrable accumulation of ice, and is much colder and more barren than the transmontane districts. On the west the shore is high and rugged, and rises close to the water's edge in cliffs and mountains. The whole coast is indented with fiords or inlets, and lined with islands, the largest of which is Disko, in the bay of the same name.

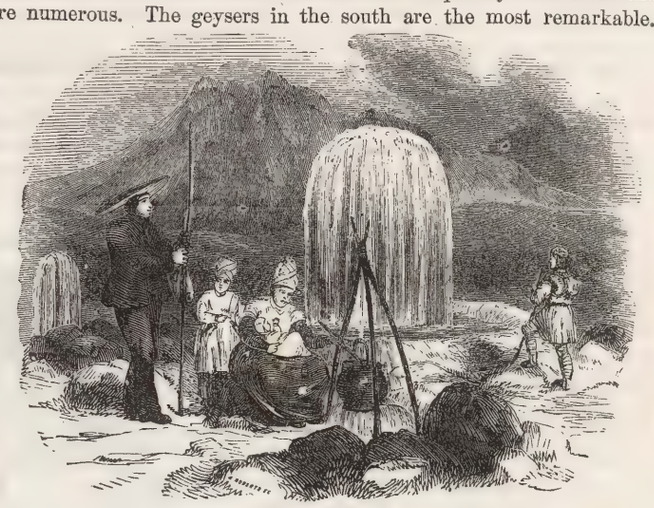
9. The rocks are chiefly primary, and consist of granite, gneiss, clay-slate, porphyry, etc. Copper ore, black lead, and precious stones are abundant, and coal is found on the island of Disko. Hot springs are seen on the coast; but no active volcanoes appear. Vegetation, even in the south, is almost suspended; a few stunted birch, alder, and willow trees, and several mosses, fungi, lichens, etc., constitute its botany. On the west coast, however, the cultivation of culinary vegetables has succeeded. Among the wild animals, the reindeer in the south and the polar bear in the north are the principal, and there are also white hares, foxes of various kinds, and dogs. Seals abound on the southern coast, whales inhabit the seas, and the fiords and rivers contain abundance of fish. Eagles and other birds of prey and sea-fowl are very numerous. Fishing and sealing employ a large number of the inhabitants.

INTERIOR OF AN ESQUIMAUX HUT.

10. The climate, as might be assumed, is intensely cold. During the summer, however, the sun has considerable power, and its short reign is a continuous day. The winter is one long night, the darkness of which is only relieved by the moon, or by the aurora, which in these latitudes shows with a splendor unknown in more meridial climates.

11. The Danish colonies extend north on the west coast to about 74°, and occupy an area of only 4,000 square miles. For administrative purposes these colonies are formed into three inspectorates, called respectively North Greenland, Middle Greenland, and Julianshaab, each of which is subdivided into colonies or districts. Godhavn, on the island of Disko, in 69° 12′, is the residence of the northern inspector, and Godthaab, in 64° 20′, that of the middle inspector. The population of these two towns is respectively 250 and 740. Upernavik, in 73° 55′, is the most northerly settlement. The best inhabited district is that of Julianshaab, near Cape Farewell, which has 2,200 inhabitants. The whole population in 1851 numbered only 9,400 souls, of whom all except about 250 were Esquimaux. The number of native Christians is stated at 1,100, and are in charge chiefly of the Moravians.

12. Greenland was first discovered by an Icelander in the first part of the tenth century, and the first colony was formed in 923. This colony is said to have flourished for many years, but was subsequently lost. The first of the modern settlements was established in 1721, under the auspices of the Danish crown.



---

13. Iceland is a large island extending between latitudes 63° 24′ and 66° 33′ north, and longitudes 13° 25′ and 24° 31′ west, and is distant from the east coast of Greenland about 200 miles. Area 38,250 square miles.

14. The coasts, especially the western, are deeply indented with fiords or estuaries of the rivers which flow from the mountains and glaciers of the interior. The southern portion of the island is traversed east and west by rugged and irregular mountains, while offsets branch out in all directions toward the coast, forming various peninsulas, and terminating in high and steep promontories. Between these and in the vicinity of the fiords are green valleys, and even the low mountains are not unfrequently covered with grass, affording summer pasture for the cattle.

15. The interior of the island is a dreary desert, and consists partly of snow mountains called *jökuls*, many of which are also volcanoes, and partly of vast tracts covered with lava, scoriæ, and volcanic sand. There are also several lakes, the largest of which, called Myvatni is about 40 miles round. The most extensive mass of icy mountain is that called Klofa, in the southeast, which lies behind another range of mountains that lines the coast, and forms a mass of ice and snow estimated to cover one tenth part of the island. These icy masses are often rent by the internal heat and volcanic action, and fall down in terrible avalanches. The glaciers present the same phenomenon of progressive motion as those of Switzerland. Vast agglomerations of basaltic pillars are seen in many places, as well as of tufa, and some mountains are incrusted with sulphur.

16. The whole island, indeed, appears to be volcanic, and there are still numerous volcanoes in full activity. Occasionally eruptions of fearful violence occur. The eruptions of Mt. Hecla are frequent, but not generally violent. The most noted volcanic eruptions on record are those of 1755 and 1783: in the first-named year the eruption of the volcano of Katlegia, near the east coast, destroyed 50 farms, and in the latter the Skeidara, and other volcanoes of the Klofa ridge, covered with lava several fertile and flourishing districts. In September, 1846, so violent was the eruption of Hecla that ashes ejected from it were carried as far as the Orkney Islands. The highest mountain in Iceland is believed to be the Snæfell, in one of the western peninsulas. Its absolute height is 4,600 feet. Mt. Hecla is not so high by 200 or 300 feet. On the southern and western coasts volcanic islands have frequently risen from the sea. Boiling springs are numerous. The geysers in the south are the most remarkable. These throw up at periodic intervals columns of boiling water to a considerable height; and that known as the Great Geyser ejects a column 10 feet in diameter and upward of 100 feet in height. There are also floods or bogs of boiling mud, numerous cones and craters now quiescent, and columns of dense smoke and steam issuing from many spots in the vicinity of the geysers.

THE GREAT GEYSER.

17. For administrative purposes Iceland is divided into three *fiordnungs* or districts, and these into 19 *syssels* or counties. The syssels are governed by *sysselmen* or magistrates, who are at the same time collectors of the king's taxes. The districts are in charge of *amtmen* or deputy governors, and the whole colony of a *sliftamtman* or governor-general, who is appointed by the king for five years. The affairs of the island are regulated by the *althing* or legislature, a council composed of 20 members, one for Reikiavik and one for each syssel.

18. In 1850 the population was given at 59,157 souls. The Icelanders are genuine descendants of the old Scandinavians or Norsemen, and retain all the primitive peculiarities of that renowned family. They are, however, short lived, and cutaneous and pulmonary affections are common among them. Leprosy of the worst kind is indigenous to the country, and for this disease alone there are four hospitals established. In educational matters the inhabitants are far in advance of many European nations. Not only elementary, but a superior education is common, and at Bessestad, near the capital, there is a college with three professors, in which most of the clergy are educated. During the last century much attention has been paid to the Icelandic language and literature. The Icelandic language is the standard of the Scandinavian dialect of the Gothic. In the middle ages it was known as the Dänsk Tunga, but since its disuse in Scandinavia it has been styled exclusively Icelandic.

19. The Icelanders are an industrious people, and pay particular attention to the rearing of livestock. The number of farms is about 6,000; and it is estimated that there are in the island 40,000 head of horned cattle, 500,000 sheep, and 55,000 horses. About 1,000,000 pounds of wool are exported annually. Hay is the great crop. Those who live on the coast attend chiefly to fishing, which is very productive. But little is manufactured, and, except coarse cloths, gloves, mittens, stockings, and other articles of domestic use, supplies are almost

wholly imported. The ordinary diet of the people is milk, butter, and fish, and the Iceland moss, a species of lichen, is a common food. The foreign trade is comparatively valuable. The exports are fish, oil, salted meats, wool, eider down, and sulphur. Turf is the fuel most used, and fossil wood impregnated with bitumen abounds. Iron and copper are found, but none are worked. The reindeer, originally imported from Norway, has greatly multiplied and lives in a wild state.

20. The only town of any pretensions is Reikiavik, the capital, built on the south side of an inlet of the Faxefiord, on the southwest coast of the island. It has about 900 inhabitants, who are chiefly employed in trade and commerce. It is the residence of the governor-general and other superior officials, and the seat of the supreme court of judicature. The houses are constructed of wood with a small garden attached to each, in which most of the common vegetables are cultivated. To the southwest of Reikiavik is the peninsula of Alftanes, adorned with the church and school of Bessestad, and a number of pretty cottages. Gardé, in the same neighborhood, is the residence of the archdeacon of the island; and Hafnarfiord, a small sheltered port some distance south of Reikiavik, has some score of houses and about 100 inhabitants. The population of the capital is more Danish than Icelandic. In the northern district is the village of Eyafiordur, and a factory called Husavik, on the Skialfiandafiord, from which sulphur from the neighboring mines is shipped. Kolum is now an insignificant place. Other factories are scattered about the coast, especially in the west. The majority of the people, however, live in detached cottages or farms, chiefly on or near the fiords.

21. Iceland was discovered in the middle of the ninth century. The first settlement was made in 874 by a Norwegian named Ingolf, who established himself at Reikiavik. His colony was soon after increased by immigrants, refugees from the tyranny of Harold Harfagra, who instituted a republic and had their Althing, which was held at Thingvalla, on the southern coast. Several learned works have lately appeared respecting the history of this period. About the year 1000 Christianity was established in Iceland, and in 1057 Isleif, bishop of Skalholt, introduced the art of writing with the Latin alphabet, the Kunic characters having been till then used only for inscriptions on stone, wood, or metal. Oral lessons had, however, kept up the historical traditions, and the feats of their heroes were recorded in song. Icelandic literature now began to be cultivated, and societies were formed for mutual instruction and education. The historical compositions called Sagas have been published, as well as many of the Icelandic songs and poems. In 1120 was framed the code of laws called Grágás. In 1204 the Icelanders, partly through intrigue and partly from fear, submitted to Haco, king of Norway, but their lands and institutions were maintained to them. In 1387 Iceland together with Norway became subject to Denmark; and in 1550 the Lutheran reformation was introduced.

22. Several other islands in the North Atlantic, and near Greenland and Iceland, belong also to Denmark. Of these the largest is Jan Mayen's Land. None have permanent inhabitants.

RUSSIAN AMERICA.

1. Russian America comprehends all the northwest coasts on the Pacific and the adjacent islands north of the parallel of 54° 40′ north, and the portion of the mainland west of the meridian (about 141° west) of Mount St. Elias. The area is computed at 580,000 square miles.

2. The part of the mainland south of Mount St. Elias consists of a narrow belt which is skirted on the east by a mountain ridge parallel to the coast, and has nowhere a greater width than ten marine leagues. Northward of the 60th parallel the mainland forms a vast peninsula extending in a general west-northwest direction toward Asia, and at one point reaches that continent within a distance of 48 miles. Throughout its western part the prevailing feature is mountain; while the part lying along the Arctic Ocean, with the exception of a stretch between the meridians 141° and 146° west, where the Rocky Mountains traverse the coast and terminate, is a dead flat, often nearly on a level with the sea, and never more than from 10 to 20 feet above it. From Point Barrow the direction of the line is southwest, rising gradually toward Cape Lisburn, which is 850 feet high. It now turns south, forming between the two large inlets of Kotzebue and Norton sounds the remarkable peninsula of Prince of Wales, which projects into Behring's Strait, and terminates in an elevated promontory, remarkable as the most westerly point of America. From Norton Sound the coast turning first southwest and then south-southeast, becomes indented by several large bays, including those of Bristol Bay and Cook's Inlet, on the opposite side of the long and narrow peninsula of Aliaska; and is lined almost throughout by groups of large islands, of which the most important belong to the Aleutian, Kodiak, and King George III. archipelagoes. The greater part of the coast last described is very bold, presenting a succession of lofty volcanic peaks, two of which, on the west coast of Cook's Inlet, have the respective heights of 11,270 and 12,060 feet. Mount St. Elias has an elevation of 16,758 feet.

HUT OF ALEUTIAN ISLANDERS.

3. The interior of the country is very imperfectly known. The climate is not so cold as the east parts of the continent under the same latitudes. It is, however, far too rigorous to admit of agricultural operations, and the whole value of the territory and adjacent seas is derived from their fisheries and hunting grounds. The Aleutian Islands extend from the peninsula of Aliaska to that of Kamtschatka, through 30 degrees of longitude. They include several subordinate groups, and are all rocky and volcanic, some having cones in present activity. The Kodiak group is divided from Aliaska by the narrow Strait of Chelikof. It consists of one large and several small islands, with broken and rugged coasts. On the north side of the main island is the harbor and station of St. Paul. King George III. Archipelago comprises the islands along the northwest coast, as Sitka, Baranof, and others. These are all inhabited.

4. The extensive territory above described has been granted to a Russian American fur company, which was established under charter from the Emperor Paul, 8th July, 1799, with power to occupy and bring under the dominion of Russia all territories north or south of 55° not previously occupied and placed under subjection by another nation. By treaties with the United States, in 1824, and Great Britain, in 1825, its present boundaries were fixed; but subsequently the British acquired the right of using the mainland south of 58°, and also the exclusive privilege of supplying the Russian posts with agricultural produce and provisions. The charter of the company was renewed in 1838, when it had 36 hunting and fishing establishments. The company's possessions include, besides the American territory, all the Asiatic coast of the Pacific north of 51°, and the Kurile Islands to their south point in 45° 50′.

5. Russian America is divided into six agencies, and is controlled by a governor-general, who resides at New Archangel, on the island Sitka. The population is estimated at 54,000 souls. Of these about 1,000 are Russians, 2,500 creoles, and 10,000 natives of the Kurile, Aleutian, and Kodiak islands. The remainder are Esquimaux, who enjoy a greater or less degree of independence. The Kuriles, Aleutes, etc., are regarded as subjects of the company, in whose service every man between 18 and 50 years of age may be required to pass at least three years.

6. New Archangel, the principal post, is situate on the island of Sitka, in latitude 57° 30′ and longitude 135° 13′. It was founded in 1805, and is a military station and the chief post of the company. The fort mounts 18 short eighteen and 42 long nine pounders, and there are about 300 officers and men; and the company have 12 vessels varying from 300 to 400 tons, mounting 10 guns of different caliber. A Greek bishop with several priests and deacons reside here, and also a Lutheran minister; and there are schools for the children of Europeans and half-breeds.

7. Subordinate to Sitka there is a smaller establishment of the same kind at Aliaska, which supplies the posts on Bristol Bay and Cook's Inlet, which are all connected with minor interior stations. Another station in Norton Sound has its own inland dependencies. The company has also permanent forts or flying posts in the Aleutian and Kurile islands, and a chain of agencies from Okhotsk, in Kamtschatka, to St. Petersburg, for the transmission of merchandise, etc.

8. The company's trade is considerable, supplying not only Russia with furs, but also the markets of China, through Kiachta, on the Tartar frontier. The annual export is estimated at 10,000 seal, 1,000 sea otter, 12,000 beaver, and 2,500 land otter, fox, and marten skins, and about 20,000 sea-horse teeth. Formerly the Russians killed the seal young and old; but now they follow the example of the English company, and kill only such a limited number of males as have attained full growth.

BRITISH AMERICA.

1. The British Possessions in North America lie chiefly north of the 49th parallel; and, exclusive of the Russian territory in the northwest, occupy the whole northern region of the continent and adjacent islands. The eastern section, however, projects southward as far as latitude 42°; and under this head the Bermuda Islands, in latitude 32° 20′, are also included.

2. The vast and valuable possessions comprise the territory of the Hudson's Bay Company, the provinces of Canada, New Brunswick, and Nova Scotia, and the island colonies of Prince Edward, Newfoundland, and Bermuda. The extent and population of these several political divisions in 1851 and 1856 are exhibited in the annexed table:

Political Divisions.	Area, sq. m.	1851. Population.	1851. Pop. sq. m.	1856. Population.	1856. Pop. sq. m.	Chief Towns.
Hudson's Bay Territory	2,436,000	80,463	0.1	100,000	0.1	York Factory.
Canada	357,822	1,842,265	5.1	2,200,000	6.1	Quebec.
New Brunswick	27,704	193,800	7.0	220,000	8.0	Fredericton.
Nova Scotia, etc.	18,746	276,117	14.7	300,000	16.0	Halifax.
Prince Edward Island	2,134	62,678	29.3	65,000	30.4	Charlotte-Town.
Newfoundland	35,913	101,600	2.8	120,000	3 3	St. John's.
The Bermudas	19	11,092	583.8	12,000	631.6	St. George.
Grand Total	2,878,338	2,563,015	0.9	3,017,000	1.05	

3. Formerly the British were the owners also of the whole country east of the Mississippi,

BRITISH PROVINCES

EASTERN PORTION.

100 Geographical or 115.26 Statute Miles, to one inch.

Entered according to Act of Congress, in the Year 1858 by J. H. Colton & Co. in the Clerks Office of the District Court of the United States, for the Southern District of New York.

now comprising the most populous portion of the United States, and containing an area of 865,576 square miles, thus making the ancient dominion of that nation in North America 3,743,914 square miles, or almost half the area of this section of America. Besides this the British had until 1846 the right of joint occupancy over the country now forming the territories of Oregon and Washington; and has at this day a right by lease to hunt over the continental portion of the Russian territories. Truly has Britain been the mother of the greatest nations of the Western World, and the means, in the hands of Providence, to lay the foundation of their civilization, their liberties, and their material progress and prosperity.

HUDSON'S BAY COMPANY'S TERRITORIES.

4. Hudson's Bay Company's Territories comprise all British America north and west of Canada, and extend over an area computed at 2,436,000 square miles. The Rocky Mountains, or, as they are here called, the Chippewyan Mountains, divide them into two grand physical sections.

5. The eastern section is a comparatively sterile region, and comprises four subordinate regions. The first of these lies east of Hudson's Bay, extending as far as the Strait of Belle Isle, and includes the whole of Labrador.* That portion of it which lies west of Hudson's Bay is called the "Barren Lands." The reindeer and musk-ox are here abundant, but fur-bearing animals are scarce. The inhabitants are chiefly Esquimaux. The second region extends on both shores of James' Bay, and along the southwestern shores of Hudson's Bay as far west as Cape Churchill, and inland to the ridge which forms the northern boundary of Canada, and to the lakes Superior, Winnipeg, Deer, and Wollaston. Along the shores and for several miles inland it is mostly occupied by swampy tracts, which are separated by comparatively narrow and dry but low ridges. Farther inland the country is well wooded, and produces fur-bearing animals in great abundance. To the west of the wood region is the third or prairie region, which extends to the foot of the Rocky Mountains, and northward to Lake Athabasca and Peace River. Its surface stretches out in extensive plains, intersected only by the beds of its several rivers, which are considerably below the general level. In the bottoms trees grow luxuriantly. The soil of the plains is rather sandy, and entirely bare of wood, but supports a thick grassy sward, on which buffalo and deer find abundant pasture. The fourth region is the valley of the Mackenzie. It comprehends the country between the sterile region and the mountains north of Lake Athabasca. The river generally runs through a bottom rarely more than a few miles wide, the alluvial soil of which is in many places covered with trees of moderate height. Its delta, which is 90 miles in length and from 15 to 40 in width, is formed by flat alluvial islands, which divide the various branches of the river.

THE BEAVER.

6. Hudson's Bay, the most prominent feature of the eastern section, is an extensive mediterranean sea, connected with the Atlantic by Hudson's Strait, and covering a larger surface than any inland sea of the old continent, the Mediterranean only excepted. Its southern part is called James' Bay, from which to Repulse Bay, in the north, the distance is upward of 1,000 miles, and it is more than 500 miles across in its widest part. The coasts, except in the southwest, are high, rocky, and rugged, and in localities precipitous. The depth in the middle of the bay has been taken at 150 fathoms. The northern part is occupied by Southampton Island, which is formed of high rocky masses, and appears to consist of numerous smaller islands separated by straits; which, however, are always closed by ice.

7. Numerous large rivers traverse this extensive country. The most important of those east of Hudson's Bay are Great Whale, East Main, Rupert, and Hurricannane rivers. Most of the rivers on the east, like those on the south and west, issue from or in some part of their course expand into lakes. Two very important rivers, on account of their situation, are the Moose and its affluent the Abbitibbe. Both issue from lakes on the high grounds separating Canada from these territories, and at no great distance from the upper branches of the Ottawa, and they are accordingly used as the most convenient means of communication between the two countries.

8. Between the mouth of the Moose and Cape Churchill are the embouchures of the Albany, Severn, Hayes, and Nelson. The Nelson is only inferior to the Mackenzie, and has its remote sources in the Rocky Mountains. Lake Winnipeg is about 240 miles long and from 5 to 50 wide. Westward of it are the two lakes Winnipegoos and Manitoba, which together occupy in length nearly the same extent as that lake. All these are united by rivers, and finally discharge through the Nelson into Hudson's Bay. The Saskatchawan and its branches are considered as the head stream of this great river. Lake Winnipeg also receives the Red River of the North. The Churchill River, called in its upper course Missinnippi and English River, rises in Methy Lake, nearly 500 miles in a direct line from its entrance into Hudson's Bay. In its course it forms several lakes.

9. The largest river of the country, however, is the Mackenzie. Its most southern branch is the Athabasca, which rises in the eastern declivity of Mount Brown, and falls into the western portion of Athabasca Lake. Peace River rises on the western side of the eastern range of the Rocky Mountains, within 300 yards of Frazer River, which falls into the Pacific. Within the mountains it is a large stream navigable for boats, and thence flowing through the plains unites with Slave River, the outlet of Lake Athabasca, which flows first north and then north-by-west to Great Slave Lake. This lake covers an area of 12,000 square miles; and the river issuing from the northwest corner now takes the name of Mackenzie. Near 62° it receives Mountain River, and near 65° Great Bear Lake River, which brings down the surplus waters of the lake so called, the area of which is about 8,000 square miles. The width of the river is generally about three miles, but in a few places is narrowed by rocky hills; including the Athabasca branch, it traverses fifteen degrees of latitude, and its whole course has been estimated at 2,000 miles. Coppermine River rises on the western border of the Barren Lands, and finds its way to the Arctic Ocean in a course of 200 miles. Back River, to the east of the Coppermine, is a still larger river.

10. The western section of the company's territories comprises all the country lying west of the Rocky Mountains, which here form two nearly parallel ranges, from 80 to 100 miles apart. The western range is much the lower, while the eastern has some summits which attain an elevation of from 15,000 to 16,000 feet above the sea-level. Mt. Hooker is 15,700 feet high, and Mt. Brown 15,990 feet. Several rivers rise between the two ranges. Frazer River has its sources in the western range, runs southward about 500 miles, and falls into the Strait of San Juan de Fuca. Its course is impetuous, but the river is navigable for canoes except where interrupted by rapids.

11. Along the coast the country is mountainous, and opposite Vancouver Island this mountainous character is maintained over a width of about 80 miles, and the declivities reach the shores of Queen Charlotte's Sound, which separates Vancouver Island from the continent. Farther north the mountain groups are more isolated, the breaks being occupied by valleys and inlets, through which numerous streams discharge their abundant waters. The shores are generally high, and rise with a steep ascent. Vegetation is vigorous in all the valleys, and the climate moist and equable. Farther inland, and to the declivities of the mountains, the country is an uneven plain, crossed by rocky ridges. The climate is still moderate, and forests cover nearly the whole surface. Fur-bearing animals are very numerous, especially beavers and otters, and the moose is also abundant. Seals are very common along the whole coast, and fish abound in the rivers. The principal islands off the coast are Vancouver and Queen Charlotte or Washington, with numerous others of smaller size. The coast and islands north of 54° 40′ belong to Russia.

WHITE BEARS AND SEALS.

12. All these countries are very sparsely populated, the latest estimate of the inhabitants of all races being only 100,000. These consist principally of Esquimaux, which live on the northern and eastern coasts, and Indians, living in small bands over the country, and subsisting on the produce of the chase. The white population is estimated at 4,000 to 5,000, chiefly agents of the company or their employees. These are mostly Scotchmen. The settlement of Assiniboin, on the Red River, numbers about 6,000 souls, about four fifths being half breeds. On Vancouver Island there is another settlement, numbering perhaps 1,200 or 1,500. Otherwise the whites are employed at the various forts or factories scattered over the country, and at which the Indian trade is carried on.

13. The Hudson's Bay Company consists of 237 proprietors, representing a stock of £400,000 sterling. Its affairs are managed by a governor, deputy governor, and committee of seven, elected by the proprietors holding not less than £900 stock for six months previous to voting, except such stock be acquired by bequest, marriage, etc. Each member of the committee must hold not less than £1,800 stock. The districts in America are each in charge of a governor, and such governor and his council has power to judge all persons belonging to the company or that shall live under him in all cases, whether civil or criminal, within his district. The business at the several stations is superintended by officers called chief factors, of which there are twenty-five, and the Indian trade is carried on by chief traders, of which there are twenty-eight. The clerks serve under both, and have salaries varying from £20 to £100 a year. The expenses of the establishments in England and America are paid out of the trade; but no expense relating to colonization or to any business separate from trade forms a charge on the concern. Profits are divided into 100 shares, of which 40 are divided to the chief factors and chief traders. Sales of furs and peltry are made at public auction several times each year at the Hudson's Bay House in Fenchurch Street, London.

14. Labrador was first discovered by John Cabot in 1497, and it is probable that his son, Sebastian, entered and partly surveyed Hudson's Bay in 1512. It was re-discovered by John Hudson in 1610. Meanwhile the French had colonized Canada, and thence carried on an active fur trade with the Indians inhabiting the countries west of Hudson's Bay. In 1668 Prince Rupert sent a vessel, the party on board of which erected Fort Charles, on the bank of Rupert River, in James' Bay.

15. The Hudson's Bay Company was incorporated by Charles II., by charter dated 2d May, 1670; and from that date to 1783 it enjoyed the sole benefit of the trade within the territories included within its charter. In the latter year another company, called the North-west Company, was organized, by parties who considered that the trade should be open to all British subjects alike. The jealousy and hostility which arose between the agents of the two companies impeded the operations of both parties for a series of years; and so serious had become the difficulty, that it was found politic to merge the two into a single company. This was effected in 1821, and at the same time a grant of exclusive trade over the territories northwest of the country covered by the original charter, as far west as the Rocky Mountains, was obtained from the crown. In 1838 a similar right for twenty-one years was granted over the territories west of the mountains to the Pacific.

16. The concessions of 1821 and 1838 were not, as the land included in the original charter, granted in perpetuity and succession. They may relapse to the crown, or in whole or part become open colonies whenever deemed advisable. Indeed, by the charter of 1838, the company is specifically enjoined to settle a colony on Vancouver Island, which has already been

* For the purposes of civil government Labrador is attached to Newfoundland.

partially effected; and it is not improbable that, on the consummation of the later leases in 1859, Canada may demand an extension of territory into the fine prairie country westward of her present limits.

PROVINCE OF CANADA.

1. Canada, lying almost wholly within the basin of the St. Lawrence, is included between latitudes 41° 47′ and 52° 40′ north, and longitudes 61° 54′ and 90° 20′ west of Greenwich. On the north it is bounded by the ridge or watershed which separates the waters flowing to the St. Lawrence and Hudson's Bay respectively; on the east and southeast by Labrador, the Gulf of St. Lawrence, the province of New Brunswick, and the states of Maine, New Hampshire, and Vermont; on the south by the State of New York, the St. Lawrence River, and the lakes Ontario, Erie, Huron, and Superior; and on the west by the river Kiministiquia,

HORSE-SHOE FALLS—NIAGARA.

which flows into Lake Superior opposite Isle Royale. The extreme length of Canada, east and west, is about 1,300 miles; the breadth varies from 80 to 300 miles, narrowing from the center to both extremities, and averaging 200 miles. The area is computed at 357,822 square miles—that of Canada West or Upper Canada being 147,832, and that of Canada East or Lower Canada being 209,990 square miles.

2. The great natural features of Canada are the river St. Lawrence, and the chain of lakes from which it descends. Four of these lakes, Ontario, Erie, Huron, and Superior, have a large portion of their shores situated within the limits of this Province: Lake Michigan is wholly within the territory of the United States.

3. In its course between Lake Ontario and the city of Quebec, the St. Lawrence spreads out in several places into lakes of some magnitude. The first of these, immediately below Lake Ontario, is known as the Lake of the Thousand Isles, from the immense number of islets with which it is studded. Lower down its course are the lakes of St. Francis, St. Louis, and St. Peter, the last named of which is about nine miles in width. At Quebec the river is not more than three fourths of a mile wide; but below this point it continually increases in breadth, and expands into a broad estuary before reaching the Gulf of St. Lawrence.

4. At the mouth of the St. Lawrence is the large island of Anticosti, which is 125 miles long, and 30 miles wide. It is low and swampy on the south side, and high, rocky, and barren on the north. It is only inhabited by a few families placed there for the purpose of affording assistance to the crews of vessels which have suffered shipwreck in the neighborhood of its shores. For the purposes of government this island is included in the colony of Newfoundland. The Magdalen Islands belong to Canada, and are much visited by fishing vessels.

FALLS OF MONTMORENCI—8 MILES BELOW QUEBEC.

5. The St. Lawrence is navigable for vessels of 600 tons as far as Montreal (580 miles above the Gulf). Within the past few years, however, extensive works have been constructed for the improvement of the navigation between Montreal and Lake Ontario, in which portion of its course the river is naturally much obstructed by rocks. By the aid of locks, combined with short lateral cuts and canals, for the avoidance of the principal rapids, vessels of considerable size are enabled to pass to and from Lake Ontario nearly along the direct line of the river.

6. The principal tributaries of the St. Lawrence are the rivers Ottawa, St. Maurice, and Saguenay upon the north bank, and the Chambly or Richelieu, St. Francis, and Chaudiere upon the southern. The Ottawa, which issues from Lake Temiscaming, and flows in a southeasterly direction to the St. Lawrence, contains numerous falls and rapids, and, like the St. Lawrence, expands in some places into lakes. By the help of artificial means, its lower course is rendered navigable, and has been connected with Lake Ontario by the Rideau Canal. The Saguenay, which issues from Lake St. John, has a rapid current, and pours an astonishing mass of turbid water into the stream of the St. Lawrence. The Chambly or Richelieu issues from Lake Champlain, a long and narrow body of water within the United States' frontier. It is navigable for decked vessels to a distance of 12 or 14 miles from its mouth, and, up to Lake Champlain, for boats and canoes.

7. The country which extends beyond the immediate banks of the St. Lawrence, upon either side, consists of a succession of plains, terraces, and elevated platforms or table-lands. But the height is nowhere considerable, and rarely exceeds from 700 to 800 feet. From the junction of the Ottawa downward to a considerable distance below the mouth of the St. Maurice, the banks are low, or only of moderate elevation, and this low country continues for some distance inland; but toward Quebec the shores assume a bold and steep aspect, and, except at occasional intervals, preserve this character to the great gulf.

8. Upon the south side of the St. Lawrence the country which extends over the lower course of the river St. Francis forms a level plain, one of the most fertile and best cultivated tracts in the Province. The country lying on the northern bank above the junction of the Ottawa is only of moderate elevation: it contains numerous small lakes and some extensive marshes; but the soil is in general fertile. Farther to the westward, a narrow plain extends along the shores of Lake Ontario, but the country rises, toward the north, into a plateau of considerable elevation. This plateau attains a height of 750 feet above the level of Lake Huron (or 1,344 feet above the sea) where it approaches that body of water.

9. The peninsular portion of Canada, which is inclosed by lakes Huron and Erie, with the western extremity of Lake Ontario, is a level or slightly undulating plain, the whole of which possesses an alluvial soil of great fertility. This is one of the finest districts of Canada, and is rapidly being filled up with an industrious population and increasing in importance. It is watered by numerous rivers, the two most important of which are the Ouse or Grand, which flows to the southeastward into Lake Erie, and the Thames, which runs in a southwesterly direction, and enters the Lake of St. Clair, midway between the channel which unites lakes Huron and Erie. Both these rivers are navigable for small schooners in their lower courses, and for boats almost through their whole courses.

10. The river Niagara, which connects lakes Erie and Ontario, is precipitated, in its midcourse, down the stupendous falls of the same name; but a navigable communication between the two lakes is effected by means of the Welland Canal, to the westward of the river, which admits vessels of 450 tons burden. A short canal also connects the waters of lakes Superior and Huron, overcoming the Sault Ste Marie.

11. The country lying to the northward of lakes Huron and Superior forms a table-land of considerable elevation, upon the surface of which are numerous lakes and small rivers. This tract contains few permanent settlements, but is signally noted as one of the richest mineral districts in the world; and which, in the course of events, must ultimately become the scene of a vast industrial development. To the westward of this extreme limit of the Province there is an immense and fertile region with a moderate climate, and now almost unoccupied. At present it is within the limits of the Hudson's Bay Company's territory.

12. The climate of Canada is much colder than that of Europe on the same parallels. It is nearly the same with the climates of Norway, Sweden, Russia, and the south parts of Iceland. Both the heat of summer and the cold of winter are extreme—the thermometer ranging between 102° above, and 36° below zero. But in the districts adjoining the great lakes the climate is milder and more equable than that of places more remote. The prevailing winds are northeast, northwest, and southwest—the last the most frequent. The azure of the sky is remarkable, and fogs are almost unknown. In Lower Canada the winter commences at the end of November, and lasts to the end of April—during this period the frosts are intense. In Upper Canada the winter is much shorter. The average depth of snow that falls in the season is about 30 inches. The winters of Quebec are six weeks longer than in the west. Up to the 50th parallel north the country is exceedingly well adapted to wheat-growing, which matures rapidly under the influence of an intense summer.

SLEIGHING SCENE, QUEBEC.

13. The mineral resources of Canada are very great, but have, until lately, been almost entirely neglected. Iron is abundant in all parts of the Province, particularly in the neighborhood of lakes Erie and Ontario, as well as in Lower Canada, and to the northward of the river Saguenay. Plumbago, and ores of antimony, lead, and copper are also found. Copper is abundant in the tract to the north of Lake Superior, and its production is now considerable. Gold, silver, and tin have also been met with in the same region. The northern and western shores of Lake Ontario abound in salt-springs, and the north shores of Lake Erie exhibit immense beds of gypsum, some of which is quarried for agricultural purposes. Various kinds of marble, with serpentine, granite, and other igneous rocks are abundant, and lithographic stone has been found in the town of Marmora.

14. But the productions of the forest are the most characteristic wealth of Canada. The variety of trees is astonishing—among the most common are pines and firs, with the maple, white cedar, birch, ash, oak, beech, elm, hazel, cherry, cypress, poplar, willow, and sycamore. One of the most useful is the maple, from the sap of which excellent sugar is made. Trees not available for timber serve to supply the pot and pearlash manufactories.

15. Wild animals, including the moose-deer, bear, wolf, wild-cat, fox, lynx, and others, are numerous, but are gradually disappearing before the increasing population and advancing extent of the settled portions of the Province. The beaver, which was formerly very abundant, is now seldom found within reach of the settlements. Two species of rattlesnake occur, but these are not numerous. Fish abound in all the rivers and lakes, and include the sturgeon, pike, trout, and a species of fresh-water herring. Salmon are plentiful in Lake Ontario, but are not found above the falls of Niagara. Seals are numerous in the lower portion of the St. Lawrence, and in the gulf of the same name there are valuable fisheries.

16. For civil purposes Canada is divided into two districts, formerly called Upper and Lower, but now West and East. In 1851 the former was divided into 42 counties, and the latter into 36 counties, as follows:

UPPER CANADA OR CANADA WEST.

Counties.	Area, sq. m.	Population.	Chief Towns.
Addington	576	15,165	Bath.
Brant	416	25,426	Brantford.
Bruce	992	2,837	Penatangore.
Carleton	898	31,397	Ottawa C. (*Bytown*).
Durham	620	30,732	Port Hope.
Dundas	377	13,811	Morrisburg.
Elgin	703	25,418	St. Thomas.
Essex	677	16,817	Sandwich.
Frontenac	1,342	30,735	Kingston.
Glengary	450	17,596	Alexandria.
Grey	2,321	13,217	Sydenham.
Grenville	421	20,707	Prescott.
Haldimand	459	18,788	Cayuga.
Halton	362	18,322	Milton.
Hastings	1,324	31,977	Belleville.
Huron	1,392	19,198	Goderich.
Kent	870	17,469	Chatham.
Lambton	1,093	10,815	Port Sarnia.
Lanark	1,180	27,317	Perth.
Leeds	805	30,280	Brockville.
Lenox	170	7,955	Napanee.
Lincoln	306	23,863	Niagara.
Middlesex	1,079	39,899	London.
Northumberland	730	31,229	Cobourg.
Norfolk	600	21,281	Simcoe.
Ontario	851	30,576	Whitby.
Oxford	710	32,638	Woodstock.
Peel	458	24,816	Brampton.
Perth	698	15,545	Stratford.
Peterboro'	1,005	15,287	Peterboro'.
Prescott	475	10,487	L'Original.
Prince Edward	334	18,887	Picton.
Renfrew	1,133	9,415	M'Nab.
Russell	379	2,870	Cumberland.
Simcoe	1,797	27,165	Barrie.
Stormont	391	14,643	Cornwall.
Victoria	749	11,657	Lindsay.
Waterloo	518	26,537	Berlin.
Wellington	1,287	26,796	Guelph.
Welland	356	20,141	Merrittsville.
Wentworth	426	42,619	Hamilton.
York	808	79,719	Toronto.
Total	32,492	952,004	

LOWER CANADA OR CANADA EAST.*

Counties.	Area, sq. m.	Population.	Chief Towns.
Beauharnois	717	40,213	Beauharnois.
Bellechasse	1,188	17,982	Berthier *en bas.*
Bonaventure	4,560	10,944	Carleton.
Chambly	211	20,576	St. John's.
Champlain	6,200	13,896	Batiscan.
Dorchester	2,050	43,105	Beauce.
Drummond	1,644	16,562	Drummondville.

Megantic	1,465	13,835	Leeds
Missisquoi	860	13,484	Philipsburg.
Montmorency	7,465	9,593	Chateau Richer.
Montreal	197	77,381	Montreal.
Nicolet	487	9,657	Nicolet.
Ottawa	35,100	22,903	Aylmer.
Portneuf	10,446	19,366	Portneuf.
Quebec	16,040	61,526	Quebec.
Richelieu	873	25,686	Sorel.
Rouville	429	27,031	Clarenceville.
Rimouski	8,900	26,882	Rimouski.
Saguenay	75,000	20,783	Eboulements.
St. Maurice	7,300	27,562	Three Rivers.
St. Hyacinthe	477	30,623	St. Hyacinthe.
Sherbrooke	2,785	21,014	Sherbrooke.
Shefford	749	16,482	Granby.
Stanstead	632	13,898	Stanstead.
Terrebonne	545	26,791	Terrebonne.
Two Mountains	1,404	30,470	St. Eustache.
Vaudreuil	330	21,429	Vaudreuil.
Verchères	198	14,393	Verchères.
Yamaska	238	14,748	Yamaska.
Total	209,990	890,261	
Canada West	32,492	952,004	
Grand Total	242,482	1,842,265	

17. Of the total population (in 1851) of Canada West 499,067 were males and 452,937 females, and of Canada East 449,967 were males and 440,294 females; and the physical and social condition of the inhabitants in the two districts was as follows:

Condition.	Canada West. Males.	Canada West. Females.	Canada West. Total.	Canada East. Males.	Canada East. Females.	Canada East. Total.
Indians	2,713	2,495	5,208	1,803	1,717	3,520
Colored persons	2,502	2,167	4,669	884	359	743
Deaf and dumb	289	189	478	514	351	865
Blind	185	131	316	308	246	554
Lunatics	519	550	1,069	891	842	1,733
Single	342,321	293,773	636,094	303,799	289,494	593,293
Married	147,872	143,506	291,378	136,999	135,421	272,420
Widowed	8,742	15,528	24,270	8,677	44,908	23,585
Attending school	88,706	68,880	152,586	72,679	48,372	121,051

18. The origin of the population in the two districts is essentially different. In the eastern and older settled portions of the province nearly three fourths of the inhabitants are of French descent, whereas in the western or more recently settled portions the population is composed of emigrants from the British Isles and their descendants. The annexed table exhibits the national origin of the great body of the people:

	England and Wales.	Scotland.	Ireland.	Canada (French).	Canada (not French).	U. States.
Canada West	82,699	75,811	176,267	26,417	526,093	43,732
Canada East	11,230	14,565	51,499	669,528	125,580	12,482

—the remainder originating from various parts of Europe, the lower provinces, the West and East Indies, etc. All countries have contributed to the population of Canada. These, in Canada West, constituted 154,502 families, occupying 145,956 dwellings, and in Canada East 142,763 families, occupying 123,983 dwellings.

19. The progress of population in the Province from period to period has been as set forth in the following table:

Canada West.				Canada East.			
1770	about 200	1832	261,060	1676	8,415	1825	423,630
1791	less than 50,000	1836	367,841	1688	11,249	1827	471,876
1806	70,718	1839	407,515	1700	about 15,000	1830	511,920
1811	about 77,000	1841	465,357	1706	" 20,000	1844	690,782
1824	151,097	1842	486,055	1714	26,904	1847	714,382
1826	163,703	1848	723,087	1759	about 65,000	1848	768,385
1830	235,164	1851	952,004	1784	" 113,000	1851	890,261

—the population at the end of 1856 was estimated—for Canada West at 1,350,923, and—for Canada East at 1,220,514.

20. The religious predilections of the people may be based upon their national origin, and as a general fact it may be assumed that in Canada East the adherents of the Roman Church predominate, while in Canada West the various Protestant denominations are in the ascendant. To illustrate this position, the census returns of 1851 need only to be referred to, which give the following returns:

Denominations.	Canada West. Churches.	Canada West. Adherents.	Canada East. Churches.	Canada East. Adherents.	Total. Churches.	Total. Adherents.
Church of England	223	223,190	116	45,402	344	268,592
Church of Rome	126	167,095	385	746,866	511	914,561
Church of Scotland	99	57,542	6	4,047	105	61,589
Presbyterian	187	146,606	52	29,488	239	176,094
Baptist	119	45,353	21	4,493	140	49,846
Methodist	403	59,585	52	11,935	455	71,520
Episcopal Methodist	84	43,884	1	7	85	43,891
New Connection Methodist	13	7,547	1	3,442	14	10,989
Quakers	12	7,460	1	163	13	7,623
Lutheran	19	12,089	—	18	19	12,107
Congregational	43	7,747	22	3,927	65	11,674
Bible Christian	38	5,726	—	16	38	5,742
Other sects	103	27,580	3	43,457	106	71,037
Total	1,474	952,004	660	890,261	2,134	1,842,265

21. The population of Canada, especially that of the western district, is constantly being augmented by immigration, chiefly from Great Britain and Ireland, but also from other European states. For the thirty years ending with 1856 the number of emigrants from Europe has averaged about 30,000, and within the last five years about 40,000 annually. Many families also remove from the United States and the lower provinces to Canada. The immigration and the natural increase for the past five years, added to the population of 1851, gave the population at the end of 1856 (as before shown—*see* § 19) at 2,571,437.

22. The Indian population of Canada included in the census returns embraces only such as have been incorporated into the body politic. In all, there are about 30,000 within the provincial limits, but their numbers are rapidly decreasing. They belong entirely to the two nations of the Ojibbeways and Mohawks (or Iroquois), and dwell in tracts bordering on the great lakes. A few have embraced Christianity and settled in villages, but the majority are hunters and have no fixed place of abode.

23. In an industrial point of view, Canada presents a rare example of what an intelligent people may accomplish. True it is that Canada is replete with every material resource; but it is to the hand of man that these owe their development. Without the laborer, agriculturist, and artisan the country must still have retained the wilderness condition in which the opening of the present century in reality found it. In the brief period since elapsed large populations, bringing with them the arts of civilization, have settled in the province, and by persistent industry made the land to yield abundantly, opened mines, built up factories and workshops, opened up the country by means of canals, railroads, etc., and initiated a commerce which is constantly and rapidly increasing in extent and value.

24. As yet, however, but a small portion of the land is occupied, and the clearance of the ground and the culture of the soil are the main employments of the settler. The total quantity of land held by individuals in 1851 was 17,939,796 acres, or only one in thirteen of the whole territory; and of this only 7,300,839 had been brought under cultivation. The condition of the land in the districts separately was as follows:

	Canada West.	Canada East.		Canada West.	Canada East.
Persons holding land	99,869	95,823	Acres of land held	9,826,417	8,113,379
Persons holding 10 acres and under	9,976	14,477	" " under cultivation	3,695,763	3,605,076
" " 10 to 20 acres	1,889	2,702	" " " crops	2,274,746	2,071,349
" " 20 to 50 "	18,467	17,521	" " " pasture	1,365,556	1,508,600
" " 50 to 100 "	48,027	37,863	" " " gardens, etc.	55,461	30,127
" " 100 to 200 "	18,421	18,639	" " wood or wild	6,130,654	4,508,303
" " over 200 "	3,080	4,591	Assessed value (£ currency)	36,670,890	29,208,158

25. The grains cultivated are wheat, barley, rye, oats, buckwheat, and Indian corn. Wheat and oats are the staples of the western portion of the Province, and oats in the eastern portion. The crops (in bushels) of 1850 were as follows:

	Wheat.	Rye.	Oats.	Buckwheat.	Barley.	Indian corn.
In Canada West	12,674,503	479,623	11,186,161	679,754	625,355	1,662,524
In Canada East	3,045,600	345,290	8,984,123	588,280	456,344	419,017
Total	15,720,103	824,913	20,170,284	1,268,034	1,081,699	2,081,541

The same crops in the United States compare with those of Canada (the populations of those countries being as 232 to 18 respectively) as follows:

100,485,944 ..... 14,188,813 ..... 146,584,179 ..... 8,956,912 ..... 5,167,015 592,071,104

which figures show distinctly that but one half the amount of wheat is grown in the United States *per capita* as in Canada; but that the great amount of Indian corn grown in the Union more than supplements the deficiency. The total grain produced for each mouth in the United States is about 37 bushels, and in Canada about 22 bushels. A great portion of the corn (the staple crop) in the former country, however, is fed to livestock.

26. The miscellaneous field and garden crops were as follows:

Crops.		Canada West.	Canada East.	Crops.		Canada West.	Canada East.
Peas	bushels	2,872,413	1,473,628	Mangel-wurzel	bushels	54,226	111,428
Beans	"	18,109	23,618	Hops	pounds	113,064	146,488
Potatoes	"	5,077,315	4,583,461	Hay	tons	681,782	727,763
Turnips	"	3,023,378	354,249	Flax and hemp	pounds	56,650	1,188,416
Clover and grass-seed	"	44,460	16,763	Tobacco	"	767,476	444,819
Carrots	"	174,895	100,820	Maple sugar	"	3,581,505	5,829,294

The potato crops throughout the Province are excellent and abundant; and all the vegetables of the temperate regions of the Old World grow with the greatest luxuriance. Tobacco, hemp, and flax are all successfully cultivated, and the two latter are indigenous. The fruits of Europe are also abundantly produced, especially in Canada West, where the peach and grape both come to perfection, as well as many of the fruits common to the warmer latitudes of the Eastern continent.

27. Canada, besides being a grain country, is also a large breeder and owner of cattle and other livestock. In this species of property it is much richer comparatively than the United States. In 1851 the numbers of each description of livestock were as follows:

	Bulls, Oxen, and Steers.	Milch Cows.	Calves and Heifers.	Horses and Mules.	Sheep.	Pigs.
Canada West	193,982	296,613	254,999	201,700	969,221	570,237
Canada East	112,127	297,500	182,691	185,343	649,523	256,587

The products of animals in 1851 were as follows:

	Wool, *lbs.*	Butter, *lbs.*	Cheese, *lbs.*	Beef, *bbls.*	Pork, *bbls.*
Canada West	2,698,764	15,976,313	2,226,776	113,912	310,058
Canada East	1,421,847	9,809,113	737,696	41,161	168,350

28. In manufactures very considerable progress has been made, and many of the products of her artisans have received favorable notice. Of all manufactures in timber the most im-

* Since 1851 Lower Canada has been re-divided into 59 counties, the population of which, as calculated from the census of that year, is as follows:

Counties.	*Population.*	*Chief Towns.*	*Counties.*	*Population.*	*Chief Towns.*	*Counties.*	*Population.*	*Chief Towns.*
Argenteuil	14,129	St. Placide.	Laprairie	14,054	Laprairie.	Richelieu	19,354	Sorel.
Arthabaska	6,539	Arthabaska.	L'Assomption	16,866	L'Assomption.	Rimouski	13,351	Rimouski.
Bagot	13,622	Upton.	Laval	11,053	Ile Jesus.	Rouville	16,531	St. Hilaire.
Beauce	15,597	Ste Marie.	Levi	15,855	St. Joseph.	Saguenay	13,041	Baie St. Paul.
Beauharnois	12,162	Beauharnois.	L'Islet	10,591	L'Islet.	St. Hyacinthe	17,348	St. Hyacinthe.
Bellechasse	12,094	St. Michel.	Lotbiniere	14,051	Lotbiniere.	St. John's	15,226	St. Jean.
Berthier	16,390	Berthier.	Maskinonge	13,415	Maskinonge.	St. Maurice	14,147	Three Rivers.
Bonaventure	10,853	Carlisle.	Megantic	15,357	Somerset.	Shefford	11,083	Granby.

Champlain	13,896	Batiscan.	Missisquoi, East	15,357	Broome.	Soulanges	11,512	Coteau du Lac.
Chateauguay	17,354	Chateauguay.	Montcalm	12,824	St. Patrick.	Stanstead	10,255	Stanstead.
Chicoutimi	7,079	Chicoutimi.	Montmagny	11,945	Montmagny.	Tadousac	1,865	Tadousac.
Compton	7,463	Compton.	Montmorency	9,598	Chat. Richer.	Temiscouata	14,552	Riviere du Loup.
Dorchester	12,790	St. Anselm.	Montreal	78,381	Montreal.	Terrebonne	16,353	Ste Therese.
Drummond	9,025	Drummond.	Napierville	13,541	Sherrington.	Two Mountains	15,722	Ste Scholastique.
Gaspe	10,094	Perce.	Nicolet	18,957	Nicolet.	Vaudreuil	9,917	Vaudreuil.
Huntingdon	15,190	Huntingdon.	Ottawa	13,038	Aylmer.	Verchieres	14,165	Varennes.
Iberville	14,862	St. George.	Pontiac	9,865	Allumettes.	Wolf and Yamaska	2,235	—
Jolliette	16,218	Jolliette.	Portneuf	19,951	Cap Sante.		14,748	La Baie.
Kamouraska	19,375	Kamouraska.	Quebec	60,941	Quebec.			

portant is that of ship-building, which is chiefly carried on at Quebec; and from thence a large number of vessels are exported. The manufactures of iron and copper are also becoming extensive and varied, and from the abundance of these two metals within its territory, Canada may ultimately rise to eminence in this branch of her industry. Already she manufactures railroad locomotives and every variety of castings, with land and marine steam-engines and fittings for all kinds of machinery; railroad cars and wagons; and her pleasure carriages are not surpassed for elegance, durability, and finish. She makes edge-tools of every variety, agricultural machines and implements, cooking and ornamental stoves, printing types, philosophical and surgical instruments, etc.; and in the manufacture of piano-fortes and other musical instruments she competes creditably with any other country. In cotton fabrics Canada has made but little progress; but in woolen goods and mixed fabrics she is a large producer. Passing over other less important manufactures, there remain the grist and saw

NIAGARA SUSPENSION BRIDGE.

mills, which minister to the first wants of the immigrant and produce the staple exports of the Province. Of the latter, especially those on the Ottawa and Saguenay, Canada has perhaps the largest in the world. In Canada also, as in all new countries, a large amount of home-made manufactures, as flannel, woolen cloth, etc., is produced.

29. The public works of Canada comprise numerous harbor and river improvements, bridges, canals, railroads, etc. The canals have been constructed chiefly to overcome the falls and rapids of the rivers, and have thus become the highways of a vast internal commerce. The railroads completed or projected extend from one end of the country to the other, with branch lines to the interior and to the ports on the water fronts. These also connect at several points with the railroads of the United States, and form continuous routes to the sea-board and between the Eastern and Western States, or between the producing and manufacturing regions of the Union. In this respect Canada West may be considered a stepping-stone between the two.

30. The canals of Canada are most stupendous achievements, and are as important as magnificent. The elevation from tide-water to Lake Ontario (more than 231 feet) is overcome by seven canals of various lengths (from 1 to 12 miles, but in all not more than 41 miles, and having locks 200 feet long and 45 feet wide); and varying from 100 to 140 feet on the water surface, with a depth of 10 feet. From Lake Ontario to Lake Erie (333 feet) the elevation is surmounted by the Welland Canal, 28 miles in length, with 27 cut-stone locks, 150 feet long and 26½ feet wide. The Rideau Canal, extending from Lake Ontario, at Kingston,

VICTORIA BRIDGE, AT MONTREAL.

to the Ottawa, at Ottawa City, is 135 miles long, and has capacity for vessels of 120 tons burden; and the navigation of the St. Lawrence and Lake Champlain is connected by the Chambly Canal.

31. The following is an enumeration of the several railroads of the Province in 1858, exhibiting the length of each in miles:

Railroads.	Total Length.	Length Opened.
Brockville and Ottawa	120	70
Perth Branch	10½	10½
Buffalo and Lake Huron	158	117
Carillon and Grenville	12½	12½
Champlain and St. Law.	44	44
Galt and Guelph	112	16
Berlin Branch	11	11
Grand Trunk:		
—Montreal Division.	143	143
—Quebec "	96	96
—Eastern "	145	41
—Toronto "	333	333
—Stratford "	88	88
—Sarnia "	75	0
Great Western:		
—Main Line	186	186
—Toronto Division	38	38
—Niagara "	43	43
—Galt Branch	12	12
—Sarnia Division	60	0
Great Southern	225	0
Hamilton and Pt. Dover.	40½	0
Industry Village	12	12
London and Port Stanley	24	24
Montreal and Lachine	8	8
Montreal and New York	37	37
Cobourg and Peterboro'.	28½	28½
Erie and Ontario	25	17
Montreal and Ottawa	87	0
Montreal and Stanstead	106	0
North Shore	154	0
Ontario, Simcoe & Huron	96	96
Ottawa and Prescott	54	54
Peterboro' and Port Hope	27	27
P. Dalhousie and Thorold	9	5
Port Hope, Lindsay and Beaverton	74½	42½
Rawdon and Industry	16	16
Welland	20	20
Woodstock and L. Erie	149	0
Total	2,879½	1,648

—connected with the Canadian railroads are several of the most magnificent bridges in the world. Among these may be mentioned the Suspension Bridge, over the Niagara River; the Tubular (Victoria) Bridge, over the St. Lawrence, at Montreal, and the great bridges over the Chaudiere and Ottawa rivers.

32. As a commercial country, Canada ranks among the first. Its natural and artificial means of transport are not excelled by those of any other country, and over these a rich traffic is constantly being carried. Its foreign commerce has increased immensely under the influence of its canals and railroads, and the wise policy of reciprocity with the United States recently adopted. The statistics of the foreign trade for the years 1850–1857 show the progress made in this branch of the national industry in the past eight years.

33. The following table shows the character, ports of shipment, destination, and value (currency) of the exports for the years 1850–1857 both inclusive:

	1850.	1851.	1852.	1853.	1854.	1855.	1856.	1857.

1856	?	?	?	?	?	?	?	?	12,245,667
1857	1,670,052	387,654	2,217,777	260,061	1,628,322	355,745	2,212,770	216,552	8,948,933

37. The statistics of ship-building and of the shipping owned in the Province in each of the years are as follows:

	Vessels Built.						Shipping Owned.					
Years.	Steamers.		Sail Vessels.		Total.		Steamers.		Sail Vessels.		Total.	
	No.	Tons.	No.	Tons.	No.	Tons.	No.	Tons	No.	Tons.	No.	Tons.
1850	11	958	76	32,180	87	33,138	31	2,985	213	33,148	244	36,133
1851	4	450	77	42,649	81	43,099	12	1,066	159	26,630	171	27,697
1852	9	1,711	62	29,406	71	31,117	44	5,585	190	43,127	234	48,712
1853	2	674	136	58,396	138	59,070	16	2,144	268	68,137	284	70,281
1854	16	2,233	104	51,822	120	54,055	32	4,479	241	70,951	273	75,630
1855	24	3,268	113	39,703	137	42,971	52	8,028	214	54,122	266	62,175
1856	?	?	?	?	?	?	?	?	?	?	?	?
1857	16	2,556	110	44,380	126	46,936	52	9,385	262	61,920	304	71,305

—from two thirds to three fourths of all the shipping is built at Quebec.

* The recognized sea-ports are Quebec, Montreal, Gaspé, New Carlisle Amherst, Isle-Verte, and Rimouski.

38. The condition of the banks of Canada, of which there were in 1851 eight, and in 1856 eleven, is stated as follows:

1851 ....Capital £2,787,035....Circulation £1,623,435...Specie £413,420...Deposits £2,691,705...Discounts £5,574,280
1856 .... " 4,311,585.... " 2,627,969... " 552,733... " 2,412,581... " 8,076,799

—all these banks have agencies in the principal towns of the Province, in Great Britain and Ireland, and many of the commercial cities of France, Germany, and the United States.

39. The form of government in Canada is that of a limited sovereignty, and in many of its provisions a copy of that of the United Kingdom. The executive power is vested in a governor, (who is also governor-general of British North America) appointed by the crown, and assisted by a council of ministers. The members of the ministry, ten in number, are also heads of departments. The provincial parliament consists of a council of 47 members (formerly appointed for life, but now elective), and an assembly consisting of members elected from 127 districts (counties, ridings, and towns included), and now 132 in number. The franchise is nearly universal; an assessed interest of £50 in lands and a £2 freehold being the real estate qualification of voters, and £7 10*s.* in cities and towns and £5 in rural constituencies, the rental qualification. Every male of full age, being a subject of the British crown, by birth or naturalization, and possessing the above qualification, is entitled to vote at all elections. The forms of procedure in parliament are identical with those of the British legislature. Bills passed by both houses must receive the assent of the crown before they acquire the force of law, and this the governor is authorized to grant or to reserve bills for sanction or rejection by the imperial government. The judiciary is also organized on the same principles as that of England. By recent enactments of the imperial parliament the Canadian government has had conceded to it the management of its own administration, and has, in fact, become all but in name an independent state. The military protection of the Province is provided for by the imperial authorities.

40. The following table exhibits a statement of the provincial revenues and expenditures for the several years beginning with 1842 and ending with 1857:

Years.	Net Revenue.* Customs.	Excise.	Pub. Works.	Territorial.	Bank Impposts.	Casual.	Total.	Expenditures. Public Debt.	Total Expen.
1842	265,387	31,925	16,370	25,795	10,277	15,851	365,605	79,644	374,482

1853	986,598	22,523	77,640	64,148	23,054	21,211	1,195,173	227,384	777,414
1854	1,168,018	17,238	50,461	71,216	26,771	35,602	1,369,306	226,182	954 962
1855	813,819	16,761	36,242	76,330	22,459	53,448	1,019,059	219,471	1,111,464
1856	1,028,905	20,582	51,765	25,656	22,143	89,665	1,238,666	225,224	1,105,228
1857	898,938	26,972	34,655	34,556	18,845	56,297	1,070,263	281,036	1,274,301

—the expenditures are ranged under sixteen heads, and the amounts expended under each in 1857 were as follows: interest on public debt £281,036, civil government £74,583, administration of justice £137,740, provincial penitentiary £17,949, legislature £128,959, education £110,009, agricultural societies £22,518, hospitals and other charities £46,605, public works £93,278, militia £48,733, maintenance of light-houses and coast-service £34,269, emigration £5,809, pensions £11,673, Indian annuities £8,855, sinking-fund, etc., £73,000, and miscellaneous £179,284.

41. The public debt of the Province on account of provincial works, and exclusive of loans, etc., on the 31st December of each year since 1841, has amounted to the following sums: 1841, £1,411,239; 1842, £1,588,212; 1843, £2,179,050; 1844, £2,944,004; 1845, £3,341,173; 1846, £3,595,432; 1847, £3,751,818; 1848, £3,873,314; 1849, £4,085,634; 1850, £4,512,468; 1851, £4,451,961; 1852, £4,666,193; 1853, £4,621,290; 1854, £4,353,949; 1855, £4,310,636; 1856, £4,703,303; and 1857, £5,367,564. The total amount of liabilities on the 31st December, 1857, was £15,789,210, of which £5,367,564 (as above) was the absolute debt incurred in the prosecution of provincial works, and includes the imperial guaranteed loan of £1,825,000 and debentures, payable in London £2,871,722 and in Canada £670,842; £7,716,163 provincial debentures loaned to municipalities and railroad companies; £703,518 special funds variously invested, and £2,001,963 miscellaneous liabilities. The three last-named sums, amounting to £10,421,646, constitute the contingent debt of the Province.

42. Education in Canada is receiving increased attention, especially in the western district, and schools are now open to all classes. The following abstract from the school returns of 1851 and 1856 exhibits the schools then in existence and the progress of the development of educational means between the two periods:

Classification.	CANADA WEST. Schools. 1851.	1856.	Scholars. 1851.	1856.	CANADA EAST. Schools. 1851.	1856.	Scholars. 1851.	1856.

—the total of funds raised for educational purposes in Canada West was—in 1851, £154,218, and in 1856, £336,192; and in Canada East in 1851, £68,897, and in 1856, £ ? .

43. Of the whole people, one half are Roman Catholic, the greater part Lower or French Canadians, and the remainder chiefly Irish and their descendants; one seventh belong to the Church of England, and of these five sixths are found in Canada West; one eighth are Methodists, of which nine tenths are in Canada West; one tenth are Presbyterians, and one thirty-seventh Baptists, both most numerous in the western district. The remainder of the population is divided among a large number of minor sects, among which unclassed Protestants, Lutherans, Congregationalists, Quakers, Mennonites, and Tunkers are the most extensive. These several denominations are all legally on an equality and equally protected, none having privileges over others, and hence a marked tolerance and Christian feeling exists among them. The clergy, as a body, are hard-working and zealous, and many of them have attained high positions for learning and literary ability.

44. In Canada West the principal places are the cities of Toronto, Hamilton, Kingston, and Ottawa, and the towns of London, Belleville, St. Catherine's, Brantford, Cobourg, Dundas, Niagara, etc. In Canada East, Montreal and Quebec hold the first rank, and of minor importance are the towns of Three Rivers, St. Hyacinthe, Sherbrooke, Sorel, etc.

45. Toronto,* the provincial capital, occupies a rather low site on a beautiful and nearly circular bay on the north shore of Lake Ontario, with which the bay communicates by a narrow entrance, and from which it is separated by a low sandy belt, nearly five miles long. Latitude 43° 39′, and longitude 79° 21′. The town, which is in the form of a parallelogram, is built with great regularity, and the streets are generally well paved, spacious, and lighted with gas. The houses are for the most part substantial, and in the principal thoroughfares have often an elegant appearance. Public buildings are numerous, among which may be specially named the Episcopal and Roman Catholic cathedrals, the City Hall, the Normal and Model schools, the Lunatic Asylum, etc. Other important buildings and institutions are the University and the Upper Canada and Trinity colleges, the Parliament Houses, the Government House, etc. Toronto is also the seat of St. Michael's (Roman Catholic) College, Knox College, the Congregational Institute, the United Presbyterian Divinity Hall, the Toronto Academy, and a county grammar school. The principal scientific and literary institutions are the Observatory, the Canadian Institute, the Atheneum, and the Mechanics' Institute. There are also various hospitals and charitable establishments, markets, etc. Toronto has numerous manufactories, among which are founderies, tanneries, breweries, distilleries, furniture, starch, glue, soap and candle factories, ropewalks, paper and flour mills, etc. The harbor, which admits vessels of the largest size navigating the lakes, is remarkably well sheltered, and affords great facilities for its extensive and increasing trade; and commerce is not only fostered by the numerous steamboats which connect it with other towns both in Canada and the United States, but from Toronto, as a center, railroads diverge east and west, and to the north as far as Lake Huron, affording vast facilities to inland trade and travel. The railroads diverging hence are the Grand Trunk, for Quebec and Portland east and Stratford and Sarnia west; the Great Western, for Niagara and Detroit, etc., and the Ontario, Simcoe and Huron, for Collingwood, at which place connection is made with steamers for Sault Ste Marie and places on lakes Michigan and Superior. Lines of steamers ply regularly to all the Canadian lake ports, and also to Rochester, Oswego, etc., on the American side of the lake. The population, which in 1841 was only 15,336, had increased in 1851 to 30,775, in 1856 was estimated at 51,000.

CITY OF TORONTO.

From "Hunter's Panoramic Guide of the St. Lawrence." By permission of the publishers, J. P. Jewett & Co.

46. Hamilton is beautifully situated at the western extremity of Burlington Bay, near the shore of Lake Ontario. The construction of the Burlington and Des Jardins canals, and of the several railroads (to Niagara, Toronto, and Detroit) centering in the town, have much promoted its prosperity. The streets

CITY OF HAMILTON.

10 * Not including expenses of collection, etc.

* The permanent capital is to be located at Ottawa City.

are well laid out, and many of the houses are built of stone. It contains a court-house, town-hall, custom-house, theater, news-room, mechanics' institute, and other public buildings, and places of worship for the principal sects. It is a place of great commercial importance, and is rapidly becoming a first-rate city. Steamboats ply regularly to and from all the principal lake ports, and every facility is otherwise afforded for interior communications by its railroads, etc. Population (1851) 14,112, and (1856) 22,440.

47. Kingston is advantageously situated at the outlet of the Rideau Canal and Cataraqui River (here crossed by a bridge 600 yards long), and is important in a military as well as a commercial point of view, being the key of the central St. Lawrence, as Quebec is of the river's seaward extremity. In its neighborhood is Navy Bay, a narrow and deep inlet of Lake Ontario, and which is the chief naval station on the lakes. The principal public buildings are the City Hall, containing also the post-office and a market, the Presbyterian College, a hospital, etc., and several handsome churches. Ship-building is carried on, and also several manufactures; and the place has a considerable commerce. The Grand Trunk Railroad passes through the city, and it is also connected by steamboat with all other principal towns. In 1851 it contained 11,585, and in 1856, 17,759 inhabitants. In the vicinity there are several mineral springs.

CITY OF KINGSTON.

48. Ottawa City (formerly Bytown), on the Ottawa, at the junction of the Rideau Canal with that river, and 92 miles northeast of Kingston, is divided into the upper and lower towns—the former the aristocratic and the latter the business portion of the city. It contains several handsome public buildings, churches, etc., and the scenery in the neighborhood is, next to that of Niagara, the finest in Canada. The Chaudiere Falls, a short distance above the city, are beautiful, and below these a handsome suspension bridge crosses the river. The trade of the city is chiefly in lumber. It is connected by railroad with Prescott, opposite Ogdensburg, and a railroad is being built to Montreal on the northeast side of the Ottawa. Population (1851) 7,760, and (1856) 12,155.

49. London is finely situated at the junction of two branches of the river Thames, 114 miles by railroad from Toronto, and between that city and Detroit. It is one of the most thriving towns in Canada West, and has extensive manufactures and a considerable local trade. Population (1856) 14,960. The Port Stanley Railroad connects it with Lake Erie, and the Grand Trunk also comes in here, and a railroad is also in progress to Saugeen, on Lake Huron. Belleville, on the Bay of Quinté, is a place of considerable trade, and the point whence the Grand Junction Railroad leaves the Grand Trunk. St. Catharine's, on the Welland Canal, is also a trading town, and exports flour. Brantford, on the left bank of Grand River, has extensive manufactures, and is one of the principal towns on the Buffalo and Lake Huron Railroad. A canal about two miles and a half long enables vessels of moderate draught to pass the falls of the river and reach the town. Cobourg, on Lake Ontario, is a well-built town, and has several manufactures and a considerable trade. Here the Cobourg and Peterboro' Railroad leaves the Grand Trunk and lake navigation. Victoria College has its seat in this town. Dundas is a manufacturing town about five miles from Hamilton, and owes its prosperity to its extensive water-power. In the immediate vicinity are splendid quarries of freestone and limestone, the stone of which is largely exported. Niagara, on the west bank of the river so called, at its mouth in Lake Ontario, is well-built, has a brisk trade, and is a principal depôt of the lake line of steamboats. The Harbor Company have extensive ship-yards at this place. Under the name of Newark it was for a short period the capital of Upper Canada, and has long been famous for its cider. The Ontario and Erie Railroad connects it with the upper lakes. Brockville, on the St. Lawrence, and on the Grand Trunk Railroad, 48 miles east of Kingston, is a finely-built town, and has manufactures and a thriving trade. A railroad hence is being built to Arnprior and Pembroke on the Ottawa River, with a branch to Perth.

50. Of the other towns of Canada West the principal are: Amherstburg, a garrison town on the Detroit River; Barrie, on Lake Simcoe, and on the railroad between Toronto and Collingwood; Chatham, on the Thames; Cornwall, at the terminus of the Cornwall Canal on the St. Lawrence; Goderich, on Lake Huron, at the entrance of the Maitland River, and at the western end of the Buffalo and Lake Huron Railroad; Guelph, on the Grand Trunk Railroad; Perth, on the Tay, and connected with the Rideau Canal by a branch 11 miles long; Peterboro', on the Trent, and connected by railroad with Cobourg; Pictou, on the Bay of Quinté, a manufacturing and commercial town; Port Hope, on Lake Ontario, 8 miles from Cobourg, and connected by the Port Hope, Lindsay, and Beaverton Railroad with the interior; Prescott, on the St. Lawrence River and Grand Trunk Railroad, opposite Ogdensburg, and connected also by railroad, with Ottawa City; Sandwich, on the Detroit River; Woodstock, a trading town, etc.

51. The principal villages in the Western District are—Chippewa, on the Niagara River, and the present terminus of the Ontario and Erie Railroad; Galt, on the railroad connecting the Great Western and Grand Trunk lines at Guelph and Harrisburg; Paris, a thriving place at the crossing of the Great Western, and Buffalo and Lake Huron railroads; St. Thomas, on the London and Port Stanley Railroad; Preston, on the railroad four miles north of Galt, and from which the road bifurcates to Guelph and Berlin; Thorold, on the Great Western Railroad and on the Welland Canal, etc.

52. Montreal is the largest city of Canada East. It is situated at the head of ship navigation on the St. Lawrence, and on the east side of the island o. Montreal, in latitude 45° 30′, and longitude 73° 35′. The island, which is at the confluence of the Ottawa, is 32 miles long and about 10 miles broad at its widest part, and generally level, and watered by numerous small streams. Behind the town, however, there is a hill of considerable elevation, and from this its name, Montreal or Mont Royal, is derived. The city contains several handsome streets, and its houses are substantially built, generally of stone. The principal buildings are the Government House, the Court House, the Ordnance Office, the banking houses, the General Hospital, and the market-houses; the Hotel Dieu, a large conventual establishment; the Catholic Cathedral, the finest ecclesiastical structure in British America; the Montreal and McGill colleges, the Royal Grammar School, etc. Seminaries, schools, public libraries, and public charitable institutions are numerous. A colossal statue of Nelson, on a Doric column, adorns one of the squares. Montreal has an increasing and valuable trade and several important manufactures. Its harbor, though not large, is very safe and convenient, and ships of 600 tons burden can receive and discharge their cargoes at the quays. Its communication with the river and lake ports is provided for by regular lines of steamboats, and it is also a principal railroad center, from which diverge lines east to Quebec, etc., southeast to Portland and New England generally, south to New York, and west to Toronto, Detroit, etc.; and a line is being built on the north-east side of the Ottawa to penetrate the regions about Lake Superior. With these facilities for intercommunication the city is rapidly rising in the scale of importance, and within the five years ending with 1856 its population has increased from 57,715 to about 75,000. The Victoria Bridge, which here spans the St. Lawrence, is one of the most stupendous structures ever projected. Its completion will be of vast advantage to the commerce of the city.

CITY OF MONTREAL.

From "Hunter's Panoramic Guide of the St. Lawrence." By permission of the publishers, J. P. Jewett & Co

53. Quebec, the most ancient city of Canada, is situated on the north bank of the St. Lawrence, 410 miles from the sea, and 180 miles below Montreal, in latitude 46° 49′, and longitude 71° 14′. The river is here about a mile wide. Quebec is built on a promontory near the confluence of the St. Charles, terminating abruptly in Cape Diamond, which has a height of 362 feet, and on the low banks below the rocks along the margins of both streams. It thus comprises the upper and the lower towns. The upper town, on the summit of the promontory, is strongly fortified, the citadel occupying the highest elevation, and the whole position is so strong by nature that it is justly deemed all but impregnable. On the same plain with the upper town, to the west, lies the suburb of St. John, and to the southwest are the Plains of Abraham. The lower town lies under the cliffs along the St. Lawrence and St. Charles, and adjoining it on the west, on a flat on the latter stream, lies the suburb of St. Roche. The towns are connected by three gates, and two gates in addition lead out from the upper town to the Plains. The streets of the city are, as a whole, narrow, irregular, and fre-

quently steep, excepting in the suburbs, which are modern and built upon a more regular plan. The houses are principally of stone or brick, and their roofs, generally of a high pitch, impart

CITY OF QUEBEC.

a quaint and antique appearance to the city. The streets are lighted with gas, and water is brought to the city from Lake St. Charles. The lower town is the great seat of business; the banks of both rivers are lined with warehouses, and with wharves jutting about 200 feet out into the streams, along which the largest vessels can moor. The basin of the river immediately below the city affords excellent anchorage. The principal buildings in respect of architecture are the old Parliament House, the Roman Catholic and Protestant cathedrals, and the Scotch Free Church. Other important structures and institutions are the Hotel Dieu Nunnery and Hospital, the Ursuline Convent, the French College, the General and Marine hospitals, the Exchange, Public Library, Museum of the Literary and Historical Society, and the Barracks, formerly the Jesuit College. On the Plains of Abraham a column 40 feet high has been erected to the memory of Wolfe, and in the upper town a handsome obelisk, on a granite pedestal 65 feet high, to the joint memory of Wolfe and Montcalm, both of whom fell at the capture of the city. Quebec has several important manufactures, but is chiefly noted as the first commercial port of the Province and for its ship-building establishments. It is also the chief seat of the Canadian winter trade, and also of the timber trade. The city was founded in 1608 by Champlain, fortified in 1690, and remained in the possession of the French until 1759, when it fell into the hands of the British in consequence of Wolfe's famous victory on the Plains of Abraham. The winter of Quebec is as severe as in the center of Russia, and the summer as warm as in the south of Italy. The inhabitants are mostly of French descent, the French language is that generally spoken, and a large majority of the people profess the Catholic religion. This city is connected with Montreal and the ports of the United States by railroad, and other lines are being built to connect it with Halifax and St. Andrew's on the east. The population, which in 1851 amounted to 42,052, had increased to 60,000 at the end of 1856.

54. Three Rivers is situated at the confluence of the St. Maurice with the St. Lawrence, midway between Quebec and Montreal, and is one of the principal depôts of the North-West traders, and is otherwise a place of considerable commercial importance. It has a brisk trade in pot and pearl ashes, and near by are iron mines, which will ultimately contribute to its prosperity. Ste Hyacinthe is situated on the left bank of the Yamaska, about 30 miles east-by-north from Montreal, and is the seat of a college. Sherbrooke is built at the junction of the Magog and St. Francis rivers, and has extensive water-power. Sorel or William Henry, at the confluence of the Richelieu, is likely from its advantageous situation to become a very important town. By the Chambly Canal there is a communication between Lake Champlain and the St. Lawrence at Sorel, and there is also a railroad on the same line of route. Besides Quebec and Montreal the only sea-ports are Amherst, on the Magdalen Islands; Gaspé, on the bay of the same name, an arm of the Gulf of St. Lawrence, south of Cape Gaspé and New Carlisle, on the Bay of Chaleurs.

55. Canada is said to have been discovered by Giovanni Caboto, a Venetian, holding a commission from Henry VII. of England, in 1497; but immediately afterward fell into the possession of France. It was not, however, until 1544 that the first European settlement was formed; in which year Jaques Cartier, a French navigator, sailed up the St. Lawrence and wintered at St. Croix harbor. In 1608 a permanent settlement was made on the present site of Quebec, Canada then being called New France; and in 1632 the title of France to the country was formally recognized by the treaty of St. Germains.

56. From this period until 1759 the French continued to occupy the country; but in that year an English army under General Wolfe captured Quebec, and within a short period thereafter all other places within the government were surrendered to the British, and by the treaty of Paris in 1763 ceded in full. In 1774 a council of not less than 19 nor more than 23 members was authorized to administer the affairs of the Province; and in 1791 Canada was divided into two separate provinces, called Upper and Lower. By the act authorizing this division the governor was empowered to summon 15 councilors in Lower Canada and 7 councilors in Upper Canada; and the administration of the latter was intrusted to a lieutenant-governor. Houses of assembly were at the same time formed to consist of not less than 50 members in Lower nor than 16 members in Upper Canada, to be elected by qualified voters, who in counties were freeholders to the value of 40 shillings per annum, and in towns £5 householders or £10 householders. In 1830 the franchise was granted to foreigners (qualified as above) after a five years' residence in the colony.

57. In consequence of the Rebellion, the constitution was suspended in Upper Canada in 1838, and a special council appointed. In 1840 Upper and Lower Canada were reunited, and a legislative council of the united provinces consolidated. This council was to consist of not less than twenty (and has, in fact, numbered forty-seven) members appointed for life, ten, including the speaker, to be a quorum. The house of assembly, constituted at this time, consisted of 42 members from each district, elected for four years. The qualifications required by the act establishing these dispositions for members of assembly were the possession of a freehold of the value of £500 sterling and a sworn allegiance to the crown.

58. Municipal institutions were established in 1840 for the management of local affairs. These are district councils, composed of representatives of a number of townships elected by the householders. The presidents of these councils are wardens appointed by the crown, and the meetings are held quarterly.

59. The present constitution of Canada is defined by three acts of Parliament, all of which were assented to on the 14th July, 1853. By the first of these, entitled "An act to enlarge the representation of the people," certain new constituencies were created, and several of those already existing were subdivided or reconstructed. The result is, that the two districts now consist of 127 electoral divisions (counties, ridings, and towns included), returning altogether 132 members to the assembly. By the second of the above-mentioned acts, entitled "An act to extend the elective franchise, etc.," a system for the registration of voters is ordained, and the qualifications of voters reduced to £7 10*s.* in cities and towns and £5 in the rural districts. The third act is entitled "An act, etc., for the better securing the independence of the assembly." By this it is provided that no office-holder nominated by the crown shall be eligible for the assembly except members of the executive council and heads of departments. The qualifications for members of the house remain as fixed in 1840.

60. Hitherto the members of the legislative council had been nominated by the provincial governor; but in 1854 an act of Parliament was passed which empowered the provincial legislature to constitute the council an elective body. This change was effected in 1856.

[*Weights, Measures, and Moneys.*—Same as in the United Kingdom. The pound (£) currency, however, is equivalent only to $4. In Canada East the old French denominations of weights and measures are still to some extent in use.]

PROVINCE OF NEW BRUNSWICK.

1. New Brunswick is situated between latitudes 45° 5′ and 48° 4′ north, and longitudes 63° 53′ and 67° 47′ west; and is bounded on the north by Canada and the Bay of Chaleurs; on the east by the Gulf of St. Lawrence and Cumberland Strait; on the southeast by Nova Scotia (with which it is connected by a narrow isthmus); on the south by the Bay of Fundy, and on the west by the St. Croix River and the east line of the State of Maine. The greatest length of the country, north and south, is 208 miles, and width from 100 to 180 miles. The area is computed at 27,704 square miles.

2. Along the shores of the Gulf of St. Lawrence, and for 10 or 12 miles inland, the country is low and marshy; the southern front is bolder; but on both sides there are numerous fine ship harbors and deep bays. The interior presents a series of bold undulations, sometimes rising into mountains or continuous ridges of high land. The latter, however, are seldom of any considerable elevation, but from their precipices and ravines contrast strikingly with the rich valleys which alternate with the more rugged scenery.

3. New Brunswick can everywhere be penetrated by its streams, and in some parts of the interior the sources of rivers flowing in opposite directions are separated only by short portages. The principal rivers are the St. John, Peticodiac, and St. Croix, all discharging through fine bays into the Bay of Fundy, and the Ristigouche, Miramichi, and Richibucto, flowing into the Gulf of St. Lawrence. Nearly one half of the surface belongs to the basin of the St. John and a fourth to that of the Miramichi. All these are noble navigable rivers; and there are many others of smaller capacity flowing directly into the ocean. Lakes are numerous, but generally of small extent. Grand Lake, on the eastern boundary, is 30 miles long and from 3 to 9 miles wide, and communicates with the river St. Croix. Most of the other lakes are the sources of tributaries of the St. John and Miramichi.

4. Along the shores facing the Bay of Chaleurs and the Gulf gray sandstone and clay slates predominate, with detached rocks of granite, mica, quartz, and iron-stone; and on the south coast, along the Bay of Fundy, limestone, graywacke, clay slate with sandstone, interrupted occasionally by gneiss, trap, and granite. Amethyst, carnelian, jasper, etc., are found in various places. Extensive veins of coal, lying a few feet above the water-level, and running horizontally, exist on the shores of Grand Lake, and coal is also found on the Salmon River. Iron ore and copper, plumbago, and manganese are abundant, and near the Chignecto basin gypsum and grindstone are found in inexhaustible quantities. Salt springs are found in several districts.

5. The climate of New Brunswick is subject to great extremes of heat and cold, but is eminently salubrious and not adverse to agricultural pursuits. The severest cold of winter usually continues from the solstice to the spring equinox. The summers are comparatively short but very hot. The coast is frequently visited by dense fogs from the south, which penetrate 15 to 20 miles inland. The fall is a season of exceeding beauty, the air being dry and clear, and the woods glowing with innumerable tints of the richest and most brilliant hues.

6. Of the soil and capabilities of New Brunswick it is scarcely possible to speak too favorably. The mineral matters produced by the decomposition of the rocks contain every ingredient requisite for the formation of a good soil; and few countries are better watered or drained. A large portion of the surface is covered with dense forests of pine, hackmatack, cedar, etc.,

and all fruit-trees acclimatable in the northern half of North America thrive here; but the peach can scarcely accommodate itself to the short summers, nor Indian corn be cultivated with success. The smaller cereals, as rye, oats, barley, and summer wheat ripen perfectly, and potatoes, turnips, and the common legumes find a climate and soil peculiarly adapted for their complete development. The most profitable crop, however, is grass, which occupies about four fifths of the land on every large farm. Agriculture, however, has hitherto made but small progress in the Province, and the demand for food in ordinary years is far beyond the supply raised on the soil. The inhabitants, indeed, find a more profitable pursuit in the lumbering business. The quantity of land under culture in 1841 was 426,611 acres, and in 1851, 643,954 acres, or at the latter period less than one twenty-eighth part of the total area.

7. Manufactures, with the exception of the preparation of lumber for market and ship-building, are limited almost exclusively to articles of primary necessity. In 1851 there were in the Province 584 saw-mills, 261 grist-mills, 125 tanneries, and 11 founderies, with several other establishments, as breweries and distilleries, weaving and carding shops, etc. The amount of lumber floated down the rivers is immense, and constitutes the staple of export. In the same year 34,350 tons of shipping were built. Mining and quarrying are also carried on to some extent, and contribute materially to the general commerce; coal, iron, lime, granite, and gypsum being largely exported. The gulf and bay fisheries are also valuable, and in the fishing season about 500 provincial vessels engage in this pursuit. This, however, conveys but a very imperfect idea of the extent of these fisheries, as vessels from the United States are much more numerous in these waters than those of New Brunswick.

SHIP LAUNCH.

8. The great extent of sea-coast and the many fine harbors furnish admirable facilities for commerce. The principal exports are the rough productions of the country, chiefly timber, fish, etc., and the chief imports, breadstuffs and salted meats, colonial produce, and manufactures generally. In 1851 the exports were valued at $3,860,120, and the imports to $4,901,200. In the same year 2,981 vessels (538,528 tons) were entered, and 3,058 vessels (489,150 tons) were cleared; and there were 775 vessels, measuring 117,475 tons, owned within the Province. The ports open to foreign commerce are St. John and St. Andrew's, on the Bay of Fundy; Miramichi and Richibucto, on the Gulf of St. Lawrence, and Bathurst and Dalhousie, on the Bay of Chaleurs.

9. The internal trade of the colony is comparatively extensive, and few countries have greater facilities of transport. Its rivers are unsurpassed for steam navigation. On the St. John steamers ascend to the Grand Falls, 225 miles, and are there interrupted by a cataract, the waters of which have a perpendicular descent of 80 feet; but steamers also navigate its upper waters to the mouth of the Madawaska. The whole length of the river is 400 miles. The Miramichi is navigable for ships of 700 tons for 30 miles, and has a total length of 220 miles. The roads of the country are also respectable, and several railroads are being constructed. The only ones as yet completed are portions of the New Brunswick and Canada railroad (open from St. Andrew's to Woodstock, 90 miles), and of the European and North American Railroad, which is intended to connect Halifax by one branch with Canada and by another branch with the United States. Telegraphic wires extend on the one hand into the United States and on the other hand into Nova Scotia and Newfoundland; and by means of these news of a coming steamer is heralded from St. John's, N. F., or Halifax, N. S., and known in New York and New Orleans almost before its anchor is dropped.

10. New Brunswick is divided into 14 counties, the names of which, with the population in 1851, and capitals of each, are as follows:

Counties.	Population.	Capitals.	Counties.	Population.	Capitals.	Counties.	Population.	Capitals.
Albert	6,313	Hopewell.	King's	18,842	Kingston.	Sunbury	5,301	Magerville.
Carleton	11,108	Woodstock.	Northumberland.	15,064	Miramichi.	Victoria	5,408	Perth.
Charlotte	19,938	St. Andrew's.	Queen's	10,634	Gagetown.	Westmorel'd	17,814	Dorchester.
Gloucester	11,704	Bathurst.	Ristigouche	4,161	Dalhousie.	York	17,628	FREDERICTON.
Kent	11,410	Liverpool.	St. John	38,475	St. John.	Total	193,800	

—of the total population 99,526 were males and 94,274 females, and 191,626 were whites, 1,058 colored, and 1,116 Indian. The Indians are chiefly of the Micmac tribe, and reside in the north part of the Province. With regard to pursuits, 456 were engaged in the professions, 1,665 in miscellaneous employments not strictly manual, 1,292 in trade and commerce, 18,601 in agriculture, 6,822 in mechanical businesses and handicrafts, 1,451 in navigation and the fisheries, and 9,448 as laborers. In 1824 the total population was 74,176; in 1834, 119,457; in 1841, 156,162; in 1851, 193,800; and in 1856 about 220,000.

MICMAC INDIANS.

11. The colonial government is administered by a lieutenant-governor, appointed by the crown, and aided by an executive council of eight members. The legislature consists of a council of 17 members, to which the bishop of Frederickton belongs *ex-officio*, and an assembly of 39 representatives of the people. The system of responsible government was formally recognized by a vote of the provincial legislature, carried 24th February, 1848; and by an act of the 1st May, 1854, the public statutes were revised and consolidated. The judicial system is based on that of England. The revenues are derived chiefly from duties on imports, and amounted in 1851 to $487,424. The expenditures for the same year were $446,624. The public debt is very small.

12. The established religion is that of the Church of England, and the Province forms the diocese of Fredericton. The other principal denominations are the Established and Free churches of Scotland, the Reformed Presbyterian, Congregationalist, Wesleyan Methodist, Baptist, and Roman Catholic. In all there are about 460 churches. Schools are established in the parishes, and grammar schools in the counties; and there is a college at Fredericton. There are also other schools for instruction in the higher branches; but generally education has been greatly neglected, and not more than one in ten of the inhabitants were attending school in 1851.

13. The principal towns are Fredericton, St. John, St. Andrew's, Liverpool, Miramichi, Bathurst, etc. Fredericton, the capital, is situated on the St. John, 90 miles from the sea, and in latitude 45° 55′ and longitude 66° 38′. The streets are regular, and the houses generally built of wood. The public buildings are the Province Hall, the Government House, etc. Fredericton is a port of entry, and the chief entrepôt of the commerce with the interior. Population 4,458.

14. St. John is situated on a rocky point projecting into its harbor at the mouth of St. John River. Latitude 45° 14′, and longitude 66° 3′. The city is regularly laid out and well built, of brick or stone, but some of the streets are inconveniently steep. Many of the public buildings have a respectable and even elegant appearance. The harbor is capacious, safe, and never obstructed with ice, and has a good entrance two miles below the city. It is the entrepôt of a wide extent of country abounding in agricultural, mineral, and forest resources, and is the principal sea-port of the colony. In 1851 its exports were valued at $2,570,130, and its imports at $3,236,765; and the number of vessels built in the year was 72, of a capacity of 37,607 tons. Steamers ascend the river to Fredericton, Woodstock, etc., and a regular steam communication is maintained with St. Andrew's, Portland, etc. It has also telegraphic communication with Halifax, Portland, Boston, etc., and the European and American Railroad will connect it with the same places. The fisheries in the harbor are very valuable. St. John was founded by American loyalists, who left the United States at the close of the Revolution. Population 22,745.

15. St. Andrew's is a sea-port at the northeast extremity of Passamaquoddy Bay. It is conveniently situated for commerce and especially for the fishing trade, which is carried on here to a large extent. The lumber trade and ship-building also employ a large portion of the inhabitants. The harbor is entered by two passes leading from the mouth of the river Schoodic, and has a depth sufficient for the largest vessels. The New Brunswick and Canada Railroad, now open to Woodstock, 90 miles, when completed will connect St. Andrew's with the railroad system of Canada. Population about 8,000. Woodstock is a flourishing town on the St. John, 65 miles northwest from Fredericton. In the vicinity there are inexhaustible iron mines, and the ores of manganese are also abundant.

16. Liverpool, on Richibucto harbor, is the center of an important trade in timber, etc., and is a safe and commodious port. Miramichi, at the head of the harbor of the same name, has also a large trade in timber and fish. The river at its mouth is nine miles wide. Below, on opposite sides of the bay, are Newcastle and Chatham, both eligible ports. Bathurst, at the head of Nipisignit Bay, an arm of the Bay of Chaleurs, has a well-sheltered harbor, and is the principal sea-port for the northern districts. Dalhousie, at the entrance of the Ristigouche into the Bay of Chaleurs, is a fine timber port.

17. New Brunswick was first settled by the French in 1639, and, with Nova Scotia, formed part of Acadia or New France. It was ceded to the English by the treaty of Utrecht in 1713, but until the final overthrow of the French power in North America, in 1758 and 1759, the British could not be said to have peaceable possession of the country. The first settlement of British subjects was effected in 1761, and afterward, in 1783, many of the troops (Hessians) disbanded at the close of the American Revolution settled on lands granted them by the government. In 1784 New Brunswick (which to that date had formed a part of Nova Scotia) was erected into a separate colony, and, by royal charter, a constitution was granted to the inhabitants, which, to the present day, has not been materially altered.

[*Weights and Measures.*—British Imperial System. *Money*—Colonial pound (£ currency) = $4 00.]

PROVINCE OF NOVA SCOTIA.

1. NOVA SCOTIA is situated between latitudes 43° 26′ and 47° 5′ north, and longitudes 59° 48′ and 66° 16′ west; and is bounded on the north by Cumberland Strait and the Gulf of St. Lawrence; on the east, southeast, and south by the Atlantic Ocean; on the west by the Bay of Fundy, and on the northwest by New Brunswick, with which it is connected by a narrow isthmus. Its greatest length, northeast and southwest, is about 280 miles, and its breadth varies from 60 to 120 miles. The area is computed at 18,746 square miles.

2. The Province consists of three distinct portions—the peninsula of Nova Scotia, the island called Cape Breton, and Sable Island. The last named lies immediately east of Halifax, in Nova Scotia, in longitude 60° west, and in the track of vessels bound to and from Europe. In length about 30 miles and in width from 1 to 2 miles, it is shaped like a bow, diminishing at both ends, and at most is but a hard sand-bank, and an obstruction in the ocean to be avoided by the mariner.

3. Nova Scotia, the largest section of the Province, lies almost parallel with the southern

coast of New Brunswick. It has a remarkably broken coast, and, especially in the southeast, presents a vast number of capacious harbors and excellent sea-ports. The interior forms a table-land of moderate elevation, some portions of which have a hilly surface, and contain numerous small lakes, but to the southwest, around Annapolis, the country is a beautiful and fertile plain. The most remarkable body of water in Nova Scotia is the Mines Basin, an arm of the Bay of Fundy, penetrating 60 miles inland, and terminating in Cobequid Bay. The tides here rush in with great impetuosity, and form what is called the "bore." The other principal bays are those of St. George and Chedabucto in the east, St. Mary's and Townsend in the west, and Mahone and St. Margaret's on the south coast. The Annapolis is the largest river, and has a length of 100 miles, and is navigable for larger vessels for 40 miles from the Bay of Fundy. The other principal rivers are the Shubenacadie, which, by means of a canal, opens communication between Cobequid Bay and Halifax harbor; the Musket and Clyde, in the south; the Mersey, falling into Liverpool harbor; and the Musquedoboit and St. Mary, falling into the Atlantic east of Halifax. Most of these rivers are navigable a short distance from their mouths.

SAMBRO LIGHT—ENTRANCE TO HALIFAX HARBOR.

4. Cape Breton Island lies to the east of Nova Scotia, and is divided from it by a narrow channel called the Gut of Canso. This strait is only three fourths of a mile wide; but it is a deep and safe channel, and affords the best passage for ships bound to and from Prince Edward Island and other places in the Gulf of St. Lawrence. The island is of a very irregular shape, and greatly indented with bays. An inlet, called Bras d'Or, entering it on the east, nearly separates it into two islands, rendering every part of its interior accessible by water. The two divisions thus created are in striking contrast: the northern portion being high, bold, and steep, while that to the south is low, intersected by numerous inlets, diversified, and rises gradually from its interior shore until it presents abrupt cliffs toward the Atlantic Ocean. The highest land in this portion does not exceed 800 feet, while the northern division, at its termination in North Cape, rises to the height of 1,800 feet. Between North Cape and Cape Ray, on the opposite coast of Newfoundland, 48 miles distant, is the main entrance to the Gulf of St. Lawrence.

5. Both the mainland and the island abound in minerals and are extremely rich in coal, iron, copper and silver, lead, manganese, etc. Coal and iron are extensively mined, both in Nova Scotia and Cape Breton. Building stone is also largely quarried and exported, and there is also abundance of roofing slate, grindstone, gypsum, etc. Beautiful agates, amethysts, chalcedonies, jaspers, etc., abound in various localities.

6. The climate is remarkably temperate; the insular position of the Province, and the proximity of the Gulf Stream serving to render the temperature milder and more equable than that of Canada. The springs, however, are tedious; but the summer heats being for a brief period excessive, vegetation is singularly rapid; and the autumns are delightful. Dense fogs are prevalent along the Atlantic.

7. The Province is divided into eighteen counties, the names of which, and the population in 1851, were as follows:

Counties.	Population.	Capitals.	Counties.	Population.	Capitals.	Counties.	Population.	Capitals.
Annapolis.....	14,285	Annapolis.	Halifax	39,112	HALIFAX.	Queen's.....	7,256	Liverpool.
Cape Breton*	27,580	Sidney.	Hants	14,330	Windsor.	Richmond*...	10,381	Arichat.
Colchester	15,469	Truro.	Inverness*....	16,917	Port Hood.	Shelburne	10,622	Shelburne.
Cumberland...	14,339	Amherst.	King's.....	14,138	Kentville.	Sidney.....	13,467	Antigonish.
Digby	12,252	Digby.	Lunenburg ...	16,395	Lunenburg.	Victoria*	†	Bedeque.
Guysboro'	10,838	Guysboro'.	Pictou.....	25,598	Pictou.	Yarmouth	13,142	Yarmouth.

—making a total of 276,117, of which 270,153 were white and 4,903 colored persons, and 1,056 Indians, and 137,677 were males and 138,440 females. With regard to pursuits, 576 were engaged in the learned professions, 2,415 in trade and commerce, 3,200 in manufactures, 8,895 as mechanics, 31,604 as farmers, 9,927 in the fisheries; 3,961 as seamen, and 1,254 in lumbering. The population in 1806 was 67,515; in 1817, 91,913; in 1827, 142,578; in 1837, 208,237; in 1851, 276,117; and in 1856 about 320,000.

8. The agricultural capacities of Nova Scotia are very great. But little of its soil is inferior, and much of a rich alluvial quality, and frequently even the hilltops are highly productive. In 1851 the quantity of land under cultivation was 539,322 acres, of which 40,012 acres were "dyked" marshes, or reclaimed alluvial lands, chiefly at the head of the Bay of Fundy. The principal cereals produced are oats, wheat, barley, and buckwheat; and the potato and turnip crops are large. Livestock is abundant and of excellent breeds. In the western counties there are extensive apple orchards, and apples and cider enter largely into the export trade.

9. Manufactures are as yet limited to articles of prime necessity. Coarse cloths, called "homespun," are made by the farmers, and also coarse flannels, sheeting, blankets, etc. Tanning is also extensively carried on, and in the towns and villages boots, shoes, saddlery, harness, furniture, and agricultural implements are made in large quantities. In the neighborhood of Halifax tobacco, confectionery, paper, hats, etc., are manufactured. In 1851 there were in the colony 10 steam mills or factories, 237 tanneries, 9 founderies, 81 carding and weaving establishments, 17 breweries, and 131 other establishments, besides 1,153 saw-mills and 398 grist-mills. Ship-building is also somewhat extensively engaged in, and from 30 to 40 vessels (chiefly small) are built in the colony every year.

10. The fisheries, both of Nova Scotia and Cape Breton, are very valuable, and are systematically prosecuted. In 1851 there were fitted out at the various ports for the coast and deep sea fisheries 812 vessels and 5,161 boats, with 30,154 nets and seines. The products in that year were valued at nearly a million dollars. In this branch of industry Nova Scotia is only excelled by Newfoundland; but here also the mackerel and herring fisheries, which claim little attention in the last-named colony, are extensively pursued. The Bay of Fundy is also a valuable ground for the Massachusetts fishermen, and large fleets of American boats are seen during the season at this station.

11. The commerce of Nova Scotia depends chiefly on its mines, forests, and fisheries for material. Agriculture produces little more than is required for consumption, and manufactures nothing for export. The leading articles of export are coal; codfish, herrings, and mackerel; oil; horned cattle and butter; timber, potatoes, etc. In 1852 the total value of exports was $4,752,800, and in the same year the imports, consisting chiefly of cordage, cotton goods, fishing gear, flour, hardware, colonial produce, etc., amounted to $5,969,595. The products of the colony are sent chiefly to Canada, the West Indies, and the United States, and the importations are mainly from Great Britain, the United States, and Canada. No less than 43 home ports are engaged in this trade, the most important of which are Halifax, Pictou, Yarmouth, Arichat, Sidney, Liverpool, Weymouth, Digby, etc.

12. The domestic trade is chiefly carried on by coasting vessels, which penetrate the harbors and rivers. The railroad now being built from Halifax will be extended to Pictou, Amherst, and Windsor. It is now in operation to Truro. The main object of this line, however, is to connect Halifax with the United States, and for this purpose it will form a junction at Amherst with the European and North American Railroad, which, passing through New Brunswick, meets the American system at Calais, in Maine. Halifax is also a principal sea terminus of the American system of telegraphs.

13. The people of Nova Scotia are chiefly of British origin. Of the aboriginal races there are now but few left. Lunenburg County is chiefly inhabited by a colony of Germans and Swiss, who emigrated from Rotterdam in 1753, and there are also several settlements of French Acadians. Time, however, has fused all nationalities. The five largest religious bodies are the Episcopalians, Presbyterians, Roman Catholics, Methodists, and Baptists. Of these the most numerous are the Roman Catholics and Presbyterians, next the Episcopalians, and then the Baptists and Methodists. Education is pretty widely and generally diffused among the people; in 1851 there were 31,354 children attending 1,096 schools.

14. Public affairs are administered by a lieutenant-governor, aided by a council of six members appointed by the crown. The legislature consists of a council of 19 (including the chief-justice and bishop *ex-officio*) members appointed by the governor, and an assembly of 51 members, elected from the counties and chief towns. Electors must be house or land holders to the value of 40 shillings per annum. Justice is administered by district courts and high courts established at the capital. The laws in force are the common and statute laws of the United Kingdom and the statute laws of the Province, which latter were revised and codified in 1851. The system of responsible government was introduced in 1848. The revenue of the colony in 1851 amounted to $350,020, and the expenditures to $338,994. The public debt at the same time amounted to $351,559.

15. Halifax, the capital, is situated on the south coast, nearly equidistant from the extremities of the peninsula, in latitude 44° 39′ 42″, and longitude 63° 35′ 30″. The city is built on a declivity on the west side of a deep inlet of the sea, and, including its suburbs, is between two and three miles long and nearly a mile wide. The streets are spacious and regular, and the houses generally well-built. The chief public edifices are the Province Building, the Dalhousie College, Military Hospital, Exchange, etc. The dock-yard, covering 14 acres, is one of the finest in British America. The harbor extends 15 miles inland; in front of the city it is only a mile broad, but farther up the inlet expands into Bedford Basin, which has an area of 10 square miles, and is capable of accommodating the whole British navy. Besides being the principal sea-port of the colony, Halifax is also the chief naval station for the North American colonies, and is defended by strong forts and batteries. In 1852 its exports were valued at $2,941,030, and its imports at $4,699,320. Halifax has also several manufactures, and a large trade with the neighboring ports and the interior. It has regular steam communication with Europe, Newfoundland, the West Indies, and the United States, and in a short time it will be connected with both Canada and the Union by railroad as it now is by telegraph. Indeed, the position and capacities of the port promise much for its commercial importance. Population about 28,000.

CITY OF HALIFAX.

16. Among the other towns in Nova Scotia are Lunenburg and Liverpool, both on the coast to the southwest of Halifax; Yarmouth, on the southwest coast, at the entrance of the Bay of Fundy; Weymouth, Digby, and Annapolis, on the southeast side of the same inlet; Windsor, on the Avon; Truro, at the head of Mines Basin; Amherst, on the east branch of Chignecto Basin; Pictou, on the shore of Northumberland Strait; Antigonish, on the bay so called, and Guysboro', on Chedabucto Bay; Wilmot, on Cape Canso; Ship Harbor, on the south coast east of Halifax, etc. All these are sea-ports, and most of them engaged in the fisheries and many of them in a flourishing commerce. The only towns of note in Cape Breton are Sidney, on a bay off the northeast coast, and Arichat, on Isle Madame, off the south coast. The first is famous for its vast collieries and its large trade; the latter is also a flourishing trading port.

17. Nova Scotia was discovered by Cabot in 1497; but the French were the first actual settlers. Port Royal, St. Croix, etc., were founded early in the seventeenth century. In 1621 Sir William Alexander obtained from James I. a grant of the territory. The first immigrants under this charter arrived out in 1623. From this time efforts were made to drive out the French, but with only partial success; and by the treaty of Breda, 1667, the colony was absolutely ceded to that nation. Some progress was now made in establishing the fisheries and extending the fur trade. In 1689 the English re-took Port Royal, but again restored it

* In Cape Breton Island.

† Population included with that of Cape Breton County.

to France in 1696. In 1701 war again broke out; but it was not before 1710 that any effective efforts were made by the British to recover the country. An expedition for its capture sailed from Boston on the 18th September of that year, and Port Royal (now Annapolis) capitulated on the 29th; and by the treaty of Utrecht the colony was finally ceded to the conquerors. In 1758 a constitution was granted to Nova Scotia; and in the same year the capture of Louisbourg, in Cape Breton Isle, gave additional security to the colony. By the treaty of Paris, 10th February, 1762, France resigned all further claims on any of her former possessions in North America. In 1784 the colony was divided into three distinct governments—New Brunswick, Cape Breton, and Nova Scotia; but Cape Breton was re-annexed to Nova Scotia in 1819.

[*Weights, Measures, and Money.*—The British Imperial system. The £ currency = $4 00.]

COLONY OF PRINCE EDWARD ISLAND.

1. Prince Edward Island is situated in the south part of the Gulf of St. Lawrence, and separated from New Brunswick and Nova Scotia by Cumberland Strait. It extends from longitude 61° 58′ and 64° 26′ west—130 miles, and from latitude 45° 54′ to 47° 13′ north, and has a width varying from 4 or 5 to 35 miles. The area is stated at 2,134 square miles.

2. The coast-line presents a remarkable succession of large bays and projecting headlands; of the latter the most prominent are the East, North, and West capes, so called from their respective positions, and the largest bays are those of Richmond, on the northwest; Egmont, on the southwest; Hillsboro', on the south, and Cardigan, on the east. These bays, by penetrating into the land from opposite directions, form narrow isthmuses, which make a natural division of the island into three distinct peninsulas; and this natural division has been adopted as the basis of a nearly corresponding civil division into counties.

3. The island is destitute of any bold features. The surface is gently undulating, nowhere rising so high as to become mountainous, or sinking so low as to form a monotonous flat. At one time the whole island was covered with a dense forest of beech, birch, maple, poplar, spruce, fir, hemlock, larch, and cedar; and though destructive fires, lumbering, and cultivation have made large gaps in it, a considerable part of the original forest still remains.

4. The whole island is eminently fitted for agriculture and cattle breeding. The soil consists generally of a light reddish loam, sometimes approaching to a strong clay, but more frequently of a light and sandy texture. The prevailing rock is a reddish sandstone; but a large part of the surface is alluvial, and entirely free from stone. No minerals of the least consequence have as yet been discovered, and even limestone and gypsum, which so abound in the neighboring province of New Brunswick, appear to be wanting.

5. The climate is much milder than that of the adjoining continent, and the air, generally free from the fogs which spread along the shores of Cape Breton and Nova Scotia, is remarkably salubrious. The winter is long and cold; but the summer, without being oppressively hot, is highly promotive of the growth and maturity of all the ordinary cereals. The principal crops are wheat, barley, and oats, all of which are abundant and of excellent quality. Peas and beans are equally good, and potatoes and turnips are nowhere else surpassed. The live-stock of the island is generally of good breeds and receives great care. In 1848 the land occupied was 746,474 acres, of which 215,389 acres were under cultivation.

6. Manufactures, in the proper sense of the term, do not exist, but there are numerous saw and grist mills, and several breweries and distilleries. Linen and flannels are made at home. The fisheries in the Gulf of St. Lawrence and of the strait are extensively engaged in and valuable, and employ great numbers during the fishing season. Ship-building is another important branch. A large portion of the vessels built here are sold in Newfoundland, and employed in the seal and other fisheries.

7. The foreign commerce of the island is considerable. In 1851 the value of exports was $607,389, and of imports $475,871. This trade includes 89 vessels (15,721 tons, valued at $16 per ton) built and exported during the year. Otherwise the exports consisted of fish, oysters, oats, barley, potatoes, wool, and timber. The shipping employed amounted to 41,823 tons outward and 24,993 tons inward, the vessels averaging about 70 tons.

8. In 1848 (latest census) the Colony contained 62,678 inhabitants, which were distributed into the counties as follows:

Prince's County (west) ..... 15,142 | Queen's County (middle) ..... 15,425 | King's County (east)..... 32,111

The present population (1856) is estimated at 85,000 to 90,000.

9. The government is administered by a lieutenant-governor and a council of nine members, appointed by the crown. The legislature consists of a council of six members, also nominated by the crown, and an assembly of 24 members elected by the people. Justice is administered according to the law of England and by courts similar to those in Canada. The revenue of the island amounted in 1851 to $90,155, and in 1855 to $122,756, and the expenditures to $99,695 and $105,804 in the respective years. The public debt in 1851 amounted to $71,756.

10. Nearly one half of the inhabitants belong to the Church of Rome, one tenth to the Church of England, a sixth to the Church of Scotland, and the remainder to the various dissenting denominations. Free schools are established throughout the island and liberally supported by the government. At Charlottetown there is an endowed academy.

11. The principal towns are Charlottetown, Princetown, and Georgetown. Charlottetown is the seat of justice of Queen's County, and the capital of the Colony. It is situated on Hillsboro' River, near the southern coast, and possesses an excellent harbor. Latitude 46° 15′, and longitude 63° 7′. The principal edifices are the Government Buildings, the Episcopal and Scotch churches, the Barracks, and a fort. Population 4,717. Princetown, chief town of Prince County, is situated on the south side of the entrance to Richmond Bay, 35 miles northwest Charlottetown; and Georgetown, chief town of King's County, on a peninsula forming the north boundary of Cardigan Bay, 31 miles east from the capital. These towns, with several others on both shores, are chiefly engaged in commerce and the fisheries.

12. Prince Edward Island was discovered by Sebastian Cabot on St. John's Day, 1497, and first thence called the "Island of St. John." Not having been formally claimed by the English, the French seized upon it as a part of their territory of Acadia, and in 1663 granted it, together with the Magdalen Islands, to Sieur Doublett. It remained, however, as a fishing station until after the treaty of Utrecht, when it began to be permanently settled and became a prosperous colony. On the capitulation of Louisbourg, the island, which had long been the granary for the supply of that fortress, was taken possession of by the English, and having been ceded by France in 1763 it was annexed to the government of Nova Scotia. In 1771 the island was constituted a separate colony, and in 1773 received its present constitution. In 1799, by an act of the colonial government, the name of the island was changed from St. John to Prince Edward. In 1851 the system of responsible government was introduced.

[*Weights, Measures, and Moneys.*—British Imperial. The pound, £, current = $4 00.]

ISLAND COLONY OF NEWFOUNDLAND.

1. Newfoundland is a large island at the mouth of the Gulf of St. Lawrence, and distant only 1,640 miles from the west coast of Ireland. Its northern part is separated from the coast of Labrador by the Strait of Belle Isle, and its southwest extremity from Cape Breton by the main entrance to the Gulf. This island lies between latitudes 46° 37′ and 51° 39′ north, and longitudes 52° 40′ and 59° 30′ west; and has an extreme length, east and west, of 350 miles, and an average breadth, north and south, of 120 or 140 miles, with a coast-line of more than 1,200 miles. The area is stated at 35,913 square miles.

2. Newfoundland is extremely irregular in form, and its shores, particularly on the southeast and south, broken in a remarkable manner by broad and deep bays, harbors, coves, inlets,

ENTRANCE TO THE HARBOR OF ST. JOHN'S.

and lagoons. The most remarkable of these indentations are Hare, White, and Notre Dame bays, the Bay of Exploits, and Bonavista, Trinity, and Conception bays on the east coast; St. Mary's, Fortune, and Placentia bays on the south coast; and St. George's Bay and the Bay of Islands on the west. There are besides these innumerable smaller bays and harbors, and many of these are extensive, commodious, and well-sheltered, with numerous rivulets running into them, while most of the harbors have complete anchorages with clear and good channels.

3. The interior appears to be rocky, with numerous tracts of moss much intersected by rivers and lakes, and but thinly wooded, except on the banks of rivers. Great boulders or loose stones scattered over the country increase its general roughness. Hills and valleys continually succeed each other, the former never rising into mountains (the highest not exceeding 1,500 feet), and the latter rarely expanding into plains. The summits of the hills and ridges and other elevated and exposed tracts are generally bare of vegetable soil, or covered with a thin and scrubby vegetation. The sea-cliffs are for the most part bold and lofty, with deep water close to the shore.

4. Rivers and lakes are numerous, and some of them of considerable size. The largest of the rivers are the Humber and Exploits, both issuing, like all the other streams of the island, from lakes or ponds in the interior. Grand Pond, 50 or 60 miles long by 5 to 8 miles broad, and Indian Lake, 30 miles long and 5 or 6 miles broad, are the largest of the lakes. Otherwise ponds or small lakes are found everywhere over the whole face of the country, not only in the valleys but on the higher lands and even in the hollows of the summits of the ridges and the very tops of the hills. So numerous and extensive are these sheets of water that at least one fifth of the whole surface of the island must be covered with fresh water.

5. The prevalent formation of Newfoundland is granite, and in some parts porphyry, quartz, gneiss, mica, and clay slate, with secondary formations. The minerals of the island comprise coal, gypsum, copper, lead, and, it is said, iron. Salt springs are found on the west coast. In this connection it may be mentioned that the whole of the land in and about Conception Bay—very probably the whole island—is rising out of the ocean at a rate which threatens at no very distant day materially to affect many of the best harbors on the coast. At Ponte-de-Grave, in Conception Bay, several large flat rocks, over which vessels might pass 40 or 50 years ago with the greatest facility, are now approaching the surface, the water being scarcely navigable for a skiff.

6. The climate, though severe, is healthful, and a greater portion of the inhabitants live to a hale old age than in any other of the North American colonies. Winter, which consists of a series of storms of wind, rain, and snow, lasts from the beginning of December until the middle of April, and in January and February the cold is extreme, though less intense than in Canada. The summer is short and warm. In May and the beginning of June dense fogs prevail on the "Banks" and neighboring shores, and are a frequent cause of disasters to shipping.

7. The principal trees are spruce, birch, larch, willow, and mountain ash. In some places where they have been disturbed by the ax, trees of a fair growth and height are found, but

generally the wood is of small and stunted growth, consisting chiefly of fir-trees of from 20 to 30 feet in height and 3 to 4 inches in diameter. These usually grow so close together that their branches interlace from top to bottom. Recumbent and trailing evergreens are met with in great variety, and the berry bearing shrubs clothe every swamp and open tract.

NEWFOUNDLAND DOG.

8. Agriculture is not extensively pursued in this Colony. The amount of land under cultivation, indeed, is very small, either actually or comparatively, and little else but hay and potatoes claim any attention. The crops, however, are abundant, and every kind of grain thrives well, wheat having been known to yield 50 bushels to the acre. But both climate and soil are more favorable to pasturage and green crops than to grain. There are no manufactures.

9. The wild animals are the deer, bear, wolf, hare, beaver, marten, dog, wild cat, etc. The pure breed of the Newfoundland dog, so much celebrated for its size, sagacity, and fidelity, is now rarely to be met with; those generally seen in the island being crosses of every conceivable variety. Birds are numerous, both land and aquatic. On the coasts the morse or sea-horse formerly abounded, but has been nearly annihilated. Seals are numerous, as are also whales, grampuses, and porpoises; and the seas swarm with cod and almost every variety of fish; and sealing and fishing constitute the great employment of nine tenths of the inhabitants.

10. These fisheries are pursued chiefly on the Grand Bank, but also off the immediate shores. The banks of Newfoundland form the most extensive submarine elevation on the globe. In their full extension they occupy six degrees of longitude and nearly ten degrees of latitude, with a depth of water on them varying from 10 to 160 fathoms, but averaging 40 fathoms. The herring fishery has been almost neglected, though the seas swarm with that fish, nor is the salmon fishery more energetically prosecuted. The seal fishery, however, is extensive, and, next to the cod fishery, the most valuable.

11. As before stated, nine tenths of the inhabitants are engaged one way or another in the fisheries; but of these many unite the businesses of farmer and fisherman, or fisherman and mechanic. On an average of years there are employed 341 vessels in the seal fisheries, and 80 in coast and bank fisheries, with 10,080 boats engaged in the cod fishery, which, with the necessary apparatus of seines and nets, stages, vats, etc., are valued at two million and a half dollars. The average annual value of the products of these fisheries is estimated at six million dollars. Among the products are about 1,000,000 quintals of cod-fish, 5,000 tierces of salmon, 20,000 barrels of herrings, 500,000 seal skins, 6,000 tons of seal oil, 4,000 tons cod oil, etc. In 1850 the quantity and value of the staple products exported were—dried fish 1,089,182 quintals, valued at $2,558,251; oil 2,636,800 gallons, valued at $1,487,654; seal-skins 440,828, valued at $318,480; salmon 4,600 tierces, valued at $44,160; and herrings 19,556 barrels, valued at $46,939. The total value of the exports in the same year was $4,683,696, and of imports, chiefly articles of consumption and equipment, $4,163,116.

COD FISHING.

12. The Colony is divided into nine electoral districts, and the population of which, in 1845, amounted to 96,295, viz., 52,064 males and 44,231 females, was distributed as follows:

Districts.	Popula.	Districts.	Popula.	Districts.	Popula.
Bonavista Bay	4,227	Ferryland	4,370	St. John's	25,196
Burin	4,358	Fortune Bay	5,100	Trinity Bay	8,801
Conception Bay	28,026	Placentia and St. Mary's	6,473	Twillingate and Fogo	6,744

Since the year above represented the population has largely increased, and is now (1855) estimated at 120,000. The official estimate for 1851 was 101,600.

13. The aborigines of Newfoundland, supposed not to be numerous, are remarkably shy of intercourse, confining themselves wholly to the interior, with which settlers have little or no communication. A large proportion of the colonists are natives of Ireland and of the islands of Guernsey and Jersey, and their descendants; but many are also from other parts of the United Kingdom. The people have retained the habits of their old country in a greater degree than in other North American settlements.

14. The colonial government is administered by a governor, appointed by the crown, and an executive council of nine members, nominated by the governor. The legislature consists of a council of nine members, and an assembly of 30 members, elected by the people. The elective franchise is vested in all males after one year's residence in the Colony. Formerly, and until 1854, the executive and legislative councils were one and the same, but in that year were separated and the system of responsible government established. Justice is administered according to English law. The colonial revenue in 1851 amounted to $319,583, and the expenditures to $291,788. The public debt amounted to $414,876.

15. Elementary schools are established throughout the island, and there are also numerous schools established by the Newfoundland and British North American School Society, and several grammar schools and academies supported by the local government. The most perfect toleration is here extended to all religious denominations. More than half the inhabitants are Roman Catholics, and about a third belong to the Church of England; the remainder are chiefly Wesleyan Methodists.

16. St. John's, the capital of the Colony, is the most eastern sea-port of North America, being only 1,640 miles from the west coast of Ireland. Latitude 47° 33′, and longitude 52° 43′. The harbor is one of the best, perfectly safe, easy of access, and well defended. The town is situated on an acclivity, and consists mainly of one street. It is lighted with gas, and well supplied with water brought from a pond on an adjoining eminence. The principal public buildings are the Government House, the House of Assembly, the Catholic Cathedral, a lunatic asylum, etc., and nine churches. This city is the depôt of the greater portion of the foreign trade of the Colony. Its trade consists chiefly in supplying the fishermen with clothing, provisions, and fishing and hunting gear. During the spring season the harbor is thronged with merchant vessels laden with dry goods, salt, provisions, various manufactures, wines, etc. The export fish trade commences in August, and is continued through the winter. The fish is chiefly exported to Spain and Portugal, Italy, the West Indies, and Brazil. Besides its fisheries, St. John's is largely engaged in sealing, and there are in the city several industrial establishments, but none on a large scale, except a factory for the manufacture of nets. Population 22,000. Placentia, on the west coast of the peninsula, extending from the southeast side of the island, and St. Mary's, on the west side of St. Mary's Bay, are also sea-ports, but comparatively little frequented; and the shores of Conception Bay and other tracts in this part of the island contain numerous small and thriving fishing villages and hamlets; but excepting within the limits of this peninsula there is no settlement—nor even a single house—at a greater distance than a mile or two from the coast.

ST. JOHN'S, NEWFOUNDLAND.

17. The coast of Labrador, on the opposite side of the Strait of Belle Isle, is attached to Newfoundland for civil purposes, and has been so since 1808. This vast country, inhospitable in climate, and uninviting, is inhabited by Esquimaux and Moravian missionaries, in all about 8,000 or 10,000. Producing nothing that can support life, this is one of the most barren and desolate of countries: but as if in compensation for these disadvantages, the sea in its vicinity forms one of the most valuable fisheries in the world.

18. Newfoundland was early visited by Norwegian and Icelandic navigators. Its discovery by Cabot, who named it "Prima Vista," dates only from 1497. It was subsequently frequented for its fisheries by Portuguese, Spanish, and French. The island was colonized by British subjects under five charters granted by the crown at various times: the first in 1578, by Queen Elizabeth to Sir Humphrey Gilbert; the second, in 1610, by James I. to Lord Northampton, Sir Francis Bacon, and certain merchants of London and Bristol; the third, to Sir George Calvert, of a tract of land called the Province of Avalon; the fourth, to Lord Pembroke, Lord Holland, and the Marquis of Hamilton, specially reserving to the grantees the rights of fishing, salting, and drying fish; and the fifth, in 1635, by the Star Chamber to certain merchants and traders. In 1663 Charles I. issued instructions to his lord-treasurer, containing regulations "for the governing of his majesty's subjects inhabiting in Newfoundland." After a series of struggles for possession between France and England, exclusive sovereignty over the island, subject to certain rights reserved to France, was ceded to Great Britain by the treaty of Utrecht in 1713, subsequently ratified by the treaty of Paris in 1763, and confirmed by the treaty of Versailles in 1783. From the period of the cession, commissions, giving powers to various merchants, were issued at various times; but it was not till 1728 that the first regular governor was appointed. In 1832 a constitution was granted to the Colony, which was amended in 1842 and 1847, and remodeled in 1854.

19. St. John's being the nearest American port to Europe, and directly in the track of

steamers plying between Great Britain and the United States, it has been made a call-station of one of these lines, and has also been connected by telegraphic wire, *via* Cape Ray, with the telegraphic system of the United States and the British continental colonies. By means of these intelligence between Europe and America is conveyed with great rapidity. But it has also been essayed to lay a submarine cable between St. John's and Valentia Bay, in Ireland, and though the first effort in 1857 failed to accomplish so desirable a result, there can be no doubt of ultimate success in the undertaking. This completed, the daily news of the countries on both sides the Atlantic will be reciprocally transmitted, and be known on the opposite shores almost simultaneously.

[*Weights and Measures.*—British Imperial System. *Money.*—Colonial pound (£ currency) = $4 00.]

ST. GEORGETOWN, BERMUDA.

BERMUDA, OR SOMERS' ISLANDS.

1. THE BERMUDA ISLANDS, a group in the Atlantic Ocean, 580 miles southeast of Cape Hatteras, in North Carolina, and between latitudes 32° 14′ and 32° 25′ north, and longitudes 64° 38′ and 64° 52′ west, constitute an important colony and naval and convict station of Great Britain. They lie southwest to northeast, based on the edge of a bank stretching in the same direction 23 by 13 miles, but occupy only a space of about 18 by 6 miles, though said to be about 365 in number. Area 19.4 square miles.

2. Viewed from the sea, the Bermudas appear to have but a trifling elevation compared with the bold and lofty aspect of many of the West India Islands. The highest land, indeed, does not exceed 200 feet above the sea-level, and the surface is very irregular. The principal islands (St. George's, Ireland, St. David's, Somerset, Paget's, Longbird, and Smith's), together with the minor islands, lie in such a manner as to form several capacious and deep bays, which, however, are difficult of ingress or egress.

3. St. George's Island, the military station of the Colony, about three miles long and at no part exceeding half a mile wide, lies at the entrance of the only passage for ships of burden. The harbor, the entrance to which is narrow, is said to be one of the finest in the world, and is completely land-locked. The naval dock-yard is situated at the west end of Ireland Island, and distant about 15 miles from St. George's. This island is about one mile in length, and perhaps a quarter broad, and is nearly all occupied by the public buildings. Boaz Island, connected with this by a bridge completed in 1849, is the site of the convict establishment.

4. These islands are all strongly fortified, and where not, the reefs and rocks that lie in their neighborhood certainly do away with the necessity of artificial works. The Bermudas are, in fact, the Gibraltar of the West. On three sides, north, west, and south, they are inclosed by formidable coral reefs and rocks, nearly all under water, and extending in some parts 10 miles from the islands—the only reefs of this description occurring in the whole expanse of the ocean.

5. The climate is delightful, a perpetual spring clothing the fields and trees in verdure. Severe thunder-storms, however, frequently occur; and when the south wind prevails the atmosphere becomes charged with excessive humidity. The soil is generally of a reddish brown color, and in some places, as at Ireland Island, bears strong marks of oxyd of iron. Round the coasts there are some districts with a strong tenacious blue clay; in others a micaceous kneadable brick earth, and again an argillaceous soil with luxuriant pasturage. The cedar grows to a great height, and would seem in many parts to spring from the bare rock. The palmetto is also indigenous; and all the fruits and vegetables of the northern section of the tropics thrive well.

BERMUDA ISLANDS.

6. The Bermudas are divided into nine parishes, of nearly equal extent, and in 1851 contained 11,092 inhabitants, distributed as follows:

St. George's	1,891	Paget's	1,028
Hamilton	1,094	Warwick	983
Smith's	514	Southampton	917
Devonshire	784	Sandys	1,636
Pembroke	2,235		

—of the total the whites numbered 4,669—1,965 males and 2,704 females, and of the colored 6,423—males 2,832 and females 3,591. Neither the military nor convicts are included in this census. The great disproportion between males and females is accounted for by the numbers engaged in maritime employments. In 1826 the population was 8,470; in 1836, 8,862; in 1843, 9,930; in 1851, 11,092, and may now (1856) be 12,000.

7. The labor of the inhabitants is employed chiefly in agriculture, commerce, and the fisheries. The agricultural crops in 1850 consisted of—sweet potatoes, 24,322 bushels; Irish potatoes, 24,946 bushels; carrots, 4,346 bushels; turnips, 7,420 bushels; onions, 838,070 pounds; garden vegetables, 256,136 pounds; tomatoes, 19,120 pounds; arrow-root, 854,329 pounds; Indian corn, 924 bushels, and barley, 269 bushels, etc. The quantity of livestock maintained is small, and dairy produce sufficient only for the wants of the inhabitants. Domestic fowls are abundant, especially ducks; and during the summer numbers of turtle are taken. The adjoining seas are stored with various kinds of fish, and whales are

Entered according to Act of Congress, in the Year 1858, by J. H. Colton & Co. in the Clerks Office of the District Court of the United States, for the Southern District of New York.

occasionally taken between March and June. Many small cedar vessels are built here; and another important branch of industry is the plaiting of straw and mid-rib of the palmetto. The principal articles of export are arrow-root, potatoes, and onions. The value of imports for the year ending 5th January, 1854, was £120,387, and of exports £25,563. The Colony owned 42 vessels, having a burden of 2,952 tons. The imports are chiefly supplies for the army and naval forces stationed here, and for the convict establishment on Boaz Island. Regular steam navigation is kept up between the Bermudas, Halifax, N. S., New York, and the West Indies.

8. The legislature consists of a governor, council, and assembly. The council is composed of ten members and a president, nominated by the governor; and the house of assembly of 36 members, returned by the nine tribes or parishes into which the island is divided. The ordinary revenue for 1854 amounted to £15,851, and the expenditures to £16,388; a parliamentary grant covering the deficit. The military expenditure in the year 1850 was £67,354. The islands contain 9 churches, and 5 chapels for dissenters; and with regard to the inhabitants, 9,332 are members of the Church of England, 519 Presbyterians, 1,018 Wesleyan Methodists, 109 Roman Catholics, and 113 other religions. There are 24 public or free schools, principally supported by different societies in England and by funds under the control of the bishop of Nova Scotia, in whose diocese the Bermudas are included; and besides these there are 25 private schools. The number of convicts at the depôts in 1850 was 1,566, and the cost of their maintenance for the year £33,211.

9. A small dock-yard, formerly maintained at St. George's, has been removed to Ireland Island, on which large sums have been expended in order to render it a strong post for a naval and military depôt. Between 1838 and 1848 there was spent in the public works upward of £288,000, of which £150,720 was for a breakwater. The works include a steam-factory, a victualing office, store-houses, hospitals, workmen's dwellings, etc. Besides those named, defensive works have been constructed on St. George's, Main, Boaz, and Ireland islands, the cost of which has been upward of £150,000; and a causeway, constructed by convict labor, has been built to connect Walsingham and Longbird islands. The ship channels have also been improved.

10. There are in the Bermudas two towns, each of which has its mayor and civic officers—St. Georgetown, on the island of that name, and Hamilton, on Bermuda Island. Both towns are well-built, of white stone. St. Georgetown, which is the capital, is the finer of the two, and contains a new government-house, jail, lunatic asylum, etc. There are also several settlements or villages.

11. In 1593 there was wrecked on these islands a French ship, on board of which was one Henry May, who afterward wrote an account of the Bermudas in English. In 1609 Sir George Somers was driven on the islands in the course of a voyage to Virginia; and on this account the Virginia Company claimed them, and sold their right to a company of 120 persons, who, having obtained a charter from the king in 1612, sent out 60 settlers with a governor. The colony settled on George's Island. In 1619, the islands having become famous for their beauty and salubrity, many of the nobility purchased plantations, and their cultivation was much encouraged. The number of white inhabitants at this time amounted to about 1,000. On the 1st August, 1620, the general assembly was instituted, and for many years hence the islands prospered. During the civil wars many persons of character and opulence took refuge in the Bermudas, and the population rapidly increased, and is supposed to have been about 10,000. These islands have always remained in possession of the British, though toward the close of the American Revolution, Washington had an eye to their capture, to make them a station for war vessels for the annoyance of the West India trade, as the islands lie in the homeward-bound track. At the present time their chief importance is their fine location and adaptedness for military purposes.

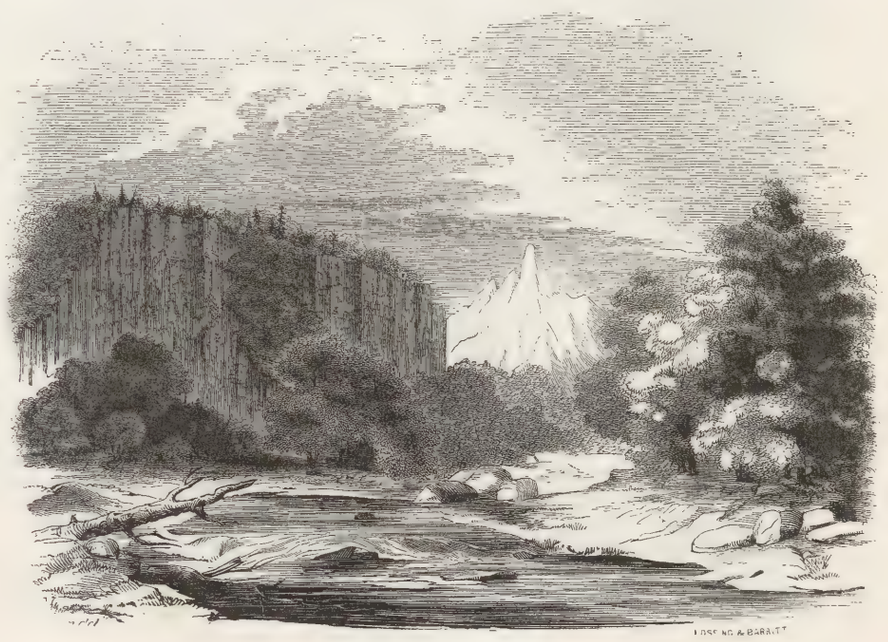
FRENCH FISHERY ISLANDS.

1. The French possessions in North America consist of the small islands of St. Pierre, Grand Miquelon, and Petit Miquelon, which lie south of Newfoundland. St. Pierre, the most southerly and smallest of the islands, is rocky and scant of vegetation. The heights attain in some parts 500 feet. In the flatter parts ponds and marshes are frequent. Area about 10 square miles. The chief town of the same name, on the southeast coast, has excellent roads, in which large vessels find good anchorage. Grand Miquelon contains 40 square miles, and Petit Miquelon or Langley Island 30 square miles. Both these islands are situate at the mouth of Fortune Bay. They are well wooded. The largest of the two is in latitude 47° north, and longitude 56° 20′ west; the smaller, immediately south, being separated only by a narrow channel. Population 2,226.

2. The almost sole occupation of the inhabitants of these islands is fishing. They are under a governor who resides at St. Pierre. The trade consists altogether in the export of fish and in the importation of supplies for the navy and fisheries. These islands, indeed, supply France with the greatest portion of its cod-fish, the taking of which is encouraged by a liberal bounty. About 400 vessels, with a tonnage of 50,000 or 60,000 tons, are employed in the French fisheries, and about 12,000 men. These of course are not resident. The take of fish averages about 400,000 metrical quintals, but this includes the products of the Great Bank and other stations.

3. Such are the French possessions in North America—three small islands. Formerly that nation owned nearly one half of the whole northern peninsula—the present British possessions and the valley of the Mississippi. Newfoundland passed from French authority in 1713; Cape Breton and Prince Edward's Island in 1745; Canada and Nova Scotia in 1763, and also in the latter year the immense territory west of the Mississippi. Louisiana, however, was restored in 1801, but in two short years it again lapsed, and became by purchase the property of the United States. The islands above noticed were secured to France in 1763 by the treaty of Paris.

UNITED STATES OF AMERICA.



1. The United States occupy the middle and temperate region of North America, between latitudes 24° and 49° north, and longitudes 67° and 125° west; and extend from the Atlantic to the Pacific, and from the British Possessions on the north to the Gulf and Republic of Mexico on the south. The area of this vast territory is estimated at 2,963,666 square miles.

2. The frontier line on the ocean, including bays, sounds, etc., measures 12,609 miles, of which 6,861 miles represent the Atlantic coast, 3,467 miles the Gulf coast, and 2,281 miles the Pacific coast. The line toward the British Possessions measures 3,303 miles, and that toward Mexico 1,456 miles. The shore-line of rivers to the head of tide-water, and including both banks, is stated at 49,065 miles, and that of the northern lakes within the United States territory, including bays, etc., is 3,620 miles. These facts are important elements in determining the commercial facilities of the country.

3. On the Atlantic and Gulf of Mexico the shores are generally low and shelving; on the Pacific, on the contrary, they are mostly bold and rocky. Their indentations are comparatively few and of no great magnitude; but are more numerous on the east than on the west side of the continent. The most important on the Atlantic are—Passamaquoddy Bay, between New Brunswick and the State of Maine; Massachusetts Bay, between capes Ann and Cod; Long Island Sound, between the island so called and the State of Connecticut, and in connection with it the noble Bay of New York; Delaware Bay, commmencing between capes May and Henlopen, and penetrating far into the interior between the States of New Jersey and Delaware; Chesapeake Bay, opening sea-ward between capes Henry and Charles, and stretching north for 200 miles between Maryland and Virginia; and Albemarle and Pamlico sounds on the coast of North Carolina. The Gulf of Mexico is an immense indentation of the Atlantic, but contains no sub-indentations of any consequence. The Pacific coast is also deficient in bays, but possesses in that of San Francisco one of the largest and finest natural harbors in the world.

4. The territory of the United States is traversed by two principal chains of mountains, the Alleghanies on the east side, and the Rocky Mountains on the west. These divide the country into three distinct geographical regions: the Atlantic slope, from the Alleghanies to the ocean; the Valley of the Mississippi, between the Alleghanies and the Rocky Mountains; and the declivity from the Rocky Mountains to the Pacific.

5. The Alleghanies are less a chain of mountains than a long plateau, crested with several

ROCKY MOUNTAIN SCENERY.

chains, separated from each other by wide and elevated valleys. East of the Hudson the mountains are chiefly granitic, with rounded summits, often covered at their tops with bogs

and turf, and distributed in irregular groups without any marked direction. Some peaks of the Green Mountains in Vermont, and of the White Mountains in New Hampshire, rise to the height of 5,000 to 6,400 feet above the sea-level. After passing the Hudson, the structure of the mountains seems to change. In Pennsylvania and Virginia they assume the form of long parallel ridges, varying in height from 2,500 to 4,000 feet, and occupying a breadth of 100 miles. In North Carolina the highest culmination is 6,941 feet; but in Georgia and the northern part of Alabama, where they terminate, they again lose the form of continuous chains, and break into groups of isolated mountains, touching at their bases, some of which attain a considerable elevation.

6. The Rocky Mountains are on a much grander scale than the Alleghanies. Their base is 300 miles in breadth, and their loftiest summits, covered with eternal snow, rise to the height of 10,000 to 18,000 feet. These vast mountains may be considered as a portion of the Cordillera, which traverses western America from Cape Horn to the North Sea. They are distant from the Pacific from 500 to 600 miles, but between them and the coast several minor ranges intersect the country. The Maritime range, in which the highest culminations of North America occur, runs almost parallel to, and but a comparatively short distance from, the shores of the Pacific Ocean, and is seldom broken through or in any part subsides throughout its whole length.

7. The immense valley included between the Rocky Mountains and the Alleghanies is intersected by the Mississippi River, which runs from north to south all through the United States. The country west of this river, with partial exception, is yet a wilderness, inhabited by roaming Indians, and beyond the limits of the organized States the whites have scarcely a settlement; but the country east of this is thickly populated, and in a forward state of development.

8. The most remarkable feature of the United States, however, is the low plain, from 50 to 100 miles wide, which extends along the Atlantic coast. Beyond this plain the land rises toward the interior, till it terminates in the Alleghanies. The rest of the country east of the Mississippi is agreeably diversified. The soil of the low country, except along the watercourses, is sandy and comparatively unproductive; but the remainder has a strong fertile soil, capable of supporting a dense population.

9. The Pacific section is a highly varied country, abounding in wild and majestic scenery, and traversed by magnificent rivers. Much, however, of its interior is desert, and will probably never be inhabited by civilized man. The great California desert, indeed, is one of the dreariest regions of the world, the solitude being relieved only by a few oases in the neighborhood of streams or on the borders of its numerous lakes.

10. With the exception of Michigan and Champlain, none of the great lakes of North America lie wholly within the territory of the United States. The others are on the northern borders, along which they form a connected chain extending through a distance of nearly

AMERICAN AND HORSE-SHOE FALLS (NIAGARA)—FROM PROSPECT POINT.

1,200 miles. The first in this chain is Lake Superior, the largest body of fresh water on the globe; this empties into Lake Huron; Huron into Erie; Erie, its waters tumbling over the cataract of Niagara, into Ontario, and Ontario into the St. Lawrence. Lake Champlain lies between New York and Vermont, and discharges its waters through the Sorel into the St. Lawrence. It is computed that these lakes contain 14,000 cubic miles of water—a quantity more than five sevenths of all the fresh water of the earth. The extent of the country drained by them, from the northwest angle of Superior to the St. Lawrence, including also the area of the lakes themselves, is estimated at 335,515 square miles, of which 112,649 square miles are land surface within the United States.

11. The rivers of the United States, exclusive of the St. Lawrence, may be divided into four classes—first: the Mississippi and its wide-spread branches, which drain off the waters of the whole country included between the Alleghanies and Rocky Mountains; second: the rivers east of the Alleghany Mountains, which, rising on their declivities, water the Atlantic plain and flow into the Atlantic Ocean; third: the system of rivers flowing into the Gulf of Mexico, which may be subdivided into those flowing from the southern slope of the Alleghanies, and those having their sources in the northwestern highlands of Texas; and, fourth: those streams on the west of the Rocky Mountains which flow into the Pacific Ocean.

12. The Mississippi rises in Minnesota Territory, west of Lake Superior, in latitude 47° 47′ north, amid lakes and swamps, dreary and desolate beyond description, and after a southeasterly course of about 500 miles reaches the Falls of St. Anthony, where it descends perpendicularly 16 feet, and where are numerous rapids. From these falls it pursues first a southeasterly, then a southerly direction; and after forming the boundary of Minnesota, Iowa, Missouri, and Arkansas on the west, and of Wisconsin, Illinois, Kentucky, Tennessee, and Mississippi on the east, passes through Louisiana, and discharges itself through an immense and complicated delta into the Gulf of Mexico. It is nearly 3,200 miles long, and is navigable, with few obstructions, to the Falls of St. Anthony. Its principal tributaries are—on the east: the Wisconsin, the Illinois, the Ohio, and the Yazoo; and, on the west: the Minnesota, the Des Moines, the Missouri, the Arkansas, and the Red River.

FALLS OF ST. ANTHONY.

13. The principal rivers of the Atlantic slope are—the Connecticut, the Hudson, the Delaware, the Susquehanna, the Potomac, James River, the Savannah, etc. These are fine navigable rivers, and with their constituents and tributaries drain the whole slope.

14. The rivers falling into the Gulf of Mexico are—the Appalachicola, the Mobile, the Sabine, Trinity, Brazos, Rio Grande, etc.—the first two rising in the southern declivities of the Alleghanies, and the others from the highlands of Texas and New Mexico.

15. The rivers flowing from the mountains to the Pacific Ocean consist of—the Columbia, the Sacramento and San Joaquin, the Buenaventura and the Colorado and Rio Gila, the latter two discharging themselves into the Gulf of California.

16. Immense alluvial tracts occur along the Gulf of Mexico, commencing at the Rio Grande and covering a wide belt in the State of Texas, the whole of Louisiana, considerable portions of Mississippi and Alabama, and the whole of Florida. Similar tracts, but narrower, stretch north along the Atlantic as far as the northeast extremity of Long Island, but are partially interrupted by tertiary groups, which belong to the eocene or earliest geological period in parts of Georgia and South Carolina, or to the miocene or less ancient period in North Carolina, Virginia, and Delaware. In the same States, and more especially in the north and west of New Jersey, the cretaceous system is seen in isolated spots or narrow strips. The chief development of this system, however, occurs to the north of the alluvial tracts of the Gulf, where it forms the prevailing formation of large areas in Arkansas, Tennessee, Mississippi, and Alabama.

17. The alluvial and tertiary tracts along the Atlantic, already referred to, are not followed in like manner by the cretaceous system, but by a large development of what have been called hypogene rocks, consisting of gneiss, etc., which stretch north from Alabama and the west part of Georgia along the main chain and eastern slope of the Alleghanies, become greatly narrowed in Virginia, Maryland, and Pennsylvania, but afterward widen out in Massachusetts, and then cover a large part of northern New York, and the whole, or almost the whole, of Vermont, New Hampshire, and Maine. From Virginia northward to Massachusetts the granite and gneiss inclose narrow belts of new red sandstone, pierced by masses of trap. These seem to be the only spots in the United States where either new red sandstone or trap occurs.

18. In the Alleghanies, west of the granite and gneiss, the silurian system, forming the lowest series of the sedimentary rocks, begins to be developed. It commences on the banks of the Tennessee, where it turns west and stretches in a narrow belt, but not without interruption, till it reaches the frontier of Vermont. It belongs to the lower part of the system, and consists chiefly of what is known by the name of Trenton limestone.

19. This formation is succeeded west by narrow strips of old red sandstone and occasional belts of carboniferous limestone, giving indication of the approach to the true coal measures. These, accordingly, immediately occur, and on a scale of almost unexampled magnificence, and form an immense coal-field, which stretches continuously from south-southwest to north-northeast, between the parallels of 35° and 42°, for a distance of more than 600 miles. Both south and north it tapers to a point, but gradually widens out from both extremities

till on the 40th parallel it has a width of 170 miles. The area of the whole field is moderately estimated at 63,000 square miles. The coal occurs in numerous thick beds, partly bitu-

INTERIOR OF A COAL MINE IN PENNSYLVANIA.

minous and partly anthracite, and is accompanied by valuable seams of iron ore, and the limestone necessary for smelting it.

20. The old red sandstone bounding the coal-field on the east widens out so as to occupy an extensive area on the north, and is then continued south in a narrow belt, so as to form the greater part of its outer western edge. Still farther west, chiefly in the States of Ohio and Indiana, this old red sandstone is succeeded by rocks of the silurian system, belonging, with few exceptions, to the upper series, but again appears in a very remarkable shape, forming, along with an upper belt of carboniferous limestone, an oval almost mathematically exact, and inclosing, as with a kind of outer rim, the great coal-field of Illinois. This coal-field, which consists of horizontal strata, with numerous rich seams of bituminous coal, comprehends parts of the States of Illinois, Indiana, and Kentucky, and has an area of not much less than 50,000 square miles. Beyond this field the rocks of the silurian system are continued into Missouri, and both there and in the north of Arkansas are seen inclosing a large area of granite and gneiss. The country west to the mountains has been little explored, and the space left blank in the geological map remains to be filled up by future investigators.

21. The remarkable peninsula of Michigan, washed by the lake of the same name on the west, and by lakes Huron and Erie on the east, consists of three distinct formations—first, the upper silurian, bounding it on the north and southeast and terminating it on the north; next, the old red sandstone, stretching round on all sides so as to inclose a large heart-shaped nucleus; and lastly, this nucleus itself, consisting of a thin rim of carboniferous limestone, which forms the basis of a third coal-field of smaller dimensions compared with those already noticed, but large compared with most European coal-fields, having a length, north and south, of 150 miles, with a medium breadth of not less than 90 miles, and containing an area of about 12,000 square miles.

22. To the northwest of Lake Michigan, and to the south and west of Lake Superior, tracts of granite and gneiss, rich in copper, occur. The peninsula of Kewenaw, extending out into the lake some 70 miles, and elevated in its center from 500 to 600 feet, is filled with copper rock, and the same formation extends southwest from the peninsula for an equal dis-

COPPER HARBOR, ON LAKE SUPERIOR.

tance. The metal occurs both in veins and in enormous boulders, weighing several tons. From this source the ancient inhabitants of Ohio, the mound-builders, whose history is lost, derived their supplies; and even at the present day the miners find the stone hammers and other implements used by them in their operations.

23. That large blank existing in the map, in regard to the more western territories, has begun to be filled up in the southwest, toward the shores of the Pacific, in consequence of the discovery of the vast auriferous region which covers large areas in California and Oregon. As far as has yet been ascertained, this gold region appears to occupy an area of 500 miles long by 40 to 50 miles wide; but this area will probably widen out as the different districts of the territory are more accurately explored. The matrix of the metal is quartz, existing in the form of veins or rocky masses, embodied in granite and primitive schists. These accordingly appear to be the prevailing formations. As yet, however, gold has not been found to any great extent *in situ*, and has been chiefly obtained by collecting it, by various mechanical processes, from the superficial debris which floods and torrents have brought down from the mountains. Besides gold, cinnabar is an abundant product of this remarkable region; and other metals, as copper, iron, and lead, undoubtedly exist in the same districts in quantities sufficient to yield productive returns.

24. Otherwise than as developed by the above cursory view of the geological structure of the country, the United States are rich in all the minerals useful in the arts and manufactures. Wisconsin, Iowa, and Illinois have inexhaustible supplies of lead ore; almost every State has abundance of iron in one or more of its various forms, but more especially Pennsylvania, Missouri, and Upper Michigan. Copper is also abounding in eastern Tennessee; salt is found everywhere, and is largely manufactured in the western districts of New York and Virginia, etc., and in Utah, about the Great Salt Lake, is found in inexhaustible profusion. In marble and limestone and other building-stone, roofing-slate, potter's clay, etc., few countries in the world are more amply supplied.

25. A vast country, stretching over twenty-five degrees of latitude, and exhibiting all possible varieties of surface—low swampy shores, boundless alluvial plains, swelling hilly regions, elevated arid deserts, and lofty mountain chains—must obviously possess not one climate but a number of climates, differing greatly from each other, and often exhibiting most remarkable contrasts. The only one feature which can be said to be common to all the

APPROACH TO THE GREAT SANDY DESERT.

climates of the United States is inconstancy. The transitions from cold to heat and humidity to drouth take place so suddenly, and to such an extent, that even in the Central States a change of 25 or 30 degrees in the thermometer in the course of a few hours is by no means uncommon. On the northern frontier these changes become still more remarkable, and, on the other hand, at the opposite extremity, are so much diminished that the thermometer in Florida is almost stationary throughout the year, and at no time varies so as to give an annual range of more than twelve degrees.

26. Compared with that of Europe, the climate of the United States exhibits very remarkable differences. The isothermal line, which passes through Belgium (latitude 51°) after crossing the Atlantic, is found at Boston (latitude 42° 30′), and that which passes between Rome and Florence (latitude 43°) is found in the United States, at Raleigh (latitude 36°). In the north, between latitudes 42° and 45°, nearly on the parallels of Rome, Toulon, Padua, and Bordeaux, the winter is so severe for three or four months that the snow is abundant enough for sleighing, and the ice of the rivers strong enough to be crossed by horses and wagons. In Philadelphia (latitude 39° 56′) the mean annual temperature is 54° Fahr.; whereas in Naples (latitude 40° 50′) it is 63°—in other words, the American town, which, from having a lower latitude, ought to have a higher annual temperature than the European town, is about nine degrees colder. The ranges of temperature are still more remarkable than the annual averages, and hence it has been said, and with great truth, that while New York has the summer of Rome, it has the winter of Copenhagen.

27. The prevailing winds of the United States are the northwest, southwest, and northeast. The northwest wind, blowing from the frozen regions over high mountains and plateaux, prevails in winter, and though piercingly cold, is usually dry until it reaches the shores of the Atlantic, where, meeting with dense vapors, it condenses them into snow, hail, or rain. The southwest wind prevails in summer, particularly on the west side of the Alleghanies, and in the basin of the Mississippi, where, indeed, it blows more or less at all seasons, except at the winter solstice. The northeast wind arrives on the American coast charged with the vapors collected in its course from the Arctic and across the Atlantic oceans, and immediately

deposits them in cold, dense fogs or heavy showers. The average fall of rain is estimated at 37 inches, whereas in the northwest of Europe it is only 31 inches; and yet in the United States, as the showers, when they do fall, are more copious, and perhaps also more continuous, the number of rainy days is fewer.

28. So various are the soils of this section of America that no general remarks can describe them. The rich alluvions of the valley of the Mississippi and along the southern coasts are the extreme on the one hand, and the barren plains at the east base of the Rocky Mountains that on the other hand. On the whole, however, it is believed that no other portion of the world is endowed with a greater comparative area of fertile lands or lands capable of agricultural improvement. The whole middle section is one vast agricultural country, and is being rapidly filled up by an industrious population, which will eventually develop it to its utmost capacity. In New England the lands are rugged and comparatively unproductive. In the hilly region of the Alleghanies, generally, they are better adapted to grazing than proper agriculture. The valleys west of the Rocky Mountains, and especially those beyond the Sierra Nevada, are among the most fertile in the world. In other parts where agriculture is impossible or unprofitable, there is generally ample compensation for the drawback in the mineral productions of which they are possessed.

29. No other country can boast of so many species of noble forest trees. East of the Rocky Mountains the prevailing growths are the oak, pine, chestnut, walnut, poplar, maple, elm, magnolia, cypress, etc. Many of these attain an immense height and growth, and all are useful to man. The white pine frequently attains the height of 200 feet, and the poplar or tulip-tree, one of the noblest in the American forests, sometimes attains a height of 120 to 130 feet, with a diameter of 7 to 8 feet. From the sugar-maple is obtained a delicious domestic sweetening. The forests of the Pacific region are magnificent, and surpass those of all other countries in the magnitude of their numbers. The red-wood (a species of cypress) of California has sometimes a diameter of 40 feet, and frequently of from 20 to 30 feet; and pines growing on the mountain slopes of Oregon attain not unfrequently a height of nearly 300 feet, with diameters varying from 8 to 20 feet.

GRIZZLY BEAR.

30. Among the wild animals of the United States are the moose deer or elk, the caribou or reindeer (which is now seldom seen), the buffalo, the black bear, the panther, the wolf, and the wild-cat; the grizzly bear and the goat or sheep peculiar to the Rocky Mountains, and the fox, beaver, musk-rat, marmot, prairie dog, squirrel, rabbit, weasel, skunk, opossum, raccoon, etc. Among birds are the golden and bald-headed eagle, the turkey-buzzard, the black vulture, hawks, wild-turkeys, grouse, pheasants, partridges, pelicans, flamingoes, cranes, spoonbills, wild-ducks, etc. The reptiles include several varieties of snakes (some of them venomous), lizards, salamanders, and in the South alligators. In the lakes and rivers and along the shores fish in innumerable varieties abound, and no other portion of the earth's surface is so abundantly supplied with crustaceous animals, oysters, turtles, etc.

31. Of the American aborigines few remain. They have vanished from the land before the march of civilization, and the European and his descendants occupy their hunting-grounds. The nations that once covered the country eastward of the Mississippi are at the present day represented by a few partially civilized tribes gathered chiefly into the Indian Territory, and numbering about 100,000 individuals. Not more than 18,000 remain near their former haunts. The whole number within the United States, including those of the plains, the Rocky Mountains, Texas, New Mexico, Utah, California, and Oregon, does not amount to more than 400,000 souls.

AMERICAN INDIANS.

32. In 1850,* the date of the last general census, the United States comprised thirty-one States, the Federal District, four organized Territories, and extensive territories occupied almost solely by the Indians. The extent and population of each of these constituents of the Union were as follows:

States.	Area, sq. m.	Population. White.	Free Col.	Slave.	Total.	Population to sq. m.	Seats of Government.
Maine	31,766	581,813	1,356	—	583,169	18.36	Augusta.
New Hampshire	9,280	317,456	520	—	317,976	34.26	Concord.
Vermont	10,212	313,402	718	—	314,120	30.76	Montpelier.
Massachusetts	7,800	985,450	9,064	—	994,514	127.50	Boston.
Rhode Island	1,306	143,875	3,670	—	147,545	112.97	Providence, etc.
Connecticut	4,674	363,099	7,693	—	370,792	79.33	Hartford, etc.
New York	47,000	3,048,325	49,069	—	3,097,394	65.90	Albany.
New Jersey	8,320	465,509	23,810	236	489,555	58.84	Trenton.
Pennsylvania	46,000	2,258,160	53,626	—	2,311,786	46.26	Harrisburg.
Delaware	2,120	71,169	18,073	2,290	91,532	43.17	Dover.
Maryland	11,124	417,943	74,723	90,368	583,034	52.41	Annapolis.
Virginia	61,352	894,800	54,333	472,528	1,421,661	23.17	Richmond.
North Carolina	50,704	553,028	27,463	288,548	869,039	17.14	Raleigh.
South Carolina	29,385	274,563	8,960	384,984	668,507	22.75	Columbia.
Georgia	58,000	521,572	2,931	381,682	906,185	15.62	Milledgeville.
Florida	59,268	47,203	932	39,310	87,445	1.48	Tallahassee.
Alabama	50,722	426,514	2,265	342,844	771,623	15.21	Montgomery.
Mississippi	47,156	295,718	930	309,878	606,526	12.86	Jackson.
Louisiana	41,255	255,491	17,462	244,809	517,762	12.55	Baton Rouge.
Texas	237,504	154,034	397	58,161	212,592	0.89	Austin.
Arkansas	52,198	162,189	608	47,100	209,897	4.02	Little Rock.
Tennessee	45,600	756,836	6,422	230,459	1,002,717	21.99	Nashville.
Missouri	67,380	592,004	2,618	87,422	682,044	10 12	Jefferson City.
Kentucky	37,680	761,413	10,011	210,981	982,405	26.07	Frankfort.
Ohio	39,904	1,955,050	25,279	—	1,980,329	49.55	Columbus.
Indiana	33,809	977,154	11,262	—	988,416	22.23	Indianapolis.
Michigan	56,243	395,071	2,583	—	397,654	7.07	Lansing.
Illinois	55,405	846,034	5,436	—	851,470	15.37	Springfield.
Wisconsin	53,924	304,756	635	—	305,391	5.66	Madison.
Iowa	50,914	191,881	333	—	192,214	3.77	Iowa City.
California	155,980	91,635	962	—	92,597*	0.59	Sacramento.
Territories.							
Minnesota	166,025	6,038	39	—	6,077	0.04	St. Paul.

80 " " 90	31,243	34,403	1,106	1,512	4,378	4,740	36,727	40,655
90 " " 100	3,653	4,409	819	544	1,211	1,473	5,183	6,422
100 and upward	357	430	114	229	606	819	1,077	1,478
Age unknown	7,153	3,154	150	136	1,581	1,533	8,884	4,823
Total	10,026,402	9,526,666	208,724	225,771	1,602,535	1,601,778	11,837,371	11,854,215

—and the origin of the free population, including both white and colored, was as follows:

Class of Population.	Born in the State in which resident.	Resident in States in which not born.	Born in foreign State or country.	Birth-place unknown.	Total of each Class.
White persons	13,103,650	4,176,225	2,240,535	32,658	19,553,068
Colored persons	353,399	75,025	4,067	2,004	434,495
Grand Total	13,457,049	4,251,250	2,244,602	34,662	19,987,563

34. The first general census was taken in 1790, and has been taken at succeeding decennial periods. The results of these, and also the actual territory belonging to the Union at the time being, are shown in the following table:

Census Years.	Area,‡ sq. m.	White Persons.	Colored Persons. Free.	Slave.	Total.	Total Population.	Popula. to sq. m.
1790	820,680	3,172,464	59,466	697,897	757,363	3,929,827	4.79
1800	820,680	4,304,489	108,395	893,041	1,001,436	5,305,925	6.46
1810	1,720,250	5,862,004	186,446	1,191,364	1,377,810	7,239,814	4.21
1820	1,720,259	7,891,937	238,156	1,538,038	1,776,194	9,638,131	5.61
1830	1,787,159	10,537,378	319,599	2,009,043	2,328,642	12,866,020	7.19
1840	1,787,159	14,195,695	386,303	2,487,455	2,873,758	17,069,453	9.55
1850	2,936,166	19,553,068	434,495	3,204,313	3,638,808	23,191,876	7.90

—reducing these figures to proportions the following is the result:

Census Years.	White Persons.	Colored Persons. Free.	Slave.	Total.	Total Popula.
1790	8073	151	1776	1927	10000
1800	8113	204	1683	1887	10000
1810	8097	257	1646	1903	10000
1820	8157	247	1596	1843	10000
1830	8190	248	1562	1810	10000
1840	8317	226	1457	1683	10000
1850	8431	187	1382	1569	10000

—and the ratio of increase from period to period has been thus:

Census Years.	White Persons	Colored Persons. Free.	Slave.	Total.	Total Popula.
1790–1800	3568	8228	2796	3223	3501
1800–1810	3618	7290	3340	3758	3645
1810–1820	3412	2773	2910	2891	3313
1820–1830	3403	3420	3062	3110	3349
1830–1840	3472	2087	2381	2341	3267
1840–1850	3774	1247	2882	2662	3587

35. The distribution of the population at the several periods named over the several grand divisions of the United States, and its increase (per 10,000 souls) in each from period to period, is exhibited in the annexed tabular statement:

Divisions.	1790.	1800.	1810.	1820.	1830.	1840.	1850.
New England States: Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut—							
Population	1,009,828	1,233,315	1,471,891	1,659,808	1,954,717	2,334,822	2,728,116

California and Organized Territories:							
Population	—	—	—	—	—	—	184,895

* [The changes which have been effected in the political arrangement of the country since the period above noted are various and important. Oregon has been divided into the two territories of Oregon and Washington—the first occupying the portion of territory south of the Columbia River and the 46th parallel, with an area of 185,030 square miles, and the latter all north of the same line with an area of 123,022 square miles. The Indian or unorganized Territory has also been divided up, and the greater portion now constitutes the Territories of Nebraska and Kansas—the first north of 40° north latitude, containing 335,882, and the latter 114,798 square miles. Meanwhile a large territory (27,500 square miles), to which the name of Arizona is proposed to be given, has been (1854) acquired of Mexico; and is now temporarily attached to New Mexico. It may here also be stated that the territories of Minnesota, Oregon, and Kansas have framed State constitutions, and in all probability will be admitted into the Union during the present (1857–58) session of Congress, or before this work is ready for the press. In case of such events occurring, notice thereof will be made under the chapters referring to those countries.]

* Incomplete returns. † Total, including the Mexican cession of 1854, 2,963,666 square miles.

‡ The original territory of the United States, as ceded by England in 1783, amounted to 820,680 square miles. The acquisition of Louisiana in 1803 added 899,579 square miles to its extent; and by the cession of Florida (1821) the area was increased by 66,900 square miles. The admission of Texas (1845), the settlement of the Oregon question (1846), and the conquest of California, etc. (1848), added to the area 318,000, 308,052, and 522,955 square miles respectively. In 1854 a further addition of 27,500 square miles was gained from northern Mexico.

36. The population in 1855, as summed up from the results of State enumerations and estimates amounted to 27,237,510, being an increase over that of 1850 amounting to 4,045,634, or in the ratio of 17.4 per cent. in five years. About two fifths of the whole increase has been from immigration from foreign countries and the remainder the result of natural issue. This population is supposed to be distributed as follows:

Maine	641,279	North Carolina	922,979	Michigan	509,374*
New Hampshire	331,708	South Carolina	705,661	Illinois	1,242,917*
Vermont	326,592	Georgia	935,090*	Wisconsin	552,109*
Massachusetts	1,133,123*	Florida	110,725*	Iowa	325,014*
Rhode Island	166,927	Alabama	835,192*	Missouri	831,215
Connecticut	401,292	Mississippi	712,857	California	827,879
New York	3,466,212*	Louisiana	589,738	Minnesota	68,812
New Jersey	569,499*	Texas	482,837	Nebraska	4,565
Pennsylvania	2,542,960*	Arkansas	253,117*	Kansas	8,521
Delaware	97,295	Tennessee	1,107,583	Washington	5,492
Maryland	659,387	Kentucky	1,113,678	Oregon	36,187
District of Columbia	60,557	Ohio	2,311,829	Utah	88,716
Virginia	1,527,837	Indiana	1,198,783	New Mexico with Arizona	81,722

In the mean time (1850–1855) the territory of the United States has been increased by an area of 27,500 square miles by purchase from Mexico, and now includes a total area of 2,963,666 square miles. The proportion of population to territory in 1855 was, therefore, as 9.19 inhabitants to the square mile.

37. The aggregate number of "free white male persons," over 15 years of age, employed in professional and industrial pursuits, in 1850, was 5,371,876; and of these the number employed in commerce, trade, manufactures, mechanic arts, and mining was 1,596,265, or 27.72 per cent.; in agriculture, 2,400,583, or 44.69 per cent.; in labor not agricultural, 993,620, or 18.5 per cent.; in the army, 5,370, or 0.1 per cent.; in sea and river navigation, 116,341, or 2.17 per cent.; in law, medicine, and divinity, 94,515, or 1.76 per cent.; in other pursuits requiring education, 95,814, or 1.78 per cent.; in government civil service, 24,966, or 0.46 per cent.; in domestic service, 22,243, or 0.41 per cent.; and in other occupations, 22,159, or 0.41 per cent. of the whole employed.

38. The whole number of farms, plantations, etc., in the United States, in 1850, was 1,449,075; and of an aggregate extent of 1,466,455,680 acres, representing the whole area of the States and organized Territories, the land in occupation amounted to 293,560,614 acres —113,032,614 acres improved, or 7.71 per cent. of the whole acreage, and 180,528,000 acres unimproved, or 12.31 per cent. The average land to each farm was 203 acres, varying in the several States and Territories from 51 to 4,466 acres. The cash value of farms and improvements thereon was $3,271,575,426, and the average value of each farm $2,258, varying in the several States, etc., from $337 to $6,481. The value of farming implements and machinery was $151,587,638, and the average value of such on each farm $105, varying from $21 to $863.

39. The livestock, in 1850, consisted of—horses, 4,336,719; asses and mules, 559,331; milch cows, 6,385,094; working oxen, 1,700,744; other cattle, 10,293,069; sheep, 21,723,220; and swine, 30,354,213—valued in the aggregate at $544,180,516. The comparative amount of livestock in 1840 and 1850 is exhibited in the annexed:

Years.	Horses, asses, and mules.	Neat cattle.	Sheep.	Swine.
1840	4,335,669	14,971,586	19,311,374	26,301,293
1850	4,896,050	18,378,907	21,723,220	30,354,213
Increase	560,381	3,407,321	2,411,846	4,052,920
Increase per centum	12.69	22.75	12.49	15.41

The products of animals in 1849–50 consisted of—butter, 313,345,306 pounds; cheese, 105,535,893 pounds; and wool, 52,516,959 pounds. The value of animals slaughtered during the year was $111,703,142.

40. The staple food crops, according to the returns of 1840 and 1850, respectively, and the increase and decrease of each, are thus represented:

Crops.		1840.	1850.			1855 (estim.).
Wheat	bushels	84,823,272	100,485,944	*incr.*	15,662,672, or 18.46 pr. cent.	109,665,678

Sweet potatoes	"		38,268,148			
Peas and beans	"	no returns	9,219,901		—	—

Cotton, sugar, rice, tobacco, and hemp and flax may be styled special crops. Cotton is chiefly grown in South Carolina, Georgia, Alabama, and Mississippi, and less abundantly in Louisiana, Arkansas, Texas, Tennessee, North Carolina, Virginia, Florida, and Kentucky. In these States there was, in 1850, an aggregate of 74,031 plantations, each producing over five bales. Sugar is grown chiefly in Louisiana, Florida, and Texas, in which there was 2,681 plantations. Rice is grown in South Carolina and adjoining States, and was produced on 551 plantations. Kentucky and Missouri had 8,327 hemp plantations. Kentucky, Virginia, Tennessee, and Maryland grew the bulk of the tobacco crop, on 15,745 plantations. The aggregate crops of these several staples, according to the returns of 1840 and 1850, comparatively were as follows:

Crops.		1840.	1850.			1855 (estim.).
Cotton	bales	1,976,198	2,445,793	*incr.*	469,595, or 23.76 pr. cent.	2,721,022
Sugar—cane	pounds	155,100,809	237,113,000	*incr.*	116,265,627, or 74.96 "	339,541,442
" —maple			84,253,436			
Rice	"	80,841,422	215,313,497	*incr.*	134,472,075, or 166.34 "	294,127,580
Tobacco	"	219,163,319	199,752,655	*decr.*	19,410,664, or 8.97 "	—
Hemp—dew rotted	tons	95,251	33,193	*decr.*	56,525, or 59.34 "	—
" —water "			4,678			
Flax			3,855			

The miscellaneous crops in 1849–50 comprised—hay, 13,838,642 tons; hops, 3,497,029 pounds; clover-seed, 468,978 bushels; other grass-seed, 416,831 bushels; flax-seed, 562,317 bushels; molasses, 12,700,991 gallons; silk cocoons, 10,843 pounds; wine, 221,249 gallons; beeswax and honey, 14,853,790 pounds, etc.

41. The total value of farm products, animal and vegetable, has been estimated, in 1840, at $621,163,977, and in 1850 at $994,093,842; and there can be little doubt but that the value produced in 1855, though the data for such an estimate are very imperfect, had risen to $1,200,000,000.

42. The total number of industrial establishments, including mines, manufactories, mechanic shops, fisheries, etc., in the United States, producing to the annual value of $500 and upward, on the 1st June, 1850, was 121,855; the capital invested in this branch of industry amounted to $527,209,133; the value of the raw material, fuel, etc., consumed was $554,665,038; the number of hands employed 944,991, viz., males 719,479, and females 225,512; the wages paid during the year amounted to $229,736,577; and the value of the products of the year amounted to $1,013,336,463.

43. The statistics of the principal branches of industry are as follows:

a. The production of anthracite in 1850 amounted to 3,796,808 tons, and of bituminous coal to 35,088,197 bushels, or 1,253,146 tons—together valued at $7,239,110. In the year stated, coal was mined in twelve States, having an aggregate of 507 establishments, and in these a capital of $8,340,701, and 15,103 persons were employed.

b. The iron manufactures are arranged under the three heads of pig, cast, and wrought:

Specifications.		Pig Iron.	Castings.	Wrought Iron.	Total.
Establishments	number	377	1,391	552	2,320
Capital	dollars	17,346,425	17,416,361	17,033,279	51,796,065
Raw material	value.	7,005,289	10,346,265	13,524,777	30,876,331
Hands—males	number	20,298	23,541	16,110	59,949
" —females	"	150	48	138	336
Value of products	dollars	12,743,727	25,108,155	22,629,271	60,486,153

—the total amount of pig iron manufactured was 543,755; of castings, 322,745; and of wrought iron, 278,044. The raw material used was—

Material used.		In Manufacturing Pig Iron.	In Manufacturing Castings.	In Manufact. Wrought Iron.
Iron ore	tons	1,579,309	9,850	78,787
Pig iron	"	—	345,553	251,491
Old metal	"	—	11,416	—
Blooms	tons	—	—	33,344
Mineral coal	"	645,242	190,981	538,063
Charcoal	bushels.	54,165,286	2,413,750	14,510,828

—making a total consumption of 1,667,946 tons ore; 597,044 pig iron; 11,416 old metal; 33,344 blooms; 1,374,286 mineral coal, and 71,089,814 bushels of charcoal.

c. The number of salt works was 340; capital, $2,640,885; raw material, $1,051,425; hands employed—males 2,699, and females 89; aggregate annual wages—to males $744,432, and to females $9,792; annual products, 9,763,840 bushels, valued at $2,222,745.

d. Cotton factories, 1,094; capital, 74,500,931; raw material used—cotton 641,240 bales,

PICKING COTTON.

and coal 121,099 tons, valued at $34,835,056; hands employed—males 33,150, and females 59,136; products of the year, $61,869,134.

e. Wool factories, 1,550; capital, $28,118,650; raw materials used—wool 70,862,829 pounds, and coal 46,370 tons, valued at $25,755,991; hands employed—males 22,678, and females 15,574; value of products, $43,207,545.

f. Tanneries, 6,263; capital invested, $18,900,557; value of raw material used, $19,613,237; hands employed, 21,011—males 20,909, and females 102; wages per month, $417,184; products of the year—sides of leather 12,257,940, and skins 2,653,865, together valued at $32,861,796. Also about 6,000,000 sheep, goat, and other small skins.

g. Distilleries, etc., 1,217; capital, $8,507,574; raw materials used—barley 3,787,195 bushels, corn 11,067,761 bushels, rye 2,143,927 bushels, oats 56,607 bushels, apples 526,840 bushels, hops 1,294 tons, and molasses 61,675 hogsheads; hands employed, 6,140; products—ale, etc., 1,179,495 barrels, whisky and high wines 41,364,224, and rum 6,500,500 gallons.

h. Fisheries, 1,384; capital, $8,966,044; raw material, $99,681; hands employed—males 20,704, and females 429; value of the products of the year $10,000,182.

44. The following tabular statement (*see Rep. U. S. Sec. of Treas.*, 1855–6), though imperfect and differing somewhat in its results from the foregoing census returns, is valuable as presenting in a condensed form a sketch of the progress of manufactures since 1810:

	1810.	1820.	1830.	1840.	1850.
Manufactures of cotton	$26,076,997	$4,834,157	$22,584,815	$46,350,458	$61,869,084
Manufactures of wool	25,608,788	4,413,068	14,528,166	20,696,999	43,207,545
Manufactures of pig iron	3,616,457	2,230,276	4,757,403	7,172,575	12,743,727
Manufactures of iron castings				9,916,442	25,108,155
Manufactures of wrought iron	10,998,086	4,640,669	16,737,251	11,820,145	22,628,771
Prod. of distilleries and breweries	16,483 960	4,876,486	3,434,808	14,674,804	18,218,681
Products of the fisheries	463,320	—	3,640,758	11,996,008	10,000,182
Products of salt works	1,163,094	1,852,258	935.173	1,235,835	2,222,745
Manufactures produced in families	(included in cotton and woolen products.)			29 023,880	27,493,644
All other manufactures	60,975,204	29,919,621	46,077,092	329,391,574	832,103,265
Total value	$145,385,906	$52,766,535	$112,645,466	$483,278,215	$1,055,595,899

—the returns for 1820 are extremely defective; and in 1830 only ten States are represented.

* From actual census; all others estimates.

45. It is not possible to say with any degree of accuracy what progress may have been made in manufactures during the five years ending in 1855. In that year censuses were taken in several of the States, and in New York and Massachusetts elaborate returns of this great branch of industry have been published. The value of goods produced in the former is stated at $317,428,331, and in the latter at $295,820,681, against $237,597,249 and $151,137,145 in 1850; and hence in the one the increase has been at the rate of 33.5, and in the other at the rate of 95.7 per cent. Taking the lower rate as that of the whole United States, and applying it to the results of 1850, it would give for 1855 no less an aggregate than $1,351,115,284.

46. As a commercial country, the United States now ranks second only to Great Britain. France is much inferior to it in shipping; but still surpasses it in the value of its imports and exports. But the rapid progress which has been made in the commercial movements of the country promise for it a future of grandeur hitherto unattained by any other nation.

47. The statistics of the commerce of the United States with foreign nations and countries for the years ending on the 30th June, 1850 and 1855, are exhibited in the annexed forms—

a. Statement of the value of domestic and foreign exports and of imports:

Exports.	1850.	1855.
Products of the sea	$2,824,818	$3,516,894
Products of the forest	7,442,503	12,603,837
Animals and products of	10,549,338	17,178,080
Vegetable food	15,822,373	23,651,362
Cotton	71,984,616	88,143,844
Tobacco	9,951,023	14,712,468
Other agricul. products	175,402	1,738,034
Manufactures	15,196,451	28,027,180
Other raw products	953,664	2,373,317
Specie and bullion	2,046,679	53,957,418
Quicksilver	—	806,119
Domestic exports	$136,946,912	$246,708,553
Foreign merchandise	9,475,493	26,158,368
" specie and bullion	5,476,315	2,289,925
Total exports	$151,898,720	$275,156,846

Imports.	1850.	1855.
Teas	$4,588,373	$6,930,986
Coffee	11,215,076	16,872,929
Woolens	16,900,916	22,076,448
Cottons	19,681,612	15,742,923
Silk and silks	18,041,009	25,118,173
Iron and manufactures of	10,864,680	23,945,274
Wines	2,065,902	3,117,330
Distilled spirits	3,166,841	2,259,486
Sugar	6,950,716	13,284,663
Tobacco	1,743,341	4,079,569
Salt	1,227,518	1,692,587
Coal	361,855	893,925
Fish, dried, etc.	2 992,628	1,000,330
All others	73,704,139	120,794,085
Specie and bullion	4,628,792	3,659,812
Total imports	$173,188,318	*$261,468,520

b. Statement of the commerce of the United States with foreign nations:

FOREIGN STATES AND COUNTRIES.	VALUE OF EXPORTS. DOMESTIC PRODUCTS. 1850.	DOMESTIC PRODUCTS. 1855.	FOREIGN PRODUCTS. 1850.	FOREIGN PRODUCTS. 1855.	TOTAL. 1850.	TOTAL. 1855.	VALUE OF IMPORTS. 1850.	1855.
Russia on the North	$	$ 48,940	$	$ 20,414	$	$ 69,354	$	$ 250,556
Russia on the Black Sea	666,435	—	198,506	—	864,941	—	1,511,572	26,308

d. Statement of the shipping and crews employed in the commerce of the United States with foreign countries:

Years.	American Shipping. No.	Tons.	Crews.	Foreign Shipping. No.	Tons.	Crews.	Total Shipping. No.	Tons.	Crews
1850 Cleared	8,379	2,632,788	106,753	9,816	1,728,214	89,168	18,195	4,361,002	195,871
1850 Entered	8,412	2,573,016	104,369	10,100	1,775,623	91,801	18,512	4,348,639	196,170
1855 Cleared	9,569	4,068,979	143,677	9,921	2,110,322	102,878	19,490	6,179,301	246,555
1855 Entered	9,315	3,861,391	137,808	10,012	2,083,948	100,807	19,327	5,945,339	238,615

—the increase in entrances being in the five years 36.6 per cent. and in clearances 41.7 per cent.

e. Statement of the shipping registered, enrolled, and licensed at the ports of the U. States:

Years.	Registered. Permanent.	Temporary.	Enrolled and Licensed. Permanent.	Temporary.	Licensed (under 20 tons).	Aggregate Tonnage.
1850	1,262,576	323,135	1,879,514	20,041	50,188	3,535,454
1855	1,957,706	577,430	2,602,499	13,231	60,844	5,212,001

—and of the description and proportion of tonnage employed as understated:

Years.	Registered. Whale Fishery.	Steam Navigation.	Enrolled and Licensed. Coasting Trade.	Cod Fishery.	Mackerel Fishery.	Whale Fishery.	Steam Navigation.	Lic. under 20 tons. Coasting Trade.	Cod Fishery.
1850	146,017	44,942	1,755,796	85,646	58,112	—	481,004	42,028	8,160
1855	186,778	115,045	2,491,108	102,928	21,625	70	655,289	52,147	8,987

—showing an increase of the total tonnage in the five years equal to 47.4 per cent., and of steam tonnage an increase of 46.4 per cent.

f. Statement of the description and amount of shipping built in the United States:

Years.	Classes of Vessels. Ships and Barques.	Brigs.	Schooners.	Sloops, etc.	Steamers.	Total.	Total Tonnage.
1850	247	117	547	290	159	1,360	272,218
1855	381	126	605	669	243	2,024	583,450

—showing an increase in 1855 over 1850 of 311,232 tons or 114.3 per cent.

See STATISTICAL TABLE, p. 53, for the progress of commerce from 1789 to the present time.

48. Comparing the foreign commerce and navigation, etc., of the United States with that of the United Kingdom and France in 1855, the following are the results:

Countries.	Valuation of Commerce. Exports.	Imports.	Tonnage Employed. Cleared.	Entered.	Shipping owned.	Shipping built.
United States	$275,156,846	$261,468,520	6,179,301	5,945,339	5,212,001	583,450
United Kingdom	564,389,582	690,482,424	11,605,595	10,886,436	4,349,604	328,200
France	316,400,000†	255,080,000†	2,034,655	3,304,765	916,649	57,154

—the steam shipping of the countries severally and included in the above aggregate having been for the United States 770,285 tons, for the United Kingdom 380,635 tons, and for France 44,493 tons.

49. The domestic trade of the Union is incomparably larger and more valuable than its external trade. It can only be estimated from arbitrary data or from the isolated returns of a few great trade centers. On such basis an estimate was founded by Israel D. Andrews, Esq., whose valuable report for 1851 and 1852 was published by the authority of the United States Senate (32 *Cong.*, 1 *Sess.*, *Ex. Doc.*, *No.* 112). From this we learn that the grand total of exports and imports amounted to 77,647,906 tons valued at $6,242,515,574, and was apportioned to the several departments of the trade in the following manner:

Lake commerce (shore-line 3,620 miles)	1851	3,971,126 tons	valued at $314,478,458
River commerce (navigable length 26,000 miles)	1851	4,066,800 "	" 339,502,744
Coasting trade (shore-line 12,500 miles)	1851	40,794,980 "	" 3,319,039,372
Canal trade (length of canal 3,600 miles)	1852	18,000,000 "	" 1,188,000,000
Railroad trade (length of railroad 10,000 miles)	1852	10,815,000 "	" 1,081,500,000

—dividing these sums by two will give the net amount and value; and hence it would appear that the absolute amount of produce and merchandise moved from place to place in search of

* Including the value of indirect importations from the German Zollverein, Switzerland, and Austria, *via* the ports as undermentioned:

Original Source.	Countries through the ports of which transmitted. Bremen.	England.	France.	Belgium.	Holland.	Hamburg.	Rotterdam.	Total.
Zollverein	$5,324,971	$2,842,826	$2,637,747	$1,156,950	$165,673	$704,159	$3,204	$12,835,530
Switzerland	569,168	3,405,266	3,791 004	—	9,542	3,152	—	7,778,132
Austria	188,995	59,555	56,966	—	500	29,888	—	335,904
Total	$6,083,134	$6,307,647	$6,485,717	$1,156,950	$175,715	$737,199	$3,204	$20,949 566

—of the total of the Zollverein—from Prussia $7,024,562, Bavaria $823,493, Saxony $2,710,591, Frankfort $682,207, Baden $278,092, Wurtemburg $149,403, Hesse $396,418, Brunswick $3,223, Oldenburg $1,208, Saxe-Meiningen $6,171, Saxe-Weimar $13,409, Hanover $44,277, countries not specified $702,476.

† This is the foreign commerce of France by sea. To this should be added, in order to note the whole foreign commerce of that nation, its trade by land, which in the year referred to consisted of—exports $89,040,000, and imports $135,060,000. The total trade was thus—exports $405,440,000, and imports $390,140,000.

consumers was 38,823,953 tons valued at $3,121,257,787. This result may approximate accuracy so far as relates to the number of tons transported; but in relation to the valuation is unsatisfactory, as it by no means decides that the same property has not entered and re-entered several times into the general account as it was removed from point to point. The increase of domestic commerce in the five years from the dates above used must have been large, and if in the same ratio as the advance of other departments of industry, the totals for the years 1856 and 1857 may with safety be reckoned at a full third more than the amounts and values estimated with the foregoing results.

50. Few countries are so well provided with the means of prosecuting a vast and lucrative commerce. Nature has provided for it on a magnificent scale waterways which render accessible its most remote sections; and what nature has left undone has been effected by the industry of man and the aid of art. Railroads, canals and river improvements, turnpikes, roads of other grades, and telegraph lines now intersect and connect all the more settled portions of the country; and so rapidly and cheaply are these constructed that in more than one instance these modern ways of commerce have been extended into the wilderness, and been the means of peopling vast districts, which would otherwise have remained waste for an indefinite period or until the increasing density of population would have forced its surplus into their remote confines. If we take only the routes traveled by the post* the aggregate mileage is immense, and its increase year by year so great as to occasion the wonder and admiration of the world. But the routes so used by no means express the sum of the mileage in use as commercial routes, which have a much wider range and more intricate system, originating in every hamlet and coalescing at greater and greater centers until they are merged into the great streams of commerce, which directly point to and radiate from the central marts of supply and distribution.

51. The canal, railroad, and telegraph are projections of the present century. Of the canals the most conspicuous on account of their extent and value to commerce are—the Erie Canal extending from Albany, N. Y., to Buffalo, N. Y.; the Pennsylvania lines of canals from Philadelphia, Pa., to Pittsburg, Pa.; the Chesapeake and Ohio extending from Alexandria, Va., to Cumberland, Md., and further projected to Pittsburg, Pa.; and the James River Canal completed from Richmond, Va., to Buchanan, Va., and in progress to the mouth of the Kanawha River on the Ohio. These are all east and west waterways, supplying navigable channels from tide-water to the great lakes and Ohio valley. In New York and Pennsylvania there are also several lateral canals connecting with the main lines. The great lines of the interior have been opened to connect the lakes with the Ohio and Mississippi, as the Ohio canals, which extend from Cleveland and Sandusky to Portsmouth and Cincinnati; the Indiana Canal, which extends from Sandusky and down the Wabash valley to the Ohio River at Evansville, and the Illinois Canal connecting Chicago with the navigable waters of the Illinois River. A short canal also connects the navigation of the Fox and Wisconsin rivers, and through them the lakes and the Mississippi. Besides these there are numerous other shorter canals, chiefly in Virginia, North Carolina, South Carolina, and Louisiana, which are of immense local value. The total length of canal and river improvements adapted to commercial navigation has a length of about 5,000 miles.

52. The railroad was first inaugurated in 1828, in which year a short railroad was opened from Quincy quarries to Boston harbor. New York, South Carolina, and Pennsylvania were the next States to introduce this great invention, and subsequently the adjoining and at last the most remote States, spurred on by the necessities of commerce, commenced and completed to a greater or less degree works of unprecedented extent; and so persistent has been the spirit which has sustained these enterprises, that at the present time (1858) there is at least one mile of completed railroad for every thousand inhabitants of the country or about 28,000 miles, which have been built and equipped at an average cost of $35,000 a mile. Otherwise there are about 16,000 miles additional being built, and which will be opened to commerce within the next ten years; and the mileage of projected railroad is even on a greater scale.

53. But even the great conveniences supplied by the railroad were unsatisfactory to commerce. It demanded a greater speed than the railroad could attain, and hence at its call electricity was harnessed to do its behests, and now traverses the wires from one end of the country to the other and in every direction. The invention of the electric telegraph is due to Prof. Morse, an American, who in 1844 stretched the wires between Washington and Baltimore. From this small beginning a vast system of lines has been established, and all the great trade centers of the Union placed in instantaneous connection. With modifications this means of communication has been adopted by all civilized countries, and in several instances crosses the seas, and an attempt is already being made to lay a wire below the ocean from Europe to America. This will be accomplished during the present year (1858), and by its means intelligence will be transmitted from one world to the other in a space of time inappreciable except to science. The length of telegraph line within the United States is not less than 60,000 miles, and has been extended at an expense of little less than $10,000,000. In 1850 the length was only 23,281 miles, and in 1854 only 41,392. The immense utility and convenience of such an agent to commerce and society generally is beyond calculation, but requires no comment.

54. The government of the United States is a federal democratic republic. It is based on the constitution of 1787 and amendments thereto. The electors of the most numerous branch of the several State legislatures are qualified electors in the State respectively for all elective officers of the general government.

55. All legislative powers are vested in a congress, which consists of a senate and house of representatives. The house of representatives is composed of members chosen every second year by the people, and in number according to population; and in order to ascertain the number, two thirds of the slaves and all Indians not taxed are excluded from the representative population. Each State, however, is entitled to at least one representative. No person under 25 years of age, who has been less than seven years a citizen, and who is not a resident of the State from which elected, is qualified for representative. The number of representatives, under the apportionment of 1853, is 234; and in addition to these the house admits a delegate from each organized Territory, who has the right to debate on subjects in which his constituents are interested, but can not vote. The senate consists of two members from each State, elected by the legislature thereof for six years, and one third of the body is renewed biennially. Senators must be at least 30 years of age, must have been citizens for nine years, and be resident in the State from which elected. The Vice-President of the United States is *ex-officio* president of the senate; the house chooses its own speaker. Besides its ordinary legislative capacity, the senate is vested with certain judicial functions, and its members constitute a high court of impeachment. The representatives have the sole power of impeachment.

56. The executive power is vested in a President, who, as also the Vice-President, is elected for four years by an electoral college, chosen by popular vote, or by the legislatures of the States severally, the number of electors being equal to the number of senators and representatives from the States to Congress. A majority of the aggregate electoral votes is necessary to elect. The President and Vice-President must be native-born citizens, at least 35 years of age, and have been resident for 14 years. The President is commander-in-chief of the army and navy, and of the militia when in the service of the Union. With the concurrence of two thirds the senate he has power to ratify treaties, appoint civil and military officers, levy war, conclude peace, etc., and has a veto in all congressional action. In case of the death, resignation, or disability of the President, the Vice-President acts in his stead.

57. The administrative business of the nation is conducted by several officers, with the title of secretary, etc., who form what is termed the cabinet or executive council. These are the secretaries of state, war, navy, treasury, and interior, the postmaster-general, and the attorney-general. Each of these presides over a separate department.

58. The judicial powers of the government are exercised by a supreme court and such inferior courts as the Congress may from time to time establish. The present judicial establishment consists of a supreme court, circuit courts, and district courts. The supreme court, the highest judicial tribunal, is composed of a chief-justice and eight associate justices, the attorney-general, a reporter, and a clerk. The court is held at Washington, and has one session annually. Circuit courts are held by a justice of the supreme court conjointly with the judge of the district in which the court sits. For the purposes of this court the United States are divided into nine judicial circuits, in each State composing which a court is held twice a year. District courts are held by district judges alone. Each State is one or more districts for the purpose of holding these courts. There are also territorial courts, which have the same powers as district courts.

59. The receipts and expenditures in the years ending 30th June, 1850 and 1855, are thus stated:

Receipts.	1850.	1855.
Customs	$39,668,687	$53,025,794
Sales of public lands	1,859,894	11,497,049
Miscellaneous sources	1,847,218	481,087
	$43,375,799	$65,003,930
Balance from last year	2,184,964	20,137,968
Total, exclusive of loans, etc.	$45,560,763	$86,141,898
Loans and treasury notes	4,045,950	—
Total means	$49,606,713	$85,141,898

Expenditures.	1850.	1855.
Civil list	$3,042,770	$5,684,496
Foreign intercourse	4,838,595	964,311
Miscellaneous	6,958,360	17,584,680
Department of interior	3,400,525	4,126,739
Department of war	9,401,289	14,773,826
Department of navy	7,923,313	13,281,341
Public debt and interest thereon	7,437,366	9,844,528
Total	$43,002,168	$66,209,922
Balance to next year	$6,604,545	$18,931,976

—the public debt on 30th November, 1850, amounted to $64,228,238, and 1855 to $39,969,731. These figures are exclusive of trust funds.

60. The amounts of gold and silver deposited in the mint at Philadelphia and its several branches (at New Orleans, La.; San Francisco, Calif.; Dahlonega, Ga.; Charlotte, N. C.) and the assay office in New York in 1850 and 1855, and of the coinage, were as follows:

Deposits.	1850.	1855.
GOLD—		
United States coins	$9,996	$3,317
Foreign coins	1,303,740	295,919
United States bullion	36,938,314	63,574,032
Foreign bullion	113,110	440,625
Total gold	$38,365,160	$64,223,893
SILVER—		
United States bullion	$269,253	$371,337
Foreign bullion	143,192	5,421,777
Foreign coins	1,526,596	
Total silver	$1,939,041	$5,793,114
Total gold and silver	$40,304,201	$70,017,007

Coinage.	1850.	1855
GOLD—Double eagles	$26,225,220	$22,528,020
Eagles	3,489,510	2,351,870
Half eagles	860,160	1,474,425
Three dollars	—	295,245
Quarter eagles	895,542	1,205,275
Dollars	511,301	1,625,500
Bars (fine and unparted)	—	23,616,748
Total gold	$31,981,733	$53,097,183
SILVER—Dollars	$47,500	$26,000
Half dollars	1,341,500	2,472,350
Quarter dollars	150,700	1,958,000
Dimes	244,150	536,500
Half dimes	85,250	213,500
Three-cent pieces	—	12,300
Total silver	$1,869,100	$5,219,150
COPPER—Cents and half cents	$44,468	$22,458

—making a total coinage valued in 1850 at $33,892,301, and in 1855 at $58,338,791. The total coinage of gold and silver from 1793 to the end of the fiscal year, 1850, amounted to $195,074,711, and to the end of 1855 to $485,057,950, namely, for the latter date, $385,505,545 in gold and $99,552,405 in silver. The estimated amount of specie in the country in 1851 was $186,000,000, of which $138,000,000 was in circulation, and $48,000,000 in banks. In 1855 the amount in circulation was estimated at $200,000,000, and the deposits in bank at $60,000,000.

61. The gold regions of the United States are two: the Apalachian gold field and the Sierra Nevada gold field. Previous to the discovery of the latter, all the gold deposited in the mint was taken from the fields on the eastern base of the Apalachian chain, in Virginia, North and South Carolina, Georgia, etc., and amounted only to $12,808,575. Since that period, to the 30th June, 1857, the deposits were as follows:

Years.	Virginia.	N. Carolina.	S. Carolina.	Georgia.	California.	Total.
1848	$57,886	$473,543	$40,577	$257,063	$48,301	$896,675
1849	129,382	485,793	24,564	236,349	6,151,360	7,079,144
1850	65,991	355,523	19,459	209,587	36,273,097	36,933,314
1851	69,052	326,883	41,052	157,213	55,938,232	56,540,612
1852	83,626	403,295	126,982	96,542	53,794,700	54,506,963
1853	52,200	275,622	99,317	58,896	55,113,487	55,622,051
1854	23,514	207,073	36,604	55,831	56,933,931	57,258,158
1855	30,665	226,416	32,210	71,519	48,985,893	49,351,778
1856	28,535	171,070	35,756	90,119	47,508,410	47,878,440
1857 (6 months)	4,036	83,870	13,312	39,090	23,128,176	23,270,029
Total, 9½ years	$544,887	$3,009,088	$469,733	$1,272,209	$383,873,099	$389,342,177
Total, 1804–1857	1,490,781	8,537,093	1,203,373	6,618,142	383,873,099	402,150,752

—the total includes several small amounts from Alabama ($193,984), Tennessee ($80,299), New Mexico ($48,397), Oregon, etc. ($105,581).

62. From these exhibits it will be seen that of the total amount deposited since 1804, viz.,

* The length of post-routes in the United States in 1850 measured 178,672 miles, and in 1855, 227,908 miles. Of the total in the years respectively 6,686 and 18,333 miles was by railroad, 9,725 and 14,619 miles by steam navigation, 40,776 and 49,203 miles by coach road, and 121,285 and 145,753 miles by inferior grades of road. *See*, also, *Table*, p. 50.

$402,150,752, or since 1847, viz., $389,342,177, California alone has deposited $383,873,099. These sums, however, do not represent the full production of the United States mines, since large quantities, probably 20 per cent. of the whole, are exported as bullion, have been manufactured, or remain in the hands of individuals. The total gold produced in California alone, to the end of 1857, is estimated at $485,000,000.

63. It has never been the policy of the United States to maintain a large permanent armed force either by sea or land; but to trust for offense and defense to volunteers and the militia. And hence at the present day so far as the land force is concerned it numbers fewer men under arms than several of the second-rate German powers, nor is its public navy larger than those of such powers as Portugal and Sweden. Nevertheless its forces, often collected at short notice and with inadequate preparation, have been equal to all emergencies; and such is the military spirit of the nation, that both the army and navy could be amply recruited for defense at a few days' notice. The existing establishment, therefore, can only be considered as the nucleus about which the real force of the country would be collected, should war or insurrection unhappily disturb our peace.

64. The federal army in 1857 was organized as follows:

	Officers.	Men.
General officers	4	—
Adjutant-general's department	13	—
Inspector-general's department	2	—
Quartermaster's department	40	—
Subsistence department	11	—
Medical department	107	68
Pay department	28	—
Corps of engineers	47	88
Corps of topographical engineers	39	—
Ordnance department	54	244
2 regiments of dragoons	74	1,038
2 " of cavalry	75	1,582
1 " of mounted riflemen	37	694
4 " of artillery	216	3,191
10 " of infantry	350	6,225
Non. com. staff unattached to regiments	—	72
Detachments at depots, rendezvous, etc.	—	1,465
Total	1,097	14,667
Recruits required		2,205

—making an aggregate of 17,969 officers and men as the full complement of the establishment.

65. For military purposes the United States territory is divided into six departments, viz., the Department of the East (headquarters, Troy, N. Y.); that of Florida (Ft. Brooke); that of the West (St. Louis, Mo.); that of Texas (San Antonio); that of New Mexico (Santa Fé), and that of the Pacific (San Francisco). And belonging to this arm of the service are the national armories at Harper's Ferry, Va., and Springfield, Mass., with 24 arsenals and three ordnance depôts distributed over the several departments.

66. The enrolled militia, according to the Army Register for 1857, numbered in the aggregate 54,109 commissioned officers and 2,071,249 non-commissioned officers, musicians, artificers, and privates, and in the several States and Territories was returned as follows:

Maine	2,617	Virginia	125,531	Indiana	53,913
New Hampshire	33,538	North Carolina	79,448	Illinois	257,420
Massachusetts	155,031	South Carolina	36,072	Wisconsin	49,261
Vermont	23,915	Georgia	78,699	Missouri	118,047
Rhode Island	1,151	Florida	12,122	Arkansas	36,054
Connecticut	51,814	Alabama	76,662	Texas	19,766
New York	333,358	Louisiana	90,732	California	208,645
New Jersey	81,984	Mississippi	36,084	Minnesota	2,003
Pennsylvania	106,957	Tennessee	71,252	Utah Territory	2,821
Delaware	9,229	Kentucky	88,979	(Iowa and Territories of New Mexico, Oregon, Washington, Kansas, and Nebraska made no returns.)	
Maryland	46,864	Ohio	176,455		
District of Columbia	8,201	Michigan	97,094		

—but it is easily seen that in many instances the above table does not exhibit the whole military forces of the States. In general all free male persons between the ages of 18 and 45 years are liable to military duty, and of such there were in the United States in 1850 upward of 4,000,000, which number may be set down as the approximate militia force of the nation.

67. The national navy in 1857 comprised the following vessels:

Vessels	In Commission, No.	In Commission, Guns.	In Ordinary, No.	In Ordinary, Guns.	On Stocks, No.	On Stocks, Guns.	Total, No.	Total, Guns.
Ships of the line	3	288	3	252	4	336	10	876
Razee	1	56	—	—	—	—	1	56
Frigates	2	100	8	400	—	—	10	500
Sloops	17	320	4	82	—	—	21	402
Brigs	—	—	5	24	—	—	5	24
Schooner	—	—	1	3	—	—	1	3
Store ships	3	12	—	—	—	—	3	12
Screw steamers, 1st class	4	160	1	50	2	90	7	300
" 2d class	1	13	—	—	—	—	1	13
" 3d class	1	10	1	9	—	—	2	19
Side-wheel steamers, 1st class	3	34	—	—	—	—	3	84
" " 2d class	1	6	—	—	—	—	1	6
" " 3d class	2	6	1	2	—	—	3	8
Steam tenders	3	3	—	—	—	—	3	3
Total	41	1,008	24	822	6	426	71	2,256

For naval operations this fleet is distributed into the Home, Brazilian, Pacific, Mediterranean, East Indian, and African squadrons.

68. Connected with the navy there is a naval academy at Annapolis, Md.; navy yards at Kittery, Me.; Charlestown, Mass.; Brooklyn, N. Y.; Philadelphia, Pa.; Washington, D. C.; Gosport, Va.; Warrington, Fla.; Mare Island, Cal.; and Sackett's Harbor, N. Y.; navy hospitals at Chelsea, Mass.; Brooklyn, N. Y.; Philadelphia, Pa.; Norfolk, Va.; and Pensacola, Fla.; and naval magazines at or in the neighborhood of all the navy yards.

69. The personnel of the navy consists of 68 captains, 96 commanders, 311 lieutenants, 69 surgeons, 43 passed assistant surgeons, 37 assistant surgeons, 64 pursers, 24 chaplains, 12 professors of mathematics, 24 masters in the line of promotion, 24 passed midshipmen, 31 midshipmen, 145 acting midshipmen, 38 boatmen, 40 gunners, 48 carpenters, 39 sailmakers, 17 chief engineers, and 79 assistant engineers in three classes. The marine corps has the organization of a brigade under a colonel-commandant.

70. A few historical facts concerning the formation of the original United States, and the admission of new States into that Union, may be appropriately introduced in this connection.

71. On Monday, the 5th September, 1774, there was assembled in Carpenters' Hall, in the city of Philadelphia, a number of delegates who had been chosen and appointed by the several English colonies in North America to hold a congress, for the purpose of discussing certain grievances imputed against the king and his officials. This congress resolved on the next day that each colony should have one vote only.

72. On Tuesday, July 2d, 1776, the Congress resolved, "That these united colonies are and of right ought to be free and independent states," etc.; and on Thursday, the 4th July, the whole Declaration of Independence having been agreed upon, it was publicly read to the people. Shortly after, on the 9th September, it was resolved that the words "United Colonies" should be no longer used, and that the "United States of America" should thenceforward be the style and title of the Union.

73. On Saturday, the 15th November, 1777, "Articles of Confederation and Perpetual Union of the United States of America" were agreed upon by the State delegates, subject to the ratification of the State legislatures severally. Eight of the States had ratified these articles by the 9th July, 1778; one did so on the 21st July; one on the 24th July; one on the 26th November of the same year; one on the 22d February, 1779, and the last one on the 1st March, 1781. Here was a bond of union among thirteen independent States, whose delegates in Congress legislated for the general welfare, and executed certain powers, so far as they were permitted by the articles aforesaid. The war of the Revolution closed in 1783.

74. On the 4th March, 1789, the present constitution, which had been adopted in a convention, and ratified by the requisite number of States, went into operation. The dates at which the State legislatures ratified this instrument were: Delaware, 7th Dec., 1787; Pennsylvania, 12th Dec., 1787; New Jersey, 18th Dec., 1787; Georgia, 2d Jan., 1788; Connecticut, 9th Jan., 1788; Massachusetts, 2d Feb., 1788; Maryland, 28th April, 1788; South Carolina, 23d May, 1788; New Hampshire, 21st June, 1788; Virginia, 26th June, 1788; New York, 26th July, 1788; North Carolina, 21st March, 1789; and Rhode Island, 29th May, 1790.

75. The privilege of becoming members of the Union by ratifying the constitution was confined to those States that were parties to the confederation by which the constitution had been framed. This constitution had been adopted by the convention on the 17th day of September, 1787. It required that nine States should ratify it before its provisions could go into effect. On the 13th of September, 1788, Congress determined that, as a sufficient number of States had complied with this reservation—eleven having done so, it should become operative on the first Wednesday (the 4th) of March, 1789. North Carolina and Rhode Island had not yet given it sanction; but as soon as they had acceded to it, they were admitted to a participation of its benefits.

76. Since the period of the adoption of the constitution twenty new States have been admitted into the Union. These are as follows: Vermont, 4th March, 1792; Kentucky, 1st June, 1792; Tennessee, 1st June, 1796; Ohio, 29th Nov., 1802; Louisiana, 8th April, 1812; Indiana, 11th Dec., 1816; Mississippi, 10th Dec., 1817; Illinois, 3d Dec., 1818; Alabama, 14th Dec., 1819; Maine, 15th March, 1820; Missouri, 10th Aug., 1821; Arkansas, 15th June, 1836; Michigan, 26th Jan., 1837; Florida, 3d March, 1845; Texas, 29th Dec., 1845; Iowa, 28th Dec., 1846; Wisconsin, 29th May, 1848; California, 9th Sept., 1850; Kansas (conditional act), 30th April, 1858; and Minnesota, 4th May, 1858.

77. In 1850 there were in the United States, 61 towns of 10,000 inhabitants and upward, and 199 towns having between 3,000 and 10,000:

States.	Towns of 10,000 and upward. Num.	Towns of 10,000 and upward. Popula.	Towns of 3,000 to 10,000. Num.	Towns of 3,000 to 10,000. Popula.	Total Urban Population.	Propor. of Urban to Rural Pop.

1539, Iroquois Confederacy.

Discovered 1496; San Augustine settled 1565.

FLORIDA under SPAIN.

96, Pensacola.

72, Eries conquered by Iroquois.
73, Marquette reaches the Mississippi River.
79, Expedition of La Salle.

82, La Salle descends the Mississippi
85, Arkansas Post.

83, French at Detroit. 83, Kaskaskia.

99, Iberville.

2, Mobile.

1, Fort Detroit.

12, Grant to Crozat.

16, Natchez.

11, Vincennes.

20, Law's Mississippi scheme.
22, Charlevoix's visit.
24, Catholic religion established.

28, Natchez Indians
31, French population 5,000. [destr.

21, Charlevoix's visit.

36, Expedition against Chickasaws.

40, Cotton cultivated.

41, Tennessee explored.

48, Ohio Company.
Kentucky explored.

LOWER LOUISIANA.

51, Sugar-cane from Hayti.

55, Pop. 7,000 (French).

UPPER LOUISIANA.

50, Shawanese arrive from Georgia.

LOUISIANA.

56, Colony.

Henry's travels. 60, Delawares from Pennsylvania.

England.—Pontiac's War. 64, Treaty of Niagara.

LOUISIANA 68, Indian War. 69, Daniel Boone in Kentucky.

68, Carver's travels.

East of the Miami Confederacy. 75, Boonesboro'. 79, Nashville.

Mississippi River.

SPANISH PROVINCES under the VICEROYALTY of MEXICO.

83, San Francisco.

UNEXPLORED COUNTRY.

63, Ceded to Spain. 66, Carver's travels. Ceded 63, St. Louis. 69, Pop. 70, Given up

LOUISIANA

78, Dubuque's purchase.

West of the Mississippi River.

85, Pop. 33,000.

63, Ceded to Spain. 13,538 to Spain.

63, Ceded to LOUISIANA.

74, Yazoo grant.

90, Columbia River discovered.

1800, Retroceded to France. 1803, Purchased by United States.

3, Expedition of Lewis and Clarke. 1804, LOUISIANA TERRITORY. 7, Pike's Exploring Expedition.

10, Astoria. 13, Fort George. 18, Treaty with Great Britain. 24, Fort Vancouver.

12, MISSOURI TERRITORY. 19, North limit fixed at 49° N. 23, Long's Expedition. 28, Cherokees from Georgia.

32, Ft. Hall.

Ft. Walla-walla.

INDIAN TERRITORY.

38, Iowa Territory. 43,112

1849. Minnesota Ter.

1821. MEXICAN REPUBLIC. 32, Colony. 35, Revolt. 36, Republ. of Texas. 43, Americans in California, Mormons in Deseret. 48, Ceded to U. States 45, Adm. 212,592

Calif. and N. Mex. Ter. 17,380 Adm. 92,547

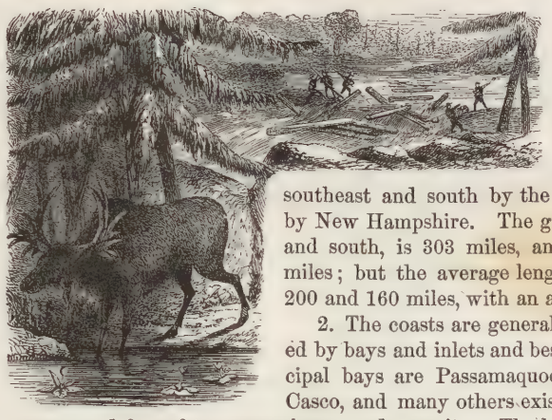
[The States and Territories constituting the United States have hitherto been arranged under the grand divisions of "Eastern" and "Western," the former subdivided into North, Middle, and South, and the latter into North and South. This classification was sufficient and correct so long as the territorial limits of the Union were bounded westwardly by the Rocky Mountains; but since their extension to the Pacific Ocean another and more comprehensive nomenclature and arrangement has become not only desirable, but absolutely indispensable. The west of former days is now the middle region of the country. In the adoption of a new classification, however, it is not proposed to blot out the ancient landmarks, but to so adjust and add to them as the exigencies of the new order of things so evidently demands. The following table classifies the several States and Territories in as nearly geographical order as their political limits will permit:

Atlantic or Eastern	*North*	Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut.
	Middle	New York, New Jersey, Pennsylvania, Delaware, Maryland.
	District of Columbia.	
	South	Virginia, North Carolina, South Carolina, Georgia.
Gulf or Southern		Florida, Alabama, Mississippi, Louisiana, Texas.
Interior or Middle.	*North*	Ohio, Indiana, Michigan, Illinois, Wisconsin, Iowa, Minnesota, Nebraska.
	South	Kentucky, Tennessee, Missouri, Arkansas, Kansas, Indian Territory.
Pacific or Western.	*North*	Washington, Oregon.
	South	California, Utah, New Mexico.



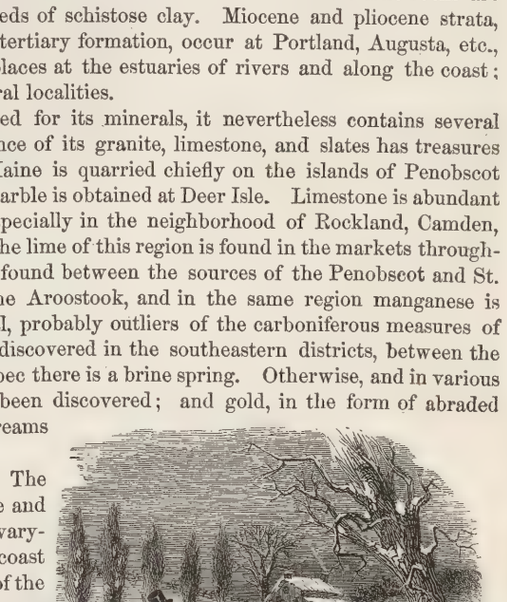
This classification divides the whole territory into four great natural sections—the Atlantic or Eastern, including all the States the greater portions of which occupy the Atlantic slope and plain; the Gulf or Southern, which includes the States occupying with little territorial exception the Gulf slope, and the waters of which are mainly carried to the Gulf of Mexico; the Interior or Middle, which comprises all the States and Territories drained by the constituents of the Mississippi not included in the first two regions, or which are drained into the great northern lakes; and the Pacific or Western, which is composed of the States and Territories which lie west of the crest of the Rocky Mountains, and which, with the exception of the eastern portion of New Mexico, drain into the Pacific Ocean.

The territorial extent of these several regions in 1850 was as follows:

Regions.	Area, sq. m.	Proportionate area.	Regions.	Area, sq. m.	Proportionate area.
Atlantic or Eastern	397,103	12.9	Interior or Middle	1,180,949	40.3
Gulf or Southern	435,905	14.9	Pacific or Western	940,209	31.9

The total area, thus distributed, is 2,936,166 square miles. To this should be added the Territory of Arizona, purchased from Mexico in 1854, containing 27,500 square miles. With this the area of the United States is 2,963,666 square miles.]

STATE OF MAINE.



1. Maine, the most easterly of the United States, is situated between latitudes 42° 57′ and 47° 32′ north, and longitudes 66° 52′ and 71° 6′ west; and is bounded on the northwest and north by Canada, on the east by New Brunswick, on the southeast and south by the Atlantic Ocean, and on the west by New Hampshire. The greatest extension of the State, north and south, is 303 miles, and the greatest width thereof 212 miles; but the average length and breadth are not more than 200 and 160 miles, with an area of 31,766 square miles.

2. The coasts are generally bold and rugged, deeply indented by bays and inlets and beset by numerous islands. The principal bays are Passamaquoddy, Frenchman's, Penobscot, and Casco, and many others exist which furnish a series of harbors unsurpassed for safety, convenience, and capacity. The harbor of Portland is one of the best on the Atlantic coast. Mt. Desert Island, in Frenchman's Bay, is the largest of the islands, and its peaks rise 1,000 to 1,800 feet above the sea. The other larger are Deer Isle, Isle Haut, etc. The Isles of Shoals belong partly to New Hampshire; and Deer, Campobello, and Menan, off the east coast, to New Brunswick. The coast extends from Quoddy Head to Kittery Point, 278 miles, but including the islands and all irregularities, the shore line measures 2,486 miles, or one mile of coast to every 12.78 square miles of land surface.

3. The Apalachian chain, which culminates in the White Mountains of New Hampshire, is continued northward along the western border of Maine, and through Canada to Cape Gaspé, and forms the watershed of the streams flowing into the lower St. Lawrence, and those which flow to the upper St. John. The southern limit of the basin of the St. John is formed by an irregular chain of highlands stretching from the main ridge eastward across this State, and terminating at Mars Hill, near the New Brunswick line. These chains are not of great elevation, but contain peaks varying in height from 2,000 to 4,000 feet; and in the southern chain Mt. Katahdin (latitude 46° and longitude 69°) rises 5,385 feet above sea-level. South, and immediately succeeding this mountain region, the surface gradually subsides into a beautifully varied region of hills and valleys and undulating plains, and replete with the most inviting scenery, embracing lakes innumerable and river falls and rapids in almost every stream. Lakes, indeed, are a prominent characteristic of the whole State, and in all occupy an area equal to a tenth of its surface. This middle region is the largest as well as the fairest section of the State. Its southern limit is a line drawn across the lower falls of the rivers, and all south of this line, the tide-water region, is comparatively an inferior tract, in many parts sandy, and generally rocky. Extensive marshes border on the Matawamkeag, a tributary of the Penobscot from the east.

4. The northern portion of the State is drained by the Walloostook, Allagash, and Aroostook, constituents of the St. John, which has its lower course in New Brunswick. The St. Croix forms the southern part of the boundary toward New Brunswick, and falls into Passamaquoddy Bay, an irregular sheet of water extending 20 miles farther to the ocean, and embracing several subsidiary bays and numerous islands, on one of which stands Eastport, the most easterly town of the United States. From Quoddy Head to Penobscot Bay no large river empties into the sea. All the waters which descend from the southern side of the highlands flow down the Penobscot, the chief tributaries of which are the Sebois and Matawamkeag from the north, and the Piscataquis, a large stream, from the west. This river has a total length of 300 miles, and is navigable to the head of tide at Bangor, 60 miles from the sea. The Androscoggin and the Kennebec reach the sea in a single stream through a channel formed by the peninsula of Phippsburg on the west, and numerous islands on the east. The Kennebec has its sources in the highlands, from which issue the southeastern branches of the Chaudiere, and after passing through Moosehead Lake, has a southerly but winding course to the sea. At Merrymeeting Bay it is joined by the Androscoggin, which is formed in New Hampshire by the union of the Magalloway River and the outlet of the Moosetocmaguntic and Umbagog lakes. Both these rivers have numerous falls, the principal of which, in the Androscoggin, are at Rumford, Livermore, Lewiston, and Brunswick; and in the Kennebec the Carratuck, Norridgewoc, Skowhegan, and Ticonic falls. The rivers of the southwestern part of the State have short courses, and, with exception of the Piscataquis, a deep and wide river which lies between Maine and New Hampshire, are of little value as navigable channels. The Presumscot is the outlet of Sebago Pond, and falls into Casco Bay a few miles north of Portland. The Saco has its sources in the White Mountains, and runs almost directly southeast into the bay of the same name. Its principal tributary is the outlet of Ossipee Lake.

LAKE SCENERY

5. Igneous and paleozoic rocks occupy a large space in the geological formation of Maine. Igneous rocks, eruptive or metamorphic, spread over both the western and southern sides, and also appear in the central silurian districts. Much of the northwest is granitic, and also the loftier summits of the highlands; and granite also occurs largely about Augusta and elsewhere toward the south. Lower silurian strata occupy the whole center of the State, except where broken through or transformed by intrusive rocks. This series is here represented chiefly by strata of blue fossiliferous limestone and argillaceous schists. The upper silurian rocks, consisting chiefly of a light gray limestone, occupy the northwest districts, including the valley of the Walloostook, and they also appear in detached portions quite across the southern portion of the State. In the extreme north the characteristic rocks are strata of old red sandstone crowning beds of schistose clay. Miocene and pliocene strata, or the middle and upper series of the tertiary formation, occur at Portland, Augusta, etc., and recent rocks are found in various places at the estuaries of rivers and along the coast; and raised beaches are met with in several localities.

6. Though Maine is not distinguished for its minerals, it nevertheless contains several economically useful; and in the abundance of its granite, limestone, and slates has treasures of incalculable value. The granite of Maine is quarried chiefly on the islands of Penobscot Bay, and at Prospect and Frankfort. Marble is obtained at Deer Isle. Limestone is abundant throughout the silurian districts, and especially in the neighborhood of Rockland, Camden, etc., on the shores of Penobscot Bay. The lime of this region is found in the markets throughout the Union. Slates for roofing are found between the sources of the Penobscot and St. John. Iron has its chief locality on the Aroostook, and in the same region manganese is abundant; and traces of bituminous coal, probably outliers of the carboniferous measures of New Brunswick, are said to have been discovered in the southeastern districts, between the Penobscot and St. Croix rivers. At Lubec there is a brine spring. Otherwise, and in various places, copper, lead, and zinc ores have been discovered; and gold, in the form of abraded spangles, has been collected in the head streams of the Penobscot and Kennebec.

WINTER IN MAINE.

7. Maine has a climate of extremes. The temperature ranges between 100° above and 20° below zero, with isothermal lines varying from 43° to 40° Fahr. Near the coast the climate is modified by the proximity of the Gulf Stream, which in these latitudes sweeps the shores. The frosts of winter are uninterrupted, and the lakes and rivers are ice-bound from December to the beginning of April. Vegetation thus commences late, but is rapid and vigorous; and only the less hardy cereals suffer from the early frosts. The general salubrity of the climate is satisfactorily attested by the robust health enjoyed by the inhabitants, and the green old age to which many have attained.

8. The soils of Maine are as various as its geological formations. The best lands are those in the limestone regions, and especially

those between and in the valleys of the Penobscot and Kennebec rivers; and there are also large bodies of excellent land in the valley of the St. John and other rivers. The mountain districts are comparatively sterile, and have a thin and poor soil; and along the coasts, and for several miles inland, especially in the southeastern districts, rock prevails to a great extent.

9. Dense forests covered the surface in its natural state, and still spread over the greater part of it. Spruce is the prevailing growth in the northern and central regions, and various species of oak in the tide-water region and near the coasts. Hemlock, pine, maple, beech, birch, and ash are also common, and cedar swamps occur in the middle districts. Otherwise there are in localities the butternut, walnut, poplar, elm, sassafras, etc.; and all the ordinary fruit-trees of the temperate zone, except the peach, are successfully cultivated.

10. The moose and caribou, once the monarchs of the forests, are still frequently seen in this State; and deer of various kinds are also numerous, and in the remote and unsettled districts the bear and wolf have still their lairs. Among the other fur-bearing animals which inhabit the wilds may be enumerated the catamount, wild cat, minx, marten, sable, beaver, raccoon, squirrel, etc. Of the bird tribe, the principal in Maine are wild geese and ducks, pigeons, hawks, and eagles; crows, rooks, and swallows. The seas swarm with fish, especially cod and mackerel, and the rivers and lakes are full of salmon, pickerel, salmon trout, etc.

11. In 1850 Maine contained 583,169 inhabitants, or 18.36 to the square mile, or 2.51 per cent. of the whole population of the Union. This was distributed into the counties as follows:

Counties.	Population.	County Towns.	Counties.	Population.	County Towns.	Counties.	Population.	County Towns.
Androscoggin..	25,788	Auburn.	Kennebec.....	58,018	Augusta.	Sagadahoc...	21,445	Bath.
Aroostook	12,529	Houlton.	Lincoln	47,241	Wiscasset.	Somerset	35,581	Norridgewoc.
Cumberland....	68,792	Portland.	Oxford	35,463	Paris.	Waldo.....	47,280	Belfast.
Franklin	20,027	Farmington.	Penobscot	63,089	Bangor.	Washington .	38,811	Machias.
Hancock	34,372	Ellsworth.	Piscataquis.....	14,735	Dover.	York	60,088	Alfred.

—of the total population (which was composed of 103,337 families, inhabiting 95,802 dwellings) 581,833 (99.77 per cent.) were whites—296,745 males, and 285,068 females, and 1,356 colored—726 males and 630 females; and 551,129 (94.54 per cent.) were Americans, of whom 517,117 were born in Maine, 31,456 (5.37 per cent.) were of foreign birth, and 584 of origin not ascertained. There were 67,193 natives of Maine in other States. The population in 1790 was 96,540; in 1800, 151,719; in 1810, 228,705; in 1820, 298,335; in 1830, 399,455; in 1840, 501,793; in 1850, 583,169; and in 1855 (estimated), 641,279.

12. In the year 1850 there were 162,711 free male persons over 15 years of age employed in various industrial pursuits. Of these 38,247 were employed in commerce, trade, manufactures, mechanic arts, and mining; 97,082 in agriculture; 26,833 in labor not agricultural; 114 in army service; 15,649 in sea and river navigation; 2,212 in law, medicine, and divinity; 1,727 in other pursuits requiring education; 419 in government civil service; 232 in domestic service, and 196 in other pursuits.

13. The most prominent industries of Maine are lumbering and ship-building. In the winter season great numbers are employed in felling timber and hauling it over the hard snow to the rivers, and on the breaking up of the ice, in driving it to the saw-mills and depôts of export. This has been a chief occupation since the first settlement of the country. In ship-building Maine ranks first among the States, and builds about a third of the whole tonnage produced in the Union, the shipping built in 1850 having been 91,212 tons, and in 1855, 215,904 tons, in totals amounting to 272,218, and 583,450 tons in the years respectively. Bath, Waldoboro', Portland, Passamaquoddy Bay, Belfast, Wiscasset, etc., are the chief ship-building districts; and Bangor, Calais, and Portland the principal seats of the lumber trade.

PINE FOREST—LUMBERING.

14. Of the 20,330,240 acres of land constituting the State of Maine, only 4,555,393 acres, or less than one fourth the surface, was held by individuals in 1850, and of this only 2,039,596 acres, or about a tenth of the whole, was under cultivation. The number of farms was 46,760, valued at $54,861,748; and the value of agricultural implements thereon was $2,284,557. The principal agricultural crops are oats, Indian corn, and Irish potatoes; and the secondary crops, wheat, barley, rye, and buckwheat, with peas and beans, etc. Indian corn, however, does not thrive well except in the lower parts of the State. The total measure of the cereal crops in 1850 was (oats 2,181,037, Indian corn 1,750,056, wheat 296,259, barley 157,731, rye 102,916, and buckwheat 104,523) 4,586,522 bushels, of potatoes 3,436,040 bushels, and of peas and beans 205,541 bushels. The quantity of hay housed was 755,889 tons.

15. Maine is comparatively well supplied with livestock, for which the climate is peculiarly favorable. In 1850 it contained 41,776 horses, etc., 343,339 neat cattle, 451,577 heep and 54,598 swine, in all valued at $9,705,726. The dairy produced in the year 9,243,811 pounds of butter, and 2,434,454 pounds of cheese; the wool crop amounted to 1,364,034 pounds, and the value of animals slaughtered was $1,646,773. The total value of the farm products in the year 1840 was $14,725,615, and in 1850, $16,282,347.

16. As a manufacturing State (excepting in the branches of lumbering and ship-building, to which reference has already been made) Maine holds only a secondary rank. In 1850, however, it contained 3,977 establishments, and had invested in this industry $14,700,452, giving employment to 21,856 males and 6,222 females, and producing annually goods to the value of $24,664,135. In the cotton manufacture it holds the seventh, and in the woolen the ninth rank. In 1830 the total value of goods manufactured was $7,043,773; in 1840, $13,244,504; and in 1850, $24,664,135. The value of home-made goods in 1850 was $513,599.

17. The fisheries of Maine are very valuable. The shad and salmon of the rivers, the herring and mackerel of the coast, and the cod of the Banks, are taken in great numbers, and dried and pickled fish are largely exported. In 1850 there were employed in the cod fisheries 41,912 tons of shipping, and in the mackerel fisheries 12,046 tons. Massachusetts alone surpasses Maine in this department of industry.

18. The foreign commerce of this State is rapidly increasing. In 1850 the exports amounted to $1,556,912, and in 1855 to $4,851,207; and the values of imports for the same years were $856,411 and $2,927,443. In 1850 the amount of shipping entered was 143,186, and in 1855, 199,173 tons; and of shipping cleared 202,137 and 313,840 tons in those years respectively. The shipping owned in the State amounted in 1850 to 501,421 tons, and in 1855 to 806,604 tons, or about a sixth of the tonnage of the Union.

19. The coasting and internal trade are also extensive. The former enjoys great facilities from the bays and inlets with which the coast abounds, and the islands with which it is inclosed. The means of internal intercourse by river and railroad are also ample, and in several instances the lakes provide eligible navigation. This State has now upward of 460 miles of railroad and about 20½ miles of canal. The latter connects Portland with Sebago Pond, and navigation is farther extended through Brandy and Long ponds by a lock in the Saco River. The principal railroads are the Atlantic and St. Lawrence, which form a part of the Grand Trunk line to Montreal and Quebec; the Portland, Saco, and Portsmouth, which, in connection with the Eastern, and Boston and Maine lines, reaches into Massachusetts; and the lines from Portland to Augusta, Waterville, and Bangor. There are also several short lines, used chiefly in the transportation of lumber, in the vicinity of Calais and Baring, and also above Bangor. The European and North American line will extend eastward from Bangor to and through New Brunswick, and to Halifax in Nova Scotia. Telegraphic wires extend entirely across the State, in the direction of the principal towns, and connect on the east with the lines from Newfoundland and Nova Scotia, and on the west with those from the States lying in that direction. From Portland steamers ply regularly to the principal coast and river ports, and Boston and New York; and lines of steamers in connection with the Grand Trunk Railroad are also established between Portland and Liverpool.

20. According to the official returns for 1850 there were in Maine 32 banks, with capital amounting to $3,248,000; and in 1855, 75 banks with $7,899,793. In the same years the circulation amounted to $2,654,208 and $5,077,248; the deposits to $1,223,671 and $2,011,028, and other liabilities to $86,291 and $223,148; and the assets comprised—loans and discounts $5,830,230 and $13,066,956; real estate, $778,955 and $1,396,430; specie, $475,589 and $753,085; and miscellaneous, $966,390 and $1,860,991.

21. The constitution of Maine went into operation in 1820. The right of voting is vested in every adult male citizen. The legislature consists of a senate of 31 members and a house of representatives of 151 members, all elected annually. The governor is also elected for one year, and is assisted in his executive duties by a council of seven members chosen by the legislature. The secretary of state and the state treasurer are also chosen by the same body. The supreme court consists of a chief and seven associate justices, who are appointed by the governor for seven years. The State is divided into three judicial districts—Western, Middle, and Eastern, and for the hearing of questions of law and equity, terms are held annually at Portland, Augusta, and Bangor. All other cases are tried in the counties in which they are commenced. Judges of probate and of municipal and police courts are elected by the people for four years. The institutions supported by the State are the Insane Hospital at Augusta, the State Prison at Thomaston, and the Reform School at Cape Elizabeth.

22. The total resources of the treasury in 1850 amounted to $604,726, and in 1855 to $636,308; and the expenditures in the same years amounted to $478,802 and $597,178. The chief sources of income are direct taxes, the bank tax, sales of land, etc. On the 1st July, 1856, the State funded debt amounted to $657,500, and its total liabilities, including trust-funds ($306,430), etc., to $1,038,174. The resources of the State other than lands, and consisting of bank shares, etc., amounted at the same time to $575,034. The valuation of taxable property in 1850 was $96,768,868, and in 1855, $131,128,186.

23. In matters of popular education Maine ranks first among the States of the Union. In 1850 the number at school was as one to every 3.1 of the population. This indeed is a higher ratio than presented by any other country of the world. The statistics for the year, as furnished by the general census, were as follows:

Classes.	Number.	Teachers.	Scholars.	Income.
Public schools	4,042	5,540	192,815	$315,436
Academies and private schools.....	131	232	6,648	199,745
Collegiate institutions.....	3	21	282	14,000

—making a total of 4,176 schools, 5,793 teachers, and 199,745 scholars, and an annual income of $529,181. The number of persons over 20 years of age unable to read and write was 6,282, of which 2,134 were natives and 4,148 foreign born, and 3,336 males and 2,946 females. The public schools are supported by the proceeds of the permanent school fund, a tax of one per cent. on bank capital and town assessments.

24. The collegiate establishments in this State are Bowdoin College at Brunswick, Waterville College at Waterville, and the Maine Medical School in connection with Bowdoin College. There is also a theological seminary, under Congregational auspices, at Bangor. Bowdoin College was founded in 1794, and has 10 professors and a library of 27,650 volumes. In 1855 it had 1,151 alumni and 186 students. Waterville College, founded in 1820, has five professors and a library of 15,500 volumes; and in 1855 had 267 alumni and 88 students. The Medical School, also founded in 1820, had in 1855 six professors, 682 graduates, and 67 students. The Bangor Theological Seminary was founded in 1816, and has three professors and a library of 7,000 volumes; and in 1855 had 37 students.

25. In 1850 the total number of churches in Maine was 945, with accommodation for 321,167 persons, and with property valued at $1,725,845. The most prevalent denomination is the Baptist, and after that the Congregational, Methodist, Universalist, and Unitarian. Friends or Quakers are relatively a numerous sect; while both the Episcopalian and Roman Catholic denominations are proportionally small, in neither case being more than one per cent. of the whole number in the Union. The Presbyterian, as a separate denomination, has scarcely an existence in Maine, or in fact in all New England.

26. The principal cites are Augusta, Portland, Bangor, and Bath. Their progress in population is exhibited in the following table:

Entered according to Act of Congress, in the Year 1856 by J.H. Colton & Co. in the Clerks Office of the District Court of the United States for the Southern District of New York

Cities.	1800.	1810.	1820.	1830.	1840.	1850.	1855.
Augusta	—	1,805	2,475	3,980	5,314	8,225	10,500
Bangor	277	850	1,221	2,867	8,627	14,432	18,300
Bath	—	2,491	3,026	3,773	5,141	8,020	9,200
Portland	3,677	7,169	8,581	12,601	15,218	20,815	25,418

—and other cities and towns are—Belfast, which in 1850 had 5,051 inhabitants; Biddeford, 6,095; Calais, 4,749; Camden, 4,005; Eastport, 4,125; Ellsworth, 4,009; Frankfort, 4,233; Gardiner, 6,486; Hallowell, 4,769: Kittery, 2,076; Lewiston, 3,584; Oldtown, 3,087; Rockland, 5,052; Saco, 5,798; Thomaston, 2,723; Waldoboro', 4,199; Waterville, 3,964; Wiscasset, 2,332, etc. All these towns have since materially increased in population.

27. Augusta, the capital, is built on the Kennebec, at the head of steamboat navigation, and 43 miles from its mouth. Latitude 44° 18′ 43″, and longitude 69° 50′. The principal part of the city is on the west bank of the river, and connects with the opposite section by a bridge 520 feet long. Above this the river is crossed by a bridge nearly 1,000 feet long, which connects the Kennebec and Portland and the Somerset and Kennebec railroads. The city is laid out with great regularity, and is a well-built and handsome place. The principal building on the west side of the river is the State-house, a noble structure of granite, commanding an extensive prospect, and fronted by a spacious and well-planted park. On the east of the river are the State Lunatic Asylum and the United States Arsenal. The city is the seat of a considerable trade, and a dam across the river, about a mile above, affords it a vast water-power, which is extensively used for manufacturing purposes. This damming up of the waters also creates a supplementary navigation as far as Waterville, to and from which a small steamboat plies daily during the open season. Steamboats also ply regularly between Augusta and towns below and on the coast.

28. Portland, the commercial metropolis of the State, is situated on an elevated peninsula at the west extremity of Casco Bay, 60 miles southwest from Augusta. Latitude 43° 39′ 52″, and longitude 70° 13′ 34″. The city is, with little exception, regularly laid out, substantially built, and approached from the sea, has a notable appearance. The main streets occupy the ridge of the peninsula, and many of the streets, which are lighted with gas, are lined with elms and other shade trees. The principal public buildings are the Court House, Custom House, City Hall, etc. Portland is more commercial than manufacturing, but its manufactures are by no means insignificant. The principal are its locomotive and car factories and sugar refineries. It has also a considerable ship-building interest. The harbor is capacious and safe, and is esteemed one of the best in the Union. It is protected from the violence of storms by several islands, is seldom obstructed by ice, has a good entrance, and is well protected by forts Preble and Scammel. The connections of the port and city with the interior are manifold. The Cumberland and Oxford Canal, 20½ miles long, extends to Sebago Pond, and navigation is farther continued through Long Pond, etc., and four railroads diverge immediately from the city, giving it access to all the principal cities of the State and of New England. The Grand Trunk Railroad extends to Montreal and Quebec, and makes Portland the winter port of Canada. The foreign commerce of the port is principally with Europe and the West Indies; and a large coasting trade is also carried on. The mackerel and cod-fisheries also employ a large tonnage. Portland was settled by the English in 1632 and chartered as a city in 1832. It is a remarkably healthy town, and is well supplied with water.

29. Bangor is situated on both sides of the Kenduskeag River, at its confluence with the Penobscot, and 60 miles from the sea. It is noted as the seat of an extensive lumber trade, and in point of population is the second city of the State. Above the city the Penobscot is crossed by a bridge 1,320 feet long. The harbor at and below this is spacious and deep, admitting at tide the largest vessels. The trade of Bangor is extensive, and it has several manufacturing establishments and ship-building yards. It has steamboat connection with Boston, Portland, etc. This city is the seat of a flourishing theological seminary.

30. Bath, in commercial importance, the second city of the State, is built on the right bank of the Kennebec, 12 miles from the sea, and is connected with Portland and Augusta by a branch of the Kennebec and Portland Railroad. The city stretches along the river for upward of two miles, and is not distinguished for regularity of design. It is, however, well-built, and lighted with gas, but has no notable buildings. The great interest of the city is ship-building, in which it ranks next to Boston and New York. The manufactures of Bath are those peculiar to a seaport, and among these may be noted its rope and block factories and smithies. The principal exports are lumber, fish, and vessels, the latter finding a ready sale in both home and foreign ports.

SHIP-BUILDING.

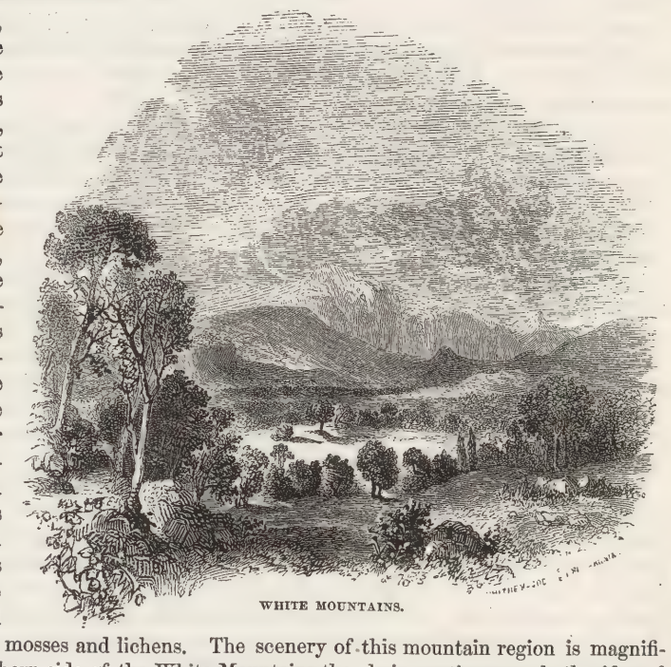
31. Belfast is situated at the head of Belfast Bay, 30 miles from the sea, and has a deep and spacious harbor. It is a commercial and ship-building town, and is largely engaged in the fisheries. In the winter season, when the Penobscot is frozen over, it is the depôt of a large portion of the trade of the valley of that river. On the opposite side of the bay, nine miles distant, is the thriving town of Castine, with a deep and spacious harbor, and engaged in the same industries.

32. Biddeford and Saco are towns on opposite sides of the Saco River. They are both largely engaged in the cotton manufacture, and enjoy extensive water-power created by the falls in their vicinity. There are also various manufactures of woolen goods, machinery, etc., and to a small amount ship-building.

33. The situation, etc., of the other principal places are—Calais, on the right bank of the St. Croix, at the head of steamboat navigation, and noted for its extensive lumber trade; Camden, on the west side of Penobscot Bay; Eastport, on Moose Island, Passamaquoddy Bay, and the most easterly port of the United States; Ellsworth, on Union River, four miles above Frenchman's Bay, and largely engaged in the coasting trade and lumbering; Frankfort, on the Penobscot, 10 miles below Bangor, engaged in ship-building and the lumber trade; Gardiner, on the west bank of the Kennebec, and on the railroad between Portland and Augusta; Hallowell, on the same river, 6 miles above, and noted for its granite; Kittery, opposite Portsmouth, N. H., the site of the United States Navy Yard; Lewiston, a flourishing manufacturing and commercial town on the Androscoggin; Oldtown, on the Penobscot, and mainly engaged in the manufacture of lumber; Rockland, on Penobscot Bay, noted for its lime, its ships, and its late rapid progress; Thomaston, on St. George's River, 12 miles from the ocean, the seat of the State Prison, and noted for its quarries; Waldoboro', at the entrance of Muscongus River, and engaged in ship-building; Waterville, a thriving town on the Kennebec, at the Ticonic Falls, the seat of Waterville College, and noted for its flourishing manufactures; Wiscasset, on Sheepscot River and Bay, once largely engaged in trade.

34. The first settlements in Maine were made in 1604 by the French, and in 1607 by Sir John Gilbert and companions; but these settlements were not of long duration. The territory was granted by James I. to the Plymouth Company, which, in 1624, transferred it to Sir Ferdinand Gorges, who governed it from 1639 to 1647. In 1652 Maine was placed under the jurisdiction of Massachusetts, and in 1677 was purchased by that province, and thenceforth governed under it until 1820. The separation of Maine from Massachusetts, though frequently attempted, was without success until 1819, when the will of the people was ascertained by popular vote to be in favor of separation, which was accordingly accomplished; and on the 15th March, 1820, the State was admitted into the Union.

STATE OF NEW HAMPSHIRE.



1. New Hampshire is situated between latitudes 42° 44′ and 45° 16′ north, and longitudes 70° 40′ and 72° 38′ west; and is bounded on the north by Canada, on the east by Maine and the Atlantic Ocean, on the south by Massachusetts, and on the west by the Connecticut River, which separates it from Vermont. Its greatest extension north and south is 176 miles, and its width east and west from 20 to 60 in the north to about 85 or 90 in the south. The area is computed at 9,280 square miles.

2. The coast is a low, sandy beach, indented by several creeks and coves, and the shore is bordered by salt marshes. The coast-line measures only 18 miles, but, including the islands and all irregularities, the length is 49 miles, or one mile of coast to every 189.39 square miles of surface. The harbor of Portsmouth, at the mouth of the Piscataqua, is one of the best on the Atlantic coast.

3. The country, to the distance of 20 to 30 miles inland, rises imperceptibly, so as to arrest the tides within 20 miles from the sea, though they rise to about 18 feet. This flat tract has a sandy soil of inferior fertility. Beyond this belt the general surface becomes hilly and broken—the hills increasing in height toward the interior until, at a few miles distance from the banks of the Connecticut River, they constitute a continuous range, running nearly due north and south. Some of the summits attain a considerable elevation, as Grand Monadnoc, which rises to the height of 3,254 feet, Sunape to 3,636 feet, and Mooseheloc to 4,626 feet.

4. On approaching latitude 44° north the chain expands into an extensive mountain group, which projects considerably toward the east, and is known as the White Mountains. The highest summit of this group, Mt. Washington, 6,285 feet, is the loftiest culmination east of the Rocky Mountains, excepting the peaks of the Black Mountain group, in North Carolina, the highest of which, Clingman's Peak, attains 6,941 feet. Several other summits rise above 5,000 feet, and for three quarters of the year have their peaks covered with snow. Round their bases are forests of heavy timber, which are succeeded by belts of stunted fir, above which are bushes, and then only a coating of mosses and lichens. The scenery of this mountain region is magnificent. From the northern side of the White Mountains the chain continues on both sides of the Androscoggin, but does not attain a great elevation; and after forming for some distance the boundary between Canada and Maine, traverses the former eastwardly to Cape Gaspé.

WHITE MOUNTAINS.

5. The range above described divides the streams flowing to the Connecticut from those flowing to the Atlantic. The slope toward the former is short and precipitous, and in this direction the only streams of consequence are the Ammonoosuc, White, Sugar, and Ashuelot. The Connecticut itself rises near the Canada border in several small branches, and forms the greater part of the west boundary of the State. Its current is obstructed by falls, rapids, and shoals; but its navigation has been so much improved by dams, locks, and short canals, that boats of considerable size may ascend it to Haverhill, 200 miles from the sea in a straight line, and small boats to Barnet Falls, 15 miles higher up. The principal streams on the eastern side of the watershed are the Androscoggin and Saco, which pass into Maine; the

Piscataqua and the Merrimac. The Piscataqua is the only considerable river which has its whole course in this State, and for about 40 miles it forms the boundary toward Maine. It is formed by the junction of Salmon Falls and Cochecho rivers. As a navigable channel it is of small importance, as its course is very rapid, and the tide ascends it only a short distance from the sea; but at its mouth it forms the fine harbor of Portsmouth. The Merrimac, which rises in the White Mountains, and traverses the central district by a southerly course,

FRANCONIA NOTCH, WHITE MOUNTAINS.

has also many falls, but its navigation has been so improved as to permit small craft to ascend it to Concord. Its principal tributaries are the Nashua, Contoocook, and Baker's rivers from the west, and the Winnipiseogee and Squam rivers from the east. These are all excellent mill-streams, and their banks the sites of many flourishing manufacturing towns.

6. Lakes are very numerous in New Hampshire, and some of them of considerable extent. Lake Winnipiseogee, 23 miles long and from 2 to 10 wide, is the largest and most picturesque. Upward of 360 islands are sprinkled over its bosom, and its shores are indented by numerous bays, formed by gentle swells of land projecting into the lake and rising gracefully from its waters. It abounds with fish, and its waters are remarkably pure. Umbagog Lake, on the eastern boundary, is 18 miles long and from 3 to 5 miles wide. The other larger lakes are Squam, north of Winnipiseogee, which outlets into the Merrimac; Ossipee, a tributary to the Saco and Sunapee, which empties into Sugar River.

7. Off the coast are the Isles of Shoals, seven in number, of which four belong to Maine. They lie about eight miles out to sea, between Portsmouth and Newburyport, and are hardly more than a cluster of rocks rising above the water. They are, however, inhabited by a hardy race of fishermen, and have for the past two centuries been noted for their superior quality of dried cod, known in the markets as Isles of Shoals dun-fish. Their population once numbered upward of 600 souls, but it is less than 200 at the present day.

8. The rocks of New Hampshire are almost entirely of the paleozoic or non-fossiliferous types. Igneous and metamorphic rocks, including granite, gneiss, sienite, and porphyry, occupy the chief part of the State. Crystalline limestone has been found in one or two places; and the new red sandstone of Massachusetts is prolonged for some distance into the western section of this State. Along the Merrimac and Connecticut rivers there are considerable alluvial tracts. The mineral products of New Hampshire are iron, copper, zinc, and lead, which have their sites near the White Mountains. Silver and tin are also found; and there is abundance of clays, ochres, etc. Its granite is largely worked on the Merrimac and Connecticut rivers, and is highly valued as a building material.

9. The climate is somewhat colder than that of Maine, and the range of temperature greater. In summer the thermometer sometimes marks 100° Fahr., and in winter the freezing-point of mercury. These extremes, however, seldom occur. In the neighborhood of the White Mountains, the peaks of which are almost always capped with snow, the air is excessively cold and the winter long. In the lower parts of the State the winter disappears in mid-April and is succeeded by a season of rapid vegetation, and the summer closes with September, but the intense frost does not occur till the middle of November, from which time to early spring the rivers are frozen to their sources and the ground is covered with snow.

10. The soils are generally stubborn, but repay careful culture by moderate harvests; and with the exception of the Connecticut valley, the lands of which are fertile and highly productive, New Hampshire is better adapted to grazing than agriculture. The principal forest growths are oak, white pine, fir, hemlock, beech, walnut, etc., on the lower slopes of the mountains, and elm, birch, poplar, ash, cherry, locust, etc., on the lowlands. The sugar-maple is also abundant. Wolves, bears, foxes, raccoons, and other indigenous animals, are still found in the State, but the moose and beaver have become rare. The bays and rivers abound with various kinds of fish, and wild fowl are plentiful.

11. The population of New Hampshire in 1850 numbered 317,976 souls or 34.26 to the square mile, or 1.37 per cent. of that of the United States:

Counties.	Popula.	County Seats.	Counties.	Popula.	County Seats.	Counties.	Popula.	County Seats.
Belknap	17,721	Gilford.	Grafton	42,343	Haverhill.	Rockingham	49,194	Portsmouth. / Exeter.
Carroll	20,157	Ossipee.	Hillsboro'	57,478	Amherst. / Manchester.	Strafford.	29 874	Dover.
Cheshire	30,144	Keene.	Merrimac	40,337	Concord.	Sullivan	19,375	Newport.
Coos	11,853	Lancaster.						

—of the total 304,227 (95.67 per cent.) were Americans, of which number 261,591 were born in the State, 13,571 (4.26 per cent.) in foreign countries, and 178 in parts not ascertained; and 317,456 (99.83 per cent.) were whites—155,960 males, and 161,496 females, and 520 colored persons, males and females equal in number. This population composed 62,287 families, occupying 57,339 dwellings. There were 109,878 natives of New Hampshire in other States of the Union. In 1790 the State contained 141,899 inhabitants; in 1800, 183,762; in 1810, 214,360; in 1820, 244,161; in 1830, 269,328; in 1840, 284,574; in 1850 (as above) 317,976, and in 1855 (estimated) 324,701.

12. In 1850 there were 94,564 free male persons over 15 years of age occupied in industrial pursuits. Of these 27,905 were engaged in commerce, trade, manufactures, mechanic arts, and mining; 47,440 in agriculture; 14,953 in labor not agricultural; 38 in the army; 778 in sea and river navigation; 1,642 in law, medicine, and divinity; 1,425 in other pursuits requiring education; 305 in government civil service; 47 in domestic service.

13. Agriculture and manufactures are the chief branches of industry pursued in New Hampshire. The principal seats of the latter are in the southeastern counties, on the Merrimac and Salmon Falls rivers and their tributaries, all of which are possessed of immense water-power. There is also considerable manufacturing business done on the Connecticut and its affluents, the Ashuelot, etc. The only commercial port is Portsmouth, and generally the foreign commerce of the State is transacted through Boston, with which New Hampshire is connected by several railroads. Both the shore and bank fisheries are extensive.

14. The whole area of New Hampshire is 5,939,200 acres. Of this 3,392,414 acres, or about three fourths of the whole, was held for farming purposes in 1850, and 2,251,488 acres were improved. The number of farms in the same year was 29,229, averaging 116 acres to each holding, and valued at $55,245,997. The value of farming implements and machinery was $2,314,125. The principal agricultural crops are Indian corn, oats, and potatoes, with wheat, rye, hops, etc. All the cereal crops, excepting Indian corn, largely decreased from 1840 to 1850, and the total of the decrease was 364,522 bushels. In 1850 the production of Indian corn was 1,573,670 bushels, of oats 973,381, of wheat 185,658, of rye 183,117, of barley 70,256, and of buckwheat 65,256 bushels, making a total of 3,051,338 bushels. The potato crop decreased in the ten years from 6,206,606 to 4,304,919 bushels; while the hay and hop crops increased from—hay 406,107 to 598,854 tons, and—hops 243,425 to 257,174 pounds. The crop of beans and peas in 1850 was 70,856 bushels; and the value of orchard and garden products $305,373.

HAYING.

15. The livestock in 1850 consisted of 34,252 horses, etc., 267,910 neat cattle, 384,756 sheep, and 63,487 swine, in all valued at $8,871,901. These figures show a large decrease from those of 1840, which, in relation to the number of animals, were 43,892, 275,562, 617,390, and 121,671 respectively. The dairy products of 1850 consisted of—butter 6,977,056 pounds, and cheese 3,196,563 pounds; the wool crop amounted to 1,108,476 pounds, and the value of animals slaughtered during the year was $1,522,873. The total value of farm products in 1840 was $10,762,019, and in 1850, $13,594,139.

16. In manufactures New Hampshire has relatively a distinguished position. In 1850 it contained 3,211 establishments employing 14,103 males and 12,989 females, and a capital of $18,242,114. Massachusetts alone exceeds it in the value of its cotton manufactures, and only four other States in that of its woolen manufactures—in these two branches more than two thirds of its manufacturing capital is invested. The total value of goods manufactured in 1830 was $5,678,499, in 1840, $9,985,010, and in 1850, $23,164,503. The value of home-made goods in 1850 was $393,455.

17. New Hampshire has valuable fisheries. In 1855 there were employed in the cod fisheries 1,358 tons, and in the herring fisheries 296 tons; and large numbers of boats are employed along the coasts and at the Isle of Shoals in the shore fisheries.

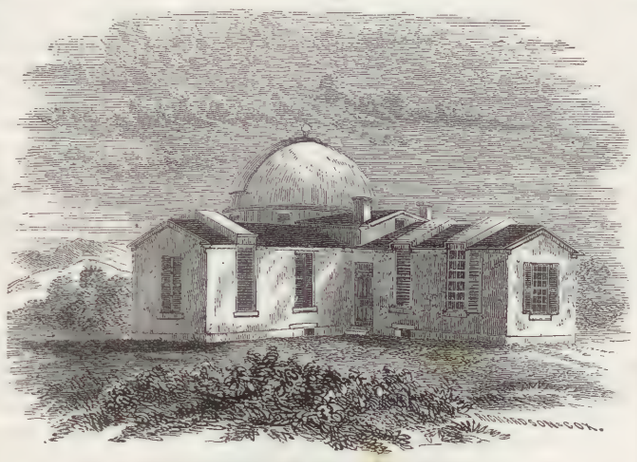
18. New Hampshire has little direct foreign commerce. In 1850 the exports amounted to but $8,927, and in 1855 to only $1,523, and the imports for the same years were only $49,079 and $17,786 respectively. The shipping entered amounted to 11,044 and 5,979 tons, and the shipping cleared to 8,213 and 5,466 tons. The shipping owned in the State was 23,096 and 30,329 tons; and the amount of shipping built was 6,914 and 8,928 tons in the years respectively.

19. The internal trade is necessarily large, and seeks Boston as its sea-port. To this point nearly all the railroads of the State converge. The position of this State in relation to Boston and Montreal is also advantageous, and secures to it the bulk of the land commerce so largely carried on between these two commercial centers. A considerable coasting trade is also established, but the deficiency of port accommodation is prejudicial to any expansion of business in this direction. In 1855 there was a total of 650 miles of railroads in the State, two of which are sections of the Boston and Portland lines, and the other principal railroads, sections of the Boston and Canada lines; besides which there are several local lines. The Grand Trunk Railroad crosses the northern part of the State. Telegraphic lines are also established.

20. In December, 1850, New Hampshire had 22 banks, and in 1855, forty-six. The liabilities of these institutions at the two periods was as follows—capital $2,375,900 and $4,449,300, circulation $1,897,111 and $2,578,336, and deposits $566,634 and $958,475; and assets—loans and discounts $3,821,120 and $8,037,427, real estate $43,670 and $56,519, and specie $129,399 and $334,411; balance total, including sundries, $4,563,086 and $8,328,357.

21. The constitution is dated 1784, and has been several times amended. The right to vote is secured to every adult male inhabitant. The house of representatives and the senate are collectively called the general court or legislature. Every town of 150 ratable polls may choose one representative, and for every 300 above that number an additional representative. Senators, of which there are twelve, are elected in districts set off on the basis of taxation. Representatives must have been resident in the State for two years, and senators for seven years, and both must be freeholders. The executive council is composed of

five members, who must have the same qualifications as senators. The governor must own an estate of $300, of which at least one half must be freehold. With the assistance of the council he nominates and appoints all judicial officers, and each has a negative on the other. All administrative officers are chosen by the general court in joint ballot. The judiciary consists of a supreme court and court of common pleas. The judges hold office during good behavior. Justices of the peace are appointed for five years. No one professing other than the Protestant religion can hold office in this State.



22. The total resources of the State treasury for the year ending 30th June, 1850, amounted to $172,056, and for 1855 $218,272; and the expenditures for the years respectively amounted to $167,012 and $199,052. The revenue is derived chiefly from general and railroad taxes. New Hampshire has no State debt. The valuation of taxable property in 1850 was $92,177,953, and in 1855 $103,804,826. The chief institutions supported wholly or in part by the State are the State Prison and the New Hampshire Asylum for the Insane at Concord. There is also a house of reformation for juvenile and female offenders against the laws near Manchester.

23. In 1850 there were in New Hampshire 81,237 persons, or one in every 3.9 of the whole population attending school. The educational statistics of that year were as follows:

Classes of Schools.	Number.	Teachers.	Scholars.	Income.
Public schools	2,381	3,013	75,643	$166,944
Academies and private schools	107	183	5,321	81,237
Collegiate institutions	1	18	273	11,000

—making a total of 2,489 schools, 3,214 teachers, 81,237 scholars, and income $248,181. The number of persons over 20 years of age unable to read and write was 3,009, of which number 945 were natives and 2,064 foreigners, and 2,957 whites and 52 free colored persons. The public schools in each county are supervised by a commissioner, and these in their collective numbers constitute the board of education.

24. Dartmouth College, founded in 1769, is located at Hanover. It is the only collegiate institution in the State, and has 16 professors and a library of 40,000 volumes; and in 1855 had 4,365 alumni and 251 students. The New Hampshire Medical School, founded in 1797, is a department of the college, and in 1855 had 5 professors, 50 students, and 930 graduates. Besides these are three theological schools, viz.: the Methodist Biblical Institute at Concord, founded in 1847, and which in 1855 had 3 professors and 40 students; the Theological Seminary (Congregational) at Gilmanton, founded in 1835, and which in 1855 had 3 professors and 23 students; and the Theological Seminary (Baptist) at New Hampton, founded in 1825, and which in 1855 had 2 professors and 36 students. The libraries of these institutions contained respectively 2,000, 4,300, and 2,000 volumes.

DARTMOUTH COLLEGE OBSERVATORY.

25. The total number of churches in New Hampshire in 1850 was 626, with accommodation for 237,417 persons, and with property valued at $1,405,786. The most numerous denominations are Congregationalists, Baptists, and Methodists, and next in point of numbers Universalists, Union, Unitarians, Christians, Presbyterians, Friends, Episcopalians, Catholics, etc. The three first-named denominations represent three fourths of the inhabitants.

26. The chief towns of New Hampshire are Concord, Portsmouth, Manchester, and Dover. The population at decennial periods and in 1855 has been as follows:

Towns	1810.	1820.	1830.	1840.	1850.	1855.
Concord, Merrimac Co.	2,393	2,838	3,727	4,897	8,576	12,000
Manchester, Hillsboro' Co.	—	—	—	3,235	13,932	21,000
Portsmouth, Rockingham Co.	6,934	7,327	8,082	7,887	9,738	14,000
Nashua (wi. Nashville) Hillsboro' Co.	—	—	—	6,054	8,942	12,000
Dover, Strafford Co.	—	2,871	5,449	6,458	8,196	10,000

—and the other principal towns are—Gilford, in Belknap County, which in 1850 had 2,425 inhabitants; Ossipe, in Carroll County, with 2,123; Keene with 3,392 and Winchester with 3,296, in Cheshire County; Lancaster with 1,559, in Coos County; Hanover with 2,350, Haverhill with 2,408, Lebanon with 3,136, Littleton with 2,008, and Plymouth with 1,290, in Grafton County; Amherst with 1,613, Milford with 2,159, Peterboro' with 2,222, and Weare with 2,435, in Hillsboro' County; Exeter with 3,329, Deerfield with 2,022, and Salem with 1,555, in Rockingham County; Boscawen with 2,063, Hopkinton with 2,169, and Warner with 2,038, in Merrimac County; Rochester with 3,006, and Somersworth with 4,943, in Strafford County; and Claremont with 3,606, and Newport with 2,020, in Sullivan County. Most of these are flourishing manufacturing towns, and have almost all of them access to the markets by railroad.

MANUFACTURING VILLAGE.

27. Concord, capital of the State, is built on the west bank of the Merrimac, in latitude 43° 12′ 29″ and longitude 71° 29′—76 miles north-northwest from Boston. It extends about two miles along the river, and is laid out in handsome streets, several of which are ornamented with shade-trees. The State House stands on a beautiful common, planted with elms and maples; it is a granite building, 126 feet long and 49 feet wide, two stories high above the basement. The State Prison, also a massive granite building, and the Asylum for the Insane, are also located here. The manufactures and general business of the town are large and increasing—the former being highly favored by the immense water-power furnished by the falls opposite the town, and the latter by its extensive connections by railroad, Concord being situated on the line of railroads between Boston and the North and West, and there is also a line connecting it with Portsmouth.

28. Portsmouth, at the mouth of the Piscataqua, is the only sea-port of the State, and has an excellent harbor. Portsmouth has also considerable manufactures and a thriving coasting trade; but has immensely declined as a commercial port, being now scarcely ever visited by foreign shipping. The principal buildings are the State Arsenal and Atheneum. On an island on the opposite side of the river is the United States Navy Yard, with a floating balance-dock, immense ship-houses, etc. The shore-line of railroad between Boston and Portland crosses the river at Portsmouth, 56 miles north from Boston. Manchester, 18 miles south from Concord, is a new town, and thirty years ago the site of the present city contained less than 50 inhabitants. It is now one of the principal centers of New England industry, and the seat of immense manufacturing establishments, producing cotton, woolen and mixed goods, machinery, railroad cars, paper, and other staples. The Merrimac has here a descent of 54 feet in one mile, called the Amoskeag Falls, which afford a vast water-power. The villages of Piscataquog and Amoskeag are included within the city limits. Manchester is connected with Boston by two lines of railroad, and also with Concord and the North and West. Seventeen miles south, and also on the Merrimac, stands—

29. Nashua, at the confluence of Nashua River, which latter has here a fall of 65 feet within two miles, and affords immense hydraulic power. The canal supplying the chief factories is three miles long, and affords a fall of 36 feet. Nashville, on the opposite side of the river, contains about one third the total population. The principal manufactures of both districts of the town are cotton goods, which employ about 2,000 hands. Nashua is 41 miles from Boston by railroad.

30. Dover, the oldest town in the State, is built on both sides of the Cochecho River at its lower falls, where its sudden descent of 32 feet creates abundant water-power. Its manufactures are principally cotton goods; shoes, woolen goods, carpets, etc., are also largely manufactured. The town is favorably situated for trade, being at the head of sloop navigation, and is connected with Alton Bay, on Lake Winnipiseogee, by the Cochecho Railroad, and with Boston and Portland by the Boston and Maine Railroad.

31. Great Falls, on Salmon Falls River, is a thriving village employed in manufactures of various kinds, and is connected by branches with the Boston and Maine Railroad. The Great Falls and Conway Railroad, now open to Union Village, 20 miles, also terminates at Great Falls.

32. Claremont, on the Connecticut River, has considerable manufactures, chiefly iron-castings and cotton goods; and Keene, on the Ashuelot River, is extensively engaged in various branches of industry. Keene is situated on the Cheshire Railroad, 42 miles northwest of Fitchburg, and is also the northern terminus of the Ashuelot Railroad, which connects at South Vernon with the Connecticut River lines. Amherst, 36 miles south from Concord, is the seat of Phillips' Academy, the most ancient academic institution of the State. To the west and southwest are Wilton and Mason villages, both engaged in manufactures.

33. In 1622 James I. of England granted to Mason and Gorges the country between the Merrimac and Kennebec rivers, and in 1623 the first settlements were begun at Dover and Portsmouth. In 1629 Mason procured a further grant of the land between the Merrimac and Piscataqua, and extending 60 miles into the interior—and this he called New Hampshire. In 1641 the settlements in New Hampshire placed themselves under the government of Massachusetts, and thus remained until 1679, when it became a royal province. In 1686 New Hampshire, with the other New England colonies, was placed under the government of Sir Edmund Andros; from 1689 to 1692 it was united with Massachusetts; from 1699 to 1702 with New York and Massachusetts; and from 1702 to 1749 with Massachusetts alone, and at the latter date the two colonies were finally separated and their boundaries settled. New Hampshire declared its independence on the 15th June, 1776, and in December of the same year framed a temporary government, which continued during the Revolution, and until the adoption of the State government in 1784. The Constitution of the United States was ratified by New Hampshire on the 21st June, 1788.

STATE OF VERMONT.

1. VERMONT is situated between latitudes 42° 34′ and 45° north, and longitudes 71° 34′ and 73° 26′ west; and is bounded on the north by Canada, on the east by New Hampshire, on the south by Massachusetts, and on the west by New York and Lake Champlain. Its length, north and south, is 157 miles, and its breadth about 40 miles in the south and 90 miles in the north. The area is 10,212 square miles.

2. Vermont constitutes a part of that irregular mountain region which extends over the greater part of the country east of the Hudson River and Lake Champlain. The Green Mountains, a continuation of the Hoosac Mountains from Massachusetts, traverse the State from south to north, forming a continuous ridge to near latitude 44°, at which point they divide into an eastern and a western branch. The highest point south of their bifurcation is Killington Peak, 3,924 feet above sea-level. Northward the mountain region widens, and occupies more than half the width of the country. Of the two branches the eastern is the lowest, but forms the watershed between the basin of the Connecticut and that of Lake Champlain. In the western branch are the highest summits of the system—Camel's Hump 4,083 feet, and Mansfield Mountain 4,343 feet. Between the mountains are valleys of considerable extent, well-sheltered and fertile. The summits are rocky and only covered with winter grass and mosses; their sides support forests of evergreen trees, especially pine, spruce,

and hemlock, which near the base of the mountains attain large dimensions, and are of great value in an economical point of view.

3. In the extreme north the valleys are narrow, and contain a comparatively small portion of cultivable land; but as the hills are not very steep or elevated, they are covered with tall forest trees, and in most places afford good pasturage. The tract of country which lies between the eastern ridge and the Connecticut is very hilly and broken, and is the least fertile part of the State. The country below the mountains on the southeast is also of indifferent quality, with a stony and gravelly soil, but it is well drained, and a large part of it is well wooded. Proceeding north the country improves, and contains a larger portion of loam

MOUNT ASCUTNEY AND WINDSOR.

and clay; and along the banks of the Connecticut some very fertile tracts occur. In these parts an isolated summit, Mt. Ascutney (latitude 43° 30′), rises to 3,320 feet above the sea.

4. The most level part of Vermont is the slope to Lake Champlain, though the surface is broken by numerous water-courses. Near the shore are some low, swampy tracts, from which the country rises gradually to the base of the mountain region, and becomes hilly in approaching it, but the hills have such gentle slopes as to admit of cultivation everywhere. This plain is about 100 miles long, and its southern parts less than 10 miles wide, but widens northward to 30 miles. The soil varies greatly, but a large portion of it is productive.

5. More than two thirds of the drainage of Vermont runs into Lake Champlain. The largest rivers falling into that lake are the Otter, Winooski or Onion, Lamoille, and Missisqui. Otter Creek drains the southern part of the plain, and is navigable for lake vessels to its first falls, about 8 miles from its mouth, and for boats to Pittsford, 17 miles higher. Onion River originates in the mountain region of the center, runs past Montpelier, and falls into the lake about five miles north of Burlington. Much of its course is remarkable for the romantic character of its scenery, and it is of great value for mechanical purposes. The Lamoille, which rises in the same region, also affords great hydraulic power. Both are much interrupted by rapids, and are unnavigable. Missisqui River rises in Canada; about 10 miles from its mouth it becomes navigable for river boats, and falls into Missisqui Bay, the northeastern arm of Lake Champlain, which is about 15 miles long and three miles wide.

6. A few small rivers draining the northern district of the mountain region fall into Lake Memphremagog, of which about one fifth part lies within Vermont. This lake has a curved form, about 30 miles long, and in no part exceeding two miles in width. It is surrounded by mountains covered with forest trees, and discharges its waters through the Magog into the St. Francis, a tributary of the St. Lawrence.

7. All the rivers falling into the Connecticut from the Green Mountains are small, and none of them navigable. The principal are the Passumpsic, White, and West rivers. The main river, which divides Vermont from New Hampshire, presents in the upper part of its course a continual succession of rapids and cataracts. The last of these, which entirely prevent navigation, are the Barnet Falls, which occur near latitude 44° 13′ north. Farther down there are also several falls and rapids; but from Haverhill (44°) southward the river is usually navigable for boats, having been improved by locks and short canals, which overcome the natural obstructions.

8. The geology of Vermont belongs almost entirely to the primitive era. The rocks are for the most part eruptive, consisting chiefly of granites, but there are also many metamorphic, including crystalline and fossiliferous limestones, etc. The only non-igneous rocks are the lower silurian strata which skirt the eastern bank of Lake Champlain. The minerals are, as might be expected, numerous. At several points of the Green Mountains quartzose veins traverse itacolumites (a quartzose conglomerate which in South America and India forms the matrix of some of the most precious gems), and contain native gold. On Otter Creek argentiferous copper ore has been found; and lead, zinc, and manganese are also met with. Iron ore occurs in great abundance along the western base of the mountains. Otherwise there is abundance of kaolin, variegated marble, slate, soap-stone, oil-stone, granite, and other useful materials, all of which are more or less worked, and some of them extensively.

9. Vermont is distinguished for the severity of its winter, which continues from November to April. During this season the mercury in the thermometer has frequently been frozen, and loaded wagons cross over the ice-bound rivers. The spring is short, but mild and pleasant, and is succeeded in June by a hot summer. The most pleasant season is from the beginning of September to the middle of October, the heat being then moderate, and the air dry, elastic, and invigorating.

10. The soil and general character of the natural products have been already noticed; but it may here be stated that the greater part of the State is more adapted for grazing than tillage, and it is said that scarcely any part of the United States is better suited for the rearing of cattle and sheep. Few States, indeed, produce a greater amount of wool, either absolute or proportional, and its dairies are only surpassed by those of the three large States of New York, Pennsylvania, and Ohio. Of the cereals oats are raised in the greatest abundance, and next maize, but the latter sometimes suffers from early frosts. Wheat is grown chiefly on the western side of the mountains. Buckwheat, rye, and barley are also grown, but to an inconsiderable extent. Potatoes are a very large crop; and garden vegetables are carefully and profitably cultivated, and all the hardier fruits ripen well everywhere. There are still many wild animals in the mountains and forests, but their numbers have greatly diminished, and many kinds once common are now extinct. Fish are plentiful in the lakes.

SHEEP WASHING.

11. In 1850 Vermont contained 314,120 inhabitants, or 30.76 to the square mile, or 1.35 per cent. of the population of the Union. This was distributed as follows:

Counties.	Popula.	County Seats.	Counties.	Popula.	County Seats.	Counties.	Popula.	County Seats.
Addison	25,549	Middlebury.	Essex	4,650	Guildhall.	Orleans	15,707	Irasburg.
Bennington	18,589	Bennington. Manchester.	Franklin	28,586	St. Albans.	Rutland	33,059	Rutland.
Caledonia	23,595	St. Johnsbury.	Grand Isle	4,145	N Hero.	Washington.	24,654	*Montpelier.*
Chittenden	29,036	Burlington.	Lamoille	10,872	Hyde Park.	Windham	29,062	Fayetteville.
			Orange	27,296	Chelsea.	Windsor	38,320	Woodstock.

—and consisted of 58,573 families, inhabiting 56,421 dwellings. Of the total population 313,402 (99.77 per cent.) were white—159,658 males and 153,744 females, and 718 free colored—375 males and 243 females; and 280,966 (89.44 per cent.) were Americans, of which number 232,086 were born in Vermont, and 32,831 (10.45 per cent.) were foreigners, the remainder (323) being of origin unascertained. There were 145,655 natives of Vermont in other States. In 1790 the population was 85,416; in 1800, 154,465; in 1810, 217,713; in 1820, 235,764; in 1830, 280,652; in 1840, 291,948; and in 1850 (as above), 314,120. In 1855 the total was estimated at 325,206.

12. Of the free male persons over 15 years of age, 92,226 were engaged in industrial pursuits. Of these 17,063 were employed in commerce, trade, manufactures, mechanic arts, and mining; 48,327 in agriculture; 22,997 in labor not agricultural; 159 in navigation; 1,827 in law, medicine, and divinity; 1,563 in other pursuits requiring education; 129 in government civil service; 34 in domestic service, and 127 in other occupations.

13. Vermont is essentially an agricultural State, and is exceedingly well adapted for cattle and sheep. It has also considerable manufactures; and besides a large transit trade by railroad, it enjoys an active domestic commerce, but having only one outlet by water, the foreign trade is necessarily restricted. In the southwest valuable marble quarries are wrought. Burlington, on Lake Champlain, is its only port of entry.

14. The State contains 6,535,680 acres; and of this, in 1850, there were included in 29,763 farms then enumerated 4,125,822 acres, or somewhat less than two thirds the whole area. The amount under cultivation or improved was 2,601,409 acres, or two fifths of the surface. The cash value of the farms was $216,401,543, and the value of agricultural implements thereon $7,021,772. The principal crops are oats, Indian corn, and potatoes. Wheat is also a fair crop, and only the three great States of New York, Pennsylvania, and Ohio produce a larger hay crop (866,153 tons), and only New York produces a larger quantity of maple-sugar (6,349,357 lbs). The total cereal crop in 1849–50 was (oats 2,307,734, Indian corn 2,032,396, wheat 535,955, buckwheat 209,819, rye 176,233, and barley 42,150) 5,304,287 bushels; in 1839–40 it amounted to 4,352,252 bushels. The potato crop amounted to 4,951,014 bushels in 1849–50, against 8,869,751 bushels in 1839–40. Among the minor crops in 1849–50 are enumerated peas and beans 104,649 bushels, hops 288,023 pounds, and flax 20,852 pounds, and the value of market-garden crops was $18,853, and of orchard products $315,255.

15. The livestock of the State in 1850 consisted of—61,275 horses, etc., 348,848 neat cattle, 1,014,122 sheep, and 66,296 swine, and was represented in money at $12,643,228. These figures show a large decrease from the enumeration in 1840, in which year Vermont contained 62,402 horses, etc., 384,341 cattle, 1,681,819 sheep, and 203,800 swine. The products of animals in 1849–50 were butter 12,137,980, cheese 9,720,834, and wool 3,400,717 (in 1839–40 wool 3,699,235) pounds. The value of animals slaughtered in the year was $1,861,336. The total value of agricultural products was in 1840, $16,977,664, and in 1850, $20,813,564.

16. Woolen goods form the staple manufacture of Vermont; and the manufactures of cotton goods and iron are considerable. The principal manufactures are located in or near the Connecticut River, and on the streams emptying into Lake Champlain, where waterpower is most abundant. In 1850 there were in the State 1,849 establishments, with a vested capital of $5,001,377, giving employment to 6,894 males and 1,551 females. The cost of material was $4,172,552, and of labor $2,202,348. In the manufacture of woolens Vermont holds the seventh place among the States. In 1820 the total value of goods manufactured was $890,353; in 1830, $1,507,779; in 1840, $6,249,434; and in 1850, $8,570,920. The value of home-made goods produced in 1840 was $674,548, and in 1850 $267,710.

17. The direct foreign commerce of Vermont is almost wholly with Canada. In 1850 the exports were valued at $430,906, and in 1855 at $2,895,468; and the imports at $463,092 and $591,593 in the years respectively. Of the exports in 1850, the value of domestic products exported was $404,749, and in 1850 only $322,544. The great increase in the exportation of foreign products is due to the increased transit trade from the sea-board toward

VERMONT, MASSACHUSETTS, RHODE ISLAND & CONNECTICUT.

25 Geographical or 28.81, Statute Miles, to one inch.

Entered according to Act of Congress in the Year 1858 by J.H. Colton & Co. in the Clerks Office of the District Court of the United States for the Southern District of New York.

Canada, consequent on the reciprocity policy lately inaugurated between the two nations. In 1850 the shipping cleared amounted to 82,546 tons, and in 1855 to 19,542 tons, and the shipping entered to 99,435 tons and 18,312 tons—a vast decrease being shown, but which is due to the greater convenience of transportation by railroad than by water. The shipping owned in the State in 1850 was 4,530 tons, and in 1855, 6,915 (4,075 steam) tons.

18. The facilities enjoyed by Vermont for commerce are ample. On its west frontier lies Lake Champlain, admitting of steam navigation from Whitehall, in New York, to Rouse's Point, on the Canada line, with numerous intermediate ports on its east shore, of which Burlington is the chief. Navigation is continued to the St. Lawrence by the Chambly River and Canal. The interior is traversed by several lines of railroad entering the State from the Atlantic ports and crossing it into Canada at three points. The principal of these are the Grand Trunk line from Portland, in Maine, the Connecticut River lines, which run almost directly north from New Haven, etc., several lines from Boston, and two lines from New York. Altogether Vermont had 527 miles of railroad in 1855, or one mile to every 19.3 square miles of surface. These, however much they may have tended to the development of the State within itself, have hitherto been of vastly greater value to its neighboring States, and as investments of capital they have signally failed to be productive. The electric telegraph accompanies most of the lines. In the open season, steamboats ply regularly from Burlington to the principal lake ports, and steam navigation has also been inaugurated on Lake Memphremagog.

19. According to the returns for 1850, Vermont had 27 banks, and in 1855, 42 banks, with capitals amounting to $2,197,249 and $3,603,460 in the respective years. In the same years the circulation amounted to $2,856,027 and $3,704,341, the deposits to $546,703 and $801,039, and other liabilities to $32,984 and $12,435, and the assets comprised—loans and discounts $4,423,719 and $6,710,928, real estate $94,497 and $123,237, specie $127,825 and $201,548, and miscellaneous $1,131,804 and $1,439,066.

20. The government of Vermont is based on the constitution of the 4th of July, 1793, and its subsequent amendments. Every male citizen of a quiet and peaceful behavior, and who has resided in the State one year, has the right to vote. The legislature consists of a house of representatives composed of 230 members and a senate of 30 members, elected annually by a plurality of votes on the first Tuesday of September, and meets at Montpelier on the second Thursday of October. None are eligible but persons "noted for wisdom and virtue." The governor and lieutenant-governor are also chosen annually, but by a majority of votes.

21. The judiciary consists of a supreme court, a court of chancery, and county courts. The supreme court consists of six judges elected annually by the legislature. The county court is held by one judge of the supreme court and two county judges elected annually by the people. The judges of the supreme court are also chancellors. Two terms of the county court and one term of the supreme court are held annually in each county, and the court of chancery has two stated sessions. Questions of law may be carried from the county court to the supreme court, and appeal lies from the decrees of the chancellor to the same.

22. The institutions supported by the State are the Vermont Asylum for the Insane at Brattleboro', established in 1836, and the State Prison at Windsor. Both are supplied with libraries. State aid is also extended to the poor deaf and dumb and the blind.

23. The total resources of the treasury for the year ending 31st August, 1850, amounted to $125,375, and for 1855 to $ ———; and the expenditures for the same years to $122,253 and $ ———. Direct tax supplies the chief source of revenue. Vermont has no State debt. In 1850 the valuation of taxable property was $71,671,651, and in 1855, $86,186,961.

24. The following exhibits the condition of the educational establishments in 1850

Establishments.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	2,731	4,173	93,457	$176,111
Academies and private schools	118	257	6,864	48,935
Collegiate institutions	5	30	464	21,558

—making a total of 2,854 schools, 4,460 teachers, and 100,785 scholars, and an annual income of $246,604. The number of persons over 20 years of age unable to read and write was 6,240, of which number 616 were natives and 5,624 of foreign birth, and 3,633 were males and 2,607 females.

25. The collegiate institutions of Vermont are (1855) as follows:

Institutions.	Location.	Founded.	Professors.	Alumni.	Students.	Libraries.	Commencement.
University of Vermont	Burlington	1791	9	619	99	13,000	1st Wed. in August.
Middlebury College	Middlebury	1800	6	960	82	8,500	2d Wed. in August.
Norwich University	Norwich	1834	4	—	80	1,650	2d Thurs. in August.

—and the medical schools are as follows:

Castleton Medical College	Castleton	1818	7	555	104	—	4th Thurs. in August.
Med. Dep. U. of Vermont	Burlington	1821	7	131	41	—	1st Thurs. in March.
Vermont Medical College	Woodstock	1835	8	350	91	—	1st Thurs. in March.

—Vermont has neither law nor divinity schools.

26. In 1850 the total number of churches in Vermont was 599, with accommodation for 234,534 persons, and with property valued at $1,216,125. The most numerous denominations are the Congregational, Methodist, and Baptist, and after these the Universalist and Episcopal. The Presbyterian, Roman Catholic, and Unitarian denominations are scarcely known as distinct organizations.

27. The principal towns in Vermont are Montpelier, the capital, with 2,310 inhabitants; Burlington, the chief port, with 6,110, Brattleboro' with 3,816, Bennington with 3,923, Rutland with 3,715, St. Albans with 3,567, Middlebury with 3,517, Woodstock with 3,041, Castleton with 3,016, St. Johnsbury with 2,758, Windsor with 1,928, etc.

28. Montpelier is situated at the confluence of the two branches of Onion River, and near the center of the State, in latitude 44° 17′, and longitude 72° 36′; and has been the State capital since 1855. A short branch connects it with the Vermont Central Railroad, and has contributed greatly to the prosperity of the town by placing it in immediate connection with Burlington and Canada north and the sea-coast south and east. The State House is a handsome structure of granite, in the form of a cross, 150 feet in length and 100 feet in width, including a portico of six columns, each 6 feet in diameter at the base and 36 feet high. The building is surmounted by a dome, the apex of which is 100 feet from the ground. It contains also the court-house of Washington County.

29. Burlington, on Burlington Bay of Lake Champlain, and 41 miles northwest by railroad from Montpelier, is the largest town of the State, and an important point in relation to commerce and the routes of travel by railroad and steamboat, the first of which connects it with the principal sea-ports and the St. Lawrence, and the latter with numerous important towns on the lake, as Plattsburg on the opposite side, Whitehall at its south end, and Rouse's Point on the north. The location is beautiful, the grade rising from the lake to a considerable elevation, and the town is regularly and well-built, with a central square, on which is the court-house of Chittenden County, the principal hotels, and several fine stores. Many of the dwellings have handsome spaces ornamented with shrubbery and shade-trees. At the mouth of the bay the United States government have erected a breakwater to protect the shipping, and a light-house on Jupiter Island. The University of Vermont is situated at the east of the town, on an elevation overlooking and about a mile distant from the lake. Burlington was settled in 1783.

30. Brattleboro', county seat of Windham, on the Connecticut River, 118 miles by rail-

BRATTLEBORO'.

road south of Montpelier, is the oldest town in Vermont, Fort Dummer having been built here in 1724. The town contains two villages, one on and a second about two miles west of the river. The east village is the most important, and is one of the most active business places in the State, and contains, besides the county buildings, numerous manufactories and the State Lunatic Asylum. It is connected with the north and south by the river line of railroads.

31. Bennington, on the Hoosac, 33 miles west Brattleboro', was settled in 1761, and is a flourishing manufacturing town. It is connected with Troy and Rutland, etc., by the Western Vermont Railroad. Rutland is a very flourishing town on Otter Creek, about 50 miles south from Montpelier. Several important railroads center here. In the town are several marble and slate works, iron works, etc., and iron ore, lime, and marble are largely worked in the vicinity. Castleton, 11 miles by railroad west from Rutland, is the seat of Castleton Medical College, and is a place of considerable trade. Middlebury, on the Rutland and Burlington Railroad, 33 miles north-by-west Rutland, is the seat of a college, and is also a busy manufacturing town. Marble is extensively quarried in the vicinity.

32. St. Albans, on the Vermont and Canada Railroad, 34 miles north Burlington, is a flourishing town on Lake Champlain, and the port of a fertile district. It has also some

BELLOWS FALLS.

manufactures. Vergennes is an old town on Otter Creek, 7 miles from its entrance into Lake Champlain, and 21 miles by railroad south of Burlington. It was settled in 1766, and is the seat of a United States arsenal. It enjoys good advantages for ship-building, the

creek being here 500 feet wide and deep enough for the largest vessels, and it was here that McDonough fitted out his flotilla that so distinguished itself in the battle of Lake Champlain, fought on the 11th September, 1814.

33. Windsor is a thriving town on the Connecticut, where it is crossed by the Sullivan and Vermont Central railroads, 77 miles south-by-east Montpelier. It is the seat of the State Prison, and the center of a fine wool-growing and agricultural district. Millbrook furnishes immense water-power, having a fall of 60 feet in less than half a mile. The vicinity abounds in beautiful and picturesque scenery, the view embracing Ascutney Mountain and the river valley. Bellows Falls, 26 miles south, is an important railroad village, in which four several lines form connections. The place takes its name from a series of falls in the Connecticut, which in half a mile have a descent of 44 feet, but which are passed by a canal and nine locks. The neighboring scenery is beautiful. Woodstock, 12 miles northwest, is the seat of the Vermont Medical College. The Quechee, on which the village is built, has immense water-power.

34. St. Johnsbury, 75 miles north Windsor, and 60 miles above White River junction, one of the great railroad crossings of the Connecticut, is a thriving manufacturing town on the Passumpsic River, and on the Connecticut and Passumpsic Railroad. It is specially noted for its vast establishment for the manufacture of weighing-scales. The railroad northward of St. Johnsbury is now open to Barton, and will soon be completed to the Canada line, where it will form connections with the roads leading to Montreal and Quebec. Barton River, on which the town of Barton is situated, empties into Lake Memphremagog.

35. Vermont was first settled in 1724, when Fort Dummer was built on the Connecticut River, in the southeast part of the State. In 1731 the French built a fort at Crown Point, and began a settlement on the eastern shore of Lake Champlain. The territory of Vermont was originally claimed both by New Hampshire and New York, and a long controversy continued between these colonies until the commencement of the war of the Revolution. In July, 1777, Vermont independently adopted a constitution, under which a government was organized in March, 1778; and not being accounted by the British one of the revolted colonies, escaped much of the troubles of the revolutionary period. In 1789 affairs were amicably adjusted with the contesting claimants to the State, and on the 4th March, 1791, Vermont was admitted as a State of the Union.

STATE OF MASSACHUSETTS.

1. Massachusetts, the most densely populated State of the Union, is situated between latitudes 41° 12′ and 42° 52′ north, and longitudes 69° 54′ and 73° 34′ west; and is bounded on the north by Vermont and New Hampshire, on the east and southeast by the Atlantic Ocean, on the south by Rhode Island and Connecticut, and on the west by New York. The length of the State east and west is about 154 miles, and the general width north and south about 50 miles; but at the eastern extremity it expands to nearly 100 miles, while a long, narrow tongue of land, known as the peninsula of Cape Cod, extends in a curve northeasterly 60 miles beyond the main. The land area is stated at 7,800 square miles.

2. Narragansett Bay, which lies chiefly within Rhode Island, enters by its most northeastern inlet into Massachusetts, and receives the Taunton, the most considerable of all the streams which fall into it. Farther east is Buzzard's Bay, a deep indentation stretching in a northeastern direction into the mainland. It is inclosed seaward by the Elizabeth Islands, and its innermost corner is divided from Cape Cod Bay by an isthmus only five miles in width. This bay is very much indented by small but serviceable inlets on both shores, but is generally shallow, yet vessels of considerable size ascend to New Bedford 17 miles from its entrance on the west. The shores are low and sandy. On the east of Buzzard's Bay begins Cape Cod peninsula, which first stretches from the mainland, a little north of east, 35 miles, varying in width from 4 to 20 miles; it then changes its direction to north and northwest for about 30 miles, with a mean width of three miles, and terminates in Cape Cod. The difference in the tides south and north of the peninsula is remarkable: in Buzzard's Bay the rise is from 3½ to 4 feet only, while in Cape Cod Bay it is 16 feet. This peninsula incloses the southern portion of Massachusetts Bay, called Cape Cod or Barnstable Bay, which extends northward to Cape Ann in the form of a parallelogram, 55 miles long from south-southeast to north-northwest and 25 miles in average breadth, and between the two points a distance of 44 miles it is open to the Atlantic. It contains the important harbors of Plymouth, Boston, and Salem. North of Cape Ann the shores are somewhat high and rocky.

3. South of Cape Cod peninsula are the islands of Nantucket and Martha's Vineyard. Nantucket is about 15 miles long and four miles wide. It constitutes with some smaller islands adjoining it a separate county. Martha's Vineyard is about 16 miles long and eight miles in general breadth, and together with its adjacent islets constitutes Duke's County. Neither of these islands rises to more than a very moderate height, and both are level, with a sterile, sandy soil. The wide bay which they inclose on the south is called Nantucket Bay, and the strait between Martha's Vineyard and the Elizabeth Islands is called Vineyard Sound. The inhabitants subsist chiefly by fishing. The total length of coast-line is 286 miles; but including islands and all irregularities, 886 miles, or one mile of coast to every 8¾ square miles of surface.

4. The surface of Cape Cod consists of two inclined planes, which attain some elevation where they meet. Between Hyannis and Barnstable the highest level is about 80 feet above the sea, but on the isthmus which unites the peninsula to the main it is only 40 feet. The soil of this tract is light and sandy, and much of it is entirely destitute of vegetation. The country along the western side of Buzzard's Bay and the shores of Massachusetts Bay is similar in soil; but at the back of this level tract is a hilly region, which in the northeast districts extends nearly to the sea, and westward to the valley of the Connecticut. Its surface is agreeably diversified, and the soil of the valleys is deep and strong. In this part some hills rise to a considerable elevation, the highest, called Wachuset, attaining 2,018 feet. Hills of smaller elevation extend toward the Connecticut, but they approach the banks of the river

VIEW FROM MT. HOLYOKE.

only near Northampton and Hadley. North and south of these places the Connecticut runs through a valley from two to three miles wide, which is covered with an alluvium of great fertility. West of it the country immediately rises into high hills, which gradually attain the elevation of mountains; and the western part of the State is traversed north and south by two continuous ridges of the Green Mountains, called the Hoosac and Taghkannuc ridges, the most elevated parts of which are above 3,000 feet high, and Saddle Mountain in the northwest and Bald Mountain or Mount Washington in the southwest attain respectively 3,505 and 2,624 feet. The hills on the east side of the Connecticut may be considered as detached members or outliers of the White Mountain system.

5. Massachusetts is everywhere well watered, but the streams are valuable rather for their abundant water-power than for navigation. The western or mountainous region is traversed by the Housatonic, which rises in the northwest part of the State, and traverses it by a southerly course of nearly 50 miles, when it enters Connecticut. It is very rapid, and not navigable in Massachusetts. The Connecticut enters this State from the north, and traverses it by a course of 70 miles, including its numerous bends. By means of short canals it has been made navigable through the State; and its tributaries furnish valuable sites for manufacturing towns. The principal are Miller's and Chicopee rivers from the east, and Deerfield and Westfield rivers from the west. Blackstone River passes from the center of the State southeast into the northwestern arm of Narragansett Bay; and Taunton River southwest into its northeastern arm. Both these rivers have vast hydraulic power, and are the seats of an immense and varied industry. There are no rivers of consequence flowing to the sea from the southeastern section; and the only considerable streams flowing from the whole eastern section of the State are the Charles and Merrimac rivers, the first into Boston harbor and the latter directly into the ocean north of Cape Ann. Charles River is navigable for eight miles for large boats, and the tide flows up it to Dedham. The Merrimac rises in the western declivities of the White Mountains, and runs nearly due south for 50 miles, when it receives the outlet of Winnipiseogee Lake, and then runs 52 miles south-southeast till it is met by the Nashua River from the southwest. Below the junction the Merrimac turns east and then northeast for about 40 miles, and falls into the Atlantic. In its natural state the Merrimac opposed great impediments to navigation, but by means of improvements an uninterrupted navigation has been effected as far up the river as Concord, in New Hampshire. The tide ascends it to Haverhill, 15 miles from its mouth.

6. The primary rocks are conspicuous in the geology of Massachusetts, and these in some places are covered by the older secondary formations. The valley of the Connecticut rests on a bed of red sandstone. The primary rocks are largely used for building purposes, and the granite of Quincy has become a staple among the economic productions of the State. The mountains in the west are composed chiefly of granite, gneiss, quartz, mica, clay-slate, limestone, and hornblende. Soapstone and argillaceous slate are found in various parts, and potter's and porcelain clays are abundant. The State is not, however, so far as ascertained, rich in minerals; but iron is mined and extensively wrought, and plumbago, lead, and copper ores are found in localities. The white clay of Martha's Vineyard furnishes alum, and anthracite is obtained in the graywacke district, to the west of Taunton River. Peat is used as a common fuel in the eastern counties. Mineral springs are numerous.

7. The climate of Massachusetts, though identical in many respects, is not so extreme as that of Maine and New Hampshire. The winters, however, are very severe, and in the year the temperature varies from 20° below to 100° above zero. The changes are frequently sudden, and sometimes a difference of 40° Fahr. is observed within 24 hours. On the eastern and southern shores the seasons are moderated by the proximity of the ocean. The season of growth commences late in all parts. but vegetation is rapid, and by the middle of April the peach and apricot are in bloom.

8. The soil is naturally stubborn, and not the most favorable to agriculture, but the skill and industry of the inhabitants have made the least fruitful soils to yield remuneratively. The best soils are those of the valleys, and the poorest those on the sandy flats of the south-east. Salt marshes, somewhat extensive, are found near the coasts. The forests abound with valuable timber; but these are now of much less extent than formerly, and cover only, in fact, a comparative small portion of the territory of the State.

MOUNT TOM.

9. The population of Massachusetts, in 1850, amounted to 994,514 souls or 127.47 to the square mile, or 4.29 per cent. of the population of the Union. This was distributed as follows:

Counties.	Population.	County Seats.
Barnstable ..	35,276	Barnstable.
Berkshire....	49,591	Lenox.
Bristol	76,192.	New Bedford. Taunton.
Essex .....131,300.		Salem. Newburyport.
Duke's.....	4,540	Edgartown.
Franklin.....	30,870	Greenfield.
Hampden....	51,283	Springfield.
Hampshire ..	35,732	Northampton.
Nantucket...	8,452	Nantucket.
Norfolk	78,892	Dedham.
Middlesex...	161,383	Cambridge. Concord. Lowell.
Plymouth ...	55,697	Plymouth.
Suffolk.....	144,517	BOSTON.
Worcester ..	130,789	Worcester.

—and comprised 192,675 families inhabiting 152,835 dwellings; of the total 985,450 (99.09 per cent.) were whites—484,093 males and 501,357 females, and 9,064 free colored—4,424 males and 4,640 females; and 830,066 (83.35 per cent.) were Americans, of whom 695,236 were born in this State, and 160,909 (16.18 per cent.) were foreigners, the remainder (3,539) being of origin unascertained. The natives of Massachusetts resident in other States numbered 199,582. In 1790 this State had 378,717 inhabitants; in 1800, 423,245; in 1810, 472,040; in 1820, 523,287; in 1830, 610,408; in 1840, 737,699, and in 1850 (as above), 994,514. In 1855 the State census gave a total of 1,133,123.*

10. Two hundred and ninety-five thousand three hundred (295,300) free male persons over 15 years of age were occupied in the various industries of the State in 1850—of these, 146,002 were engaged in commerce, trade, manufactures, mechanic arts, and mining; 55,699 in agriculture; 57,942 in labor not agricultural; 73 in the army; 19,598 in sea and river navigation; 4,702 in law, medicine, and divinity; 5,371 in other pursuits requiring education; 1,566 in government civil service; 1,375 in domestic service, and 2,972 in unclassified pursuits.

11. Massachusetts stands at the head of manufacturing States in America, and as a commercial State ranks next to New York and Louisiana. Boston is to New England what New York city is to the north interior States, and what New Orleans is to the south interior States—a great commercial mart. In the value of its manufactured products it is exceeded only by New York, a State with threefold its population, and is about equaled by Pennsylvania, with more than twice its population. In its staples, however, it differs from both its compeers, being to a greater extent than any other State engaged in the manufacture of textile fabrics of cotton and wool; while Pennsylvania is distinguished chiefly for its iron manufacture, and New York for its greatly varied and perhaps more justly balanced series of products. Massachusetts also ranks high in regard to its leather manufactures, and produces annually a greater number of shoes than all the other States in the aggregate. Its rank as an agricultural State, if estimated by the intelligence of its farmers and the thorough cultivation of its soils, would be conspicuous, but its comparatively harsh climate, and the ruggedness of its surface, are great drawbacks to rural industry, and as a consequence the production is unequal to the consumption. The State, however, boasts of the finest farms in the Union, and the most approved breeds of stock. Another and important industry of Massachusetts is its fishery, home and foreign, and in this pursuit it is the leading State. In the whale fishery, which is chiefly carried on from New Bedford, it employs three fourths of the whole United States tonnage engaged therein; in the cod fisheries, chiefly carried on from Gloucester and Barnstable, more than two fifths, and in the mackerel fishery, chiefly from Gloucester, more than two thirds. The products of its fisheries are valued at three fifths of those of the whole fishery of the United States. In ship-building it is exceeded only by Maine and New York, and New York city alone exceeds Boston as a building port.

12. Massachusetts has an area of 4,992,000 acres, and of this, 3,356,012 acres or more than two thirds were held by individuals in 1850, and 2,133,436 acres or somewhat less than one half were improved lands. The number of farms was 34,069 or on the average of 99 acres to each farm; and these were valued at $109,076,347, and the agricultural implements and machinery in use thereon at $3,209,584. The principal agricultural crops are Indian corn, oats, and rye; wheat, barley, and buckwheat are grown only to a small extent, and the same may be said of beans and peas. The total cereal crop, in 1850, amounted to (Indian corn 2,345,490, oats 1,165,146, rye 481,021, barley 112,385, buckwheat 105,895, and wheat 31,211) 4,241,142 bushels, against a total, in 1840, of 4,075,128 bushels; the potato crop amounted to 3,585,384 bushels, that of peas and beans to 43,709 bushels, and the hay crop to 569,395 tons. In the value of market-garden produce ($600,020) it is only exceeded by the large States of

MARSHFIELD—THE HOMESTEAD AND FARM OF THE LATE DANIEL WEBSTER.

New York and Pennsylvania, and in that of its orchard produce by only five other States. Maple sugar was produced to the amount of 795,525 pounds.

13. In livestock* the State has decreased vastly from 1840 to 1850, in which years it was comparatively as follows:

1840.....	horses, etc., 61,484	neat cattle, 282,574	sheep, 378,226	swine, 143,221
1850	" 42,250	" 259,994	" 188,651	" 81,119

—but its dairy products are comparatively large (butter 8,071,370, and cheese 7,088,142 pounds), and its wool crop, which in 1840 was 941,906, in 1850 amounted to 585,136 pounds, being an increase of 25 per cent. to the fleece. The total value of livestock, in 1850, was $9,647,700, and the value of the animals slaughtered in the year previous was $2,500,924.

14. The total value of agricultural produce, etc., in the year 1849–50, is stated at $14,277,595.

15. In 1850, Massachusetts contained 8,259 manufacturing establishments, employing a capital of $83,357,642, and giving employment to 96,261 males and 69,677 females. The cost of the raw material, fuel, etc., consumed was $85,856,771, and the cost of labor $39,784,116. The value of the products of the year amounted to $151,137,145. In 1810 the total value of manufactured products was $17,874,191; in 1830, $59,211,015; in 1840, $67,061,899; in 1845 (State census), $124,749,457; in 1850, as above, and in 1855 (State census), $295,820,681. The value of home-made goods in 1849–50 was $205,333.

16. For the purpose of illustrating the progress of textile manufactures in this State, in the 10 years ending 1st June, 1855, the following statistics are drawn from the State censuses of 1845 and 1855:

Manufactures.	Capital invested. 1845.	Capital invested. 1855.	Hands employed. 1845.	Hands employed. 1855.	Value of products. 1845.	Value of products. 1855.
Cotton goods of all kinds	$17,739,000....	$32,086,000.....	20,710....	34,887.....	$12,193,449....	$26,160,538
Calico.....	1,401,500....	1,980,000.....	2,053....	1,157.....	4,779,817....	5,213,000
Goods bleached and colored .	200,500....	659,000.....	325....	644.....	2,244,700....	5,111,200
Woolen goods of all kinds ...	5,604,002....	7,305,500.....	7,372....	10,000.....	8,877,478....	12,131,254
Carpeting	488,000....	2,276,672.....	1,034....	1,642.....	834,322....	1,362,819
Worsted	514,000....	1,386,000.....	846....	1,222.....	654,566....	2,123,740
Hosiery and yarn	42,500....	69,980.....	238....	256.....	94,892....	207,160
Linen.....	79,000....	550,000.....	192....	910.....	145,000....	1,440,000
Silk.....	38,000....	75,000.....	156....	189.....	150,477....	338,000
Total	$26,106,502....	$46,388,152.....	32,926....	50,997	$29,994,701....	$54,087,711

—and in the following list will be found the value of other principal manufactured goods in 1855—rolled and slit iron and nails, $5,531,316; anchors, chain cables, etc., $915,980; pig-iron, $641,540; hollow-ware and castings, $3,256,538; machinery, $4,089,590; steam-engines and boilers, $3,255,000; fire-engines, $50,000; cutlery, axes, scythes, etc., $1,320,811; hinges, screws, etc., $202,000; door-handles, latches, locks, etc., $105,800; tacks and brads, $621,212; shovels, spades, forks, and hoes, $894,515; plows, etc., $763,980; iron railing, fences, and safes, $656,400; copper, $1,796,500; brass articles, $1,504,050; Britannia ware, $302,000; buttons, $267,120; lead, $340,000; tin-ware, $1,451,240; white lead, etc., $910,190; mechanics' tools, $1,142,614; cannon, $54,151; fire-arms, $391,475—making a total of *metallic manufactures* valued at $30,468,022; and the following among the general manufactures—glass, $2,648,125; starch, $195,800; paper, $4,264,522; musical instruments, $2,295,680; chronometers, watches, gold and silver ware and jewelry, $2,105,200; brushes, $484,500; saddles, harnesses, and trunks, $1,220,049; upholstery, $1,876,800; railroad cars, coaches, etc., $2,352,355; sugar refined, $2,056,430; sperm candles and oil, $6,813,291; soap and tallow candles, $7,720,534; chairs and cabinet-ware, $3,969,982; flour $2,040,040; leather, tanned and curried, $10,934,416; patent and enameled leather, $1,276,942; boots and shoes, $37,529,483; corn and other brooms, $323,135; cards, $440,240; salt, $350,971; powder, $228,125; combs, $557,422; linseed oil, $890,000; glue and gum $532,650; cotton gins,

* State census, 1855—horses, etc., 80,321; oxen and steers 77,511, and 184,010 milch cows and heifers; sheep, 145,215, and swine, 51,113. Cheese, 5,762,776 lbs.; butter, 8,116,009 lbs.; milk, 13,204,665 quarts.

* Distributed by counties as follows—Barnstable, 35,877; Berkshire, 52,791; Bristol, 87,425; Duke's, 4,401; Essex, 151,167; Franklin, 31,655; Hampden, 54,852; Hampshire, 35,485; Middlesex, 194,082; Nantucket, 8,064; Norfolk, 94,448; Plymouth, 61,513; Suffolk, 171,818; Worcester, 149,545.

Of the whole, 886,579 were born in the United States; 21,707 in British America; 20,987 in England; 181,304 in Ireland; 6,734 in Scotland; 248 in Wales; 9,653 in Germany and Holland; 1,143 in France; 855 in Portugal; 358 in Italy; 734 in Norway and Sweden; and the remainder in other foreign countries or of unknown nativity.

The number of dwelling-houses (*i. e.*, inhabited tenements) was 175,311, and of families 228,845.

The number of deaf and dumb was 401 (371 native, 30 foreign and unknown); of blind 471 (408 and 63); of insane 1,919 (1,411 and 508); of idiotic 838 (791 and 47).

Paupers, 5,687; convicts, 2,901; legal voters, 211,681.

Occupations were as follows—agriculturists, 57,031 (17.1 p. c.); factory operatives, 8,801 (2.64 p. c.); laborers, 60,248 (18.06 p. c.) mariners and boatmen, 16,346 (4.91 p. c.); manufacturers, 5,294 (1.59 p. c.); mechanics 122,251 (36.63 p. c.); merchants, 29,039 (8.71 p. c.); professional men, 8,312 (2.49 p. c.); miscellaneous, 26,220, or 7.87 per centum.

$99,000; bricks, $2,627,163; building stone, $1,585,213; whips, $505,500; wooden ware, $745,711; fringe and tassels, $433,000; stone and earthenware, $125,450; chemicals, $1,124,765; mathematical instruments, $204,850; marble, $561,650; lime, $94,907; blocks and pumps, $314,510, etc.

17. The fisheries of Massachusetts, which have here before been alluded to as more valuable than those of any other of the United States, may be divided into two branches—those which are carried on along the American coast, and those of distant seas. In the pursuit of the whale, the vessels of this State are found in the Atlantic and Pacific, and in both polar seas. Their chief locality, however, is the North Pacific. In this business there were employed, in 1850, 122,676 tons, and in 1855, 152,719 tons of shipping. In the same years there were employed in the cod fishery 41,751 and 51,952 tons, and in the mackerel fishery 42,895 and 13,709 tons. In 1855, according to the census of that year, the value of whale oil and bone produced was $7,766,996, and of cod and mackerel taken and cured $2,845,782. The whale fishery employs 11,364 men, and a capital of $14,546.548, and the cod and mackerel fisheries 10,551 men, and a capital of $3,696,436.

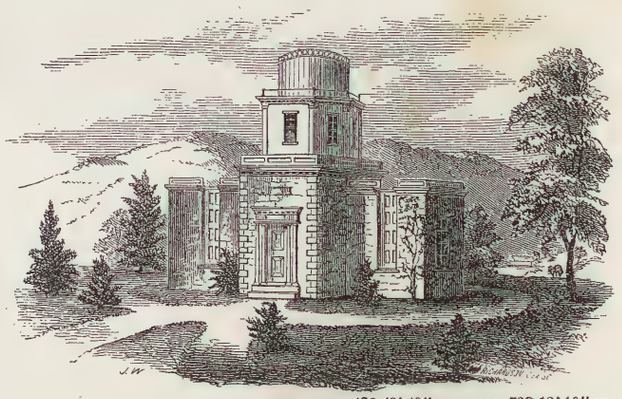
18. The commerce and navigation with foreign countries, and shipping owned and built in this State for the 10 years ending 30th June, 1855, are shown in the following table:

Years.	Commerce. Imports.	Commerce. Exports.	Navigation. Tonnage ent.	Navigation. Tonnage clear.	Tonnage owned in State. Registered.	Tonnage owned in State. Total.*	Tonnage built in the State.
1846	$24,190,963	$10,313,118	—	—	—	—	—
1847	34,477,008	11,248,462	—	—	—	—	—
1848	28,647,707	13,419,699	—	—	—	—	—
1849	24,745,917	10,264,862	576,708	524,254	445,284	636,199	23,888
1850	30,374,684	10,681,763	611,449	546,952	473,328	685,442	35,836
1851	32,715,327	12,352,682	661,574	626,800	504,377	694,404	—
1852	33,504,789	16,546,499	645,944	657,513	555,437	767,740	48,001
1853	41,367,956	19,955,276	724,174	716,828	631,548	856,155	83,015
1854	48,563,788	21,488,504	799,950	738,006	686,722	921,248	92,570
1855	45,113,774	28,190,925	836,929	813,484	737,413	979,210	79,669

—of the imports, in 1855, $29,784,688 were carried in American, and $15,329,086 in foreign vessels; and of the exports, $24,412,923 were of domestic production, of which $10,328,159 were carried in American, and $14,084,764 in foreign vessels, and $3,778,002 were of foreign production, of which $2,931,056 were carried in American, and $846,946 in foreign vessels. Of the shipping entered, 454,245 tons were American and 382,684 tons foreign, and of that cleared, 432,634 tons were American and 380,850 foreign. Included with the shipping owned in the State in 1855 are vessels navigated by steam, amounting to 17,627 tons. Of the amount (79,669 tons) of shipping built in the year, 56,496 tons were built at Boston, 8,535 at Newburyport, and 6,337 at New Bedford.

19. The ports of Massachusetts are Boston, New Bedford, Barnstable, Newburyport, Gloucester, Salem, Nantucket, Fall River, Plymouth, Marblehead, Edgartown, Beverly, and Ipswich, which are here arranged in the order of their importance, based on the amount of tonnage owned in the districts respectively. Of the total tonnage, Boston owned 546,269, New Bedford 169,986, and Barnstable 80,615 tons.

20. In regard to internal improvements, railroads, turnpikes, telegraphic lines, etc., Massachusetts stands at the head of the most progressive States. Its canals—the Blackstone and Hampshire, have been either filled up or have fallen into disuse; and those on the Merrimac and Connecticut are rather river improvements than proper canals. The railroad, indeed, is now the chief means of travel and transport; it reaches every portion of the State either as lines directed to Boston or otherwise as sections of transverse lines crossing the State north and south, and linking the ports of Long Island Sound and the Atlantic with Canada and the interior. In the latter class may be mentioned the Housatonic, the New Haven and Northampton, the New Haven, Hartford and Springfield, the New London, Willimantic and Palmer, the Norwich and Worcester, and the Providence and Worcester lines, which with their connections form great through lines. On the other hand, two great lines run east and west—the Boston and Worcester and the Western on the south, and—the Fitchburg, the Vermont and Massachusetts, and the Troy and Greenfield on the north—both connecting Boston with the Hudson River at Albany and Troy. The Troy section of the north line is still unfinished. The other lines coming into Boston are the Eastern and the Boston and Maine lines from Maine; several lines from New Hampshire and Vermont, passing through the great manufacturing towns on the Connecticut and Merrimac rivers, from the north and west; and the lines from New London, Providence, Fall River, New Bedford, Fairhaven, Hyannis, Plymouth, etc. These have in most cases considerable branches, giving access to the more important towns near their routes. In all there were in the State, in 1855, 1,622 miles of railroad† owned by 57 companies, and which had cost to that date $69,094,390. In Boston there are several passenger railroads driven by horses; and for miles around the country is completely reticulated by railroads. The mileage thus reported gives one mile of road to every 4.2 square miles of territory and to every 699 inhabitants. In Belgium, which has more railroad in comparison to its size than any other European state, there were in 1855 about 1,119 miles, or only one mile to every 10.2 square miles of surface, and to every 4,096 inhabitants. To support these lines requires an immense trade, and by these may be measured, in a great part, the internal and transit commerce of this State. Its fine turnpikes and other roads are tributary to these, and spread their arms to the remotest hamlet, so that not even the least is wanting in direct and quick routes to the commercial capital.



21. Massachusetts has also a vast coasting trade, and by this means reaches the ports of the Atlantic, north and south, and those of the Gulf of Mexico—regular lines of trading vessels communicating with all the chief sea-board towns; and steam-packets, sailing to and from Boston, maintain regular intercourse with Portland, Eastport, St. John's, N. B., etc., to the north, and New York, Philadelphia, and Baltimore to the south. A daily line of steamers also sails between Fall River and New York; and the steamer lines between New York and Stonington, New London and New Haven, form in connection with the railroads lines of rapid communication between the great metropolis and the city of Boston. Boston has also a bi-weekly steam-communication with England.

22. The number of banks in Massachusetts, in 1850 and 1855, was respectively 126 and 169, with aggregate capital amounting to $33,925,929 and $58,632,350. In the same years the circulation amounted to $17,095,826 and $23,116,024; the deposits to $11,176,825 and $21,478,717, and other liabilities to $442,004 and $6,442,377. The assets at the same times consisted of—loans and discounts, $63,330,024 and $99,506,711; real estate, $998,235 and $1,281,601; specie, $2,994,178 and $4,409,402, and miscellaneous assets, $9,383,554 and $11,558,033. In 1855 there were 80 savings' institutions, in which were deposited $27,296,216, belonging to 148,263 depositors. This sum was secured by loans on mortgage $9,423,135, to counties or towns $2,487,917, and on personal security $6,909,846, and investments in bank stock $6,366,067, and in public stock $697,247. The whole expense of management for the year had been $77,756, and the dividends averaged 4.97 per cent. In the above 80 institutions are included 13 five-cent savings' banks. The number of insurance companies in the State was 119, of which 33 were stock and 16 mutual fire and marine companies, 64 mutual fire companies, and 6 life companies. There are also numerous foreign fire, marine, and life insurance companies in the State.

23. The government of Massachusetts is based on the constitution of 1780, as amended in 1821 and with subsequent modifications. The right to vote is secured to every male citizen of the age of 21 years, who has paid taxes within the two years, and been resident in the State one year, and in the place of voting six months next preceding. All elective officers are chosen annually. The legislative authority is vested in the general court, which is composed of a senate of 40 members elected from districts, and a house of representatives (now numbering 438 members) by towns. The governor and lieutenant-governor are elected by a majority of votes. The executive council is composed of eight members, one elected from each of the eight council districts into which for such purpose the State is divided. The judiciary consists of a supreme court, courts of common pleas, a superior court, a municipal court for Suffolk County, and probate courts. The supreme court, with a chief and five associate justices, has exclusive jurisdiction in all capital crimes, and exclusive chancery jurisdiction so far as chancery powers are given by statute, and concurrent original jurisdiction in all civil cases where the amount in dispute exceeds $3,000 in Suffolk County and $300 in other counties. It holds law terms in eight of the fourteen counties of the State for the whole State, and *nisi prius* terms in all the counties. The court of common pleas is held for the trial of civil cases above $20, and has criminal jurisdiction in all cases except murder. Frequent terms are held in all the counties except Suffolk, which has special courts, the municipal courts holding monthly and the superior court bi-monthly terms. Justices of the peace have a limited civil and criminal jurisdiction. The county or probate courts are composed each of one judge with a registrar; and in 1856 the legislature established insolvent courts in each county. All judges are appointed by the governor, with the advice and consent of the council, and hold office during good behavior.

24. The institutions supported in part or wholly by the State are more numerous than in any other State. The principal are the lunatic asylums at Worcester, Taunton, and Northampton (and besides these there are hospitals of this class at South Boston, Somerville, and Pepperell); the State Prison at Charlestown; the State Reform School at Westboro'; the State Industrial School for Girls at Lancaster; the School for Idiotic and Feeble Minded Youth at South Boston and the State almshouses at Tewkesbury, Bridgewater, and Monson, etc. Otherwise the State is full of charitable and benevolent institutions.

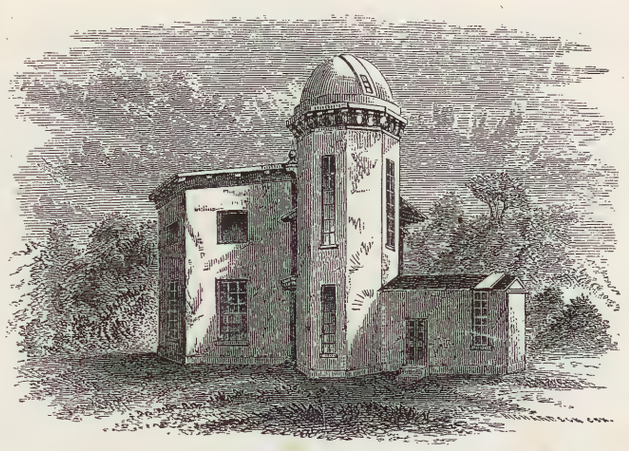
25. The ordinary revenue of the State for the year ending 31st December, 1850, amounted to $492,811, and in 1855 to $1,147,816. The total revenue in the years respectively amounted to $1,540,319 and $2,443,573. The ordinary expenditures amounted to $850,225 and $1,203,907, and the total expenditures to $1,416,281 and $2,286,451. The chief sources of the ordinary income are the State tax, the bank tax, school fund and interest, and railroad dividends, etc. The liabilities of the State on the 1st of January, 1856, were—funded debt, $1,764,000, temporary loans and sums due $678,162, and liabilities for scrip loaned to the various railroads, $5,049,555. The value of property owned by the commonwealth amounted to $11,744,626, of which $4,038,587 was productive, $2,656,483 non-productive, and $5,049,555 mortgages on various railroads. The valuation of taxable property in the State in 1850 amounted to $546,003,057, and in 1855 to $597,936,995.

OBSERVATORY AT WILLIAMS COLLEGE—LAT. 42° 42′ 49″ N., LONG. 73° 13′ 10″ W.

26. The schools of Massachusetts rank among the best conducted and most efficient in the world. In 1850 the number at school was as one to every 4.48 of the total population. The statistics of the year as given in the federal census are as follows:

Classes.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	3,679	4,443	176,475	$1,006,795
Academies and private schools	381	521	12,774	310.177
Collegiate institutions	6	85	1,043	107,901

—making a total of 4,066 school, 5,049 teachers, and 190,292 scholars, and $1,424,873. The total number on the school registers was 222,220 scholars. The number of persons over 20 years of age unable to read and write was 28,345, of which 1,861 were native born and 26,484 foreign born; 27,539 were white and 806 free colored persons, and 11,953 were males and 16,392 females. The public schools of this State are supported by the proceeds of the school fund and special town taxes. There are also large permanent funds, the interest of which is applied to the support of academies, and the State makes annual appropriations for the normal schools, teachers' institutes, and college scholarships. The whole system is under the supervision of a board of education, composed of the governor and lieutenant-governor of the State and eight members, one of whom is appointed each year by the governor and council for eight years.



* Including enrolled and licensed tonnage engaged in the coasting trade and fisheries.

† This includes all companies reporting to the State authorities; the actual length of road within the State is not more than 1,200 miles.

27. The collegiate institutions in Massachusetts are (1855) as follows:

Institutions.	Location.	Founded.	Professors.	Alumni.	Students.	Libraries.	Commencement.
Harvard University	Cambridge	1636	24	6,700	365	101,250	3d Wed. in July.
Williams College	Williamstown	1793	9	1,557	224	1,500	1st Wed. in Aug.
Amherst College	Amherst	1821	14	1,147	218	20,000	2d Thurs. in Aug.
Holy Cross (R. Cath.) Col.	Worcester	1843	9	—	80	12,000	1st Mon. in Sept.
Tuft's College	Somerville	1854	5	—	80	3,000	2d Wed. in July.
Dane Law School (Harvard University)	—	—	3	—	111	14,000	3d Wed. in July.
Divinity School (Harvard University)		1816	2	295	14	8,700	3d Wed. in July.
Theological Seminary	Andover	1807	5	1,606	101	21,259	——
Theological Institution	Newton	1825	4	201	33	5,500	——
Medical School (H. Univ.)	Boston	1782	6	699	104	--	1st Wed. in Nov.
Berkshire Med. School	Pittsfield	1823	5	473	103	—	1st Thur. in Sept.

—and besides the above it may here be stated that many of the academies in this State are essentially collegiate institutions, only wanting the powers to grant degrees.

OBSERVATORY AT AMHERST COLLEGE—LAT. 42° 22′ 16″ N., LONG. 72° 31′ 28″ W.

28. In 1850 the total number of churches in Massachusetts was 1,475, with accommodation for 691,823 persons, and owning property valued at $10,206,184. The most numerous denominations are the Congregational, and then the Baptist, Methodist, and Unitarian; and after these, according to their numerical force, the Universalist, Roman Catholic, Episcopalians, and Friends. Presbyterianism has but a comparatively few adherents, nor are any of the other denominations large.

29. In 1855 Massachusetts contained thirteen cities with populations ranging from 12,680 to 160,508; seventeen towns with 6,049 to 13,750; eleven towns with 5,000 and 6,000, and nineteen towns containing between 4,000 and 5,000 inhabitants. The cities with their population at various periods are as follows:

Cities.	1790.	1800.	1810.	1820.	1830.	1840.	1845 *	1850.	1855.*
Boston, *Suffolk Co.*	18,038	24,027	32,250	43,298	61,392	93,383	114,366	136,881	160,508

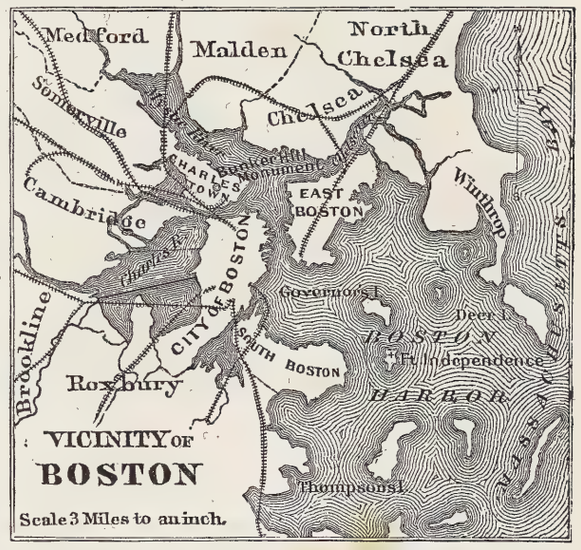
Fall River, *Bristol Co.*	—	—	1,296	1,594	4,159	6,738	10,290	11,524	12,680

—and the following are the chief towns or those having in 1855 upward of 6,000 inhabitants—Taunton, 13,750; Chelsea, 10,151; Gloucester, 8,935; Dorchester, 8,359; Nantucket, 8,064; Haverhill, 7,940; Chicopee, 7,576; Milford, 7,489; Adams, 6,980; Abington, 6,936; Marblehead, 5,933; Newton, 6,768; Weymouth, 6,530; Pittsfield, 6,501; Fitchburg, 6,486; Plymouth, 6,486; Waltham, 6,049.



30. Boston, the capital and commercial metropolis, is situated at the west extremity of Massachusetts Bay, in latitude 42° 21′ 22″, and longitude 71° 4′ 9″. The city consists of Old Boston, East Boston, and South Boston. Old Boston occupies a peninsula containing from 700 to 720 acres, with a hilly surface, rising in one instance to 138 feet above the sea, and connected by the "Neck" with the mainland on the south. This isthmus, once overflowed by the tides, has been raised and widened so as to afford space for several avenues, and otherwise seven bridges and several steam ferries connect Boston proper with the mainland and also with East and South Boston. These are irrespective of the railroad bridges. South Boston extends about two miles along the south shore of the harbor, and embraces about 600 acres, varied in surface, and well laid out into streets and squares. Near the center, and two miles from the State House, are Dorchester Heights, about 130 feet elevation, which afford a fine view of the city and harbor. East Boston occupies the western part of Noddle's Island, and contains 630 acres with extensive flats. This island, which is of uneven surface, is about equidistant between Old Boston and Charlestown. Already it has become a thriving quarter, particularly as regards ship-building and general manufactures. It is also the station of the Cunard steamers, which have here a magnificent wharf. These several parts of the city, with Chelsea, North Chelsea, and Winthrop, constitute the county of Suffolk. In the vicinity, for 10 miles around, and connected with it by railroad and other means, are numerous flourishing towns and villages, which make up a populous metropolitan district.

BOSTON, FROM ABOVE CHELSEA BRIDGE.

31. Originally laid out in consonance with the uneven surface of the site, the streets of Boston are by no means regular, but of late years great improvements have been made to remedy this defect. Nevertheless Boston is entitled to be considered as one of the handsomest cities of America. The "Common" is a spacious public ground of some 50 acres, inclosed with a costly iron fence, and is in part occupied by a botanic garden. In the newer portions of the city there are other public grounds, some of which have been laid off and ornamented with shade trees, fountains, etc. Of the streets, those called Washington and Tremont are by far the best, and have become the promenades of fashion.

32. Boston Harbor is one of the largest and best in the world. It opens to the sea between Point Alderton, on Nantasket, and Point Shirley, in Chelsea, distant from each other about four miles. It is sheltered from the ocean by several islands and the peninsulas of which the foregoing points are the extremities. The main entrance, between Castle and Governor's islands, is very narrow, and strongly defended. Its area is about 70 square miles, and about one half affords good anchorage for the largest vessels. It is seldom obstructed by ice. The surface is thickly studded with islands. Into this basin the Charles, Mystic, Neponset, and other streams empty their waters.

33. Boston has many public buildings which are interesting from their associations or on account of their substantial structure. Among these the State House is conspicuous. It stands on the height of Beacon Hill, fronting on the Common. This edifice is 173 feet long and 61 feet wide, with a dome 50 feet diameter and 30 feet high, the summit being 130 feet above the ground. From its cupola the view is grand, and encompasses the whole city, vicinity, and harbor. On the entrance floor stands a fine statue of Washington, by Chantrey. The Hall of Representatives occupies the center of the main floor, flanked on the east by the Senate Chamber and on the west by the Council Chamber. The old State House is still standing at the head of State Street.

34. Faneuil Hall, the "cradle of liberty," in which the statesmen of the Revolution were wont to harangue the people, stands in Dock Square. It is 100 feet long, 80 feet wide, and of three stories. Faneuil Market, east of Faneuil Hall, is 500 feet long, 50 feet wide, and of two stories, with a dome. It is one of the finest market-houses in the Union. The second story is called Quincy Hall, and consists of several apartments, which may, as occasion requires, be thrown into one spacious room. There are several other markets in Old Boston and also in East Boston and South Boston.

35. The Custom House and Exchange are also handsome buildings. The first occupies a site at the head of Long Wharf, fronting the harbor. It rests on a foundation of 3,000 piles, is a cruciform edifice of granite, and surmounted by a dome. It is 140 feet long, and, including the arms of the cross, 95 feet wide, each front being adorned with a portico of six Doric columns. The cost of the building was $1,076,658. The Merchants' Exchange is a large-fire proof building on State Street, length 250 feet and breadth 76 feet. The front is of Quincy granite, with four pilasters, each a single stone 45 feet high and weighing between 50 and 60 tons. The roof is of wrought iron. The City Hall, Court House, and City Prison are also fine substantial buildings; and among other notable edifices mention must be made of the Freemasons Hall, the Tremont Temple, and the Music Hall.

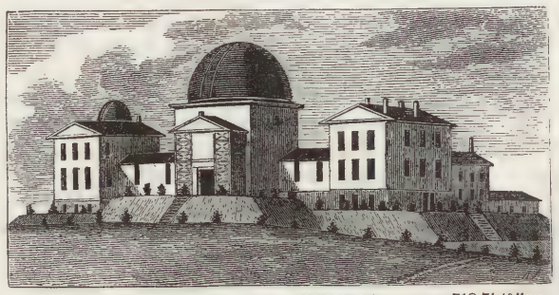
36. Boston contains upward of a hundred churches; of these Christ Church, built in 1723, is the oldest. The old South Meeting-house, erected seven years later, is associated with numerous Revolutionary incidents.

37. In the number of its educational and literary institutions this city is conspicuous, and as the "modern Athens" has no competitor. It has about 200 primary schools and numerous grammar, high, and Latin schools, which are attended by about 25,000 children and youths of both sexes. Nearly a million and a half dollars have been expended upon school buildings, and nearly $400,000 are annually expended in their support. Among the supplementary institutions of education may be named—the Athenæum, with a library of more than 50,000 bound volumes, 20,000 pamphlets, and 500 volumes of engravings, with collections of coins, paintings, sculpture, etc.; and the Apprentices' Library, also an institution of exceeding value to the classes to whose benefit it is devoted. Otherwise than these may be mentioned the institutions of the Boston Library Society, the American Academy of Arts and Sciences, the Mercantile Library Association, the Lowell Institute, the American Oriental Society, the American Statistical Association, the Boston Lyceum, etc. About 100 periodicals are issued in Boston, treating on all subjects, and among these are twelve daily newspapers.

38. The benevolent institutions of the city are numerous and well endowed. Among these

* According to State census.

the Massachusetts General Hospital has the first place, and with its branch, the McLean Asylum for the Insane, constitutes an institution worthy of a great people. The Perkins' Institution and Massachusetts Asylum for the Blind, in South Boston, is an equally deserving institution; and there are also in South Boston the City Lunatic Hospital and the House of Industry and Reformation. In the western part of the city is the Eye and Ear Infirmary.



39. In industrial pursuits Boston ranks among the first of American cities, alike in manufactures and commerce. Its manufactures comprise machinery of every kind, and all the products which make up a varied and extensive manufacturing city. But it owes its fame more to its commercial pursuits and the industries connected therewith, ranking next to New York in this respect. Its foreign connections extend to almost every country of the world, and its coasting trade from Eastport to the Rio Grande. In 1855 the number of arrivals from foreign ports numbered 3,144 (707,924 tons), and of departures outward 2,944 (687,825 tons). During the year 63 vessels (56,496 tons) were built in its ship-yards. The trade of Boston with the British provinces has also become very extensive, and has yearly increased largely under the operation of the reciprocity treaty. Boston has 37 banks, with a capital of upward of $33,000,000, and is the great monetary center of New England.

40. The city is governed by a mayor and councils, and is one of the best regulated cities in America. It is well supplied with water, brought in pipes (more than 100 miles are now laid) from Cochituate Lake, 20 miles west of the city, at a cost of about $5,500,000; is lighted with gas, and is kept remarkably clean.

41. The early settlers chose for their residence, in 1630, the peninsula, which at that period was divided at high tide into two islands. It was called "Shawmut" or "Tremont," the first having reference to its sources of water, and the latter to its topography, in which figured three lofty hills. Boston soon became an important sea-port, and at an early period distinguished for its enterprise and trade, and was peculiarly noted for its ship-building and fisheries. In 1740 it contained 17,000 inhabitants. For more than half a century succeeding, the growth of the city was checked by wars and the restrictive policy of England, and hence, in 1790, the city contained only 18,038 inhabitants. Before the Revolution it was the first commercial city of the coast, and its reputation identified with the progress of the country. During that eventful struggle its citizens were compelled to abandon their firesides, and their commerce was literally ruined. In the common cause its sacrifices were great, and its recovery from its disasters slow. New York and Philadelphia consequently outstripped Boston in material progress. Since 1790, however, the city has rapidly advanced. Its merchants embarked largely in the India and China trade, in voyages to the northwest coast, and in the fisheries, carrying trade, etc., and opened an extensive trade with Russia, the Mediterranean, South America, England, and the British American colonies. When, in 1812, commerce was embarrassed by the embargo, manufactures were inaugurated, which have ever since been expanding, and have now become a vast interest. More recently its citizens have taken a deep interest in railroads, and opened to the city an interior to which nature gave no access.

42. The peninsula on which the old city stands has for a long period been inadequate for its wants, and other large outlying districts have been annexed, the principal of which are Dorchester Point and Noodle's Island, and considerable surface has been reclaimed from the waters. Outside its chartered limits is found a population already equaling in numbers that within. Chelsea, northeast of Boston proper, and, in fact, a suburb of the city, is handsomely situated on the Eastern Railroad, and contains the United States Marine Hospital. Charlestown, on a peninsula immediately north of Boston, and connected therewith by Warren and Charles River bridges, is the site of the United States Navy Yard and of a State Prison. It is a busy commercial place. The exploits of the people of Boston within its limits at the commencement of the Revolution are matters of history, and are commemorated in the grand monument on Breed's (commonly called Bunker) Hill, an eminence which rises near the center of the peninsula on which the city is built.

43. Cambridge is a city about three miles west-northwest Boston, and comprises Old Cambridge, East Cambridge (formerly Lechmere Point), Cambridgeport, midway between Cambridge and Boston, and the district of North Cambridge. Old Cambridge is delightfully situated on the rise from Charles River, and is the seat of Harvard University, the oldest and best endowed collegiate institution in the United States. East Cambridge, which is connected with Boston by the Prison Point Bridge, is noted for its manufactures of glass. Cambridgeport, also connected with the metropolis by a bridge, has an extensive car factory and other manufacturing establishments.

OBSERVATORY AT CAMBRIDGE—LAT. 42° 22′ 48″ N., LONG. 71° 7′ 40″ W.

44. Three miles south Boston, and connected therewith by what is termed the "Neck," now a splendid viaduct, stands Roxbury, built on a rugged site, and commanding extensive views of Boston and vicinity. Of late years it has become a favorite place of residence for the Bostonians, and contains numerous elegant mansions surrounded by shrubberies and garden plots. Its general interests are also connected with Boston; it has, however, a considerable trade of its own, and also several large manufacturing establishments, etc. A short distance back from the city is the Forest Hills Cemetery.

45. Northerly from Boston, and in Essex County, are Lynn, Salem, Newburyport, and Lawrence. Lynn, 11 miles north by the Eastern Railroad, is situated on the northeast shore of Massachusetts Bay and amid the most picturesque scenery. The Nahant peninsula and the beaches in the vicinity are noted places of summer resort. Lynn has long been celebrated for the manufacture of women's shoes, which it exports largely to all parts of the Union, and it is, perhaps, below the truth to say that 5,000,000 pairs are annually manufactured in the city, besides about 500,000 pairs in the neighborhood. Besides the above there are manufactories of leather, morocco, printed cottons, machinery, chocolate, glue, etc.

46. Salem, five miles farther north, is situated on a tongue of land formed by two inlets of the sea. It has a convenient harbor, and is an important commercial town, though the greater part of the foreign trade it formerly enjoyed has been transferred to Boston. Manufacturing is carried on to a considerable extent, chiefly chemicals, leather, machinery, cordage, oil, paint, etc. The city is also largely engaged in the fisheries and coasting trade. Railroads connect it with all the interior, and a branch railroad with Marblehead. From Beverly, on the opposite side of the north inlet, another branch diverges to Gloucester. Salem is the seat of a State Normal School. Next to Plymouth, Salem is the most ancient town of New England, having been settled in 1626. The "witches of Salem" are of historical renown—nineteen of them suffered martyrdom in 1692–3.

47. Newburyport, 20 miles farther north, stands on the south bank of the Merrimac, and at the junction of the Newburyport and Eastern railroads. The harbor, eight miles from the sea, is spacious and safe, but at its entrance is obstructed by a moving sand-bar. The town is considered one of the most attractive in New England. It is built on a gentle acclivity, and is laid out as a regular parallelogram. Near its center, on a hill 60 feet high, is a pond of about six acres, which has been surrounded by a wall and terraced promenade. The principal public buildings are the Custom House, Court House, and City Hall; and the city contains a well-ordered lyceum. The commerce of this port was formerly large, and is again reviving; but its trade is chiefly coastwise, and a large amount of its tonnage is employed in the cod and mackerel fisheries. Its manufactures consist of cotton goods, machinery, boots and shoes, etc. The celebrated George Whitfield died at Newburyport on the 30th September, 1770.

48. Lawrence, also on the south bank of the Merrimac, 21 miles southwest Newburyport, and 26 miles north Boston, is a new town which has almost instantaneously risen to importance as a manufacturing center. In 1845 a dam was constructed across the river by which a fall of 22 feet was obtained, and also a canal to conduct the water to the mills. On this basis the manufactures of the place have been built up, and at the present day, in the manufacture of textile fabrics, it ranks among the first cities of the world. Otherwise the manufactures of Lawrence comprise nearly every article embraced in the various branches of mechanical industry. The town is lighted with gas and is abundantly supplied with pure water from the river. Near its center is a handsome common of 18 acres. In its schools and educational institutions it has great advantages. Lawrence derives its name from the family so called, and of which Abbott and Amos Lawrence were the illustrious representatives. Six lines of railroad diverge from this town to Boston, Salem, Newburyport, Portland, Manchester and Concord, and Lowell, affording unsurpassed facilities for intercourse and business.

49. Lowell is situated on the Merrimac, 13 miles southwest from Lawrence by the Lowell and Lawrence Railroad, and 26 miles northwest from Boston by the Boston and Lowell Railroad, both of which here join the Lowell and Nashua Railroad for Nashua, Concord, and the north. A railroad also communicates with Salem, 24 miles to the southeast. It is the first manufacturing city of New England, enjoying a vast water-power in the Pawtucket Falls, and increased facilities from artificial works. So late as 1822 the site of this now populous city contained scarcely 200 inhabitants. It has already upward of fifty mills, employing a capital of $20,000,000, and about 15,000 hands. The products are chiefly cotton and woolen goods, carpets, machinery, paper, batting, etc. About a third of the population is of foreign birth, and the remainder from various parts of New England, especially Maine and New Hampshire. Great efforts are made to avoid the immorality incident to manufacturing cities, and have been so signally successful that the farmers have no fear as to the safety of their children employed in the mills. This result has been produced by furnishing the operatives with ample means of social and intellectual improvement and of innocent amusement. More than half the operatives have deposits in the savings' bank. The economies of the establishments are also complete; they are heated by steam and lighted with gas, and every attention is paid not only to the conveniences but also to the comforts of the employed. The city derives its name from Francis C. Lowell, a Boston merchant, who distinguished himself by his efforts in promoting the cotton manufacture in America.

50. West-southwest from Boston, distant 45 miles, is the city of Worcester. Latitude 42° 16′ 17″, and longitude 71° 48′ 13″. The city is built partly in a valley environed by beautiful hills and partly on an elevation which rises toward the west. It is laid out regularly, with broad and handsome streets, is well-built, and contains a fine city hall, the county court-house, and numerous churches and schools. It is the seat of Holy Cross College, a Roman Catholic institution. The State Lunatic Asylum occupies an elevated side to the east of the city. The manufactures of Worcester are various and extensive, and include cotton and woolen goods, carpets, castings, fire-arms, railroad cars, hollow ware, wire, paper, leather goods, etc. The commercial facilities of the city have been largely increased by the opening of numerous railroads to the principal centers—to Boston and Albany east and west, to Providence and Norwich southerly, and to Fitchburg, Concord, etc., northerly. The Indian name of Worcester was Quinisigamond. On the east bank of the Connecticut River, and 54 miles west by the Western Railroad, is

51. Springfield, a rich and flourishing city. The site occupies the river bottom and the western edge of an elevated plain extending many miles eastward. It is one of the handsomest cities of America. The distinguishing manufactures of Springfield are machinery, locomotives, railroad cars, paper, etc. It is also the seat of one of the principal federal arsenals. Two bridges connect the city with West Springfield, and several ferries ply between the two places. During navigation a steamboat also plies to and from Hartford, connecting with the New York steamers. The Western Railroad, pointing east and west, to Albany and Boston, is here joined by the New Haven, Hartford and Springfield Railroad from the south and the Connecticut River Railroad from the north. A branch railroad also connects Springfield with Chicopee, an industrious manufacturing town on the north, and formerly a constituent portion of the town of Springfield.

52. In the southeast part of the State the principal towns are New Bedford, Taunton, and Fall River. New Bedford is a large and flourishing commercial city, on Acushnot, a small estuary of Buzzard's Bay, by railroad 55 miles south from Boston, and in latitude 41° 38′ 7″, and longitude 70° 55′ 49″. The city is built on a rise and has a beautiful appearance from the water; the streets are laid off regularly and adorned with shade trees, and the houses are frequently surrounded with ornamental grounds. The Town Hall is one of the handsomest civic structures in the State, and cost upward of $60,000, and the Custom House, which also

contains the post-office, is a substantial granite structure. There are upward of 20 churches, with numerous schools, etc., and a good city library. New Bedford is one of the wealthiest places in New England, and has a larger interest in the whale fisheries than any other town of the Union. This business has distinguished it for nearly 100 years, and may now be valued at five million dollars annually. It has also a considerable foreign trade. Its manufactures are such as depend on its peculiar industries, as oil and candle factories, roperies, coopers' shops, etc., and also ship-building establishments. New Bedford is connected with Fall River, Taunton, Providence, and Boston by railroad, and by steamboat with Holmes' Hole and Nantucket.

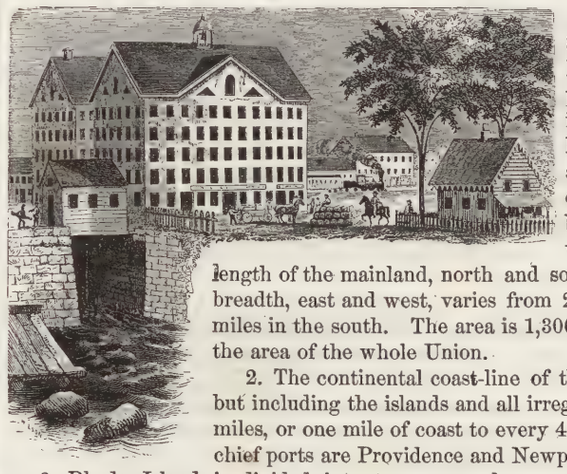
UNITED STATES ARSENAL, SPRINGFIELD.

53. Taunton, 20 miles north-northwest New Bedford, is a manufacturing town at the head of navigation on Taunton River. It contains a State lunatic asylum and several fine civic buildings, and about a dozen churches. Its manufactures are various and extensive, and comprise machinery and hardware of various descriptions, paper, leather, etc. One of the largest locomotive and steam-engine manufactories in the Union has its seat in this town, and there are two extensive print-works. The Taunton River furnishes a good water-power, and is navigated by small vessels employed in the coasting trade.

54. Fall River is situated at the entrance of Taunton River into Mount Hope Bay, the eastern arm of Narragansett Bay, and at the south terminus of the Old Colony and Fall River Railroad, 54 miles from Boston. It is a well-built town, chiefly of granite quarried in the vicinity, and contains a fine town-hall and 12 or 15 churches. The streets are adorned with shade trees. The river, from which the town derives its name, is about two miles in length, and has a descent of some 130 feet in the last half of its course, which furnishes immense water-power. The principal manufacture is that of cotton goods, but it has also extensive machine shops and other factories. The harbor is deep, capacious, and of easy access, and the port enjoys a considerable trade, foreign as well as coastwise, and is also largely engaged in the whale fisheries. It is connected with New York by a daily line of steamboats. On the 2d July, 1843, this city was visited by a disastrous fire, which consumed about 200 buildings. New Bedford and Taunton are the two capitals of Bristol County. Fairhaven, on the Acushnot, opposite New Bedford, and connected with that city by a bridge, is largely engaged in the whale fisheries It has a "fair haven," spacious, and about a mile long. A branch of the Cape Cod Railroad connects it with Boston.

55. Besides the cities and towns already noticed, Massachusetts contains a large number of others deserving mention, some on account of their historical and others of their industrial importance. These are noticed in the following table:

Names, etc.	For what remarkable.	Pop. 1850.	Pop. 1855.
Barnstable..*on Barnstable Bay*..	BARNSTABLE Co.—Coasting trade and fisheries	4,901	4,996
Provincetown.....*on Cape Cod*..	—Mackerel fishery—Wealth of its citizens	3,157	3,096
Sandwich ...*on Cape Cod Bay*..	—Terminus of Cape Cod Branch R.R., 80 miles S. E. Boston..	4,368	4,495
Adams .....*on Hoosac*..	BERKSHIRE Co.—Manufactures—Terminus of Pittsfield and North Adams R.R.—Saddle Mountain and natural bridge on Hudson's Brook	6,172	6,980
Gr. Barrington..*on Housatonic*..	—Edged tools, sheeting, India-rubber goods, etc.—Iron ore and quarries of variegated marble	3,264	3,449
Lee .....*on Housatonic*..	—Woolen, paper, and cotton mills	3,220	4,226
Pittsfield	—Railroad center—Medical school—Woolen and cotton goods, machinery, railroad cars, fire-arms, etc	5,872	5,501
Sheffield .....*on Housatonic*..	—Paper, marble, etc	2,769	2,624
Stockbridge .....*on Housatonic*..	—Woolen goods	1,941	2,058
Williamstown	—Williams College—Woolens, boots and shoes, carriages	2,626	2,529
Attleboro'.....*on Mill River*..	BRISTOL Co.—Printed calicoes, metal buttons, straw hats, clocks, etc.	4,157	5,451
Dartmouth...*on Buzzard's Bay*..	—Whale fishery	3,868	3,658
Fairhaven ...*on Buzzard's Bay*..	—Ship-building and whale fishery	4,304	4,693
Pawtucket.....*on Pawtucket*..	—Four miles N. E. Providence, and partly in the State of Rhode Island—Machinery, thread, cotton goods, etc.—Coasting trade—First cloth manufactory established 1790	3,753	4,132
Seekonk.....*on Seekonk*..	—Manufactures	2,243	2,304
Edgartown ..*on Martha's Vine*..	DUKE'S Co.—Commerce and fisheries—Small but safe harbor	1,990	1,898
Amesbury .....*on Merrimac*..	ESSEX Co.—Manufactures—Terminus of Branch R.R.	3,143	3,585
Andover .....*on Merrimac*..	—Flannels, linens, etc.—Theol. Seminary—Phillips' Academy	6,945	4,910
Beverly .....*on Ann Arbor*..	—Opposite Salem—Commerce and fisheries—Carriages, Britannia ware, cotton and woolen goods, etc	5,876	5,944
Danvers and South Danvers	—Leather and boots and shoes	8,109	9,348
Gloucester.....*on Cape Ann*..	—Commerce and fisheries—Settled 1624	7,786	8,935
Haverhill.....*on Merrimac*..	—At head of navigation, opposite Bradford, ...—Boots and shoes, bricks, etc	5,877	7,940
Marblehead	—Coasting trade and fisheries—Boots and shoes	6,167	6,933
Salisbury.....*on Merrimac*..	—Cotton and woolen goods	3,100	3,185
Greenfield .....*on Connecticut*..	FRANKLIN Co.—Cutlery and carpenters' tools	2,580	2,945
Chicopee .....*on Chicopee*..	HAMPDEN Co.—Cotton and woolen goods, paper, machinery	8,291	7,576
Holyoke .....*on Connecticut*..	—Opposite South Hadley—Lawns, silks, and cotton goods; machinery, etc.—Hadley Falls.	3,245	4,639
Monson	—State Almshouse—Cotton and woolen goods	2,831	2,942
Palmer	—Cotton and woolen goods, boots and shoes, castings, etc	3,974	4,012
Westfield .....*on Westfield*..	—State Normal School—Westfield Academy, incorporated 1793	4,181	4,575
Amherst	HAMPSHIRE Co.—College—Machinery, edge tools, cotton goods	3,057	2,937
Belchertown	—Carriages, sash and blinds, etc	2,680	2,698
Northampton ...*on Connecticut*..	—Lunatic Asylum—Water-cure—Boots and shoes, cotton, wool, and silk goods, leather, iron, paper, cabinet ware, etc.	5,278	5,819
South Hadley ...*on Connecticut*..	—Hadley Falls—Mt. Holyoke—Ginghams, satinets, etc	2,495	2,051
Ware .....*on Ware*..	—Cotton, woolen, straw goods—Tin, copper ware, etc	3,735	3,498
Williamsburg	HAMPSHIRE Co.—Iron castings, machinery, edge tools, carriages..	1,537	1,831
Brighton	MIDDLESEX Co.—Cattle market—Four miles W. Boston	2,356	2,895
Concord.....*on Concord River*..	—Flannels, pencils, boots and shoes, carriages, etc.—Battle 19th April, 1775	2,206	2,250
Framingham	—Cochituate Lake—Blankets, coatings—State Normal School.	4,252	4,676
Groton .....*on Nashua*..	—Railroad center—Lawrence Academy	2,515	2,745
Holliston	—Boots and shoes, combs, cotton goods, straw hats, etc.	2,428	2,894
Hopkinton	—Boots and shoes—Mineral spring	2,801	3,934
Lexington..11 *m. N. W. Boston*..	—Battle 19th April, 1775—Monument	1,894	2,549
Malden.....*on the Malden*..	—Five miles N. Boston—Tin ware, India-rubber goods, lasts and trees, leather, coach lace and tassels, iron pipes, etc., dyeing and staining	3,520	4,591
Marlboro'	—Boots and shoes	2,941	4,288
Medford .....*on Mystic*..	—Tuft's College—Ship-building, etc	3,749	4,615
Natick	—Boots and shoes	2,744	4,188
Newton .....*on Charles*..	—Baptist Theological Institute—Falls—Iron works, machinery, paper, cotton, etc	5,258	6,768
Pepperell.....*on Nashua*..	—Lunatic Asylum	1,754	1,764
Somerville.....*on Mystic*..	—Copper-tubing, glass, dyeing, etc.—McLean Asy.—Tuft's Col.	3,540	5,806
Tewkesbury.....*on Merrimac*..	—State Almshouse	1,048	1,722
Waltham .....*on Charles*..	—Cotton goods, boots and shoes, etc.—Prospect Hill	4,464	6,049
Watertown.....*on Charles*..	—United States Arsenal—Various manufactures	2,837	3,578
Woburn ...*on Middlesex Canal*..	—Boots and shoes, leather, carriages etc	3,956	5,451
Nantucket ...*on Nantucket Isl*..	NANTUCKET Co.—Whale fishery—Boots, shoes, oil, candles, etc....	8,452	8,064
Braintree	NORFOLK Co.—Boots and shoes, machinery, woolens, etc	2,969	3,472
Brookline.....*on Charles*..	—A suburb of Boston remarkable for its beauty	2,516	3,740
Dorchester .....*on Boston Bay*..	—Paper, cotton goods, chocolate, tin and iron wares	7,969	8,358
Medway	—Thread, prints, osnaburgs, cotton flannel, boots, shoes, etc...	2,778	3,230
Quincy .....*on Boston Harbor*..	—Granite quarries—Quincy, Hancock, and the Adams, father and son, born here—First R.R. in the U. S. opened 1828 ..	5,017	5,921
Randolph	—Boots and shoes	4,741	5,538
Stoughton ...	—Boots and shoes, cotton goods, thread, etc	3,494	4,369
Weymouth...*on Boston Harbor*..	—Boots and shoes—Coasting trade	5,369	6,530
Wrentham.....*on Charles*..	—Straw bonnets and cotton goods	3,037	3,245
Abington	PLYMOUTH Co.—Boots and shoes, nails, etc	5,269	6,936
Bridgewater	—Boots and shoes—State Almshouse—State Normal School	2,79	3,363
Hingham ..*on Massachusetts B*...	—Hats, castings, plumes—Fisheries, etc	3,980	4,256
Middleboro'.....*on Taunton*..	—Prints, sheetings, castings, carriages, boots, shoes, etc	5,336	4,234
North Bridgewater	—Boots and shoes	3,940	5,208
Plymouth....*on Plymouth Bay*..	—Pilgrims landed, 22d Dec., 1620—Cotton and iron	6,124	6,486
Wareham....*on Buzzard's Bay*..	—Iron works	3,186	3,246
Chelsea	SUFFOLK Co.—U. S. Marine Hospital—Suburb of Boston	6,701	10,151
North Chelsea	—Suburb of Boston	935	793
Winthrop	—Suburb of Boston; taken from Chelsea 1852	—	866
Blackstone.....*on Blackstone*..	WORCESTER Co.—Printed muslins	4,391	5,353
Fitchburg	—Railroad center—Paper, machinery, wood ware, etc	5,120	6,486
Grafton .....*on Blackstone*..	—Boots and shoes, leather, cotton goods, etc	3,904	4,409
Lancaster .....*on West Branch*..	—State Industrial School for girls—Ginghams, etc	1,688	1,725
Milford	—Various manufactures	4,819	7,489
Milbury .....*on Blackstone*..	—Woolen and cotton goods, carpets, etc	3,031	3,286
Southbridge....*on Quinnebaug*..	—Mousselines de la ne	2,824	3,429
Uxbridge	—Woolen goods, etc	2,457	3,068
Westboro'	—Boots and shoes, sleighs, etc.—State Reform School	2,371	3,014
West Boylston	—Carriages, etc	1,749	2,310



—most of the above-named towns are connected by railroad with Boston.

BATTLE MONUMENTS.

56. The territory of Massachusetts was settled by two separate colonies, viz., Plymouth colony, which landed at Plymouth, December 22d, 1620, and the colony of Massachusetts Bay, which founded Salem in 1626. These colonies continued separate, and elected each their own governor annually until 1685–6, when they were deprived of their charters, and were placed under the government of Joseph Dudley, and afterward of Sir Edmond Andros. In 1692 they were united under a new charter into one colony, called Massachusetts, of which the governors were appointed by the crown of Great Britain until its power was thrown off in 1774. In the wars between France and England, the troops raised in Massachusetts for the campaign in Canada bore a most valiant part, and were the chief instruments of the successful issue of the conflict. The great expenses of this war led to the imposition of internal taxes on the colonies, and Massachusetts was the first to strenuously oppose these. Since the peace of 1783, the rank held by Massachusetts among the States in regard to general enterprise, in manufactures, commerce, internal improvements, aggregate wealth, support of schools, etc., has in proportion to its population been higher than any other in the Confederacy.

STATE OF RHODE ISLAND.

1. RHODE ISLAND, the smallest State of the Union, and, next to Massachusetts, the most densely populated, is situated between latitudes 41° 6′ and 42° 3′ north, and longitudes 71° 8′ and 71° 54′ west; and is bounded on the north and east by Massachusetts, on the south by the Atlantic Ocean, and on the west by Connecticut. The extreme length of the mainland, north and south, is less than 50 miles, and its breadth, east and west, varies from 22 miles in the north to 33 or 37 miles in the south. The area is 1,306 square miles, or 0.04 per cent of the area of the whole Union.

2. The continental coast-line of the State measures only 45 miles; but including the islands and all irregularities it has an extension of 320 miles, or one mile of coast to every 4.08 square miles of surface. The chief ports are Providence and Newport.

3. Rhode Island is divided into two unequal proportions by the great bay Narragansett, which sets up in a north direction from the Atlantic Ocean. This fine sheet of water extends more than 30 miles inland, and is about 15 miles wide at its southern part; but a considerable portion of this space is occupied by islands. It communicates with the ocean between Point Judith (latitude 41° 21′ 35″, and longitude 71° 29′ 18″) on the west,

and Seconnet Point (latitude 41° 27′ 3″, and longitude 71° 11′ 18″) on the east. The northeastern arm of the bay is called Mount Hope Bay, which receives the Taunton River from Massachusetts; the northwestern arm is called Greenwich Bay; and the northern arm is called Providence Bay, the last of which is the recipient of Providence River. It affords great advantages to ship navigation, having many excellent harbors both on the mainland and islands, and being accessible at all seasons. Newport Harbor, in the channel between Canonicut and Rhode islands, is one of the finest of the world; the entrance is protected by Fort Wolcott, on Goat's Island, and Fort Adams, on Rhode Island—the latter a large stone castle of great strength. Providence Harbor, at the confluence of Providence River and the bay, is also an excellent shipping port, and has lately been improved by the removal of obstructions.

4. Rhode Island, lying in Narragansett Bay, gives name to the State. It is 15 miles long, and on the average three and a half miles wide. Its climate is delightful, and the soil very fertile. Travelers have called it the "Eden of America," and Newport, its principal town, has long been famous as the resort of invalids and the fashionable world in the summer season. Canonicut is a beautiful island to the west of Rhode Island. These islands, in connection with the mainland, form three several water entrances from the ocean. Canonicut is about seven miles long and one mile wide. Prudence Island lies to the northeast of Canonicut, and is of somewhat lesser extent. Projecting from the mainland southward is an extensive peninsula, which divides the northern section of the bay and forms the two arms known as Providence and Mount Hope bays before noticed.

5. About ten miles southwest of Point Judith is Block Island, which is about seven miles long and four miles wide, and is almost severed into two parts by a large salt pond. The islanders derive their support chiefly from fishing, but they have also large numbers of cattle and sheep, and produce cheese and butter of the finest quality. Block Island forms the town of New Shoreham, in Newport County, and in 1850 contained 1,262 inhabitants The population of the islands in Narragansett Bay at the same period was 12,584.

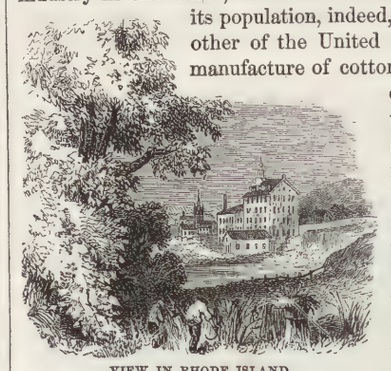
6. The surface of the mainland is generally hilly and broken; but nowhere does it present any elevation deserving of the name of mountain. The highest land in the State, Mount Hope, has only 300 feet elevation above the sea-level. In the neighborhood of Narragansett Bay, and on the islands within the same, the land is more level, and at most exhibits but slight undulations.

7. The rivers of this State are little more than mill-streams, with courses of not more than 50 or 60 miles in length, and discharging an inconsiderable amount of water; but as they descend from 200 to 450 feet, and are steady in their supply of water, they furnish valuable moving power, which is extensively applied to manufacturing purposes. The Pawtuxet, the principal river, rises in Massachusetts, where it has the name of Blackstone River, and running southeast into this State, falls into Providence River. There are falls of about 50 feet descent four miles from its mouth—below the falls it bears the name of the Seekonk River, and about equidistant between these and its confluence with the bay it receives Ten Mile River from Massachusetts. Providence River is formed by the Wanasquiatucket and the Mohasuck, two small streams which unite a short distance above the city of the same name. It falls into the northern arm of Narragansett Bay, and is navigable to Providence for ships of 1,000 tons burden. Pawtuxet River rises by several branches in the northwest part of the State, and flowing in an easterly direction, enters Providence River five miles below the city. Pawcatuck River, formed by Wood and Charles rivers, waters the southwestern section of the State, and falls into Stonington Harbor; and in the latter part of its course it is the boundary between this State and the State of Connecticut.

8. The same geological formation which distinguishes southeastern Massachusetts extends into the northern parts of Rhode Island. The southern section of the State is chiefly of a later era. The mineral productions are of comparatively little importance. Iron ore, however, is found in several places; and anthracite occurs, but although it has been pronounced to be of good quality, little has been done to bring it into use. It is found chiefly in the same graywacke formation with the Massachusetts coal. Limestone abounds in the northeastern section, and there are some excellent quarries of marble. Serpentine is also abundant; and there are in various places good quarries of freestone. Salt is manufactured along the sea-coast.

9. The climate, influenced by the vapors from the Atlantic, is remarkably mild, though changeable, and in its general characteristics is said to assimilate that of Great Britain. The seasons are more uniform than in the more northern parts of New England—the winters are sensibly less severe, and the heats of summer more temperate. Spring commences in March, and the summer reigns from June to September. The latter month and also October have delightful weather. With November the winter sets in, and continues to the middle or end of March. The air is at all times pure, and the longevity of the inhabitants bears witness of its salubrious qualities.

10. On the continental portions of the State the soil is generally a gravelly loam, which is tolerably fertile, but of difficult cultivation. The soils of the islands are slaty, yet they form the most productive and valuable lands of the State. There is very little alluvial land. Pine plains are found in several low regions, but there are no extensive forests. Oak, walnut, and chestnut are the prevailing growths, with some cedar. Fruits and culinary vegetables are produced in great perfection and in abundance. Grain is grown in considerable quantities in reference to the area of the State; but on the whole the lands are better adapted for grazing than for ordinary or cereal agriculture.



11. Rhode Island, in 1850, contained 147,545 inhabitants or 112.97 to the square mile, or 0.64 per cent. of the population of the Union. This was distributed as follows:

Counties.	Population.	County Seats.	Counties.	Population.	County Seats.	Counties.	Population.	County Seats.
Bristol	8,514	Bristol.	Newport	20,007	Newport.	Providence	87,526	PROVIDENCE.
Kent	15,068	E. Greenwich				Washington	16,430	Kingston.

—and consisted of 143,875 (97.51 per cent.) white persons—70,340 males and 73,535 females, and 3,670 free colored—1,738 males and 1,932 females; comprised in 28,216 families, occupying 22,379 dwellings. Of the total, 124,299 (84.25 per cent.) were Americans, of which number 102,641 were natives of Rhode Island, and 23,111 (15.66 per cent.) were foreign born, the remainder (135) being of unascertained origin. In other States there were 43,300 natives of Rhode Island. In 1790 Rhode Island contained 69,110; in 1800, 69,122; in 1810, 77,031; in 1820, 83,059; in 1830, 97,199; in 1840, 108,830, and in 1850 (as above) 147,545. The population in 1855 was estimated at 166,927.

12. The occupations of 43,471 free males over 15 years of age were ascertained by the census of 1850. Of these, 21,004 were engaged in commerce, trade, manufactures, mechanic arts, and mining; 8,482 in agriculture; 9,296 in labor not agricultural; 2,033 in sea and river navigation; 556 in law, medicine, and divinity; 881 in other pursuits requiring education; 176 in government civil service; 774 in domestic service, and 269 in pursuits not classified.

13. From the preceding results, it is evident that agriculture is but a secondary branch of industry in this State, and that manufactures and trade are pre-eminent. In proportion to its population, indeed, Rhode Island ranks higher in manufactures than any other of the United States, Massachusetts perhaps excepted; and in the manufacture of cotton goods it has no rival, more than a full half of the capital invested in manufactures being employed in this branch. Besides its cotton manufacture, the State has also extensive manufactures of woolen goods, machinery, and jewelry, and many other profitable branches. From the earliest times it has been largely engaged in commerce, and much of its present prosperity is owing to its eminent success in foreign trade. Its domestic trade is also extensive, its requirements from the interior agricultural States being large; and for the successful prosecution thereof it is amply supplied with the means in its excellent harbors and its connections by railroad, steamboat, and telegraph.

VIEW IN RHODE ISLAND.

14. In 1850 Rhode Island contained 5,385 farms, in which were included 356,487 acres of improved and 197,451 unimproved lands, or a total of 553,938 acres. The area of the State is 835,840 acres, and hence a third of the surface is either waste or appropriated to other than agricultural purposes. The valuation of the farms amounted to $17,070,802, and of farming implements and machinery to $497,201.

15. The principal crops are Indian corn, oats, and potatoes. Wheat and buckwheat scarcely deserve any calculation, and the other cereals, rye and barley, are comparatively small crops. The following exhibits the totals (bushels) of each, in 1840 and 1850 comparatively.

	wheat,	rye,	oats,	Indian corn,	barley,	buckwheat,
1840	3,098	34,521	171,517	450,498	66,490	2,979
1850	49	26,409	215,232	539,201	18,875	1,245

—the potato crop in 1840 was 911,973, and in 1850 but 651,029 bushels. The hay crop of 1850 amounted to 74,418 tons.

16. The amount of livestock in the State at the two periods, 1840 and 1850, was comparatively as follows:

	horses, etc.	neat cattle,	sheep,	swine,
1840	8,024	36,891	90,146	30,659
1850	6,169	36,262	44,296	19,509

—the value of stock in 1850 having been $1,532,637, and the value of animals slaughtered during the year $667,486. The products of animals, in 1849–50, consisted of—cheese 316,508, butter 995,670, and wool 129,692 pounds. In 1840 the wool crop amounted to 183,830 pounds or about 32½ ounces per fleece; in 1850 the average was nearly 47 ounces.

17. The total value of the products of agriculture, in 1840, was $1,951,141, and in 1850 $2,168,332.

18. In 1850 this State contained 853 manufacturing establishments, in which was invested a capital of $12,923,176, and which gave employment to 12,837 males and 8,044 females. The cost of raw material consumed in the year was $13,183,889, and the cost of labor $5,008,656. The value of goods produced was $22,093,258. In 1810 the manufactured products of Rhode Island were valued at $3,017,762; in 1820 at $1,617,221 (returns imperfect); in 1830 at $3,585,105; in 1840 at $13,096,805, and in 1850 (as above) at $22,093,258. The value of goods made in families in 1840 was $51,180, and in 1850 $26,495.

19. The fisheries of Rhode Island are comparatively extensive, and have their seats chiefly at Bristol and Newport. In 1850 the shipping engaged in the whale fishery amounted to 5,829 tons, and in 1855 to 7,592 tons.

20. The direct foreign commerce of Rhode Island is now comparatively small; formerly it had a flourishing trade with the East Indies, and it has still an extensive foreign connection through Boston. Its exports direct to foreign countries, in 1849–50, amounted to $216,265, and in 1854–55 to $336,023, and the imports for the same years amounted to $258,303 and $536,387. The shipping cleared in the years named was 18,475 and 23,684 tons, and the shipping entered, 19,922 and 28,798 tons. The total shipping owned in the State amounted to 40,489 and 51,039 tons; and the shipping built amounted to 3,587 and 7,861 tons in the years respectively.

21. Rhode Island is well supplied with railroads which connect its principal towns, and afford outlets for its trade. Its two great lines, diverging from Providence, connect it with Boston and New York, and a third line with Worcester and the north. There is also a short line connecting Providence with Bristol, and which will be continued to Newport. The total length of all the railroads within the State is 104 miles, which gives about one mile to every 13 square miles of surface or to every 1,650 inhabitants. Steamboats run between the principal ports, and there is a daily line of steamers between Newport and New York, and another between Stonington and that metropolis, in connection with the New York, Providence and Boston Railroad.

22. In 1850 there were in this State 63 banks, and in 1855, 92 banks; and in the mean time their capital was increased from $11,645,492 to $18,682,802. Their liabilities, at the two periods, consisted of—circulation, $2,553,865 and $5,404,104; deposits, $1,488,586 and $2,914,596; and others, $784,333 and $2,550,088; and their assets of—loans and discounts, $15,492,547 and $26,385,458; specie, $297,661 and $385,767; and other, $1,427,507 and $2,924,062. There are 15 savings' institutions, in which 23,229 depositors had, in 1855, credits to the amount of $4,834,312.

23. Until the year 1842 the form of government was that ordained by the royal charter of 1663, which was originally one of the most liberal ever granted to an American colony. In that year a new constitution was framed and ratified by the people. Every male citizen of the United States resident in the State for the last past year and in the town or city for six months preceding an election, and owning real estate worth $134, or of the clear yearly

value of $7, may vote for all civil officers. No Narragansett Indian can vote. In all elections a majority of votes is necessary to a choice. Every elector is qualified to hold every office for which he may be qualified to vote.

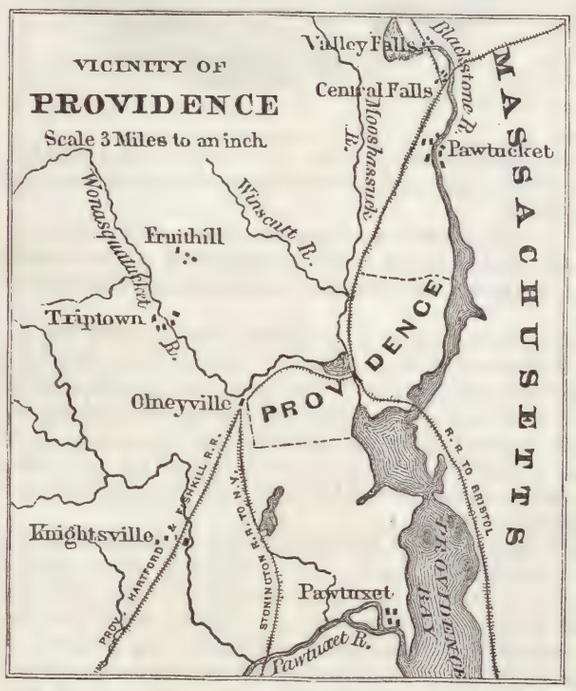
24. The legislative power is vested in a general assembly consisting of a senate and house of representatives, both of which are renewed annually. Each town or city sends one member to the senate (now 32 in number), and the lieutenant-governor is also a member of that body, and the governor its president. The house consists of 72 members, elected on the basis of population; each town and city, however, is entitled to at least one member. The general assembly holds annually two sessions; one at Newport, on the first Tuesday of May, and the other on the last Monday of October—at South Kingston every two years, and at Bristol and East Greenwich alternately the intermediate years, and this last session adjourns every year to Providence.

25. The governor and lieutenant-governor are also elected annually, as are the several administrative officers. The secretary of state is by virtue of his office secretary of the senate.

26. The judiciary consists of one supreme court and such inferior courts as the legislature may establish. Chancery powers may be conferred on the supreme court, the judges of which are elected by the legislature in grand committee.

27. The institutions which are supported either in whole or in part by the State are the Butler Hospital for the Insane, the Reform School, and the State Prison, all at Providence. The deaf and dumb are sent to the American Asylum, at Hartford, Conn., and the blind to the Perkins Institution, at South Boston.

28. The total resources of the State treasury, for the years 1849–50 and 1854–55, amounted to $161,649 and $174,706, and the expenditures, for the same years, to $161,414 and $153,541. The income is chiefly derived from tax on banking and insurance companies, interest on public deposits, a small direct tax (in 1855, $18,455), etc. More than a third of the expenditures is applied to schools. The State has no public debt. In 1850 the valuation of taxable property was $77,758,974, and in 1855, $111,175,174.



29. The educational condition of the State in 1850 is described in the census of that year as follows:

Classes of Schools.	Number.	Teachers.	Scholars.	Annual Income.
Primary and public schools	416	518	23,130	$100.451
Academies and private schools	46	75	1,601	32,748
Collegiate institutions	1	11	150	3,500

—making a total of 463 schools, 604 teachers, and 24,881 scholars, and an income of $136,729. The only college in the State is Brown University, at Providence, founded in 1764, and which, in 1855, had 225 students and a library of 34,000 volumes. In 1850 the number of persons over 20 years of age unable to read and write was 3,607, of which 3,340 were white and 267 colored persons, and 1,248 were natives and 2,359 foreigners.

30. The churches of Rhode Island, in 1850, numbered 228, with accommodation for 101,210 persons, and owning estate valued at $1,254,400. The most numerous denomination is the Baptist, which includes a third of the whole population, and the next in numerical order are the Episcopalian, Congregational, and Methodist denominations, to which another third, in about equal proportions, belongs. The Roman Catholics and Friends number about one each in every 20 inhabitants. Other denominations are numerically insignificant.

31. Providence, one of the capitals of the State, is situate at the head of navigation of the northwestern arm of Narragansett Bay, or Providence River, 34 miles from the ocean, in latitude 41° 49′ 26″ north, and longitude 71° 23′ 59″ west. The city is divided by the river, and the parts connected by bridges. The business of the city is alike commercial and manufacturing, and both branches of industry are pursued on a considerable scale, and many vessels are built in the port. Several whale-ships fit out at this port annually. The manufactures consist principally of cotton and woolen goods, machinery, hardware, etc., and in these about six or seven million dollars are employed. The coasting trade is large, and the city has a respectable inland commerce. Many public buildings are found in Providence, the principal of which are the State House, Brown University, and the Arcade, the latter a fine building used for mercantile purposes; and among its eleemosynary institutions the Butler Insane Hospital, Dexter's Asylum for the Poor, etc., are conspicuous. The State Prison is also located here. The churches count between 30 and 40 in all. The city has six wards, and is governed by a mayor, aldermen, and common council, elected annually. Providence was founded by Roger Williams in 1635. Next to Boston it is the most populous and wealthy city of New England. Population (in 1850) 41,513, and (in 1855) 47,785.

32. Newport, the other principal seat of government, is situate on Rhode Island, about 5 miles from the ocean, in latitude 41° 29′ 12″ north, and longitude 71° 18′ 28″ west. Its harbor is strongly fortified. It has considerable commerce, and is engaged in the whaling business to a small extent. The public buildings are the State House, the Redwood Atheneum, fifteen or sixteen churches, etc. This place, however, is more noted for its natural attractiveness than industrial peculiarities. Population 9,563.

33. The other towns are—in Bristol County, Barrington 795, Bristol 4,616, and Warren 3,103 inhabitants; in Kent County, Coventry 3,620, East Greenwich 2,358, West Greenwich 1,350, and Warwick 770; in Newport County, Jamestown 358, Little Compton 1,462, Middletown 830, Newport (as above), New Shoreham 1,262, Portsmouth 1,833, and Tiverton 4,699; in Providence County, Burrellville 3,538, Cranston 4,311, Cumberland 6,661, Foster 1,932, Gloucester 2,872, Johnston 2,937, North Providence 7,680, Scituate 4,582, and Smithfield 1,500; and in Washington County, Charleston 994, Exeter 1,634, Hopkinton 2,477, North Kingston 2,971, Richmond 1,784, South Kingston 3,807, and Westerly 2,763. More or less manufacturing is done in all these towns, and most of them have excellent railroad facilities.

NEWPORT, FROM BRENTON'S ISLAND.

34. Roger Williams was the first white settler within the present limits of Rhode Island. Expelled from Massachusetts for maintaining opinions for which the minds of men were not yet prepared, he sought refuge in the wilderness, and after habiting with the Indians for many weeks he descended the Pawtuxet River, and turning round Fox Point, slaked his thirst at a spring on the bank, and afterward erected his habitation near by. In grateful acknowledgment of "God's merciful providence to him in his distress" he called the place Providence.

35. In 1638, two years after the expulsion of Williams, William Coddington and 17 others, being persecuted for religious heresies (?) in Massachusetts, followed him to Providence. By his advice they purchased of the Indians the island of Aquetnec, now called Rhode Island, and removed thither. Coddington was chosen their chief magistrate. Pursuing the same policy which distinguished the settlers at Providence, numerous emigrants from the neighboring settlements came among them.

36. In 1643 Williams went to England, and in the following year obtained a patent for the united government of Providence, Newport, and Portsmouth, which was established in 1647, and continued in force until 1663, when Charles II. granted a new charter incorporating the colony of "Rhode Island and Providence Plantations."

37. Thenceforth the colony enjoyed prosperous tranquillity (excepting the disturbance of Sir Edmund Andros in 1686) until the Revolutionary War. Rhode Island was not represented in the convention which framed the constitution of the United States in 1787, and did not ratify the same until 1790. The charter granted by Charles II. in 1663 was the only constitution of the State until November, 1842, at which time the present constitution was adopted; but this was not accomplished until after much popular excitement and nearly a civil war.

STATE OF CONNECTICUT.

1. Connecticut is situated between latitudes 41° and 42° 2′ north, and longitudes 71° 46′ and 73° 46′ west; and is bounded on the north by Massachusetts, on the east by Rhode Island, on the south by Long Island Sound, and on the west by New York. The length of this State, east and west, is about 90 miles, and the breadth thereof from 60 to 70 miles. The area is stated at 4,674 square miles, or about 0.15 per cent. of the whole United States territory.

2. The shore-line of Connecticut stretches along Long Island Sound, and has a length of 104 miles, or including islands and all irregularities a length of 262 miles, or one mile of coast to every 17.84 square miles.

3. Long Island Sound is an extensive gulf or channel, 140 miles long and 24 miles wide in its broadest part. This sound is the common recipient of all the rivers of Connecticut. It is somewhat narrow at its Atlantic or eastern entrance, expands in the middle, but toward the west it again gradually contracts till it joins the harbor of New York by a narrow and crooked gut called the East River. It admits of a free navigation for the largest ships through its whole length, the dangerous rocks at Hell Gate, where the current becomes most contracted, having been removed. The northern shore of the Sound is deeply penetrated by numerous bays and creeks, affording excellent harbors, as New London, New Haven, Stonington, and Bridgeport, and these constitute so many starting points of travel and internal

trade between New York and Boston with the whole of New England and the northeast British provinces.

4. The interior of the country is greatly diversified by hills and valleys; and much of the surface is rugged, being traversed by several ranges of mountains, or rather hills. These are generally of a moderate size, and occur in quick succession, presenting a beautiful and constantly varying scenery.

5. All the principal ranges are continuations of the mountains of the States lying northward. The Housatonic range enters the State in the northwest, and extends in a southerly direction along the Housatonic River to the coast. This is rather a succession of groups and eminences, than a continuous range. The Green Mountain range, coming from Vermont and Massachusetts, passes through the State, and terminates at West Rock, a bluff 400 feet high, two miles northwest of New Haven. Between this and the Connecticut River is the Mount Tom range, which, coming from Massachusetts, also traverses this State and terminates at East Rock, 370 feet high, a little to the northeast of New Haven. The Blue Hills of Southington, a part of this range, have an elevation of 1,000 feet, and are said to be the highest land within the State. On the east side of the Connecticut is a fourth range, which crosses the river at Chatham, and terminates at East Haven.

6. The principal valleys of the State are the Housatonic in the west, the Connecticut in the center, and the Quinnebaug in the east. The valley of the Connecticut varies in breadth from 10 to 16 miles, and extends northward from Middletown, having in this State a length of about 30 miles. This is a rich agricultural district. The valleys of the Quinnebaug and Housatonic have also fertile soils, and produce fine crops. The scenery of these valleys, especially of the valley of the Connecticut, is magnificent, and the landscape varied and romantic. Many of the neighboring hills, sometimes in close proximity to the rivers, are cultivated like gardens to the very summit, while others are bald, or only support a few stunted trees and shrubs. The Farmington valley extends from New Haven north, through the State between the Green Mountains and the Mount Tom range, and is from three to five miles wide. In the hilly parts of the State the soils are of moderate fertility, and afford excellent pasturage.

7. Few of the streams are of much use to navigation, except in their lower courses. The principal is the Connecticut, which coming from the north and pursuing a pretty direct southerly course to Middletown, then suddenly turns to the southeast, and so flows to the Sound. There is a bar at its mouth, but vessels drawing ten feet of water can ascend to Middletown, and those drawing not more than eight feet to Hartford, 50 miles from the mouth of the river. The navigation of the upper course has been improved by locks and canals, which secure boat navigation to Barnet Falls. The Tunxis or Farmington is the principal tributary of the Connecticut in this State. The Housatonic rises in the west part of Massachusetts and enters this State near the northwest corner, after which it runs in a southerly or southeasterly course to the Sound; the first part of its course is broken by falls, and its entrance is barred against large vessels. It has, however, a sloop navigation for a distance of twelve miles. The Thames, formed by the junction of the Quinnebaug, the Shetucket, and the Yantic at Norwich, empties itself into the Sound at New London, after a navigable course of about fourteen miles. All these streams, and numerous smaller ones, are applicable for motive-power, and highly favorable to the fertility of the land through which they pass. Scarcely is there a single square mile in all the country but has a sparkling, never-failing rill to refresh the soil and make it productive.

8. Connecticut produces many of the economic minerals. Iron ore of excellent quality, and in great abundance, is found in various parts. The copper mines of Bristol and Plymouth are now profitably worked, and the ores exist from Bristol in a southerly direction toward Hampden, for a distance of more than thirty miles. The Plymouth mines are equally rich. The vein here runs from east to west, with a vertical dip, cutting the geological formation of the mountain at right angles. Copper also occurs at Granby, where it is found at the junction of the greenstone and new red sandstone formations. Fine marbles of different characters are abundant, and freestone, extensive quarries of which exist in the mountain regions, furnishes an excellent building material. At Portland are the celebrated quarries of Portland stone. Zinc, cobalt, and manganese also occur; and plumbago and other metals of minor importance have been discovered at various places. The mineral waters of Stafford have long been celebrated for their medicinal properties.

9. The soils of Connecticut are generally good, and suitable in parts to cereal agriculture, but as a whole they are best adapted to grass-growing. The valley of the Connecticut has a strong and fertile argillaceous loam, varying in different sections from a hard stiff clay to a light sandy loam, according to the prevalence of argillaceous or silicious formations. In the eastern part of the State the soil is strong, warm, fertile, and excellent for the grasses. The northwestern part is in some places comparatively cold and sterile. In the west, however, are many fertile districts. The climate and vegetation correspond nearly with those of Massachusetts, the climate differing only in being a little more temperate, and the season of growth in being earlier and somewhat more prolonged. The peach perfects its fruit in the southern portion of the State.

10. In 1850 the population of Connecticut numbered 370,792 souls, or 79.33 to every square mile, or 1.6 per cent. of the population of the United States. It was distributed as follows:

Counties.	Population.	County Seats.	Counties.	Population.	County Seats.	Counties.	Population.	County Seats.
Fairfield	50,775	Fairfield. Danbury.	Middlesex	27,216	Middletown. Haddam.	New London	51,821	N. London. Norwich.
Hartford	69,967	Hartford.	New Haven	65,588	New Haven.	Tolland	20,091	Tolland.
Litchfield	45,253	Litchfield.				Windsor	31,081	Brooklyn.

—and consisted of 73,448 families inhabiting 64,013 dwellings. Of the total population 363,099 (97.93 per cent.) were whites—179,884 males and 183,215 females, and 7,693 free colored—3,820 males and 3,873 females; and 332,525 (89.69 per cent.) were Americans, of whom 292,653 were natives of this State, 37,473 (10.11 per cent.) were foreign born, and 794 were of unascertained origin. The number of natives of Connecticut in other States of the Union was 154,891. In 1790 Connecticut contained 238,141 inhabitants; in 1800, 251,002; in 1810, 262,042; in 1820, 275,202; in 1830, 297,675; in 1840, 309,978, and in 1850 (as above) 370,792. In 1855 the population was estimated at 401,292.

11. The census of 1850 returned 97,010 free male persons over the age of 15 years as engaged in industrial pursuits. Of these 38,653 were engaged in commerce, trade, manufactures, mechanic arts, and mining; 31,881 in agriculture; 16,813 in labor not agricultural; 4,801 in sea and river navigation; 1,614 in law, medicine, and divinity; 2,162 in other pursuits requiring education; 189 in government civil service; 220 in domestic service, and 677 in pursuits not classified.

12. Connecticut is distinguished for the diversity of its industrial pursuits, and is equally an agricultural and manufacturing and commercial State, and is amply provided with the means of internal communication in its fine system of railroads, steam navigation routes, and lines of telegraph. It is one of those States in which no one occupation can claim pre-eminence, and in which industry is mainly carried on by small individual capitals. In the fisheries it ranks next to Massachusetts.

13. The State contains 2,991,360 acres of land. In 1850, 2,383,879 acres, or about four fifths of the whole surface, were laid off into 22,445 farms, and of this 1,768,178 acres or three fifths were under cultivation or improved lands. The cash valuation of farms was $72,726,422, and the value of farming implements and machinery was $1,892,541.

14. The principal crops are Indian corn, oats, rye, and potatoes. Buckwheat is also a good crop, but those of wheat and barley are insignificant. The total cereal crop in 1850 amounted to (Indian corn 1,935,043, oats 1,258,738, rye 600,893, buckwheat 229,297, wheat 41,762, and barley 19,099) 4,084,832 bushels, and the potato crop to 2,689,805 bushels. In 1840 the first was 4,114,938 and the latter 3,414,238 bushels. Tobacco is largely grown in the valley of the Connecticut, and in 1850 the crop amounted to 1,267,624 pounds; and the hay crop amounted to 516,131 tons.

15. The livestock in the State in 1840 and 1850 consisted of—

1850	horses, etc., 26,928	neat cattle,	212,675	sheep,	174,181	swine,	76,472
1840	" 34,650	"	238,650	"	403,462	"	131,961

—a statement showing a vast decrease in the intervening ten years. The stock of 1850 was valued at $7,467,490, and the value of animals slaughtered in 1849–50 was $2,202,266. The products of animals in the census year were—butter 6,498,119, cheese 5,363,277, and wool 497,454 pounds. In 1840 the wool crop was 889,870 pounds, but "per capita" more than ten ounces short of that of 1850.

16. The total value of the products of agriculture in 1840 was $11,201,618, and in 1850, $12,556,189.

17. According to official returns the value of the products of Connecticut manufactures has increased in the 40 years ending with 1850 from $5,858,682 to $45,110,102. The returns for 1820 are very imperfect; those of 1830 gave the value at $8,053,053, and those for 1840 at $19,923,638. In 1850 there were in the State 3,482 establishments, with an aggregate capital of $23,890,348, and in which were employed 31,287 males and 16,483 females. In the same year the raw material consumed was valued at $23,589,397, the cost of labor was $11,695,236, and the value of goods produced was $45,110,102. The capital invested in the manufacture of cotton was $4,219,100, in wool $3,773,950, and in iron $1,407,400, and the value of the manufactured products were respectively $4,257,522, $6,465,216, and $2,244,196. The value of goods manufactured in families in 1840 amounted to $226,162, and in 1850 to $192,252.

MANUFACTURING VILLAGE.

18. There is considerable mining in this State for iron, copper, and lead, and building stone of various kinds is extensively quarried, especially in the town of Portland, which produces the valuable stone of that name. The ascertained mineral wealth of several sections augurs well for the future.

19. Long Island Sound, with its bays and creeks, forms a famous fishing-ground, and the fisheries established here employ a large number of inhabitants. Immense oyster beds have been planted along the coast, and millions of this bi-valve, with lobster, etc., are furnished to the New York markets, or packed in tin and sent to the interior States. New London and Stonington are the chief centers of the foreign fisheries. In 1850 there were engaged in the whale fishery 11,483 tons, and in 1855, 22,724 tons; in the cod fishery, in the same years, 5,249 and 7,487 tons, and in the mackerel fishery 571 and 73 tons. Between $2,500,000 and and $3,000,000 capital is invested in this interest.

20. The direct foreign commerce of Connecticut is comparatively limited, New York and Boston affording greater facilities than the domestic ports. For the years 1849–50 and 1854–55 the exports were valued at $241,930 and $878,874, and the imports at $372,390 and $633,826. The shipping cleared amounted to 27,317 and 28,748 tons, and the shipping entered to 34,152 and 31,419 tons. The shipping owned in the State, in the years referred to, amounted to 113,085 and 137,180 tons, the greater portion of which was engaged in the coasting trade or fisheries; and the amount of shipping built was 4,819 and 14,067 tons. The principal ports are Stonington, New London, Middletown, New Haven, and Fairfield.

21. The domestic trade of the State as carried on by steamboat and railroad is very extensive, and a large commerce is also carried in transit between Boston and New York, and New York and New England generally. The directions of the Connecticut railroads are north and south and east and west, the first connecting with the New York steamboats on the Sound, and extending northward connect with the lines to Canada and the interior, and the latter forming with their exterior connections the great through lines between Boston and New York. The total length of railroad within the State in 1857 was 648 miles, and this had been built at a cost of $24,348,963.

22. In 1850 Connecticut had 41 banks and 2 branches, with an aggregate capital amounting to $9,907,503, and in 1855 it had 67 banks and 1 branch bank with $17,147,385. The liabil-

ities of these institutions at these periods respectively were—circulation, $5,253,884 and $6,871,102; deposits, $2,357,939 and $3,433,081; and other liabilities, $1,603,151 and $1,428,819; and assets—loans and discounts, $15,607,315 and $23,704,458; specie, $640,622 and $810,101, and other assets, $2,824,271 and $5,335,457.

23. The charter granted in 1662 by Charles II. constituted the basis of government until 1818. On the 5th October of that year the present State constitution was adopted. The right to vote is secured to every white male citizen of the United States, 21 years of age, resident of the State one year and of the town six months, and of good moral character. The general assembly is composed of a senate of 21 members, chosen in districts, and a house of representatives of 232 members, chosen in towns annually, and by a plurality of votes. Sessions are held annually at Hartford and New Haven alternately. The governor, lieutenant-governor, treasurer, controller, and secretary are chosen for the same term by a majority of votes. The judiciary consists of the supreme court of errors and the superior court, the first consisting of a chief and two associates, and the latter of six judges. Two terms of the supreme court and four of the superior court are held annually in each county. The judges hold their offices for eight years, and are chosen by the general assembly. Justices of the peace are chosen by the electors of towns. The institutions supported wholly or in part by the State are the Retreat for the Insane at Hartford, the Asylum for the Deaf and Dumb at the same place, the State Prison at Wethersfield, the State Reform School at West Meriden, and the State Normal School at New Britain.

24. The total resources of the State treasury, for the years ending 1st April, 1850 and 1855, amounted to $122,347 and $216,264; and the total expenditures for the same years amounted to $118,392 and $179,862 respectively. The chief sources of income are direct taxation, bank stock dividends, etc. Connecticut has no absolute public debt; but holds available property to the amount of $406,000, and has a productive school fund amounting to $2,049,953. The valuation of taxable property in the State in 1850 was $119,088,672, and in 1855, $203,739,831.

25. Connecticut ranks among the most enlightened States, and has established one of the most thorough and efficient systems of education extant, and which its large means enables it to support. In 1850 one out of every 4.34 inhabitants was attending school. The following table exhibits the general condition of the several classes of educational institutions for the same year:

Classes.	Numbers.	Teachers.	Scholars.	Income.
Primary and public schools	1,656	1,787	71,269	$231,220
Academies and private schools	202	329	6,996	79,003
Universities and colleges	4	56	738	53,639

—making a total of 1,862 schools, 2,172 teachers, 79,003 scholars, and an annual income amounting to $363,862. The number of persons over 20 years of age unable to read and write was 5,306, and of these 4,739 were whites and 567 colored persons; and 1,293 were natives and 4,013 foreigners.

26. The principal collegiate institutions and professional schools in the State are enumerated in the annexed table:

Institutions.	Location.	Founded.	Professors.	Alumni.	Students.	Libraries.	Commencement.
Yale College	New Haven	1700	23	6,400	473	63,000	Last Thurs. in July.
Trinity College	Hartford	1824	13	506	79	15,000	1st Thurs. in July.
Wesleyan University	Middletown	1831	7	501	117	13,000	1st Wed. in Aug.
Theological Department	Yale College	1822	4	650	24	1,000	Last Thurs. in July.
Theological Institute of Conn.	East Windsor	1834	3	151	17	5,000	——
Law School	Yale College	1820	2	—	25	—	Last Thurs. in July.
Medical Institution	Yale College	1813	6	689	46	—	September.

—there is also a scientific school attached to Yale College.

27. In 1850 Connecticut had a total of 734 churches, with accommodations for 307,299 persons, and owning property to the value of $3,555,194. The most numerous denomination is the Congregational, to which about a third of the whole population is attached; and then the Methodist, Baptist, and Episcopalian, each including about a sixth. The Roman Catholic ranks next in numbers, and after it the Universalist and Presbyterian; and lastly the Friends and Unitarians, etc. The Jews have two synagogues.

28. Connecticut contains six cities, twelve boroughs, and a large number of flourishing villages. The cities with their population at the periods stated are as follows:

Cities.	1810.	1820.	1830.	1840.	1850.
Hartford	3,955	4,726	7,076	9,468	13,555
New Haven	5,772	7,147	10,678	12,960	20,345
Middletown	2,014	2,618	2,965	3,511	4,211
New London	3,238	3,330	4,356	5,516	8,991
Norwich	—	—	5,161	7,239	10,265
Bridgeport	—	—	—	4,570	7,560

—Hartford and New Haven are the seats of government alternately.

29. Hartford, on the right bank and 50 miles from the mouth of the Connecticut River, and at the head of steam navigation thereof, stands on rising ground and is a regularly laid out city. Latitude 41° 45′ 59″, and longitude 72° 40′ 45″. The principal public buildings are the State House, City Hall, Custom House, Trinity College, the American Asylum, the Retreat for the Insane, and the Atheneum. Several of the churches, of which there are twenty-four, are handsome buildings, and besides Trinity College there are numerous other excellent schools. The city is the center of the State system of railroads, and carries on a large trade. Its manufactures consist principally of machinery, fire-arms, boots and shoes, etc., and the city is also celebrated for its extensive book trade. The American Asylum for the Deaf and Dumb was the first established, and is still one of the most flourishing and important asylums of the kind in the United States. The Retreat for the Insane is also a very important institution, and is resorted to by patients from all the New England States.

30. New Haven stands at the head of New Haven Bay, 4 miles from Long Island Sound, and in latitude 41° 18′, and longitude 72° 55′—36 miles by railroad south-southwest from Hartford. It is a pleasantly situated city, with wide streets, which are generally bordered by stately elms. The central square forms a sort of public park, and is said to be one of the finest public grounds in the Union. In this square are three fine churches, the State House, and the chief part of the buildings of Yale College, an institution ranking among colleges second only to Harvard University. Besides these the city contains several scientific and literary institutions, libraries, etc., and numerous academies and schools. Silliman's American Journal of Science is published at New Haven. Its churches, of which there are twenty-two, are handsome structures, and it has two cemeteries, in which several eminent Americans are interred. The public buildings are mostly of brick. New Haven is the chief commercial city of the State, and has an extensive domestic as well as foreign trade, and is largely engaged in the fisheries. The harbor is spacious but shallow and is gradually filling up. Carriages and clocks are the principal products of the New Haven factories, but there are also considerable manufactories for hardware and cutlery, woolen goods, leather, etc. The railroads centering here afford great facilities for communication, and a daily line of steamers plies to and from New York.

OBSERVATORY, YALE COLLEGE—LAT. 41° 18′ 28″ N., LONG. 72° 55′ 24″ W.

31. Middletown is situated on the right bank of the Connecticut 14 miles south of Hartford. It is built on a gently rising site, the main street running parallel to the river and the other streets at right angles with it. It is the seat of the Wesleyan University, and otherwise contains several handsome public buildings. Its manufactures are considerable, and it has an extensive coasting trade. In the vicinity are valuable mines of argentiferous lead, and inexhaustible quarries of feldspar in much request for the manufacture of porcelain. A branch railroad connects the city with the New Haven and Hartford line, and New York and Boston Central Railroad when completed will connect it directly with New Haven and New York, on the one hand, and Providence and Boston on the other.

32. New London, on the right bank of Thames River, 3 miles above Long Island Sound and 45 miles southeast from Hartford, is the chief port for the coasting and whaling trade of Connecticut. The harbor is deep and the most complete in the State. The shore-line of railroads passes through this city connecting it with New York and Boston, and railroads also connect it with Worcester and Palmer in Massachusetts. Steamboats ply daily to and from New York.

33. Norwich, at the junction of the Quinnebaug and Yantic, 13 miles above New London, occupies a very picturesque site, and is an important commercial and manufacturing town. The rivers afford great water-power. Seven miles below the city is Allyn's Point, a noted steamboat station, reached by a railroad, and at Norwich connecting with the roads to Worcester, etc., northward. The celebrated Yantic Falls are in the vicinity.

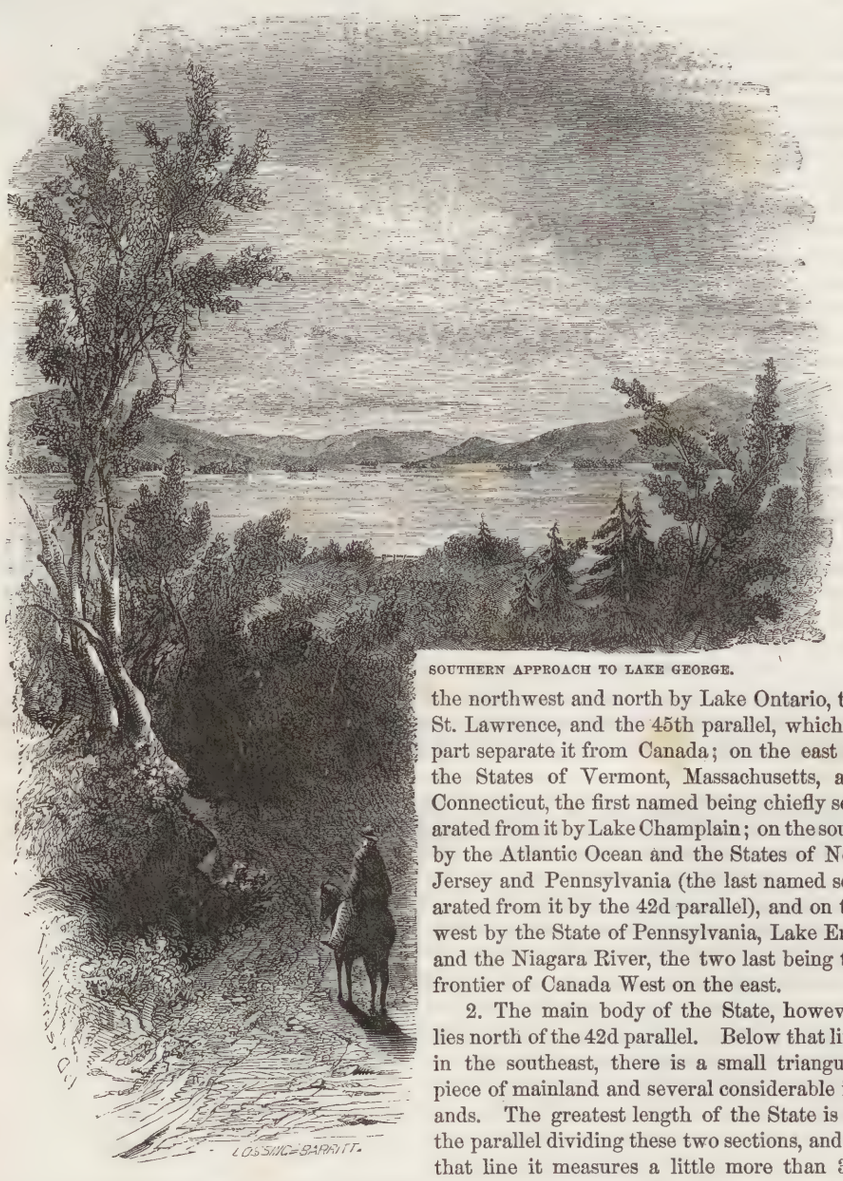
34. Bridgeport, on the shore-line of railroad and the southern terminus of the Housatonic Railroad, is a thriving city, 78 miles southwest from Hartford and 56 miles east from New York. The harbor, formed by an arm of Long Island Sound, is eligible for steamboats and coasting vessels. It is a place of considerable manufactures, and has a wide commercial connection.

35. The boroughs are—Danbury (population 5,964), near the western border of the State, and at the northern end of the Danbury and Norwalk Railroad; Essex (population 950), on the Connecticut, 7 miles from its mouth; Guilford (population 2,653), on the New Haven and New London Railroad, 16 miles east New Haven, with a good harbor frequented by coasting and fishing vessels and resorted to in the season for sea-bathing; Litchfield (population 3,953), a manufacturing town 28 miles west Hartford; New Britain (population 3,029), 10 miles southwest Hartford, the seat of the State Normal School, and noted for its brassware and cutlery; Newtown (population 3,338), on the Housatonic; Norwalk (population 4,651), on Norwalk River, which has 6 feet of water, and the New York and New Haven Railroad, which is here joined by the Danbury and Norwalk Railroad; Southport (population 1,250), on the New York and New Haven Railroad, 24 miles west New Haven and on an inlet of Long Island Sound admitting vessels of 100 tons; Stamford (population 5,000), on the same railroad 16 miles farther west, with a harbor admitting vessels of 8 feet draft; Stonington (population 5,431), on Long Island Sound and on the shore-line of railroads near the southeast extremity of the State, with one of the best harbors on the Sound, and connected also with New York by a daily line of steamboats, run in connection with the railroads to Providence and Boston; Waterbury (population 5,137), a busy manufacturing town on the Naugatuck, and at the crossing of the Naugatuck and the Hartford, Providence and Fishkill railroads, 33 miles west-by-south Hartford; and Willimantic, also a thriving town, on the river of the same name and on the Hartford, Providence and Fishkill Railroad, where it is crossed by the New London, Willimantic and Palmer Railroad, 31 miles east Hartford. These, and also many of the villages, of the State, are engaged to a greater or less degree in manufactures; several, as already stated, are also largely engaged in the coasting trade and fisheries, and with few exceptions their railroad facilities are ample.

36. The territory now constituting the State of Connecticut originally contained two colonies, viz., the colony of Connecticut and the colony of New Haven.

37. The old patent of Connecticut colony was granted March 19, 1631, by Robert, Earl of Warwick, President of the Council of Plymouth, to Lord Say and Seal, Lord Brook, and others. The Dutch, desiring to anticipate the English colonists, erected a fort at Hartford, in June, 1633; but in September following the company from Plymouth arrived, and effectually defended their selections. The other early settlements were at Windsor, October, 1633, and at Wethersfield and Saybrook, in the autumn of 1635.

38. The New Haven colony, consisting of Governor Eaton, Rev. John Davenport and



others, arrived at Boston in July, 1637; but the next year removed, and on April 15, 1638, commenced the settlement of New Haven.

39. In 1662, Charles II. granted a charter for the union of the colonies, which union was not perfected until 1665, but thenceforth continued until October 31, 1687, when Sir Edmund Andros assumed the government, annexing this to the other colonies of New England, and thus held it until May 9, 1689. After resuming its former government, according to the charter, Connecticut was principally engaged in the administration of its own affairs, repelling incursions of Indians, etc., until the wars between Great Britain and France, in which, in common with the other colonies, it was compelled to engage. In bringing about the Revolutionary war, Connecticut was among the foremost of the colonies, and during its continuance furnished in proportion to its population very large supplies of means.

40. The State ratified the federal constitution January 9, 1788.

STATE OF NEW YORK.

1. New York, the most populous and commercial of the United States, is situated between latitudes 40° 30′ and 45° north, and longitudes 71° 54′ and 79° 57′ west; and is bounded on

SOUTHERN APPROACH TO LAKE GEORGE.

the northwest and north by Lake Ontario, the St. Lawrence, and the 45th parallel, which in part separate it from Canada; on the east by the States of Vermont, Massachusetts, and Connecticut, the first named being chiefly separated from it by Lake Champlain; on the south by the Atlantic Ocean and the States of New Jersey and Pennsylvania (the last named separated from it by the 42d parallel), and on the west by the State of Pennsylvania, Lake Erie, and the Niagara River, the two last being the frontier of Canada West on the east.

2. The main body of the State, however, lies north of the 42d parallel. Below that line, in the southeast, there is a small triangular piece of mainland and several considerable islands. The greatest length of the State is on the parallel dividing these two sections, and on that line it measures a little more than 300 miles, and its greatest extent, north and south, is on the meridian of New York city, which measures somewhat less than 300 miles. In its western portion it gradually narrows, being in that direction encroached upon by the St. Lawrence and the lakes, the shores of which trend from the southwest northeastwardly. Including the islands, the area of the State is computed at 47,000* square miles. The shore-line of the ocean, including bays, islands, and all irregularities, is estimated at 980 miles. No part of the continental line is exposed to the sea. The whole northwest border is traced by the lakes and the St. Lawrence.

3. The great body of the State forms a portion of the elevated table-land of the United States, broken in some places by mountain ranges, and contains some remarkable depressions, which form the basins of lakes and channels of rivers. The loftiest part of this table-land occurs in the western part of the southern section, where Lake Chautauque is from 1,800 to 2,000 feet above the sea, and although it is but nine miles from Lake Erie, it discharges its waters by the Alleghany River.

4. In the eastern section the Taconic Mountains lie on the border of the State from Lake Champlain southward to Putnam County, at which point their course, diverging to the southwest, crosses the Hudson at West Point, and is continued thence into New Jersey and Pennsylvania. This range divides the waters of the Hudson and Housatonic.

5. The northern section is traversed by six several ranges of mountains, and these, with their offshoots, cover a large portion of the country. The Palmerstown range runs through the tongue of land which separates lakes George and Champlain, and terminates at Ticonderoga. The Kayaderosseras or Lucerne range runs along the west side of Lake George, and is broken through by the Hudson River. The Clinton range extends from Montgomery County northeast to Point Trembleau, on Lake Champlain. It is the largest range north of the Mohawk, and at its most elevated portion there are numerous distinct peaks forming the Adirondack group, and the range itself is the dividing line between the waters of the St. Lawrence and Mohawk. Au Sable or the Peru range commences in Montgomery County, and running parallel with the Clinton range, has a greater general elevation than the preceding. The Chateaugay range is the largest and highest chain in the State; it commences on the line of the Kaätsbergs, has an elevation of 2,000 feet, and terminates upon the Canada plains. The St. Lawrence range, commencing 10 or 12 miles north of this range, and trending along the slope of the St. Lawrence valley, is of less extent, and is divided into several portions by the St. Regis, Grasse, and other rivers flowing to the St. Lawrence. This section of the State has also two minor ranges: the highlands of Black River and the Hassencleaver Mountains.

6. The southern section may be divided into two portions—the eastern and the western. In the eastern portion there are three distinct ranges—the Highlands of the Hudson, the Shawangunk Mountains, skirting the valley of the Rondout, and the Kaätsbergs or Catskill Mountains. The western division of this section rises gradually to successive terraces from the shores of Lake Ontario till it attains its greatest elevation in the southern tier of counties. The first of the terraces composing this ascent extends from the Genesee near Rochester to Niagara Falls, and is from 6 to 10 miles in width. The second terrace extends from this ridge to the falls of the Genesee River, where there is another abrupt acclivity, of nearly 300 feet. This surmounted, the ascent is gradual to the summit-level, from 1,800 to 2,000 feet elevation. These terraces are each characterized by a difference of soil and of forest growths.

7. The principal culminations, with their elevation in feet above the sea-level are—in the Adirondack group, Mt. Marcy, 5,467; Mt. M'Intyre, 5,183; Mt. M'Martin, 5,022; Dial Mountain, 4,907; and Mt. Seward, 3,988—in the Au Sable range, Whiteface, 4,855—in the Kaätsbergs, Round Top, 3,804; High Peak, 3,718; and Pine Orchard, 3,027—in the Shawangunk, the highest peak is 1,866—in the Highlands of the Hudson, New Beacon, 1,685; Button Hill, 1,520; Old Beacon, 1,471; Breakneck, 1,187; and Anthony's Nose, 1,128, etc. Mt. Defiance, in Essex County, has an elevation of 753; the Palisades, in Rockland County, 550, and Fort Putnam 500; Harbor Hill, Long Island, 319; and Richmond Hill, Staten Island, 307 feet.

CATSKILL MOUNTAIN (KAATSBERG) HOUSE.

8. The most distinguishing feature of New York is perhaps its vast system of waterways, which bound it and intersect it in every direction. Its lakes are the common highways of an immense commerce. Numbers of these lie wholly within the State, but the great lakes, properly so called, lie on its borders, Ontario and Erie on the north and west, and Champlain on the northeast. Lake George or Horicon is wholly within this State, and discharges itself into Champlain by a descent of 150 feet. The northern portion of the State abounds with small lakes, and these number 200 at least. Some of these, among the Adirondacks, are

* According to United States Census, 1850. Burr's Atlas gives it at 28,297,142 acres or 44,214 square miles, and Gordon's Gazetteer of New York at 29,220,936 acres or 45,658 square miles.

greatly elevated, as Avalanche Lake, 2,900 feet; Colden, 2,750 feet; and Racket, 1,731 feet above tide. The western portion of the State contains numerous lakes of considerable size. The largest and most important of these are Seneca, Cayuga, Oneida, Crooked, and Canandaigua lakes, all emptying into Lake Ontario. Chautauque Lake flows into the Alleghany.

9. The rivers of New York, in connection with a splendid system of canals, afford an immense stretch of inland navigation. The Hudson is the largest, and one of the most magnificent water-courses of North America. It is 320 miles long, having its sources in the Adirondack group. Navigation for large ships is open to Hudson, and for steamers to Troy. The Mohawk from the west, and the Hoosic from the east, are its principal tributaries; but there are also numerous other affluents from both sides. The Mohawk has extensive falls, and runs a course of about 135 miles, joining the Hudson at Waterford. The next important river of New York is the Oswego, the outlet of a long series of lakes and rivers, and which falls into Lake Ontario. The Alleghany, the recipient of the waters of Chautauque Lake and a constituent of the Ohio, and the Susquehanna and Delaware have also their sources within this State. The other principal rivers are the Niagara, the Genesee, the Black, the Chenango, the Chemung, the Oswegatchie, etc. The Niagara is the connecting strait between lakes Erie and Ontario, and is interrupted by the celebrated falls of the same name.

10. The sea-coast is almost wholly comprised in the shores of Long and Staten islands, which contain no eligible harbors. The bay of New York is the most magnificent harbor-water on the Atlantic sea-board. It extends nine miles below the city, and is from two to five miles wide. The Hudson River enters it from the north. On the lakes there are good harbors.

11. The largest islands are Long and Staten islands; the former projects into the Atlantic, opposite the southern shore of Connecticut, a distance of 140 miles; and Staten Island, at the mouth of New York harbor, is separated from Long Island by the bay and Narrows. It is 15 miles long, and about 8 miles broad. Manhattan or New York Island, which is occupied by the city of the latter name, is 13 miles long, with an average width of one mile and a half. The other islands of the bay are—Governor's, on which stands Fort Columbus and other strongholds; Bedloe's, also fortified; and Ellis's, the site of a naval arsenal.

RUINS OF TICONDEROGA.

12. The secondary formations of geologists, as well as the upper formations of the transition system, have no existence in this State; and all the formations, except the alluvial and diluvial, and the beds of tertiary on the St. Lawrence, are below the coal measures, the Kaätsbergs, which are the highest members of the transition system, being the layer immediately beneath. The prevalence of limestone in nearly all the formations is worthy of notice, affording as it does the basis rock best adapted to yield the materials for fertilizing the soil. The eastern and northeastern portions of the State are principally of the primary or unstratified formations, which contain extensive iron mines and mines of lead and plumbago, and the gneiss of this system furnishes a fine building material. Transition rocks are most prevalent in the southwestern portion of the State, and in this section gypsum, water-lime, and the salt springs of Salina occur. Old red sandstone is predominant in the Kaätsbergs. Fossils occur largely from the Hudson to the Niagara. Lead is found in immense quantities in St. Lawrence County, and less abundantly in the Shawangunk Mountains. Zinc and copper occur in various parts. Barytes and strontian, and also alum, are abundant in some parts. Serpentine and its kindred minerals, soapstone, talc, and magnesia, occur in the southeast. Mineral springs, the waters of which are medicinally valuable, exist in various districts.

13. The climate in this State is extremely various; in the south it is modified by the proximity of the ocean, and in the extreme west the influence of the great lakes perceptibly modifies its characteristics. It is only in the mountain regions of the north that any notable severity is observed. But though within the parallels which in Europe produces the fig, the olive, and the grape, its more severe climate admits only of the culture of the hardier plants and grains, and early frosts and backward springs are not uncommon throughout the whole State. The extreme summer heat is 97° Fahr., and the average maximum 92°, the mean annual range is 104°, and the mean annual temperature 46½°. The average time throughout the whole State, from the blooming of the apple to the first killing frost, is 174 days.

14. Holding a middle place between the north and south, nearly all the great features of the United States' flora are here produced. Immense forests still occupy the uncultivated regions north and west, consisting mainly of pine, oak, and beech, while the chestnut, hickory, and maple, with a host of other less numerous but not less valuable trees are scattered over its territory. The mountain sides and woods are clothed with an undergrowth of shrubs, as the whortleberry, rhododendron, and mountain laurel. In the open fields flourish hundreds of more herbaceous plants, among which will be found many that are rare and curious as well as of great beauty and utility.

15. Among the animals of this State the most conspicuous are those of the deer tribe. The carnivora are represented in the panther, wild cat, lynx, marten, wolverine, skunk, etc., and the rodents in the northern hare, rabbit, muskrat, squirrels of various species, the porcupine. The remains of the mastodon have been discovered in almost every section, and also teeth of the American elephant. Birds, reptiles, and insects abound, and the lakes, bays, and rivers teem with fish in great variety.

16. In 1850 New York contained 3,097,394 inhabitants or 65.9 to every square mile or 13.36 per cent. of the total population of the Union. This population was distributed among the counties as follows:

Counties.	Population.	County Seats.
Albany	93,279	Albany.
Alleghany	37,808	Angelica.
Broome	30,660	Binghamton.
Cattaraugus	33,950	Ellicottville.
Cayuga	55,458	Auburn.
Chautauque	50,493	Mayville.
Chemung	28,821	Elmira.
Chenango	40,311	Norwich.
Clinton	40,047	Plattsburg.
Columbia	43,073	Hudson.
Cortland	25,140	Cortlandville.
Delaware	39,834	Delhi.
Duchess	58,992	Poughkeepsie.
Erie	100,993	Buffalo.

Franklin	25,102	Malone.
Fulton	20,171	Johnstown.
Genesee	28,488	Batavia.
Greene	23,126	Catskill.
Hamilton	2,188	Lake Pleasant.
Herkimer	38,244	Herkimer.
Jefferson	68,153	Watertown.
King's	138,882	Brooklyn.
Lewis	24,564	Martinsburg.
Livingston	40,835	Geneseo.
Madison	43,072	Morrisville.
Monroe	87,650	Rochester.
Montgomery	31,992	Fonda.
New York	515,547	New York City
Niagara	42,276	Lockport.
Oneida	99,566	Utica.
Onondaga	85,890	Syracuse.
Ontario	43,929	Canandaigua.
Orange	57,145	Goshen.
Orleans	23,501	Albion.
Oswego	62,198	Oswego.
Otsego	48,638	Cooperstown.
Putnam	14,138	Carmel.
Queen's	36,833	N. Hempstead.
Rensselaer	73,363	Troy.
Richmond	15,061	Richmond.
Rockland	16,962	Clarkstown.
St. Lawrence	68,617	Canton.
Saratoga	45,646	Ballston.
Schenectady	20,054	Schenectady.
Schoharie	33,548	Schoharie.
Schuyler	(*new.*)	Watkins.
Seneca	25,441	Waterloo.
Steuben	63,771	Bath.
Suffolk	36,922	Riverhead.
Sullivan	25,088	Monticello.
Tioga	24,880	Owego.
Tompkins	38,746	Ithaca.
Ulster	59,384	Kingston.
Warren	17,199	Caldwell.
Washington	44,750	Sandy Hill.
Wayne	44,953	Lyons.
Westchester	58,263	White Plains.
Wyoming	31,981	Warsaw.
Yates	20,590	Penn Yan.

—and consisted of 566,869 families, inhabiting 473,936 dwellings. Of the total population, 3,048,325 (98.42 per cent.) were whites—1,544,489 males and 1,503,836 females, and 49,069 were free colored—23,452 males and 25,617 females; and 2,439,296 (78.75 per cent.) were American born, of which number 2,151,196 were born in this State, and 651,801 (21.04 per cent.) of foreign birth, the remainder (6,297) being of origin not ascertained. The number of natives of New York in other States of the Union was 547,218. In 1790 the State contained 340,120 inhabitants; in 1800, 586,756; in 1810, 959,049; in 1820, 1,372,812; in 1830, 1,913,006; in 1840, 2,428,921, and in 1850 (as above), 3,097,394. In 1855 the State census returned 3,466,212* inhabitants.

17. The occupations of 888,294 free male persons over 15 years of age, as given in the census of 1850, were as follows: 312,697 in commerce, trade, manufactures, mechanic arts, and mining; 313,980 in agriculture; 196,613 in labor not agricultural; 1,462 in the army; 23,243 in sea and river navigation; 14,258 in law, medicine, and divinity; 11,104 in other pursuits requiring education; 4,985 in government civil service; 6,324 in domestic services, and 3,628 in occupations not classified.

18. New York stands at the head of industrial States. In a few specialties it yields precedence to others, as in ship-building to Maine, in the mining of coal and iron to Pennsylvania, and in the manufacture of the textile fabrics to Massachusetts and Rhode Island; but for variety and aggregate value of industrial products it has no rival. Its foreign commerce is

* Of the population in 1855 the males numbered 1,727,650 and the females 1,738,562; the whites numbered 3,420,926, viz., 1,706,273 males and 1,714,653 females, and the colored population 45,286, viz., 21,377 males and 23,909 females. The number of voters was 652,322, viz., 516,745 natives and 135,577 naturalized foreigners. The number of aliens was 632,746. In this population there were—deaf and dumb, 1,422, viz., 785 males and 637 females; blind, 1,136, viz., 682 males and 454 females; insane, 2,742, viz., 1,215 males and 1,527 females; and idiotic, 1,812, viz., 1,002 males and 810 females.

Born in the United States, 2,528,444, viz., in New York, 2,222,321; in New England, 207,589; in New Jersey and Pennsylvania, 71,863; in the Southern States, 13,124; and in other States, 11,876; born at sea and unknown, 17,749; and born in foreign countries, 922,019. Of the foreigners, 469,753 were Irish, 218,997 German, 102,286 English, 47,842 Canadian, 27,523 Scotch, 18,366 French, 8,557 Welsh, 6,352 Prussian, 4,214 Dutch, 3,948 Swiss, etc.

Distributed into the counties, the population of each was as follows:

Albany	103,681	Cortland	24,575	Herkimer	38,566	Oneida	107,749	Richmond	21,389	Sullivan	29,487
Alleghany	42,910	Delaware	39,749	Jefferson	65,420	Onondaga	86,575	Rockland	19,511	Tioga	26,962
Broome	36,650	Duchess	60,635	King's	216,929	Ontario	42,672	St. Lawrence	74,977	Tompkins	31,516
Cattaraugus	39,530	Erie	132,331	Lewis	27,229	Orange	60,868	Saratoga	49,379	Ulster	67,936
Cayuga	53,571	Essex	28,339	Livingston	37,913	Orleans	28,435	Schenectady	19,572	Warren	19,669
Chautauque	53,380	Franklin	25,477	Madison	43,687	Oswego	69,398	Schoharie	33,519	Washington	44,105
Chemung	27,988	Fulton	23,284	Monroe	96,324	Otsego	49,735	Schuyler(*new*)	18,777	Wayne	46,760
Chenango	39,915	Genesee	31,934	Montgomery	30,804	Putnam	13,934	Seneca	25,358	Westchester	59,678
Clinton	42,482	Greene	31 137	New York	629,904	Queen's	46,266	Steuben	62,965	Wyoming	32,140
Columbia	44,391	Hamilton	2,543	Niagara	48,262	Rensselaer	79,234	Suffolk	40,906	Yates	19,512

The Census Report for 1855 contains also a vast fund of useful and interesting information apart and beyond the enumerations of that year. A few abstracts from this source will be appropriate in this connection, and serve to illustrate the progress of the Colony and State.

1. *Colonial Censuses* from 1698 to 1771:

Years.	White Persons. Males.	White Persons. Females.	Colored Persons. Males.	Colored Persons. Females.	Total Population.	Increase. Numerical for periods.	Increase. Annual rate p. c.
1698	8,143	7,754	1,085	1,085	18,067		
1703	9,322	9,085	1,174	1,084	20,665	2,598	2 87
1723	17,583	16,810	3,364	2,807	40,564	19,899	4.81
1731	24,856	18,205	4,866	2,897	50 824	10 260	3.16
1737	25,740	25,776	4,948	3,993	60,437	9,513	3.15
1746	26,860	25,622	4,857	4,250	61,589	1,152	0.21
1749	32,365	30,401	5,696	4,796	73,318	11,758	6.36
1756	43,261	39,981	7,570	5,978	96,790	23,442	4.57
1771	78,990	69,484	10,623	9,240	168 3 7	66,547	4.59

2. *Census of the Revolutionary Period.*—Partial returns still exist of censuses taken in 1776 and 1782, and also complete returns of a census taken in 1786. In the latter year the total population was 238,897, of which 229,996 were white persons—112,465 males and 107,531 females; 18,889 were colored persons—9,521 males and 9,368 females; and 12 were Indians who paid taxes.

3. *State Censuses.*—The first census taken under State authority was that of 1790, which, excluding the population of Clinton and Ontario counties, which made no returns, gave the population at 319,627, viz., 152,949 males and 145,749 females, and 20,935 slaves of both sexes. The State censuses as ordained under the constitutions of 1821 and 1826 are taken at intervals of ten years. The census of 1855 is the fourth of this series.

Years.	Whites.	Colored.	Total.	Increase. Numerical.	Increase. Proportional.
1825	1,576,459	39,999	1,616,458		
1835	2,130,169	44,348	2,174,517	558,059	34.5
1845	2,559.148	45.347	2,604,495	429,978	19.8
1855	3.420,926	45,286	3,466,212	861,717	33.1

4. *Indians in the State of New York*, 1845 and 1855:

Reservations.	Where Located.	Population. 1845.	Population. 1855.
Alleghany	South Valley, Cold Spring, Bucktooth, Great Valley, and Carrollton, *Cattaraugus County*	783	754
Buffalo	Lancaster, *Erie County*	446	broken up.)
Cattaraugus	Perrysburg, *Cattaraugus County*; Collins, *Erie County*, and Hanover, *Chautauque County*	922	1,179
Oneida	Lenox, *Madison County*, and Vernon, *Oneida County*	157	161
Onondaga	Fayette and Onondaga, *Onondaga County*	368	349
St. Regis	Bombay, *Franklin County*	290	413
Shinecook	Southampton, *Suffolk County*	(no sep. returns.)	160
Tonawanda	Pembroke and Alabama, *Genesee County*; Newstead, *Erie County*, and Royalton, *Niagara County*	503	602
Tuscarora	Lewiston, *Niagara County*	312	316
Total		3,753	3,934

—in 1845 the quantity of land under cultivation by the Indians was 13,867¼ acres, and in 1855, 14,197¼ acres.

world-wide, and in value more than that of all the other States of the Union together, and its internal commerce, facilitated by its vast systems of canals and railroads, reaching from the sea-board to the great lakes, and connecting in every direction with the systems of other States, extends to the farthest limits of the settled portions of North America. It is the great center, indeed, of production, distribution, and wealth, and the financial heart of the whole Union, giving life and health to the industry of the nation.

19. No coal measures that could be profitably worked are found in this State. It has, however, extensive deposits of iron, especially in the northeast and east, which are being rapidly developed. Gypsum is largely quarried in the western districts for agricultural purposes; while marble of excellent quality is quarried at Sing-Sing, and gneiss, granite, sandstone, and limestone in various parts. Salt is chiefly manufactured in Onondaga County, where the salines are among the most valuable in the world. Copper, zinc, manganese, etc., may also to some extent be classed among the mineral products of New York.

20. In 1850 the quantity of land included in farms amounted to 19,119,084 acres,* of which 12,408,964 acres were improved and 6,710,120 acres unimproved. This is a little less than three fifths of the whole surface, and about two fifths are under use. The total value is stated at $554,546,642, and the value of agricultural implements and machinery is stated at $22,084,926. The number of farms was 170,621, averaging 113 acres, and valued at $3,379 each.

21. The principal crops consist of oats, Indian corn, and wheat. Those of rye, barley, and buckwheat are comparatively small; but the potato crop, though only half as large in 1840, is larger than that of every other State. The following shows the amount of the cereal crops (bushels) in 1840 and 1850 comparatively:

1840.....wheat, 12,286,418..rye, 2,979,323..oats, 20,675,847..corn, 10,972,286..barley, 2,520,068...buckwheat, 2,287,885
1850..... " 13,121,498.. " 4,148,182.. " 26,552,814.. " 17,857,400.. " 3,585,059... " 3,183,955

—the potato crop in 1840 was 30,123,614, and in 1850 only 15,403,997 bushels; and the hay crop in the two years was 3,127,047 and 3,728,797 tons respectively. Hops are also a valuable crop, having been in 1850 no less than 2,536,299 pounds or about five sevenths the total produced in the Union. The value of market-garden products in 1850 was $912,047, and of orchard products $1,761,950, in both surpassing every other State; and maple sugar was produced to the amount of 10,357,484 pounds. Among other products of 1850 are also enumerated clover seed 88,222, and other grass seed 96,493 bushels, peas and beans 741,546 bushels, beeswax and honey 1,755,830 pounds, flax 940,577 pounds, tobacco 83,189 pounds, silk cocoons 1,774 pounds, wine 9,172 gallons, etc.

22. The comparative amounts of livestock owned in the State, according to the returns of 1840 and 1850, are exhibited as follows:

1840.....horses, asses and mules, 474,543.....neat cattle, 1,911,244.....sheep, 5,118,777.....swine, 1,900,065
1850..... " " " 447,977..... " 1,877,639..... " 3,453,241..... " 1,018,252

—the neat cattle, in 1850, consisted of 931,324 milch cows, 178,909 working oxen, and 767,406 other cattle. In 1850 the amount of butter made was 79,766,094 pounds, and of cheese 49,741,413 pounds; and the amount of wool produced in 1840 was 9,845,295, and in 1850, 10,071,301 pounds. The total value of livestock in the last-named year was $73,570,499; and the value of animals slaughtered in the year was $13,573,883.

23. The aggregate value of agricultural produce, etc., in the year 1850 was $117,019,115 or one eighth part of the whole produce of the Union, and one third more than that of all New England.

24. In 1850 New York contained 23,553 manufacturing establishments,† in which was invested an aggregate capital of $99,904,405, and which gave employment to 147,737 males and 51,612 females, whose wages or the cost of whose labor amounted in the year to 49,131,000. The value of raw material and fuel, etc., consumed was $134,655,674, and the value of the goods produced was $237,597,249. Among specified products, in 1850, are noted—cotton goods to the value of $3,591,989, woolen goods to $7,030,604, pig iron to $597,920, cast iron and castings to $5,921,980, wrought iron to $3,758,547, spirits, beer, etc., to $6,278,065, salt to $998,315, etc. In 1810 the total value of manufactures was $14,569,138; in 1840, $95,840,194; in 1850 as above, and in 1855 (State census), $317,428,331. The value of goods manufactured in families was, in 1840, $4,636,547, and in 1850, $1,280,333.

25. The fisheries of New York, though ample for domestic purposes, are in comparison with those of the New England States of inferior value. They are carried on chiefly in the neighboring ocean, and abundantly supply the markets of the metropolis. The whale fishery is carried on only to a small extent, and from Greenport, which, in 1855, employed in this industry shipping to the amount of 3,812 tons. In the same year Sag Harbor employed 182 tons of shipping in the cod fishery. Oysters and other shell-fish are abundant along the shores of Staten and Long islands; and the shad fisheries of the Hudson are very productive. According to the census of 1850 there were in the State 26 fisheries, using a capital of $482,100, employing 583 men, and producing annually $484,345.

26. The commerce and navigation and the shipping owned and built in this State, for the 10 years ending 30th June, 1855, are shown in the following table:

Years.	Commerce. Imports.	Commerce. Exports.	Navigation. Tonnage ent.	Navigation. Tonnage clear.	Tonnage owned. Registered.	Tonnage owned. Total.	Tonnage built 1854-5.
1846	$74,254,283	$36,935,413	—	—	—	—	—
1847	84,167,352	49,844,368	—	—	—	—	—
1848	94,525,141	53,351,157	—	—	—	—	—
1849	92,567,369	45,963,100	3,335,379	2,143,157	899,754	911,281	44,104
1850	111,123,524	52,712,789	2,277,720	2,149,096	458,903	944,349	58,342
1851	141,546,538	86,007,019	—	—	—	—	76,805
1852	182,329,306	87,484,456	2,900,062	2,477,720	585,871	1,160,097	72,072
1853	178,270,999	78,206,290	3,725,335	3,044,644	681,845	1,294,462	83,224
1854	195,427,933	122,534,646	3,188,354	2,953,471	769,940	1,415,039	117,166
1855	164,776,511	113,731,288	3,309,916	3,001,879	749,821	1,464,221	115,231

—in the last-named year the proportions of tonnage, etc., due to the sea-ports and lake-ports respectively was as follows:

Sea-ports	1,737,652	1,447,818	749,821	1,316,729	92,866
Lake-ports and ports of the St. Lawrence	1,572,264	1,554,061	—	147,492	22,365

—of the imports, in 1855, $133,055,311 were carried in American vessels, and $31,721,200 in foreign vessels; and of the exports, $96,414,808 were of domestic production, of which $73,579,375 were carried in American and $22,835,433 in foreign vessels, and $17,316,430 were of foreign production, of which $11,147,108 were carried in American and $6,169,322 in foreign vessels. Of the shipping entered in the same year 2,164,006 tons were American and 1,145,910 tons foreign, and of that cleared 1,861,682 tons were American and 1,140,197 tons foreign. Of the shipping owned in this State 246,933 (89,105 registered) tons were navigated by steam, and 196,912 (89,105 registered) tons belonged to sea-ports and 50,021 tons to lake-ports.

27. The following exhibits a statement of the amount of shipping entered at and cleared from each of the ports, in 1850 and 1855, comparatively, and also of the shipping owned and built in each:

Sea Ports.		Tonnage Entered. American.	Tonnage Entered. Foreign.	Tonnage Entered. Total.	Tonnage Cleared. American.	Tonnage Cleared. Foreign.	Tonnage Cleared. Total.	Shipping (tons). Owned.	Shipping (tons). Built.

—these figures, however, exhibit only that portion of the foreign trade conducted by water. There is also a large trade carried on with the British Possessions by land across the frontier, but of this no statement can be separately given, as on this point the published official returns are silent, and from a like omission it is impossible to give the separate values of the sea and

---

* The following is a summary of the agricultural statistics for the whole State, as exhibited by the census of 1855:

Total land in farms	acres 26,758,183	Market gardens	acres 12,591 — products $1,138,682
Improved land	" 13,657,491	Orchard products: Apples	bushels 13,668,831
Unimproved land	" 13,100,692	Orchard products: Cider	barrels 213,639
Number of farms	231,740	Maple sugar	lbs. 4,935,815
Cash value of farms	$799,355,367	" molasses	galls. 85,091
" " of stock	103,776,053	Wine	" 18,182
" " of tools and implements	26,927,502	Honey	lbs. 2,557,876
Land plowed in 1854	acres 3,377,471	Wax	" 138,033
" in fallow	" 506,030	Silk cocoons	" 267
" in pasture	" 4,984,114	Neat cattle	total number 2,105,465
" in meadow	" 3,384,441	Under 1 year old	311,474
Hay produced .... 3,256,949 tons, and grass-seed	120,867 bushels.	Over 1 year old	577,887
Wheat (spring)	acres 194,316 — bush. 2,033,353	Working oxen	144,597
Wheat (winter)	" 601,141 — " 7,059,049	Milch cows	1,068,427
Oats	" 1,349,384 — " 27,015,296	Cattle killed for beef last year	225,338
Rye	" 281,715 — " 3,039,438	Butter	pounds 90,293,073
Barley	" 212,608 — " 3,563,540	Cheese	" 38,944,249
Buckwheat	" 293,233 — " 2,481,079	Milk sold	gallons 20,965,861
Indian corn	" 917,601 — " 19,290,691	Horses	number 579,715
Potatoes	" 220,576 — " 15,191,852	Mules	" 2,274
Peas	" 48,155 — " 705,967	Swine	" 1,069,792
Beans	" 16,917 — " 244,079	Sheep	" 3,217,024
Turnips	" 7,578 — " 985,522	Fleeces shorn	" 2,630,203
Flax	" 11,764 — seed " 87,093; lint lbs. 4,907,556	Wool	pounds 9,231,939
Hemp	" 3.5-8 — " 1,500	Poultry	value $1,076,598
Hops	" 9,482 — " 7,192,254	Eggs sold	" 1,360,673
Tobacco	" 7o6 — " 946,502	Miscellaneous crops and products	" 1,421,750
		Cloths of domestic manufacture (yards, viz.: Fulled cloth 198,203; Linen cloth)	105,086
		Flannel 379,922; Cotton and mixed	245,464
		Miscellaneous domestic manufactures	value $258,345

† The census of 1855 enumerates and classifies the manufactures as follows:

Classes of Manufactures.	Establishments. Total No.	Establishments. Water Power.	Establishments. Steam Power.	Capital Invested. In Real Estate.	Capital Invested. In Tools and Machinery.	Hands Employed.	Value of Raw Materials used.	Value of Manufact. Products.
1. Agricultural tools and implements	302..	65..	126....	$749,505..	$344,855....	2,474..	$1,235,929..	$3,120,409
2. Metallurgy and manufacture of metals and implements therefrom	4,783..	500..	302....	10,078,305..	6,426,378....	33,946..	21,806,828..	43,192,687
3. Manufactures of fibrous and textile substance	889..	103..	505....	5,294,629..	5,406,825....	19,669..	10,804,173..	19,643,028
4. Chemical processes, manufac. and compounds	1,351..	246..	115....	11,497,274..	7,591,263....	14,646..	35,692,784..	61,527,083
5. Calorifics: stoves, grates, lamps, etc.	57..	28..	3....	616,900..	201,963....	1,872..	949,135..	2,348,421
6. Steam-engines, boilers, locomotives, etc.	32..	20..	—....	1,412,300..	1,218,850....	4,348..	2,274,787..	4,331,806
7. Navigation and maritime implements	236..	14..	1....	2,070,150..	331,245....	4,786..	3,992,723..	8,268,106
8. Mathematical, philosophical, and optical instruments	49..	9..	2....	105,550..	125,440....	337..	159,080..	537,010
9. Civil engineering and architecture	554..	63..	97....	1,606,030..	443,511....	5,317..	1,057,808..	3,653,398

12. Lever, screw, and other mechanical powers	12..	1..	1.. .	27,950..	13,100....	79..	41,121..	158,700
13. Grinding mills, mill gearing, etc.	1,518..	109..	1,172....	8,159,940..	2,173,853....	1,518..	42,856,563..	52,195,426
14. Lumber, including tools and machines for its manufacture	6,704..	732..	4,274....	9,951,174..	3,004,875....	21,514..	12,206,957..	24,208,041
15. Stone, clay, pottery, and glass manufactures	865..	90..	146....	3,895,690..	1,132,854....	12,313..	2,243,609..	9,494,217
16. Leather and manufactures therefrom	3,015..	142..	438....	4,489,182..	956,917....	19,342..	14,921,705..	27,870,163
17. Household furniture and machines and implements for domestic purposes	959..	67..	174....	1,977,279 .	859,994....	9,679..	3,795,357..	9,185,348
18. Arts, polite, fine, and ornamental	482..	89..	12....	2,426,717..	2,005,209....	6,981..	3,371,788..	8,331,161
19. Fire-arms and implements of war, manufacture of powder and shot	76..	5..	9....	172,145..	140,640....	593..	589,754..	992,068
20. Surgical, medical, and dental instruments and apparatus	36..	3..	—. ..	111,250..	19,000....	211..	73,549..	255,863
21. Wearing apparel, articles of the toilet, etc.	1,010..	22..	27....	2,504,873..	791,649....	38,195..	12,656,715..	22,045,229
22. Miscellaneous manufactures	497..	45..	15....	1,782,672..	1,112,531....	6,190..	5,369,269..	8,900,634
General total	24,833..	2,444..	7,551....	$71,130,407..	$35,219,570....	214,899..	$178,294,329..	$317,428,331

—of the grand total of "employed," there were 155,159 men and 37,771 women, and 15,736 boys and 6,233 girls under 18 years of age.

The following enumerates the trades, of each of which there were at least 50 establishments in the State: (*class* 1) agricultural implements 59; (*class* 2) blacksmitheries 1,921, furnaces 388, iron manufactories 78, machine shops 189, silver ware manufactories 143, tin and sheet-iron manufactories 480; (*class* 3) carding and cloth-dressing establishments 114, cotton fabrics 86, paper-mills 109, woolen cloth and yarn factories 184; (*class* 4) asheries 68, bakeries 196, breweries 128, chandleries and soap factories 111, distilleries 88, painting and glazing establishments 61, salt manufactories 193; (*class* 7) boat-building 74, ship-building 86; (*class* 9) house-building 88, sash and blind factories 200, stair-building establishments 212; (*class* 10) coach and wagon factories 1,397; (*class* 13) grist mills 1,476; (*class* 14) carpenters' shops 232, cheese-box manufactories 60, coopers' shops 666, lath manufactories 68, planing-mills 98, saw-mills 4,948, shingle factories 262, stave manufactories 71, turning shops 136; (*class* 15) brick-yards 269, lime works 101, marble works 138, plaster-mills 144, stone-cutting shops 60; (*class* 16) boot and shoe shops 1,467, harness, saddle, and trunk manufactories 595, tanneries 863; (*class* 17) broom manufactories 54, cabinet shops 616, chair factories 88; (*class* 18) book binderies 48, piano-forte manufactories 66, printing-offices 102; (*class* 19) gunsmiths' shops 65; (*class* 21) glove and mitten manufactories 69, hat and cap manufactories 124, milliners' shops 151, tailor shops 560; (*class* 22) butcher shops 87, tobacco and cigar factories 139, etc. In all 447 different kinds of occupation are separately enumerated under the 22 classes as above described.

The State censuses of 1825, 1835, and 1845 embraced statistics of a few of the leading manufactures, which in the

lake commerce. All that is exhibited in the returns is the aggregate value of the foreign commerce of each State, in which of course the commerce by land as well as water is included.

28. Situated in the midst of great manufacturing and agricultural districts, the interchange between which is constant and of great value, and having within itself all the materials of a vast trade, New York finds itself possessed of a magnificent transit and domestic commerce, and has well provided itself by the construction of canals, railroads, and telegraph lines to meet the exigencies of its favored position. In 1855 there were in operation within the State upward of 3,000 miles of railroad and nearly 1,000 miles of canal, and it is an ascertained fact that the first carry annually from 1,200 to 1,500 tons of freight, and the latter from 8,000 to 9,000 tons to every mile of their length. Hence the merchandise carried by railroads will, even at the lower figure, average 3,600,000 tons, and that carried by canals 8,000,000 tons. The commerce by coasting and the lake and river trade, in the years referred to, employed 701,051 (157,828 steam) tons of shipping; and an allowance of ten trips for each vessel in the year would give an aggregate of 7,010,510 tons. Thus:

Railroad freight	3,600,000 tons	valued at $80 =	$288,000,000
Canal freight	8,000,000 "	" at $60 =	$480,000,000
Coasting, lake, and river freight	7,000,000 "	" at $40 =	$280,000,000
Total	18,600,000 "	"	$1,048,000,000

—represents the gross movement; but on the supposition that these amounts have by transhipment been at least twice accounted for, the whole must be divided by two, and the remainder (9,300,000 tons and $524,000,000) will approximately represent the aggregate net quantity and value of the property carried from the producer to the consumer.

29. With the exception of the Delaware and Hudson Canal, all the canals of this State are public works, and comprise a main channel from Albany to Buffalo (362 miles), connecting the waters of the Hudson with those of Lake Erie, and from this lateral canals break away to the north and south:—*northward*, from Albany to Lake Champlain (78 miles), and from Utica to the navigable waters of Black River (95 miles), completing the waterways to the St. Lawrence, and from Syracuse to Oswego (38 miles), connecting the main line with Lake Ontario; and—*southward*, from Utica to Binghamton (97 miles), from Montezuma to Geneva (23 miles) on Seneca Lake, and from the foot of the lake to Elmira (23 miles), forming together a continuous navigation from Montezuma to Elmira (at which place a short canal—the Junction—connects the New York system with that of Pennsylvania), and from Rochester to Olean (106 miles), etc. The Delaware and Hudson Canal extends from Honesdale, Pa., to the Hudson River at Kingston, and has a length of 108 miles, of which 83 miles are in this State.

30. The railroads of New York have in all cases been constructed by chartered companies. Three principal lines traverse the State east and west, namely, the Northern from Rouse's Point on Lake Champlain to Ogdensburg on the St. Lawrence, 118 miles, the Central from Albany on the Hudson to Buffalo on Lake Erie, 298 miles, and the New York and Erie from Piermont on the Hudson to Dunkirk on Lake Erie, 445 miles. The two latter have numerous branches, and all the transverse roads connect with one or the other and extend beyond them north to the St. Lawrence and the lakes, and south to Pennsylvania and New Jersey. By its connection with the New Jersey lines, the New York and Erie Railroad has its main eastern terminus at Jersey City, opposite to the city of New York. On the east side of the Hudson River are the Hudson River Railroad and the New York and Harlem Railroad, connecting the metropolis with Albany (144 miles) and Troy (151 miles), and also roads continuous of these northward to Canada and eastward into New England and to Boston. The New York railroads, indeed, may be considered as the center of a grand national system connecting the railroads of other States and the British Provinces, and reaching over the whole extent of the Atlantic and interior States of the Union. The electric telegraph is extended along all the principal lines of railroad, and connects every city and town of importance.

31. In 1850 New York contained 198, and in 1855, 338 banks, with aggregate capital amounting to $48,618,762 and $85,589,590. In the same years the circulation amounted to $26,415,556 and $31,340,003; the deposits, to $50,774,193 and $88,852,395; dues to other banks, to $21,873,928 and $26,045,439; and other liabilities, to $2,984,727 and $3,615,502. The assets for the years respectively consisted of—loans and discounts, $107,132,389 and $192,161,111; stocks, $13,177,944 and $20,590,150; real estate, $3,321,589 and $5,857,537; other investments, $736,120 and $*nil*; due by other banks, $10,403,509 and $12,666,517; notes of other banks, $3,031,957 and $2,958,038; specie funds, $10,498,824 and $18,096,545; and specie, $10,045,330 and $10,910,330. In 1855, besides the capital employed by the chartered banks, an additional capital of $43,064,000 was employed by private bankers and money and exchange brokers. Of this sum, $41,500,000 was owned and used in the city of New York.

32. In accordance with the constitution of the State of New York, adopted in convention 9th Oct., 1856, every white male citizen who shall have been such for ten days, and who has resided in the State one year, in the county four months, and in the district 30 days next preceding an election, may vote at all elections in his place of residence. Colored citizens to enjoy the like privilege must have resided in the State three years, and be possessed of a freehold of $250, and have paid taxes thereon.

33. The legislature consists of a senate of 32 members, elected from single districts for two years, and an assembly of 128 members apportioned among the counties, elected for one year. Every white voter is eligible for election, but no person holding office of profit under the State or United States can sit as a member. The legislature meets at Albany on the first Tuesday of January annually.

34. The chief executive power is vested in a governor, who is elected for two years. No person can be governor who has not attained the age of 30 years, nor unless a citizen of the United States and a resident for the last five years in this State. The lieutenant-governor is *ex-officio* president of the senate, and on the death or disability of the governor succeeds to that office. His qualifications are necessarily the same as those of the governor.

35. The administrative officers of this State are the secretary of state, the controller, the treasurer, the attorney-general, etc., elected for two years, and three canal commissioners and three inspectors of State prisons elected for three years, one of each class annually.

36. The judiciary is composed of several courts provided for by the constitution. The court for the trial of impeachments consists of the members of the senate and judges of the supreme court. It meets only when specially called, and its judgments extend only to removal from office and disqualification. The court of appeals, the highest civil and criminal power, is composed of eight judges, of whom four are elected (one every second year) by the people at large, and four selected each year from the judges of the supreme court having the shortest time to serve. The court is presided over by the oldest of the elected judges, and holds four terms annually and district terms every two years. The supreme court has general jurisdiction in law and equity, and power to reverse judgments of county courts, etc. For the purposes of this court, the State is divided into eight districts, each of which elects four judges to serve eight years, one retiring every second year. One general term of this court is held in each county annually, and every county has at least two special (equity) terms and two circuit courts for the trial of issues of fact. The county and surrogate courts have local jurisdiction only; the judges and surrogates are elected for four years. Criminal jurisdiction is vested in courts of oyer and terminer and courts of sessions. New York and some other cities have special civil and criminal courts.

37. The principal institutions supported in whole or in part by the State are the State prisons at Auburn, Sing-Sing, and Clinton, in which the average number of persons confined has for the eight years ending with 1855 amounted to 1,700; the Western House of Refuge at Rochester, the State Lunatic Asylum at Utica, and the New York City Asylum, etc.; the Asylum for Idiots at Syracuse; the Deaf and Dumb and Blind asylums at New York; and numerous hospitals, infirmaries, and other charitable establishments. At West Point on the Hudson is situated the United States Military Academy for the education of officers.

38. The revenue of the general fund on which are charged the ordinary expenses of the government, amounted, for the year ending 30th September, 1850, to $881,241, and for 1855 to $1,684,100, and the expenditures, for the same years, to $826,720 and 1,755,904. The total resources of the treasury for 1855 (including $3,544,126 balance from last year) amounted to $14,957,205, and the total payments to $11,829,694. The general fund debt at the close of the fiscal year 1850 amounted to $6,359,693, and 1855 to 6,692,654, and the canal debt to $16,171,109 and $20,281,333. There is also a small contingent debt of $770,000. The property owned by the State consists of the funds devoted to education, which in 1855 amounted to $5,624,187, and the State canals, the value of which can only be estimated by the amount of their annual net income, which for the six years, 1849 to 1854 inclusive, was $2,330,049, equivalent to a capital of $38,834,157, at six per cent. interest. The taxable property in the State, in 1855, amounted to $1,402,849,304, which was assessed for 8.3 mills on a $1 valuation—and yielded taxes to the amount of $11,678,016, viz., State tax $1,753,561, county tax $7,947,503, and town tax $1,976,951. Of the total tax, New York city raised $5,844,772. In 1848 the valuation of property in the State amounted to $727,494,583.

39. Education in New York is provided for on a liberal scale, and the common schools are open to the children of all classes. In many instances the common schools are fully equal to the best conducted grammar schools and academies, and in the larger cities the courses embrace the classics, mathematics, drawing, music, and all the elements of a thorough training. In the city of New York a Free Academy is open to common school pupils after a successful examination. In 1850 the whole number of scholars returned as attending school in that year was one in every 4.3 of the total population; and the general statistics of schools of that year were as follows:

Classes.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	11,580	13,965	675,321	$1,472,657
Academies and private schools	887	3,136	49,328	727,222
Collegiate institutions	18	174	2,673	148,258

—making a total of 12,485 schools, 17,275 teachers, and 717,222 scholars, and an annual income of $2,348,137.

The number of persons over 20 years of age unable to read and write was 98,722, of which number 91,293 were whites and 7,429 free colored persons, and 30,670 native born and 68,052 foreign born.

HAMILTON COLLEGE OBSERVATORY.

40. In 1855 the State superintendent of common schools returned 11,028 schools, and stated the number of children between the ages of 4 and 21 years of age to be 1,224,127, of which number 900,532 attended school during the year ending 30th June. The number returned as attending private schools was 53,764, and attending academies 38,734. The average attend-

---

first-named year included only the number of establishments, but in the other two years the value of the manufactured products, etc. These returns, compared with those of 1855, are as follows:

Classes.	Number of Establishments.				Value of Products.		
	1825.	1835.	1845.	1855.	1835.	1845.	1855.
Grist mills	2,264	2,051	1,944	1,476	$20,140,435	$22,791,474	$51,531,358
Saw mills	5,195	6,945	7,406	4,946	6,881,055	7,577,154	14,655,103
Oil mills	121	71	87	27	275,574	1,695,025	1,316,627

Paper mills	—	70	82	109	685,784	702,505	2,813,147
Tanneries	—	412	1,414	863	5,598,626	6,585,006	15,642,383
Breweries	—	94	102	128	1,381,446	6,313,273	4,448,453

ance at the State Normal School at Albany is 250, and 1,803 had been attending academies at the expense of the State in expectation that they would become teachers. The aggregate expenditures in the year for school purposes had been $3,216,669, of which $2,128,263 was from the general school fund and $1,115,995 from local taxation. The number of volumes in the district libraries was 1,505,370.

41. The capital of the several funds appropriated to the purposes of education amounted, in 1855, to $6,740,662, and the annual revenue derived therefrom to $824,829, viz.: the Common School Fund $2,457,521, producing annually $488,161; the United States Deposit Fund $4,014,521, producing $282,684; and the Literature Fund $268,620, producing $53,984. Of these funds, what was exclusively the Common School Fund in 1855 may be stated as follows:

Productive capital of the Common School Fund	$2,457,521
Amount from United States Deposit Fund which, at 6 per cent., will produce $165,000, the sum annually appropriated therefrom for the support of common schools	2,750,000
Amount from United States Deposit Fund which, at 6 per cent., will produce $25,000, that being the sum reserved by the constitution to be added annually to the capital of the School Fund	416,667

—the annual interest on this sum at 6 per cent. is $337,451. The remainder of the income of the United States Deposit Fund is appropriated for the support of colleges, academies, the normal school, Indian schools, teachers' institutes, etc. The income of the Literature Fund must by the constitution be applied to the support of academies.

42. The principal collegiate and professional schools in the State in 1855 were as follows;

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.	Commencement.
Columbia College	New York City	1754	6	167	24,000	Last Wed. in July.
Union College	Schenectady	1795	16	338	15,000	4th Wed. in July.
Hamilton College	Clinton	1812	11	158	10,500	3d Thurs. in July.
Hobart Free College	Geneva	1825	6	98	6,650	3d Thurs. in July.
Univer. of the City of New York	New York City	1831	13	80	4,000	Wed. bef. 4th July.
Genesee College	Lima	1834	6	82	5,000	1st Wed. in July.
St. John's College	Fordham	1840	15	162	12,300	15th July.
Madison University	Hamilton	1846	9	159	7,457	3d Wed. in Aug.
University of Rochester	Rochester	1850	8	137	5,200	2d Wed. in July.
Albany Law School	Albany	1851	2	162	State Lib.	—
Theol. Institute of Epis. Church	New York City	1817	5	58	12,000	—
Union Theol. (Presb.) Seminary	"	1836	5	106	18,000	—
Theological (Presb.) Seminary	Auburn	1821	4	30	6,000	—
Hamilton Theol. (Bapt.) Sem.	Hamilton	1820	3	262	7,500	—
Rochester Theol. (Bapt.) Sem.	Rochester	1850	3	50	5,500	—
Hartwick (Lutheran) Seminary	Hartwick	1816	2	52	1,250	—
Theol. (Assoc. Ref. Ch.) Seminary	Newburg	1836	1	143	3,200	—
College of Phys. and Surgeons	New York City	1807	6	219	—	—
Medical Faculty of University	"	1841	11	280	—	—
Medical Inst., Geneva College	Geneva	1836	6	12	—	—
Albany Medical College	Albany	1839	8	114	—	—
Buffalo Medical College	Buffalo	1850	6	38	—	—

—and besides the above there has been founded the People's College at Havana and the State Agricultural College at Rochester, neither of which is yet in a condition to receive students.

43. In 1850 there were in this State 4,169 churches, with accommodation for 1,915,179 persons, and owning property to the value of $21,219,207. The most numerous denominations are the Methodist, Presbyterian, and Baptist, and after these the Episcopalian, Dutch Reformed, Roman Catholic, and Congregational, and then the Universalist, Friends, and Lutheran. Other denominations are numerically small, and together will not count more than a tenth of the whole number.

44. New York contains thirteen cities, as follows:

Cities.	1790.	1800.	1810.	1820.	1825.	1830.	1835.	1840.	1845.	1850.	1855.

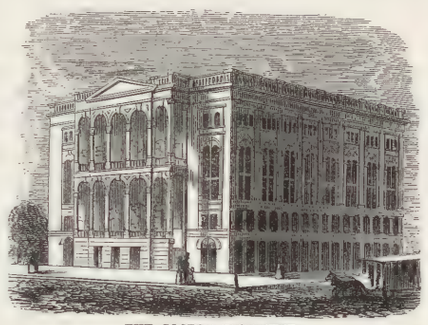
45. New York, the metropolitan city of the State and of the United States, is situated at the head of New York Bay, and on Manhattan Island, at the confluence of the Hudson River with the bay and harbor of New York and the strait called East River, which latter connects the bay with Long Island Sound. The island on which the city is built has an extreme length of 13½ miles and an average width of a mile and a half, with a maximum width of two and a half miles; and contains about 14,000 acres. It is separated from the mainland on the north by Harlem River, a navigable water-course eight miles long, connecting the Hudson and East rivers. Latitude (City Hall) 40° 42′ 40″ north, and longitude 74° 1′ 8″ west from Greenwich. The island, with which the city is co-extensive, was originally much diversified, and in its upper portion, where least populated, it still retains much of its original character. With the increase of population improvements have been made according to a uniform plan—in laying out avenues and streets, grading them, providing them with sewers, etc.

VIEW OF NEW YORK FROM WILLIAMSBURG.

46. The harbor, stretching southward of the city, is one of the most magnificent in the world, and occupies not only the inner bay, but also the East and Hudson rivers for several miles up. The bay is about eight miles long, and 25 miles in circuit, and in it lie Governor's, Bedloe's, and Ellis' islands, all strongly fortified. This bay, forming the inner harbor, has water enough to admit the largest vessels to its wharves, and excellent anchorage, in which the united navies of the world might ride in safety. It is approached from the sea in two directions—from the northeast by the Sound, already mentioned, and from the southeast at the point called Sandy Hook. The latter, about 18 miles distant, is the great ocean thoroughfare; it has a bar across it on which the water is only 21 feet at ebb and 27 at full tide; but within it attains a much greater depth, and widens suddenly out into the fine expanse of Raritan Bay, which, affording both complete shelter and good anchorage, is regarded as an outer harbor. Between the two harbors lies Staten Island, completely blocking up communication excepting at its west and east sides, along each of which there is a navigable channel. The first, leading along the coast of New Jersey, is not much frequented—the latter, formed by the near approach of Long and Staten islands, is the main entrance, and having a width nowhere exceeding two thirds of a mile, it is appropriately called the Narrows. The admirable facilities which this intrusion of the land affords for defending the inner harbor has not been overlooked: it is completely commanded by strong forts, two on each side, and even should an enemy obtain entrance, other equally formidable works on the islands in the bay have to be encountered. The sea defenses are completed by Fort Schuyler, on Throg's Neck, where the East River is entered from Long Island Sound.

47. The island on which New York stands narrows toward its south extremity, and finally terminates in a kind of parabolic curve. This curve incloses the original nucleus of the city, and is still its densest locality. Having been allowed to grow up as immediate convenience might dictate, it is irregularly built, and it is only at Houston Street, about two miles from the Battery, that the adoption of a regular plan becomes visible. Above this the streets and avenues, crossing each other at right angles, are spacious—the avenues, generally 100 feet wide, running north and south, and the streets, from 80 to 100 feet, running east and west, or between the rivers. Both avenues and streets are designated by numbers, as 1st Avenue and 1st Street, etc., except near the East River, where there are avenues A, B, C, and D. The as yet thickly built portion of the city does not extend beyond 50th Street, about four miles above the City Hall; but beyond this there are several suburban villages, and it is probable that within 20 years the island, in its whole length, will be one dense mass of houses. The main thoroughfare is Broadway, extending from the Battery to 25th Street; it is 80 feet wide, and with its public buildings, theaters, hotels, and splendid stores and dwellings presents at all times an imposing scene. The other streets particularly deserving of notice are the Bowery, on the east and nearly parallel with Broadway; Canal Street and Grand Street, crossing Broadway about a mile up; Wall Street, opening from the east into Broadway in its lower part, and containing some of the finest public edifices, and still better known as the center of stock and monetary operations; South Street, along East River, and West Street, along the Hudson, both occupied chiefly by shipping houses; Pearl, Pine, Cedar, and Broad streets, the principal localities for dry goods jobbing and importing houses; Nassau Street, noted for its publishing houses; Water and Front streets, occupied chiefly by wholesale groceries, etc. The squares and other open places are, perhaps, less numerous and attractive than might be desired, though the general spaciousness and directness of the streets may make such not so indispensable.



VIEW IN WALL STREET.

48. The public architecture in New York is of a very superior character, and the number of public buildings is being constantly increased. The City Hall, occupying a commanding position in the Park, is a very imposing structure of marble and freestone, and rising above the structure is a fine cupola, on the top of which a colossal statue of Justice has been placed. The extent of the building, 216 feet long by 105 feet wide, affords ample space for the numerous municipal offices and courts. The Merchants' Exchange, in Wall Street, is a massive granite building, surmounted by a dome 124 feet above the ground. The edifice is 200 feet long and from 144 to 171 feet wide, and 77 feet high to the top of the cornice; in front is a recessed portico of 18 Ionic columns, each a single solid block, 38 feet high, and weighing 43 tons, and among the numerous rooms is the Rotunda, 80 feet in diameter, and crowned by a dome, supported in part by eight Corinthian columns of Italian marble. The Custom House, at the head of Broad Street, is a splendid Doric structure of white marble modeled after the

* Including Williamsburg and Bushwick, which were incorporated with Brooklyn in 1854.

Parthenon at Athens. The present Post Office, formerly the Dutch Church, is a miserable building for such a purpose, but is to be replaced by one worthy of so large a city. The Halls of Justice, commonly called "the Tombs," are built in the Egyptian style. The building occupies the block surrounded by Centre, White, Elm, and Worth streets, and is used as a police court and house of detention. The City Penitentiary is located on Blackwell's Island, in the East River, and is a very extensive and imposing series of buildings. On the same island are—the Lunatic Asylum and Almshouse, buildings more remarkable for their magnitude than architectural pretensions. The new State Arsenal, on Fifth Avenue between 62d and 64th streets, is a massive Gothic structure, in the castellated style, surmounted by eight towers 69 feet high, four in front and one at each angle of the building. The churches number about three hundred, and many are costly and magnificent structures. Of these the Presbyterians, Episcopalians, and Methodists have each about 50, the Baptists 35, the Roman Catholics and Dutch Reformed each 25, and the Congregationalists and Jews each a dozen; and all the other sects have one or more places of worship.

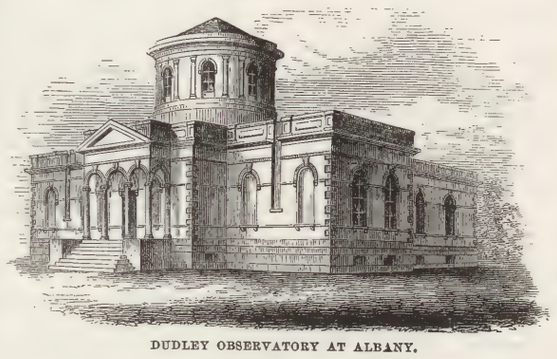
THE COOPER INSTITUTE.

49. The educational establishments of New York are extremely numerous, and besides its excellent public schools, include several great collegiate and professional institutions. Among the principal are—Columbia College, the University, the College of Physicians and Surgeons, the University Medical College, the New York Medical College, the General Theological Seminary, etc., and numerous academies and high schools, public and private. The chief literary institutions and libraries are—the Historical Society, the Geographical and Statistical Society, the Law Institute, the Society Library, the Mercantile Association, the American Institute, the Lyceum, etc., the Astor Library, founded by the late J. J. Astor at a cost of $400,000, and the noble Institute recently founded by Peter Cooper, Esq. The hospitals, asylums, and benevolent institutions are both numerous and well-provided; and few cities are better supplied with places of amusement than is New York. The city is supplied with water by the Croton Aqueduct, a vast work completed in 1842 at a cost of nearly $15,000,000. The water is brought from a lake or pond, formed by damming up the Croton River, by a covered aqueduct 40 miles long, and capable of supplying daily 60,000,000 gallons of water.

50. The commerce of New York has, with occasional fluctuations, been steadily progressive. The returns for the past 25 years are as follows:

Years.	Ship. built. Tons.	Ship. owned. Tons.	Ship. enter. Tons.	Ship. clear. Tons.	Years.	Ship. built. Tons.	Ship. owned. Tons.	Ship. enter. Tons.	Ship. clear. Tons.
1830.....	12,079....	256,558....	314,715....	243,235	1845	26,621....	550,359....	579,218....	483,525
1835.....	17,368....	376,697....	464,464....	369,590	1850.....	55,525....	835,867....	1,145,331....	982,478
1840.....	13,357....	414,818....	527,594....	392,597	1855.....	92,697....	1,288,234....	1,735,907....	1,445,754

—of the shipping owned in 1855, that classed as registered amounted to 737,509 tons, that as enrolled to 538,161, and that as licensed (under 20 tons) to 12,563 tons. Of the registered shipping, 89,105, and of the enrolled shipping 107,692 tons represented the steam marine. The coasting and internal trade greatly surpass that with foreign countries; and besides the vast tonnage engaged in the foreign trade, there are generally about 2,000 coasting vessels lying in the harbor at the same time. The commercial intercourse with the interior and with the States westward is secured by the Hudson River and the very complete system of railroads and canals terminating on its borders; and no less than 11 lines of railroads diverge from New York, placing it in direct communication with all the more important trading stations of the Union. There are also "avenue railroads" through all the principal north and south thoroughfares of the city.



51. Though mainly distinguished for its vast commerce, New York is at the same time the greatest of American manufacturing cities. At the census of 1850 the persons employed in productive and manufacturing establishments numbered nearly one sixth of the entire population—the number of establishments was 3,387, the capital invested $34,232,822, and the manufactured products for the year were valued at $105,218,308. The principal establishments in the city are its iron founderies and machine shops, breweries, distilleries, sugar refineries, brass founderies, carriage factories, hardware works, etc., with manufactories of pianofortes, furniture, jewelry, and all the usual branches of useful and ornamental goods required for ordinary use or luxury in a wealthy metropolis. The publishing trade is also one of the great industries of the city. There are 56 banks in New York and 16 savings' institutions, and 104 fire, 15 marine, and 21 life insurance offices.

52. To estimate the resources of such a city is almost impossible; but a good idea of its wealth may be formed from the annual assessments for taxation. In 1856 the total value of taxable property was $513,939,279, and the amount of tax levied for the support of the city government and institutions was $7,075,425. The aggregate wealth of but few of the States of the Union amounts to a sum like this; and the amount taxed on the city annually is sufficient to pay all the ordinary expenses of the 31 State governments in bulk.

53. Brooklyn, the second city of the State in population, is located at the west end of Long Island and opposite New York, with which it connects by numerous steam ferries crossing the East River. The site is elevated, and fronting on the river the heights in one part are 70 feet above mean tide, affording a splendid view of the harbor and shipping. This city must be considered simply as an expansion of New York, and as one of its suburbs; but it is a handsome and well-governed place, and much more cleanly and better built than its metropolitan. The streets and avenues are wide and spacious, and in the outer districts there are several public squares, of which Washington Square or Fort Greene is the largest and most picturesque, occupying the highest part of the city. In architecture it is particularly rich: among its public buildings are its splendid City Hall (a marble building, 162 by 102 feet, and 75 feet high, consisting of three stories and a basement, and surmounted with a dome, the top of which is 150 feet above the ground), occupying a conspicuous site at the head of Fulton Street; its hundred churches, many of them exceedingly handsome and ornate; its literary and charitable institutions—among the first, the Atheneum, the City Library, the Lyceum, etc., and among the latter the City Hospital, the Orphan Asylum, the Marine Hospital, the Graham Institution, etc.; and its public schools, very numerous and probably better conducted than in any other city. Brooklyn is also a place of extensive manufacturing industry, commerce, and trade. Fulton Street, in old Brooklyn, and Grand Street, in the Eastern District, vie with many of the great thoroughfares of New York in the amount and variety of their merchant stores, and almost the whole lower part of the city, from the Atlantic Docks to Newtown Creek, is taken up with manufacturing establishments, ship-yards, etc., and many species of manufacture are conducted throughout the city limits. As a port it is subsidiary to that of New York, and, in fact, is a part of it, and is the great depôt for naval stores, grain, etc. The Atlantic Dock, at the south end of the city, is one of the largest in the Union, and is well provided with warehouses. Its surface covers 41 acres, and its depth is sufficient for the largest shipping. On the south side of Wallabout Bay, which makes up toward the north part of the city, is the United States Navy Yard, occupying about 40 acres, and inclosed on the land side by a stone wall. It is one of the chief naval depôts, and contains a vast amount of material and every facility in its ship-houses, workshops, and dry-docks for the purposes of its establishment. Near by is the United States Marine Barracks (a miserable wooden building), and on the opposite side of the bay, on elevated ground, the fine hospital edifice. Greenwood Cemetery is at the southern extremity of the city. Brooklyn was first settled in 1625, and was incorporated as a town in 1806 and as a city in 1834. In 1854 the city of Williamsburg and the town of Bushwick (now forming what is called the Eastern District) were annexed to it; and at the present day Brooklyn may be considered as one of the great cities of the world; in the United States the only cities having larger populations are New York, Philadelphia, and Baltimore.

54. Buffalo, capital of Erie County, and the principal city on Lake Erie, built near the eastern extremity of that water, is the great entrepôt between the lake country and the seaboard. The harbor, formed by Buffalo Creek, is capacious and well protected from storms by a breakwater, and sufficiently deep for the largest lake vessels, and every accommodation has been provided for its vast and increasing commerce. The shipping of the port in 1850 amounted to 39,679 tons, and in 1855 to 76,952 (of which 38,262 steam) tons. In the latter year the total entrances and clearances amounted to 3,333,232 tons, and the aggregate value of the imports and exports, foreign and coastwise, was $303,023,000, or an amount equal to two thirds of the whole foreign commerce of the United States! The principal materials of this commerce are the manufactures of the East and foreign countries, groceries, etc., and the products of the fields, forests, and mines of the West. The commerce of Buffalo is also augmented and greatly facilitated by the Erie Canal, here terminating, and the numerous railroads of which it is the center. The manufactures of the city are also extensive, chiefly consisting of the various manufactures of iron, machinery, cars, etc. But it is almost wholly to its eligible position that Buffalo owes its rapid growth and present eminence. It was laid out so late as 1801; it became a military post in 1812. In 1832 it was incorporated.

55. Albany, on the west bank of the Hudson, 145 miles north of New York city, is the political capital of the State and the eastern entrepôt of the vast commerce between the East and West. It is built on the slope of a hill and along the river flat, and approached from the east has a fine appearance. Here terminate the Erie and Champlain canals and numerous important railroads, and here also sloop navigation on the river. Its manufactures are large and diversified, including hardware, machinery, railroad cars, carriages, stoves, etc., and its breweries are the most extensive in the Union. Albany is also one of the greatest lumber markets in the world. The local trade of the city is active, and many of the warehouses and stores equal those of New York in the variety, value, and splendor of the merchandise exhibited. The city is not distinguished for regularity in its plan nor elegance in its domestic architecture; but it contains several spacious public places and many buildings which compare well with those of other large cities, among these may be named the Capitol, State House, City Hall, Geological Hall, etc. It has also a University, Observatory, Medical College, and numerous scientific and literary institutions; and many of its churches are worthy specimens of architecture.

DUDLEY OBSERVATORY AT ALBANY.

56. Troy, capital of Rensselaer County, is built on the east side of the Hudson, six miles above Albany, and at the head of steamboat navigation. Its commerce consists chiefly in the transhipment of merchandise to and from the canals, river, and railroads; but the city has also a large commerce of its own, furnished with material from its numerous workshops. As a manufacturing city, indeed, it is one of the first in the State, and produces large quantities of machinery, hardware, railroad cars, etc. It is also noted for its breweries and as an extensive lumber market. On the opposite side of the river is West Troy, also a manufacturing place, and which may be considered as a suburb of the city.

57. Rochester, capital of Monroe County, is built on both sides of the Genesee River, seven miles from its entrance into Lake Ontario, 229 miles west of Albany, and 68 miles east of Buffalo by the Central Railroad. At this point the Genesee Valley and the Erie canals form a junction, and also several important lines of railroad. It is the largest town on the great central avenue, and is equally noted for its commerce and manufactures. Its flour-mills are, perhaps, the most extensive in the Union, and it also manufactures machinery, agricultural implements, castings, cotton and woolen goods, paper, etc., these branches of business relying chiefly on the vast water-power derived from the river falls for their prosecution. About 600,000 barrels of flour are annually manufactured in the Rochester district, requiring at least 3,000,000 bushels of wheat, which is chiefly received by canal, but in a great measure also by lake from Canada. Rochester is a fine city, on a nearly level site, and has spacious and well-paved streets, adorned with numerous public buildings and handsome residences, built chiefly

of brick or limestone quarried in the vicinity. The Genesee, within a course of three miles, falls 226 feet, and has three perpendicular falls of 97, 20, and 105 feet respectively. The first of these is within the city limits.

ROCHESTER AND THE GENESEE FALLS.

58. Syracuse, capital of Onondaga County, is situated at the south extremity of Onondaga Lake and on the Erie Canal and Central Railroad, about midway between Buffalo and Albany. The canal is here joined by the Oswego Canal, extending along the Oswego River from Lake Ontario. and the Central Railroad, by a line from Oswego and another from the south *via* Binghamton. The central position it thus enjoys is highly conducive to its prosperity, and has made it a commercial station of importance. It is also an important manufacturing town, and in its vicinity are several villages engaged in the manufacture of salt.

59. Utica, in Oneida County, is a goodly city on the Mohawk River, Erie Canal, and Central Railroad, 95 miles from Albany; and the Chenango Canal and several lateral railroads also come in here. The city is well-built and is the seat of the State Lunatic Asylum and several other public buildings. Its manufactures are extensive and flourishing, and its commerce rapidly increasing.

60. Oswego, capital of Oswego County, is situated on the shore of Lake Ontario and on both sides of Oswego River. It is the natural port of Syracuse, and has a large trade with Canada. In 1855 its shipping amounted to 42,460 (5,199 steam) tons, and the entrances and clearances to 1,607,000 tons. The value of its imports and exports in the same year amounted to $146,235,000. The port is connected with Syracuse by the Syracuse and Oswego Railroad and the Oswego Canal.

61. Poughkeepsie, capital of Duchess County, is built on the east side of the Hudson River, and on the line of the Hudson River Railroad, 75 miles above New York. It is the largest place between Albany and New York, and has a considerable manufacturing interest.

62. Auburn, capital of Cayuga County, is a thriving city on the old line of the Central Railroad, 174 miles west from Albany. The outlet of Owasco Lake flows through the town and affords excellent water-power. The State Prison at this place is one of the largest in the world. The manufactures of the city consist chiefly of cotton and woolen goods, carpets, iron, paper, etc.

63. Schenectady is built on the right bank of the Mohawk, and on the line of the Erie Canal. It is one of the oldest cities of the State, and although enjoying extraordinary facilities for commerce is almost stationary in its population. It is the seat of Union College.

64. Hudson, capital of Columbia County, is situated at the head of ship navigation on the Hudson River and on the Hudson River Railroad, 116 miles above New York. It is both a commercial and manufacturing town, and was formerly extensively engaged in the West India trade and more recently in the whale fisheries.

65. The following is a list of the principal villages in the several counties of the State, with their population, in 1855:

ALBANY.....Coeyman's Landing, 640; Cohoes, 6,106; Green Island, 1,324; Groesbeck, 1,232; Rensselaerville, 561; West Troy, 8,306.
ALLEGHANY....Angelica, 846; Belfast, 801; Belmont, 763; Cuba, 816; Oramel, 738; Rushford, 654; Scio, 496; Wellsville, 1,286.
BROOME.....Binghamton, 8,818; Chenango Forks, 506; Deposit (656, and in DELAWARE 593), 1,249; Union, 520.
CATTARAUGUS..Ellicottville, 695; Gowanda (520, and in ERIE 338), 858; Olean, 994.
CAYUGA.....Montezuma, 650; Port Byron, 1,669; Union Springs, 1,118; Weedsport, 1,226.
CHAUTAUQUE...Dunkirk, 4,754; Ellington, 487; Forestville, 540; Fredonia, 2,004; Jamestown, 1,625; Mayville, 501; Panama, 500; Silver Creek, 652; Westfield, 1,433.
CHEMUNG.....Elmira, 8,308; Horseheads, 1,000; Millport, 706.
CHENANGO.....Greene, 814; New Berlin, 740; Norwich, 2,430; Oxford, 1,218; Sherburne, 1,140.
CLINTON.....Champlain, 1,473; Clintonville, 855; Keeseville (1,199, and in ESSEX 1,370), 2,569; Peru, 504; Plattsburg, 2,926; Rouse's Point, 1,769.
COLUMBIA.....Chatham 4 Corners, 697; Claverack, 496; Kinderhook, 1,078; Shaker Village, 392.
CORTLAND.....Cortland Village, 2,117; McGrawville, 558; Marathon, 500.
DELAWARE.....Delhi, 919; Franklin, 490; Hancock, 502.
DUCHESS.....Fishkill Landing, 1,100; Hyde Park, 692; Matteawan, 1,476; Myersville, 500 Pleasant Valley, 500; Red Hook, 625; Rhinebeck, 1,051; Wappenger's Falls, 1,819.
ERIE.....Lancaster, 1,259; Springville, 953; White's Corners, 609; Williamsville, 1,166.
ESSEX.....Essex, 601; Port Henry, 503; Westport, 456.
FRANKLIN.....Malone, 1,993.
FULTON.....Fonda's Bush, 651; Fort Covington, 894; Gloversville, 1,965; Johnstown, 1,661; Mayfield Cor., 600.
GENESEE.....Batavia, 2,868; Careyville, 500; Le Roy, 2,081.
GREENE.....Athens, 1,747; Catskill, 2,520; Coxsackie, 1,800; New Baltimore, 709; Prattsville, 617.
HAMILTON.....Lake Pleasant, (?); Hope Center, (?); Arietta, (?).
HERKIMER.....Frankfort, 1,150; Herkimer, 1,371; Ilion, 813; Little Falls, 3,984; Mohawk, 1,355; Newport, 671.
JEFFERSON.....Adams, 963; Antwerp, 621; Brownville, 621; Cape Vincent, 1,026; Carthage, 785; Clayton, 896; Sackett's Harbor, 994; Theressa Falls, 559; Watertown, 5,873.
KING'S.....East New York, 1,000; Union Place, 500.
LEWIS.....Copenhagen, 505; Lowville, 908.
LIVINGSTON....Avon, 879; Caledonia, 623; Dansville, 2,879; Mt. Morris, 1,851; Nunda, 1,125.
MADISON.....Canastota, 1,081; Cazenovia, 1,177; Chittenango, 916; Clarksville, 578; De Ruyter, 727; Eaton, 510; Hamilton, 1,448; Morrisville, 715; Oneida, 1,713; Oneida Castle, 337.
MONROE.....Brockport, 2,143; Fairport, 685; Mumford, 535; Penfield, 560; Pittsford, 702; Scottsville, 925; Spencerport, 578.
MONTGOMERY..Amsterdam, 2,044; Canajoharie, 1,500; Fonda, 687; Fort Plain, 1,502; Fultonville, 850; St. Johnsville, 648.
NEW YORK.....New York City.
NIAGARA.....Lewiston, 1,014; Lockport, 8,939; Middleport, 689; Niagara City, 1,365; Niagara Falls, 2,976; Wilson, 666; Youngstown, 768.
ONEIDA.....Booneville, 1,000; Camden, 862; Clayville, 817; Clinton, 1,174; Durhamville (800, and in MADISON 234), 1,034; New Hartford, 892; New London, 668; Oriskany, 701; Rome, 7,088; Sauquoit, 690; Waterville, 1,109; Whitesboro', 953.
ONONDAGA.....Baldwinsville, 1,675; Brewerton, 621; Camillus, 552; Elbridge, 630; Fayetteville, 1,376; Geddes, 950; Jordan, 1,331; Liverpool, 672; Manlius, 934; Skaneateles, 1,200. (Salt region.)
ONTARIO.....Canandaigua, 4,154; E. Bloomfield, 590; Geneva, 5,057; Naples, 700; Phelps, 1,278; Phœnix, 1,164.
ORANGE.....Chester, 704; Cornwall Landing, 615; Middletown, 1,878; Montgomery, 760; Newburg, 9,256; Port Jervis, 3,023.
ORLEANS.....Albion, 3,776; Eagle Harbor, 639; Holley, 614; Knowlesville, 490; Medina, 2,104.
OSWEGO.....Cleveland, 1,005; Constantia, 600; Fulton, 3,192; Mexico, 948; Oswego Falls, 703; Pulaski, 1,168.
OTSEGO.....Cherry Valley, 933; Laurens, 726; Lewisville, 504; Oneonta, 678; Unadilla, 795.
PUTNAM.....Cold Spring, 2,237.
QUEEN'S.....Astoria, 2,971; Flushing, 3,488; Hempstead, 1,486; Jamaica, 2,817; Roslyn, 592; Strattonport, 1,150; Whitestone, 680.
RENSSELAER....Greenbush, 3,303; Hoosic Falls, 1,200; Lansingburg, 2,730; Schaghticoke Point, 1,148; Schagticoke, 889.
RICHMOND.....Graniteville, 481; Mariner's Harbor, 1,142; Port Richmond, 1,429; Tottenville, 600.
ROCKLAND.....Nyack, 1,458; Piermont, 2,204; Rockland Lake, 480.
ST. LAWRENCE..Canton, 1,029; Gouverneur, 785; Ogdensburg, 7,057; Potsdam, 2,123; Waddington, 705.
SARATOGA.....Ballston Spa, 2,285; Crescent, 593; Mechanicsville, 1,111; Saratoga Springs, 5,129; Schuylerville, 1,184; South Glen's Falls, 513; Stillwater, 552; Victory Mills, 729; Waterford, 3,083.
SCHENECTADY..Schenectady.
SCHOHARIE.....Gilboa, 566; Schoharie, 806.
SCHUYLER.....Havana, 1,290; Watkins, 1,084.
SENECA.....Seneca Falls, 2,125; South Waterloo, 597; Waterloo, 3,050.
STEUBEN.....Bath, 2,012; Corning, 3,626; Hammondsport, 560; Hornellsville, 1,519; Knoxville, 628; P. Post, 777.
SUFFOLK.....Babylon, 470; Cold Spring, 602; Greenport, 1,665; Huntington, 1,328; Northport, 430; Patchogue, 1,562; Port Jefferson, 1,247; Riverhead, 813; Sag Harbor, 2,776; Sayville, 822; Setauket, 1,136.
SULLIVAN.....Jeffersonville, 433; Monticello, 629; Wartsboro', 492.
TIOGA.....Owego, 3,041; Waverly, 1,067.
TOMPKINS.....Dryden, 522; Groton, 587; Ithaca, 4,908; Trumansburg, 1,052.
ULSTER.....Kingston, 3,971; Naponeck, 700; Port Ewan, 1,300; Rosendale, 450; Saugerties, 3,334.
WARREN.....Glen's Falls, 3,420; Warrensburg, 700.
WASHINGTON...Fort Ann, 608; Fort Edward, 1,565; Grandview, 425; North White Creek, 652; Salem, 632; Sandy Hill, 1,260; Union Village, 1,173; Whitehall, 3,225.
WAYNE.....Clyde, 1,856; Lyons, 3,221; Newark, 2,042; Palmyra, 2,310; Wolcott, 566.
WESTCHESTER..Dobbs' Ferry, 1,040; Eastchester, 551; Hastings, 1,135; Irvington, 599; Morrisania, 2,587; Mott Haven, 843; Mount Vernon, 1,661; New Rochelle, 2,000; Peekskill, 3,538; Port Chester, 1,695; Sing-Sing, 1,440; Verplanck's, 1,456; Westchester, 1,000; West Mount Vernon, 630; Yonkers, 4,710.
WYOMING.....Arcade, 637; Attica, 1,184; Castile, 682; Perry, 935; Pike, 581; Portageville, 561; Warsaw, 1,200.
YATES.....Dundee, 732; Penn Yan, 2,277; Rushville (408, and in ONTARIO 175), 583.

66. Verrazano, a Florentine, in the service of France, is said to have discovered New York Bay in 1524; but the history of the State commences with the arrival of Hudson, an Englishman in the Dutch service, who, in 1609, ascended the river bearing his name as far as the present site of Albany. The country thus discovered was inhabited by the Mohawks, a formidable and warlike tribe, and the Manhattans, who inhabited the island on which New York city is built. In 1610 a ship was sent from Amsterdam to trade with these Indians, and other voyages were made during the succeeding years. In 1613 small trading forts were erected on the river, and several houses were built on Manhattan Island.

67. On the 29th March, 1614, the States General of the United Netherlands passed an ordinance granting to all original discoverers of lands in North America the exclusive privilege of making four voyages to each, for the purposes of trade. Under this ordinance five ships were dispatched the same year by a company of merchants. They explored extensively the coast near New York. Blok, one of the commanders, discovered and named Block Island, south of Rhode Island, and also the East River; and Captain Mey, proceding southward, discovered capes May and Henlopen; and on the return of these ships a Captain Henrickson was left on the coast to prosecute discoveries. The country extending between the Connecticut and Delaware rivers received the name of New Netherlands, and the exclusive right to trade there for three years from that date (11th October, 1614) was granted to the discoverers, who, upon the passage of this grant, formed themselves into a company called the United New Netherlands Company. This company erected the same year a fort and trading-house on an island just below the present city of Albany, and garrisoned it with ten or twelve men. Another fort was erected on the southern point of Manhattan Island. The grant expiring in 1618, the company petitioned for its renewal in vain. Private traders, however, continued to visit the country for the purposes of traffic.

68. In June, 1621, was passed the charter of the Dutch West India Company, an armed mercantile association. This company sent out a ship called the New Netherlands, on the 20th June, 1623, to their newly acquired possessions, under the direction of Mey, already noticed, and Tienpont. The former of these proceeded to the Delaware, and established a fort near the present town of Gloucester, which he named Fort Nassau, and the same year a fortified post, called Fort Orange, was erected on the site of Albany. In 1624, Peter Minuit, having been appointed director, arrived out with several families of Walloons, inhabitants of the frontiers of Belgium and France. These settled on a bay of Long Island, and called from them Wahlebocht, or bay of foreigners, a name since corrupted into Wallabout. The government was vested in the director and a council of five. In 1626 Staten Island was purchased of the Indians, and in the same year Manhattan Island was purchased for twenty-five dollars. The fort upon this latter island received the title of Fort Amsterdam, and the colony that of

STADT HUYS, NIEUW AMSTERDAM.

New Amsterdam. The exports this year amounted to $19,000. In 1627 the settlers of Plymouth Colony set up a claim to the region watered by the Connecticut, which the Dutch denied. Up to 1629 the settlements were simply trading posts. On the 7th June, 1629, a measure was adopted which is still felt in the State, and under this extensive seignories, with

feudal rights, were granted to certain individuals. Active exertions were now made to colonize these vast estates. In 1632 Minuit was recalled, and the government of Wouter Von Twiller installed, and after a lapse of five years of mal-administration, Twiller was succeeded by William Kieft.

69. During the administration of Twiller difficulties arose between the English settlers on the Connecticut and the Dutch authorities. In 1638 the restrictions which had hitherto been placed by the company upon trade were taken off and free traffic encouraged. This measure gave a new impulse to immigration. Persecution, too, drove many from New England and Virginia to settle among the more tolerant Dutch. In the mean time the aggressive disposition of the English continued. They founded a colony at New Haven, occupied the Tunxis (Farmington) Valley, and even went so far as to plow and sow the company's land around Fort Good Hope, at Hartford. Remonstrances were vain. Not satisfied with these encroachments, the Plymouth Company granted the whole of Long Island to the Earl of Stirling, and a settlement was soon after effected by Lyon Gardiner, at Gardiner's Island. The Dutch, meanwhile, were active in establishing settlements at the western extremity of the island—in *Breuckelen*, at *Gowannus*, and *Gravenzande*. In May, 1640, emigrants from Lynn, Mass., settled on Cow Neck, but were driven off by the authorities. In the autumn of the same year, however, they returned, and founded the towns of Southampton and Southold. The Indians saw, with daily increasing envy and dislike, the heritage of their fathers thus falling from them. War was the consequence, which desolated the colony for five years. In 1645 Peter Stuyvesant became governor, and only terminated his administration by the capture of his colony by the English, on the 6th September, 1664.

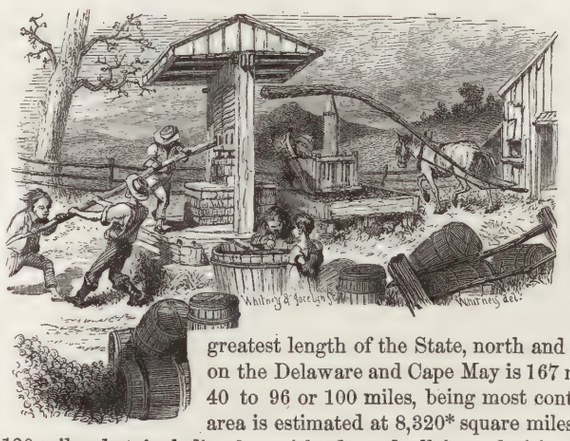
70. The name of the colony and city was now changed to that of New York, and Colonel Nichols was appointed by the Duke of York, to whom the territory had been granted by the king, as governor. On the 12th June, 1666, the governor granted a charter to the city of New York. The colony was recaptured by the Dutch on the 7th August, 1673. The name of the city was now changed to New Orange, that of Albany to Williamstadt, and the fort previously called Fort James to William Hendrick. Captain Anthony Colve was appointed governor. The country, however, was not destined to be Dutch, for, by the treaty of 9th February, 1674, it was restored to the English, and given up the following autumn.

NEW YORK IN 1664.

71. Some doubts arising relative to the validity of the Duke of York's patent, both on account of the Dutch occupancy and the fact that it was wrested from that nation in time of peace, he deemed it advisable to obtain a new patent from his brother, the king, in 1674. In the autumn of that year Major Edmund Andros, afterward so well known as the tyrant of New England, arrived in New York and assumed the office of governor. In February, 1685, the duke ascended the throne, under the title of James II., and among the first acts of this bigot were his instructions to allow no printing-press to be established in the colony. But his reign was short, having been put an end to by the Revolution of 1688, and the proclamation of William and Mary as heritors of the throne.

72. In 1744 war was declared between England and France, and the colonists prepared to carry it on with vigor. In 1745 New England and New York united in an attack upon the French fortress at Louisburg, and New York furnished ten pieces of cannon and £8,000 toward the expedition. It was surrendered in July of that year. The colonists were so severely molested during the year 1746 by the Indians in pay of the French, that it was determined to attack Crown Point and Niagara, and to capture Quebec. For this purpose New York raised £40,000. The enterprise proved unsuccessful, and the peace of Aix la Chapelle was concluded in 1748. For a few years after this the colony prospered, and began to recover from its losses by the wars.

73. In 1754 a convention from all the colonies north of Mason and Dixon's line met at Albany, to devise some plan of common defense against the French, who had again commenced hostilities. At this convention, Dr. Franklin, afterward so eminent in the history of the Revolution, proposed a plan of political union. In the spring of the following year an expedition was sent against Fort Du Quesne, but entirely failed, Braddock, the leader of the expedition, having been killed. Nor was the campaign of 1756 more successful. In 1758 William Pitt was placed at the head of the English government, and a new impulse was given to the energies of the nation. Success soon followed. Forts Frontenac and Du Quesne were captured. Stimulated by these successes, New York, in 1759, raised $625,000 and a force of 2,680 men. Ticonderoga was captured early in the season, and Crown Point surrendered a few days later. Fort Niagara was reduced, and on the 13th September the brave General Wolfe laid down his life, in the moment of victory, when the English banners floated over the towers of Quebec. The ensuing year the French made an unsuccessful effort to recapture Quebec, and on the 8th September all the French possessions east of the Mississippi were surrendered to the British, and the French power extinguished. Two small islands off the southern coast of Newfoundland alone were preserved to them of their former vast possessions.



74. The imposition of the Stamp Act, in 1764, and the other atrocities of the British government which followed it, and which led to the overthrow of the British power in the colonies, need not be enlarged upon in this connection, being a part of the general history of the Union. On the first Tuesday in October, 1765, a congress, composed of delegates from the New England and Middle States, assembled at New York, to take into consideration their grievances. South Carolina had also delegates. This congress made declaration of the privileges and rights of the colonies.

75. On the 5th September, 1774, a congress from several colonies met at Philadelphia, in which, however, New York was not represented. In April, 1775, a provincial convention met at New York, and elected delegates to the second congress. The news of the battle of Lexington caused great excitement in the city, and the arms of the city were ordered to Boston, but seized by the authorities before their shipment. The war had now commenced. Ticonderoga, Crown Point, and Whitehall, in this State, were captured by the provincials, and the entire command of Lake Champlain was obtained. On the 9th July, 1771, the provincial congress met at White Plains, and took the title of Representatives of the State of New York. On the first day of their meeting they received the Declaration of Independence, and immediately passed a resolution approving it. The fortunes of the continental army from this time to the acknowledgment by England of the will of the sovereign people were various, and in New York were fought many of the famous battles of the period—those of Brooklyn Heights, Harlem Heights, Bemis' Heights, Stony Point, Ticonderoga, Fort Schuyler, Stillwater, and Saratoga, at the last of which Burgoyne surrendered to the Americans.

76. On the 12th March, 1777, a constitution for the State of New York was reported by a committee of the provincial congress, and on the 20th April ensuing was adopted as the basis of the government. Under the new constitution George Clinton was elected governor. In 1791 the industry of the State received a new impulse from the organization of a society for the promotion of agriculture, arts, and manufactures. The next year companies were organized to improve the navigation of the Hudson and Mohawk rivers, and open canals to lakes Champlain and Ontario. In 1807 Robert Fulton made his first trip with the Clermont, the first steamboat which ever plied successfully on the waters. In this enterprise he was aided by Robert R. Livingston, one of the most distinguished statesmen of the nation. The war of 1812–15 soon followed. On the 24th of December, 1814 the treaty of Ghent was signed, and peace again restored the land to its wonted prosperity.

77. Of the events which have happened since the war there are many living witnesses, and a brief notice only is required. The canal project was revived, and in 1816 the subject was brought before the legislature, and in 1817 the Erie and Champlain canals were commenced. The first was completed in 1825 and the latter in 1823. In 1835 a law was passed ordering the enlargement of the Erie Canal. Railroads had already been commenced in the State. Both have been since prosecuted with untiring energy, and these works have no doubt had a mighty influence on the prosperity of the country. In 1821, and also in 1846, the fundamental laws were revised, and many important additions made to them.

STATE OF NEW JERSEY.

1. New Jersey is situated between 38° 55′ and 41° 21′ north latitude, and 73° 58′ and 75° 29′ west longitude; and is bounded on the north by the State of New York, on the east by the Hudson River and Atlantic Ocean, on the south by the Atlantic Ocean and Delaware Bay, and on the west by Delaware Bay and River, which divide it from the States of Delaware and Pennsylvania. The greatest length of the State, north and south, between Carpenter's Point on the Delaware and Cape May is 167 miles, and the breadth varies from 40 to 96 or 100 miles, being most contracted in the middle. The land area is estimated at 8,320* square miles. The coast-line has a length of 120 miles, but including bays, islands, and all irregularities a length of 540 miles, or about one mile of coast to every 15½ square miles of surface.

2. The northwestern part of the State is hilly rather than mountainous, being traversed by several prolongations from the ridges of the Alleghanies. These hills nowhere rise to a great height, but they abound in bold and varied scenery, and are interspersed with fertile and pleasant valleys, comprising some of the best lands. Schooley's Mountain, the most prominent of these elevations, is much resorted to in the summer season, on account of its salubrious atmosphere, and for the purpose of using its mineral waters, which possess medicinal properties.

3. The eastern line of the State is formed by a bold ridge of trap rock, called the Palisades or Cloister Hill, which presenting a precipitous wall to the river, at several places, as at Weehawken, 200 feet high, gives an air of grandeur and wildness to the scenery. This wall of rock extends about 20 miles along the shore, and forms one of the principal objects which distinguish the noble panorama of the Hudson River, and many historical recollections and national traditions are connected with its localities.

4. The southern part of the State, from Raritan Bay and Trenton to Cape May, consists of a great sandy plain, nowhere rising more than 60 feet above the sea, except at the Navesink Hills, which although only 300 feet high form prominent objects on the general level, and from the ocean are the first land sighted by the approaching mariner.

* According to a recent State document the area is computed at 7,750.93 square miles. Darby gives it at 6,851 square miles. The statement in the text is from the United States census of 1850, and is retained to preserve the uniformity of the work.

5. From the low, projecting sand-bank called Sandy Hook, opposite the Narrows, to the similarly formed point of Cape May, the whole eastern coast consists of a long line of sandy beaches, here and there interrupted by inlets, and inclosing narrow, shallow lagoons, behind which extends for several miles a low marshy tract. This coast is constantly changing—several old inlets have been closed and new ones opened since the settlement of the country; and being exposed to the heavy surf of the Atlantic, and affording no sufficient harbors, it has been the scene of many dreadful shipwrecks. Barnegat, Great Egg Harbor, and Little Egg Harbor inlets are the principal points of access to the inland waters. The southwestern coast, on Delaware Bay, consists chiefly of a strip of salt marsh, which gradually terminates in the predominating sandy plain. On the shores of the Delaware River the land is more elevated, the line being intersected by the mountain ridges trending eastward from the State of Pennsylvania, and over a ledge of which, crossing the Delaware River at Trenton, the waters are carried.

6. The middle section of the State presents a beautiful and fertile region, in which agriculture is pursued with the most eminent success. This is also the great fruit-growing section of the State, and has been long and universally celebrated for its fine apples and excellent cider.

7. The Hackensack and the Passaic, the two largest rivers of the State, fall into Newark Bay. The former, which rises in New York near the line of this State, is navigable for sloops 15 miles from its mouth, and the latter, which rises in Morris County, after receiving several considerable streams from the northwest and south, has a fall of 72 feet. The Great Falls of the Passaic are surrounded by a scene of wild beauty, but much of their natural magnificence has been destroyed by turning their waters for mill purposes, and it is now only in time of flood that their normal grandeur is recognized. From these falls the course of the river is south, and it is navigable for small vessels a distance of 12 miles from its mouth. About five or six miles above the Great Falls the river has another descent of 51 feet by two leaps and a rocky rapid in the distance of half a mile—these are called the Little Falls of the Passaic.

8. The Raritan, which is navigable for small craft to New Brunswick, 17 miles up, rises to the south of the hills; and having collected the waters of its several tributaries, it takes a course eastward almost across the State, and falls into Raritan Bay opposite the southern point of Staten Island.

9. The principal streams in the southern part of the State are Great and Little Egg Harbor rivers, which admit of sloop navigation for about 20 miles inland, and Maurice River, which falls into Delaware Bay. The streams emptying into the Delaware River are numerous, but short and not navigable.

10. The sea-coast and the shores of Delaware Bay present many inlets and coves, but none accessible to vessels of large draft. Raritan Bay, between Sandy Hook and Staten Island, affords a ready communication from Amboy, the principal sea-port of the State, to the ocean. Newark Bay, to the north of Staten Island, has navigable communication through the "Kills" (a narrow strait) with New York and Raritan bays. Delaware Bay affords no harbors.

11. Sandy Hook, the southern cape of Raritan Bay, is a low sandy island about three miles in length, and is constantly extending by the accumulation of sand and other debris, and is thus always influencing and changing the currents to and from the Bay of New York.

12. All the rocks referable to the primitive, secondary, and transition eras exist: gneiss, sienite, graywacke, slate, calcareous rocks, etc., are the principal formations in the northern region. Iron in all its forms occurs abundantly, and copper, which appears in the secondary formations, is found near New Brunswick, Belleville, and Somerville in considerable quantities. In the mountain section, which extends in breadth varying from 15 to 35 miles, the geological formations are strongly blended. Rocks of a pretty uniform character, however,

PALISADES.

are found in the primitive ridges, but they are of a coarse and uneven texture, and on the surface aggregated with quartz and feldspar. Sometimes they contain shorl, garnet, hornblende, epodite, and mica. Granite, gneiss, and sienite are formed in this section by the blending and combination of these materials; and at some points the primitive greenstone is seen. The richest and most productive iron mines are also found here; as also large quantities of graphite. Black mica is found on the Ramapo River, and highly magnetic iron ore in Schooley's and Musconetong mountains; and Wallkill Valley, west of the Hamburg Mountains, is noted for the number and variety of its minerals. At Mendham a beautiful marble is found. The zinc mines of Sussex are among the most valuable in the world. Foliated or lamellar zinc is abundant in these mines; the ore, however, is chiefly in the form of red oxyd associated with iron and manganese. From this ore a paint more durable than those having lead as a base is largely manufactured.

13. The soils vary materially with the topography of the country. The mountain section is principally in its normal state, only now and then a cultivated farm being seen on the hill-sides. The soil best adapted for agriculture is found in the alluvial valleys, nor is the sandy plain in the south unfruitful. Clay and marl abound. The vegetation of New Jersey is similar to that of the central region of the United States generally: on the mountains, oak, pine, and other forest trees abound, and in many instances occupy large tracts, in which the wild animal still ranges. Abundance of stunted oaks and other trees cover the southern plain. The middle section is the most highly improved and wealthy part of the State, and is noted for its apples and peaches.

14. The climate of New Jersey is in many respects similar to that of southern New York, but is much influenced by locality and elevation; in the north, where the hills are highest, it is much cooler than in the south, where the influence of the ocean is felt, and where a low situation and reflecting sands accumulate heat in the superincumbent atmosphere. In those parts, where the mephitic vapors of the swamps taint the air with their poison, agues and fevers prevail. The hilly region and the shores, however, are eminently salubrious, and highly attractive to summer visitors and invalids.

15. In 1850 New Jersey contained 489,555 inhabitants or 58.84 to every square mile of surface or 2.11 per cent. of the total population of the United States. This population was distributed as follows:

Counties.	Population.	County Seats.	Counties.	Population.	County Seats.	Counties.	Population.	County Seats.
Atlantic	8,961	May's Landing.	Gloucester	14,655	Woodbury.	Ocean	10,032	Tom's River.
Bergen	14,725	Hackensack.	Hudson	21,822	North Bergen.	Passaic	22,569	Paterson.
Burlington	43,203	Mount Holly.	Hunterdon	28,990	Flemington.	Salem	19,467	Salem.
Camden	25,422	Camden.	Mercer	27,992	TRENTON.	Somerset	19,692	Somerville.
Cape May	6,433	Cape May C. H.	Middlesex	28,635	N. Brunswick.	Sussex	22,989	Newton.
Cumberland	17,189	Bridgeton.	Monmouth	30,313	Freehold.	and Warren	22,358	Belvidere.
Essex	73,950	Newark.	Morris	30,158	Morristown.			

—and consisted of 89,080 families inhabiting 81,064 dwellings. Of the total population 465,509 (95.09 per cent.) were whites—233,452 males and 232,057 females, 23,810 free colored—11,708 males and 12,012 females, and 236 slaves—96 males and 140 females: and of the free population (489,219), 430,441 (87.98 per cent.) were American born, of whom 385,429 were born in this State; 58,364 (11.93 per cent.) of foreign birth, and 514 of origin not ascertained. The number of free natives of New Jersey in other States was 133,381. In 1790 New Jersey contained 184,139 inhabitants; in 1800, 211,949; in 1810, 245,555; in 1820, 277,575; in 1830, 320,823; in 1840, 373,306, and in 1850 (as above), 489,555. The State census of 1855 gave the population at 569,499.*

16. The occupations of 128,740 free male persons over 15 years of age were noted in the census of 1850. Of these, 46,544 were engaged in commerce, trade, manufactures, mechanic arts, and mining; 32,834 in agriculture; 38,386 in labor not agricultural; 4,351 in sea and river navigation; 1,731 in law, medicine, and divinity; 2,457 in other pursuits requiring education; 373 in government civil service; 404 in domestic service, and 1,663 in unclassified occupations.

17. As an industrial State, and considered in relation to its population, New Jersey occupies a high station, and may be considered among the most prosperous in the Union. The *per capita* value of its products in 1850 exceeded those of all others but the four States of Massachusetts, Rhode Island, Connecticut, and California. Its railroads and canals are the routes of a vast internal commerce, and have not only been of great benefit to the State itself, but have also contributed largely to the importance and opulence of the States on its opposite borders which they connect, and over these lines the great bulk of the coal of Pennsylvania is carried to New York city and the East. The foreign commerce of the State as reported in the official returns is comparatively insignificant, but it must be remembered that its principal ports are included in the districts of the adjoining States, and that New York and Philadelphia are the entrepôts through which the greater part of its business, as well foreign as domestic, is transacted.

18. The amount of inclosed land in New Jersey in 1850 was 2,752,946 acres, or a little more than one half the total surface. This was divided into 23,905 farms, averaging 115 acres, and of the whole 1,767,991 acres were improved lands. The cash value of the whole was $120,237,511, or of each farm $5,030, and the value of implements and machinery was $4,425,503, or to each farm $185.

19. All the cereals except barley are largely cultivated. The following exhibits the amount (bushels) of each crop for the years 1840 and 1850:

	wheat,	rye,	oats,	corn,	barley,	buckwheat,
1840	774,203	1,665,820	3,083,524	4,361,975	12,501	856,117
1850	1,601,190	1,255,578	3,378,063	8,759,704	6,492	878,934

—making a total in 1840 of 10,754,140 bushels, and in 1850 of 15,879,961 bushels. The potato crop in 1850 amounted to (Irish 3,207,236, and sweet 508,015) 3,715,251 bushels; that of hay to 435,950 tons; that of clover-seed to 28,280 bushels, and of other grass-seed to 63,051 bushels, and of peas and beans to 14,174 bushels. The value of market-garden products was $475,242, and of orchard products $607,268, and in the same year 340,602 cords of wood were sold.

20. The amount of livestock in the State at the two periods, 1840 and 1850, was—

	equines,	neat cattle,	sheep,	swine,
1840	70,502	220,202	219,285	261,443
1850	68,044	211,261	160,488	250,370

—in the aggregate (1850) valued at $10,679,291; and the value of animals slaughtered in the year preceding had been $2,638,552. The other products of animals were—butter 9,487,210, and cheese 365,756 pounds; and the wool crop amounted in 1840 to 397,207, and in 1850 to 375,396 pounds.

21. The total value of agricultural products for 1840 is stated at $15,314,006, and for 1850 at $19,322,894.

* The distribution of the population among the counties in 1855 was as follows: Atlantic, 8,608; Bergen, 17,774; Burlington, 46,442; Camden, 29,160; Cape May, 6,935; Cumberland, 18,966; Essex, 95,199; Gloucester, 16,261; Hudson, 41,823; Hunterdon, 30,400; Mercer, 32,722; Middlesex, 32,403; Monmouth, 34,978; Morris, 32,493; Ocean, 10,541; Passaic, 24,624; Salem, 20,226; Somerset, 21,022; Sussex, 23,470; Warren, 25,442.

22. In 1850 New Jersey contained 4,108 manufacturing establishments, in which was invested an aggregate capital of $22,184,730, and which gave employment to 28,549 male and 8,762 female operatives. The cost of the raw material consumed in the year previous had been $21,992,186, and the amount of wages paid $9,202,788; and the value of manufactures produced was $39,713,586. The capital employed in the leading branches was as follows: in the cotton manufacture (21 factories), $1,483,500; in the woolen manufacture (41), $494,274; in the manufacture of iron—pig (10 works) $967,000, cast (45) $593,250, and wrought (53) $1,300,393; in distilleries and breweries (68), $409,655; in tanning (133), $572,857, etc. And besides these New Jersey is distinguished for its machine shops, carriage and locomotive factories, saddleries, jewelry works, glass-houses, potteries, fire-brick yards, paper mills, small-arms factories, paint works, etc. The principal seats of this industry are Newark and Paterson; and Trenton, Camden, and Jersey City are also largely engaged in manufactures, and many of the interior towns are employed in the making of shoes and boots, hats, etc. The progress of manufactures has been as follows: in 1810 the value of products was $5,313,288; in 1820 (imperfect returns), $1,175,139; in 1830 (cotton, wool, and iron only), $3,662,359; in 1840, $19,571,496; and in 1850 (as above), $39,713,586.

23. The value of home-manufactures or family goods in 1840 was $201,625, and in 1850, $112,781.

24. The shore and oyster fisheries of this State are very valuable, and from this source the markets of New York and Philadelphia receive a large portion of their supplies. In 1850 there were 101 fishing stations returned, and the capital invested in the same amounted to $109,678.

25. As before stated, the commercial returns of this State do not show a true statement of its foreign trade. For the years ending 30th June, 1850 and 1855, the value of exports is given at $1,655 and $687, and of imports for the same years at $1,494 and $1,473. These sums are due to Newark and Perth Amboy, and wholly irrespective of Jersey City, included in the port of New York. Jersey City, however, has a large direct foreign trade, and is the western station of the Cunard line of steamships. The shipping (as reported) entered in 1850 amounted to 1,601 tons, and in 1855 to 1,257 tons, and the shipping cleared amounted to 1,131 and 606 tons. The amount of shipping owned in the State in 1850 was 80,030 tons, all of which, except 201 tons, was employed in the coasting trade, and the amount in 1855 was 121,019 tons, all of which, but 173 tons, in the coasting trade. The steam shipping amounted in 1850 to 5,489 tons, and in 1855 to 20,289 tons; and the amount of shipping built in 1850 was 6,201 tons, and in 1855, 10,960 tons. The ports of New Jersey, exclusive of Jersey City, are Perth Amboy, Bridgeton, Burlington, Camden, Newark, Little Egg Harbor, and Great Egg Harbor, all of which are actively engaged in the coasting trade.

26. New Jersey has a large domestic trade carried on by means of railroads and canals, and enjoys also a vast transit business. The principal railroads have an east-and-west direction, terminating on the Delaware at Camden (opposite Philadelphia), Bordentown, Trenton, Phillipsburg (opposite Easton), and Bridgeville above Belvidere, and on the east at Jersey City (opposite New York), Newark, Elizabethport, South Amboy, and Atlantic City. The New York and Erie Railroad has also one of its termini at Jersey City. Besides these lines there are several short local lines. The total length of railroad in the State in 1855 was 529 miles, or one mile of railroad to every 15.1 square mile of surface and to every 1,076 inhabitants. The canals are the Morris Canal and Delaware and Raritan Canal, the first extending from the Delaware at Easton to Jersey City, and the latter from the Delaware at Trenton to the Raritan at New Brunswick. Both are largely engaged in the Pennsylvania and New York coal trade. As yet, however, few internal improvements have been made in the northern part of the State, but several railroads are projected toward Cape May, so as to provide lines to connect at that point with steamers to Norfolk, Va., etc.

27. In 1850 New Jersey had 26 banks, with an aggregate capital of $3,754,900, and in 1855 it had 35 banks, with capital amounting to $5,682,262. The liabilities of these institutions in the years respectively consisted of—circulation $3,046,658 and $4,285,079, deposits $2,411,861 and $3,994,541, and dues to other banks $373,453 and $616,321; and the assets comprised—loans and discounts $7,158.977 and $10,999,919, real estate $270,546 and $265,228, dues from other banks $1,578,663 and $1,639,249, specie $622,855 and $782,659, and other assets $183,468 and $1,335,233.

28. The constitution under which the State is organized was adopted on the 13th August, 1844, and went into operation on the 2d September of the same year. Every white male, 21 years of age, having resided one year in the State and five months in the county, is allowed to vote. All elections are by ballot. The legislature consists of a senate and assembly. Each county is entitled to one senator, and the members of Assembly, not more than 60 in all, are apportioned among the counties in ratio of their population. One third the senators and all the representatives are chosen annually. The governor, who must be at least 30 years of age and a seven years' resident, is elected for three years. There is no lieutenant-governor, but in case of disability or death, the president of the senate takes the governor's place. The judiciary consists of a court of errors and appeals, a chancery court, a supreme court, circuit courts, courts of common pleas, etc. Judges are appointed by the governor. New Jersey returns five representatives to the federal Congress.

29. The total resources of the State treasury for the years ending 31st December, 1850 and 1855, were $138,544 and $221,263, and the whole amounts expended were, in 1850, $125,543, and in 1855, $221,140. The principal sources of income are transit duties on railroads and canals (in 1855, $115,347), dividends on railroad and canal stock ($30,000), and taxes on railroad stock ($33,910), etc. Of the expenditures in 1855, $126,421 was for the ordinary expenses of government and $95,119 for extraordinary expenditures, including appropriations for public schools, etc. The public debt on the 1st January, 1856, amounted to $95,000, on which the interest was $5,700 a year. At the same date the State owned productive property to the value of $252,174 and other not now productive (surplus revenue loaned to the counties without interest) $764,670. The school fund amounted to $424,644, yielding $71,708 per annum. The amount of taxable property in the State in 1850 was $153,151,619, in 1855, $179,750,000.

30. The principal institutions supported in whole or in part by the State are the State Prison and the State Lunatic Asylum, both at Trenton. There is also a State Normal School at the same place.

31. The whole number of children attending school in 1850 was 91,601, or one to every 5.34 of the whole population. The school statistics refer to the 1st June of that year, and are as follows:

Classes.	Numbers.	Teachers.	Scholars.	Income.
Primary and public schools	1,473	1,574	77,930	$216,672
Academies and private schools	225	453	9,844	88,244
Universities and colleges	4	49	470	79,700

—making a total of 1,702 schools, 2,076 teachers, and 88,244 scholars, and a total income of $384,616. The number of children attending public schools alone in 1855 was 114,923, and the total cost amounted to $475,168. The number of persons unable to read and write in 1850 was 18,665, of whom 12,787 were Americans and 5,878 foreigners, and 14,248 were white and 4,417 colored persons.

32. The principal collegiate institutions and professional schools in the State in 1855 were as follows:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.	Commencement.
College of New Jersey	Princeton	1746	16	225	18,000	Last Wed. in June.
Rutger's College	New Brunswick	1770	9	106	9,600	Thurs. before 4th July.
Burlington (Episc.) College	Burlington	1846	29	118	2,100	September 29th.
Theol. Sem., Dutch Ref. Ch.	New Brunswick	1784	3	25	7,000	—
Theol. Sem., Presb. Church	Princeton	1812	5	153	11,000	—
Law School, College of N. J.	Princeton	1849	3	8	—	—

—there is no medical school in the State.

33. In 1850 New Jersey had a total of 813 churches with accommodation for 346,133 persons, and the value of these as property was $3,680,936. The most numerous denominations are the Methodist, to which about a third of the whole population belongs, and the Presbyterian, which claims a fourth of the whole. Next in point of numbers are the Baptist, Dutch Reformed, Friends, and Episcopal denominations; and then, but at a wide figure, the Roman Catholic, Congregational, Lutheran, Universalist, Unitarian, etc.

34. The principal cities of New Jersey are—Trenton, Newark, Paterson, Jersey City, New Brunswick, Camden, Burlington, etc. Their population at various times was as follows:

Cities.	1810.	1820.	1830.	1840.	1850.
Trenton	3,003	3,942	3,925	4,035	6,461
Newark	5,984	6,507	10,953	17,290	33,894
Paterson	—	—	7,331	7,596	11,334
Jersey City	—	—	—	3,072	11,473
New Brunswick	6,312	6,764	7,831	—	10,719
Camden	—	650	2,340	3,371	9,479
Burlington	2,419	2,558	2,670	3,434	4,526
Princeton	—	500	—	3,055	3,021
Elizabethtown	2,277	3,515	3,451	—	5,583

35. Trenton, the seat of government, is situate on the Delaware, at the head of steamboat navigation, and Assunpink Creek. Latitude 40° 13′ 10″ north, and longitude 74° 45′ 29″ west. The public buildings are the State House, the State Lunatic Asylum, the State Prison, etc. Several manufactures are carried on, and the city has a considerable commerce, it being the terminus of several railroads, and of the Delaware and Raritan Canal. The Delaware River is here crossed by bridges. This city is memorable on account of the battle fought here

WASHINGTON CROSSING THE DELAWARE.

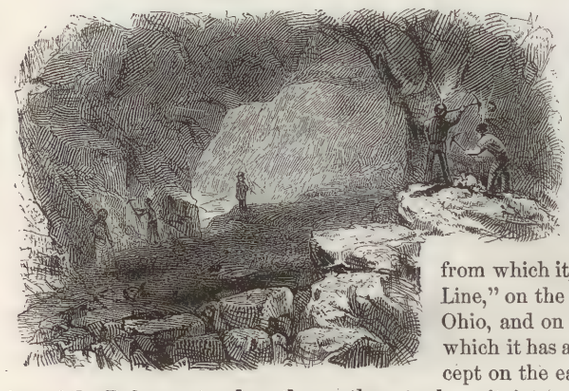
on the night of December 25th, 1776, when General Washington crossed the Delaware and captured 1,000 Hessians.

36. Newark, on the Passaic, three miles above its outlet in Newark Bay, is the principal commercial and manufacturing city of the State, as well as the largest and most populous. It is regularly laid out, the streets are wide, and in parts bordered by lofty elms, and well

supplied with water and lighted with gas. Some of the public buildings are handsome and the houses generally substantial. The manufactures of Newark are on a large scale, the principal being machinery, railroad cars, carriages and wagons, zinc paint, leather goods, especially saddles and harness, jewelry, cutlery, paper hangings, etc. The commerce is generally coastwise and by railroad, by which latter means the city has communication with New York and Philadelphia, and lies on the great line of travel north and south; and regular steamboat navigation is maintained between the city and New York. The vicinity for miles round is studded wth handsome villas and villages.

37. Paterson, immediately below the great falls of the Passaic, and 16 miles northwest from New York, is also a large manufacturing city, and the great seat of the cotton manufacturing interest of the State, which is fostered by the immense water-power acquired from the falls. It contains about 20 cotton mills, several large woolen factories, machine shops, and locomotive and car factories, iron and brass founderies, gun and pistol (Colt's) factories, paper mills, etc. The city is well-built, and, with its numerous public buildings, has many claims to architectural merit. On the opposite side of the Passaic, and connected with it by two bridges, is Manchester, the manufactures of which are similar to those of Paterson, of which it is, in fact, a suburb. Paterson is on the line of the New Jersey section of the New York and Erie Railroad.

38. Jersey City is a flourishing city at the mouth of the Hudson River, opposite New York, and the northern terminus of southern travel, and the eastern terminus of the New York and Erie Railroad and of the Morris Canal. Though a separate municipality, it may be considered as a suburb of the great metropolis, with which it is connected by several ferries, and many persons doing business in New York have residences here. It is a place of considerable manufacturing industry, ship-building, and commerce, and is the New York station of the Cunard line of British steamships, which has here a splendid dock and warehouses.



39. Elizabeth City, on Elizabeth Creek, about two miles from its entrance into Staten Island Sound, is a pleasant city and a place of considerable trade. At this point the New Jersey and the Central railroads intersect; the latter also extends to the Sound at Elizabethport, to and from which there is regular steamboat communication with New York. Elizabethport has recently become the coal depôt of the Lackawanna coal-fields.

40. New Brunswick, on the Raritan, is the terminus of the Delaware Canal, and a place of some considerable trade. It is also the seat of Rutger's College. Burlington, opposite Bristol, on the Delaware, and Camden, opposite Philadelphia, are both flourishing places—the former is the seat of a college, and the latter has thriving manufactures, and is the terminus of several railroads. Princeton is the seat of the College of New Jersey, the oldest institution of learning in the State.

41. The other principal places are Belleville, which, in 1850, had 3,514 inhabitants; Bergen, 2,758; Bloomfield, 3,385; Bordentown, 2,725; Chester, 3,601; Dover, 2,385; Gloucester, 4,559; Greenwich, 3,726; Hackensack, 3,506; Hillsboro', 3,409; Hoboken, 2,668; Middletown, 3,251; Newton, 3,279; North Bergen, 3,578; Orange, 4,385; Plainfield, 2,447; Rahway, 3,306; Salem, 3,052; Wantage, 3,934; Woodbridge, 5,141, etc.

42. In 1664 the Duke of York sold from his grant (obtained that year from Charles II.) the district between the Hudson and Delaware rivers to Lord Berkeley and Sir George Carteret, who called it New Jersey, and appointed Philip Carteret its governor. In 1673 the colony was taken by the Dutch, who resigned it in 1674. About this time the province was divided into East and West Jersey, which were separately sold and resold, and trouble steadily increased until 1702, when both were surrendered to Queen Anne, who united them under the government of New York, of which Lord Cornbury was governor. In 1738 a separate government was instituted by the crown, which lasted until 1776, when the first State constitution was adopted.

STATE OF PENNSYLVANIA.

1. Pennsylvania is situated between latitudes 39° 43′ and 42° north, and longitudes 74° 40′ and 80° 36′ west; and is bounded on the north by the State of New York, on the east by the State of New Jersey—from which the Delaware River separates it, on the south by the States of Delaware, Maryland, and Virginia—from which it is divided by "Mason and Dixon's Line," on the west by the States of Virginia and Ohio, and on the northwest by Lake Erie—on which it has a coast-line of about 47 miles. Except on the east, which is formed by the winding of the Delaware, and on the northwest where it juts northward to Lake Erie, its boundaries are straight lines, and the whole territory of the State is very compact, forming a parallelogram about 300 miles long and 160 miles wide; and containing a superficial area estimated at 46,000 square miles.*

2. Pennsylvania is naturally divided into three distinct geographical regions—the eastern or Atlantic slope, the central or mountain region, and the western or the Ohio and Erie table-land. It is the only State, with the exception of Virginia, that stretches quite across the great Apalachian system of mountains.

3. The principal mountain chains definitely traceable in the State are as follows:

The South Mountain, which enters from New Jersey, between Northampton and Bucks counties, and after being interrupted by the Schuylkill above Pittstown, and the Susquehanna near the southern border of the State, passes into Maryland;

The Blue Ridge enters Pennsylvania below Easton, crosses the Schuylkill at Reading and the Susquehanna below Harrisburg, and passes out of the State between Adams and Franklin counties. The elevation of the South Mountain nowhere exceeds 1,000 feet, and that of the Blue Ridge not more than 1,200 feet;

The Kittatinny or Blue Mountain also enters this State from New Jersey, and is broken by the Delaware at Water Gap, by the Lehigh at Wind Gap, by the Schuylkill above Hamburg, and by the Susquehanna about five miles above Harrisburg. It then passes between Franklin and Bedford counties into Maryland. Its elevation in Pennsylvania varies from 800 to 1,500 feet above the level of the sea. Between this range and the north branch of the Susquehanna, a distance of about 35 miles, is the great anthracite region;

The Broad Mountain, which lies in the intervening space between the Kittatinny Mountain and Susquehanna River, forms a less continuous but more elevated chain than the last mentioned. It is continued southwest of the Susquahanna by the Tuscarora Mountains;

Sidelong Hill forms a well-defined ridge, from the Maryland line to the Juniata; and—

The Alleghany Mountain, which is the dividing ridge between the Atlantic basin and the basin of the Ohio.

Westward of the Alleghany chain, and on the Ohio table-land, two well-defined chains cross the State from north to south, under the names of—Laurel Ridge, about 25 miles west of the Alleghany Mountain, and—Chestnut Ridge, ten miles farther west.

Though in some places rude and rocky, many of these mountain ranges consist of gradually rising swells, cultivated to the summits, and the whole mountain region is interspersed with highly beautiful and productive valleys, some of which are of considerable extent, and under an excellent system of cultivation.

4. The Delaware, that rises in the Kaätsbergs in New York, and washes the eastern border, may yet be considered as a river of Pennsylvania, from which it receives its principal tributaries. This river meets the tide at Trenton, to which place it is navigable for sloops; at and above that point navigation is impeded by falls and shoals. Large ships ascend to Philadelphia, about 40 miles below which it expands into a broad bay. Its whole course is about 320 miles in length. The canals connected with various points of the coal region, and uniting its waters with those of the Hudson, the Raritan, and the Chesapeake, have greatly increased its importance as a channel of trade. Its principal tributaries in Pennsylvania are the Lackawanna, the Lehigh, and the Schuylkill, which rise in the anthracite region. The Schuylkill has a course of 130 miles, and is navigable for vessels of above 300 tons to Philadelphia, six miles below which it falls into the Delaware. The Susquehanna is the principal river of the State in point of size, but is much broken, and of comparatively small value to commerce. It rises in Otsego Lake in New York, and flows in a generally south direction to the Chesapeake, 400 miles from its source. Its principal tributaries are the Unadilla, and Chenango in New York, and the Tioga, West Branch, and Juniata in Pennsylvania, all from the right. The most considerable from the left are the Lackawannock, Swatara, and Conestoga. The channels of the Susquehanna are so winding and broken, that even the descending navigation is extremely difficult and dangerous, and its tributaries partake of the same character.

VIEW IN THE VALLEY OF WYOMING.

6. The great rivers of Western Pennsylvania are tributaries or rather constituents of the Ohio. The Alleghany, one of its constituents, is navigable to Olean in New York, 240 miles from its mouth, and to Waterford in French Creek, its principal tributary, 14 miles from Lake Erie. The Conemaugh is its principal tributary from the east. The other constituent of the Ohio is the Monongahela, which descends from the Alleghany Ridge of Virginia, and before its junction with the Alleghany receives the Youghiogeny, a large stream from Maryland.

* According to Darby 46,980 square miles, of which 6,710 belongs to the basin of the Delaware, 21,390 to that of the Susquehanna, 150 to that of the Genesee, 1,590 to that of the Potomac, 16,760 to that of the Ohio, and 380 to that of Lake Erie.

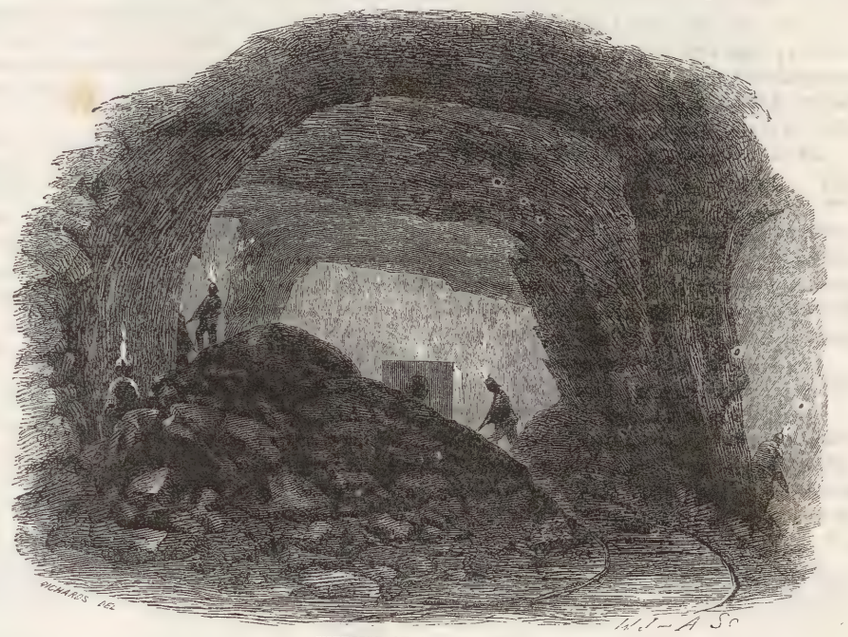
Both these rivers afford boat navigation for a considerable distance. After the junction of the Alleghany and Monongahela, the Ohio has a short part of its course on the border of Pennsylvania. Big Beaver is the only tributary from this State.*

7. The mineral resources of Pennsylvania consist chiefly of its vast deposits of coal and iron. The coal is of three distinct varieties, anthracite, semi-bituminous, and bituminous. The anthracite of Pennsylvania is found chiefly in the Lehigh, Schuylkill, Wyoming, and Lackawanna regions. This coal district is occupied by mountains which run parallel with the Blue Ridge, and from 1,200 to 1,500 feet high. But little of all this surface, with the exception of a few narrow valleys, invites cultivation, and as yet the mountains offer a secure retreat to cougars, wolves, bears, and other animals. The rocks of this region are of the transition series, and present little diversity. Anthracite has been found in the greatest quantity in sections most accessible by water. Extensive veins and beds range from the Lehigh to the Susquehanna, crossing the head waters of the Schuylkill and Swatara; but in no part of the district does it occur in such apparently inexhaustible beds as in the vicinity of Mauch Chunk. Next to Mauch Chunk, Pottsville, situate at the head of the Schuylkill Canal, has worked the principal anthracite coal-fields. Almost every eminence adjacent to Pottsville discloses indications of this mineral. The western part of Pennsylvania is abundantly supplied with bituminous coal, as the eastern is with anthracite. It is found on the Conemaugh, Alleghany, and Monongahela, and in numerous places on the west of Alleghany Ridge, which is, in general, its eastern boundary. Of the total area of the State, about one third is coal-lands. The semi-bituminous coal occupies a region intermediate with the anthracite and bituminous regions.

8. Almost every county of the State contains deposits of iron, in one or other of its multifarious forms. It exists in the greatest measure, and in its most valuable ores, in the bituminous coal region. Pennsylvania, indeed, is said to produce nearly one half of the whole iron manufactured in the United States. The State is also rich in many of the other useful metals. Extensive copper and lead formations have lately been discovered near the Schuylkill. The lead is argentiferous. Zinc is also a product of the State. Limestone, marbles, granite, etc., with a vast variety of other valuable building materials; alum, and other useful earths, etc., are distributed over the State in an unexampled profusion. Salt is chiefly derived from springs on the Kiskiminetas, Alleghany, and Beaver rivers. There are also, in various parts, many mineral springs.

9. Pennsylvania has a climate intermediate between the extremes of the northern and southern sections of the country; the temperature, however, varies much with elevation, and even in the summer the air of the mountains is cool and pleasant. On the whole, the climate is highly favorable to agricultural pursuits. The great extent of limestone formation in Pennsylvania assures to the soil fertility and productive strength, and, though extending over so large a surface, it is in the main of excellent quality. Many of the mountains admit of cultivation to their summits, and the intervening valleys contain much fine land. West of the mountains the soil is a deep mold, equal in fertility to the best lands in America.

10. The natural growths vary with the locality and elevation, but do not differ in their character from those of other portions of the middle zone of the Union. The trees most common in the forests are beech, hemlock, and sugar-maple, the oak, hickory, and elm, chestnut, mulberry, and locust. The wild plum and crab-apple grow in abundance, and the grape flourishes in the valleys. Fruit and garden vegetables of every description are cultivated. In the more sequestered parts of the State, wild animals are still numerous.



11. In 1850 Pennsylvania contained 2,311,786 inhabitants or 50.26 to the square mile or 9.97 per cent. of the total population of the Union. The distribution of this population to the counties was as follows:

Counties.	Population.	County Seats.
Adams	25,981	Gettysburg.
Alleghany	138,290	Pittsburg.
Armstrong	29,560	Kittanning.
Beaver	26,689	Beaver.
Bedford	23,052	Bedford.
Berks	77,129	Reading.
Blair	21,777	Hollidaysburg.
Bradford	42,831	Towanda.
Bucks	56,091	Doylestown.
Butler	30,346	Butler.
Cambria	17,773	Ebensburg.
Carbon	15,686	Mauch Chunk.
Centre	23,355	Bellefonte.
Chester	66,438	Westchester.
Clarion	23,565	Clarion.
Clearfield	12,586	Clearfield.
Clinton	11,207	Lock Haven.
Columbia	17,710	Bloomsburg
Crawford	37,849	Meadville.
Cumberland	34,827	Carlisle.
Dauphin	35,754	Harrisburg.
Delaware	24,679	Media.
Elk	3,531	Ridgeway.
Erie	38,742	Erie.
Fayette	39,112	Uniontown.
Franklin	39,904	Chambersburg
Fulton	7,567	McConnelsb'g.
Greene	22,136	Waynesburg.
Huntingdon	24,786	Huntingdon.
Indiana	27,170	Indiana.
Jefferson	13,518	Brookville.
Juniata	13,029	Mifflinstown.
Lancaster	98,944	Lancaster.
Lawrence	21,079	Newcastle.
Lebanon	26,071	Lebanon.
Lehigh	32,479	Allentown.
Luzerne	56,072	Wilkesbarre.
Lycoming	26,257	Williamsport.
McKean	5,254	Smithport
Mercer	33,172	Mercer.
Mifflin	14,980	Lewistown.
Monroe	13,270	Stroudsburg.
Montgomery	58,291	Norristown.
Montour	13,239	Danville.
Northampton	40,235	Easton.
Northumberl.	23,272	Sunbury.
Perry	20,088	Bloomfield.
Philadelphia	408,762	Philadelphia.
Pike	5,881	Milford.
Potter	6,048	Coudersport.
Schuylkill	60,713	Pottsville.
Somerset	24,416	Somerset.
Sullivan	3,694	La Porte.
Susquehanna	28,688	Montrose.
Tioga	23,987	Wellsboro'.
Union	26,083	New Berlin
Venango	18,310	Franklin.
Warren	13,671	Warren.
Washington	44,939	Washington.
Wayne	21,890	Honesdale.
Westmorel'd.	51,726	Greensburg.
Wyoming	10,655	Tunkhannock.
York	57,450	York.

—and it was composed of 408,497 families inhabiting 386,216 dwellings. Of the total population 2,258,160 (97.68 per cent.) were whites—1,142,734 males and 1,115,426 females, and 53,626 free colored—25,369 males and 28,257 females; and 2,014,619 (87.14 per cent.) were American born, of whom 1,844,672 were born in this State; 294,871 (12.75 per cent.) foreign born, and 2,296 of unascertained origin. The number of natives of Pennsylvania in other States of the Union was 422,055. In 1790 Pennsylvania contained 434,373 inhabitants; in 1800, 602,361; in 1810, 810,091; in 1820, 1,049,458; in 1830, 1,348,233; in 1840, 1,724,033; and in 1850 (as above), 2,311,786. In 1855 a State census gave the population at 2,542,960.

12. Of 680,644 free male persons over 15 years of age returned in the census of 1850 as employed in industrial pursuits, 266,927 were engaged in commerce, trade, manufactures, mechanic arts, and mining; 207,495 in agriculture; 163,628 in labor not agricultural; 101 in the army; 9,064 in sea and river navigation; 9,954 in law, medicine, and divinity; 10,830 in other pursuits requiring education; 3,719 in government civil service; 4,431 in domestic service, and 4,495 in unclassified occupations.

13. Pennsylvania is the chief mining State of the Union; but at the same time it is eminently an agricultural region and also largely engaged in manufactures. In the absolute value of its annual agricultural products it is exceeded only by New York and Ohio, and in that of its manufactures by New York alone; but in the *per capita* value of its aggregate products it ranks below any of the New England States except Maine and Vermont, and also below New York, New Jersey, and California. Thus in 1850 while the production of Pennsylvania was only $99 30 *per capita*, that of Massachusetts (the highest) was $166 60, and that of New York (the lowest among the States above named) was $111 94. The Delaware being its only seaward outlet its foreign commerce is comparatively limited; but it has a large coasting trade, and from the facilities given it by its canals and railroads enjoys a vast and ever-increasing transit and domestic trade. It is, however, to its mines that this State owes its peculiar prosperity, and from its coal and iron regions are derived fully two thirds of the whole coal and iron consumed in the Union—its eastern mines supplying New York and New England, and its western mines supplying Pittsburg and its commercial circuit with these important minerals.

INTERIOR OF A COAL MINE.

14. The quantities of the several varieties of coal mined in Pennsylvania in 1857 were—anthracite 6,420,342 tons, semi-bituminous 494,100 tons, and of bituminous about 58,000,000 bushels. Of the latter 28,973,594 bushels were mined on the Monongahela, and the quantity in other sections of the bituminous regions is estimated at an equal amount.

15. Of the anthracite mined in 1857, the Schuylkill region delivered 2,985,541 tons, the Lehigh 1,318,549 tons, the Lackawanna 480,677 tons, the Pittston 543,873 tons, the Scranton 332,146 tons, and other regions (Wyoming, etc.) northwestward 759,556 tons. In 1820, the year in which anthracite coal was first mined, the product was only 365 tons, all from the Lehigh region; the first coal was brought from the Schuylkill region in 1825; from the Lackawanna region in 1829, from the Wyoming region in 1839, from Pittston in 1850, and from Scranton in 1856. The productions of these regions for the ten years ending with 1857 has been as follows:

Years.	Schuylkill.	Lehigh.	Lackawanna.	Pittston.	Scranton.	Other Regions.	Total.
1848	1,652,885	680,746	437,500	—	—	256,627	3,089,238
1849	1,605,126	801,246	454,240	—	—	303,736	3,242,541
1850	1,712,007	722,622	432,339	111,014	—	276,339	3,254,321
1851	2,184,240	989,296	472,478	316,017	—	415,099	4,377,130
1852	2,452,026	1,114,026	497,839	426,164	—	439,342	4,925,695
1853	2,470,943	1,080,544	494,827	512,659	—	556,018	5,114,491
1854	2,895,208	1,246,418	438,406	496,643	—	676,689	5,753,369
1855	3,430,768	1,284,114	565,460	504,803	—	767,156	6,552,301
1856	3,258,356	1,351,970	499,650	612,500	122,773	906,293	6,751,542
1857	2,985,541	1,318,549	480,677	543,873	332,146	759,556	6,420,342

—and the average annual delivery in periods of five years from 1820 has been as follows—(1820–24) 3,809 tons, (1825–29) 67,194 tons, (1830–34) 315,961 tons, (1835–39) 736,656 tons, (1840–44) 1,165,504 tons, (1845–49) 2,736,226, and (1850–54) 4,685,001 tons. The annual average for the three years ending with 1857 was 6,574,728 tons.

16. Blossburg was the first source of the semi-bituminous coal, and the only source from 1840 to 1849. The quantity mined in the intervening years was as follows—(1840) 4,235 tons, (1841) 25,966 tons, (1842) 13,164 tons, (1843) 6,268 tons, (1844) 14,234 tons, (1845) 29,836 tons, (1846) 16,509 tons, (1847) 29,087 tons, (1848) 33,762 tons; and the following exhibits the quantities from the regions severally for the nine years ending with 1857:

Years.	Lykens Valley.	Short Mountain.	Dauphin.	Trevorton.	Broad Top Mountain.	Blossburg Mines.	Barclay Summit.	Grand Total.
1849	25,325	—	—	—	—	32,095	—	57,420
1850	37,763	—	—	—	—	23,161	—	60,924
1851	54,200	—	20,000	—	—	25,000	—	99,200
1852	59,857	—	33,639	—	—	20,000	—	113,496
1853	69,007	—	29,000	—	—	45,571	—	143,578
1854	57,500	50,000	63,000	—	—	70,454	—	240,954
1855	66,721	50,500	52,494	—	—	73,201	—	242,916
1856	61,187	41,739	77,307	73,113	42,000	70,670	4,115	370,131
1857	65,201	56,588	82,285	110,711	78,812	94,314	6,289	494,100

17. The relative amounts of fixed carbon and volatile matter in the several varieties of Pennsylvania coal are as follows:

Anthracite	carbon 87 to 89 per cent.,	and volatile matter	11 to 13	per cent.
Semi-bituminous	" 73 to 74 "	and " "	26 to 27	"
Bituminous	" 54 to 55 "	and " "	45 to 46	"

—and the steam-producing power of each is 545, 515, and 384 pounds per cubic foot of the respective coals. According to Childs' Tables, Pennsylvania contains a coal area of 15,000

* Professor Rogers, in his "Geology of Pennsylvania," states the area of the river basins to be as follows:

Basin of the Delaware proper	3,895	Basin of the Alleghany	9,546 sq. m.
" Schuylkill	1,884 "	" Monongahela	2,800 "
" Brandywine	720 "	" Beaver	3,086 "
Total of the Delaware Basin	6,499 "	*Total of the Ohio (Gulf) Basin*	15,432 "
Basin of the Susquehanna proper	17,018 "		
" Juniata	3,428 "	Basin of Lake Erie	352 "
Total of the Susquehanna Basin	20,446 "	" Lake Ontario (Genesee)	90 "
Basin of the Potomac	1,581 "	*Total of the St. Lawrence Basin*	442 "
Total of the Atlantic Basin	28,526 "	Grand Total of all the Basins	44,400 "

square miles, while in Great Britain and Ireland the coal area is only 11,000 square miles; and in relation to iron ore the relative proportions are nearly the same. Thus it will be seen that Pennsylvania in these articles of first necessity and indispensable to a state of civilization, possesses vast advantages over the most wealthy and prosperous country of the world, and holds within its own grasp a destiny as brilliant as that already achieved by the British miner.

18. In 1850 Pennsylvania contained 127,577 farms, averaging 117 acres, or in the aggregate 14,918,347 acres, or less than one half the whole surface of the State. Of the inclosed lands 8,623,619 acres were improved, and 6,294,728 acres unimproved; and together were valued at $407,876,099, averaging to each farm $3,197, and the value of implements and machinery was $14,722,541 or $115 to each farm.

19. The cereal crops in 1839–40 amounted to 57,032,426 bushels, and in 1849–50 to 63,905,497 bushels, and in the following proportions to each crop:

1840....	wheat, 13,213,077	rye, 6,613,873	oats, 20,641,819	corn, 14,240,022	barley, 209,893	buckwheat, 2,113,742
1850....	" 15,367,691	" 4,805,160	" 21,538,156	" 19,835,214	" 165,584	" 2,193,692

and in 1850 the other principal crops were—potatoes (Irish 5,980,732, and sweet 52,172), 6,032,904 bushels; hay, 1,842,970 tons; clover seed, 125,030, and other grass seed, 53,913 bushels; peas and beans, 55,231 bushels; flax, 530,307 pounds; tobacco, 912,651 pounds; wine, 25,590 gallons, etc.; and in the same year were produced 859,509 pounds of wax and honey, 2,326,525 pounds of maple sugar, etc. The value of market-garden products was $688,714, and of orchard products $723,389.

20. The description and number of livestock in the State in 1840 and 1850 was as follows:

1840.....	equines, 365,129	neat cattle, 1,172,665	sheep, 1,767,620	swine, 1,503,964
1850.....	" 352,657	" 1,153,946	" 1,822,337	" 1,040,366

—of the equines (in 1850), 350,398 were horses and 2,259 asses and mules, and of the neat cattle, 530,224 were milch cows, 61,527 working oxen, and 562,195 other cattle. The whole were valued at $41,500,053; and in the previous year the value of animals slaughtered was $8,219,848. Butter was produced to the amount of 39,878,418 and cheese to 2,505,034 pounds. The wool crop in 1840 amounted to 3,048,564, and in 1850 to 4,481,570 pounds.

21. The total value of the agricultural products of the State in 1839–40 was estimated at $51,232,204, and in 1849–50 at $73,576,837.

22. In 1850 Pennsylvania contained 21,605 manufacturing, mining, and mechanical establishments, in which was invested capital to the amount of $94,473,810, and which gave employment to 124,688 males and 22,078 females. The value of raw material consumed in the years 1849–50 was $87,206,377, and the amount paid for labor $37,163,232; and the value of the manufactures produced in the year was $155,044,910. The principal branches are thus enumerated:

Branches.	Establishments.	Capital invested.	Hands employed.	Value of products.
Cotton manufactures	208	$4,528,925	7,663	$5,322,262
Woolen manufactures	380	3,005,064	5,726	5,321,866
Iron manufactures—pig	180	8,570,425	9,294	6,071,513
" " —cast	320	3,422,924	4,783	5,354,881
" " —wrought	162	7,828,916	6,598	9,224,256
Distilleries and breweries	371	1,719,960	1,092	2,585,557
Tanneries	1,039	3,540,318	2,980	5,275,492
Salt works	47	168,360	219	206,796
All others	18,898	61,688,918	108,411	115,682,287
Total	21,605	$94,473,810	146,766	$155,044,910

The value of goods manufactured and returned by the censuses of 1810–1850 inclusive will exhibit the progress of industry in this State:

Census Years.	Cotton Goods.	Woolen Goods	Iron. Pig and Cast.	Iron. Wrought.	Spirits, Ale, etc.	All other Manufactures.	Grand Total.
1810.....	$3,060,772	$3,421,055	$1,301,343	$4,492,478	$4,365,503	$19,176,630	$35,817 781
1820*.....	555,673	333,371	563,810	1,156,266	476,516	3,809,583	6,895,219
1830*.....	2,099,715	1,323,070	1.643,702	3,762,847	—	2,502,613	11,331,947
1840.....	5,013,007	2,319,061	3,722,545	5,670,860	3,599,698	42,831,336	63,156 507
1850.....	5,322,262	5,321,866	11,426,894	9,224,256	2,585,557	121,164,575	155,004,910

The amount of domestic goods or such as are made in families was in 1840, $1,303,093, and in 1850, $749,132.

23. The following exhibits a statement of the foreign commerce of Pennsylvania for the years ending 30th June, 1850 and 1855, comparatively:

	1850. In Am. ves.	1850. In For. ves.	1850. Total.	1855. In Am. ves.	1855. In For. ves.	1855. Total.
Exports—Domestic produce	$3,428,150	$621,314	$4,049,464	$4,946,025	$1,089,100	$5,985,125
" —Foreign produce	363,225	88,917	452,142	266,335	22,878	289,213
Total exports	$3,791,375	$710,231	$4,501,606	$5,212,360	$1,061,978	$6,274,338
Imports—Total	10,795,462	1,270,692	12,066,154	12,727,017	2,582,918	15,309,935

The total shipping cleared in 1850 was 111,618, and in 1855, 149,928 tons, and the shipping entered in the years respectively 132,370 and 192,826 tons. The shipping owned in the State in 1850 amounted to 258,839, and in 1855 to 397,768 tons, and in the respective years the registered shipping was 64,205 (66 steam) and 77,441 (2,480 steam) tons, and the enrolled and licensed shipping 194,734 (60,810 steam) and 320,326 (112,879 steam) tons. The distribution of the shipping at the two periods was as follows:

Philadelphia, on the Delaware	in 1850—139,159 (15,541 steam) tons,	and in 1855—294,807 (28,732 steam) tons.
Presque Isle, on Lake Erie	" — 7,870 (5,351 ") tons,	" — 9,269 (4,720 ") tons.
Pittsburg, on the Ohio	" — 43,476 (39,840 ") tons,	" — 93,691 (81,896 ") tons.

—and the shipping built in the two years was as follows:

1850.....	ships 7	brigs 1	schooners 39	sloops, etc., 107	steamers 31	total 185 = 21,410 tons.
1855.....	" 10	" 1	" 21	" 148	" 74	" 254 = 44,415 tons.

—namely, at Philadelphia 18,150 and 33,829 tons, at Presque Isle 22 and 170 tons, and at Pittsburg 3,238 and 10,416 tons in the years respectively.

24. The progress of commerce and navigation, etc., in this State for the ten years ending 30th June, 1855, is exhibited in the annexed table:

Years.	Value of exports.	Value of imports.	Tonnage cleared.	Tonnage entered.	Tonnage owned.	Ton. built.
1846.....	$4,751,005	$7,989,396	—	—	—	—
1847.....	8,544,391	9,587,516	142,143	140,453	—	24,126
1848.....	5,732,333	12,147,584	—	—	—	—
1849.....	5,343,421	10,645,500	120,327	142,623	231,653	24,007
1850.....	4,501,606	12,066,154	111,618	132,370	258,839	21,410
1851.....	5,356,036	14,168,761	—	—	284.363	28,628
1852.....	5,828,571	14,785,917	139,932	178,364	301,723	31,220
1853.....	6,527,996	18,834,410	151,685	183,944	338,734	31,539
1854.....	10,104,416	21,359,306	174,207	194,339	361,827	36,768

* Returns partial and very imperfect.

With exception of a small trade with Canada from the Presque Isle District, of which Erie City is the chief port, the whole foreign commerce of Pennsylvania centers at Philadelphia.

25. The domestic trade is carried on coastwise, by railroad and canal. The coasting trade, including that of Lake Erie and the Ohio River, is very extensive, and the amount of Pennsylvania tonnage engaged therein in 1855 was 214,267 tons, of which 112,668 tons were navigated by steam. These sums include the shipping of all the districts, and the proportion to each was thus: Philadelphia 213,594, Presque Isle 9,269, and Pittsburg 91,403 tons. The figures here given present a view of the relative importance of the trade of the several districts. That of Philadelphia extends north and south along the coast from the British to the Mexican territory, and steamers ply regularly to the principal intervening ports. The Ohio River trade, of which Pittsburg is the center, embraces a large share of the whole commerce of the interior States.

26. The total length of railroad in Pennsylvania in 1855 was 2,600 miles or one mile to every 18.1 square miles of surface or to every 977.9 of the total population. A large portion of this road traverses the eastern coal region, and is used for the purpose of conveying that mineral to the markets. The great traffic roads have an east-and-west direction, namely, the Pennsylvania Railroad which extends from Philadelphia to Pittsburg, and the Sunbury and Erie which with its eastern connections will when completed extend from the same city to the city of Erie on the lake of that name. West from Pittsburg several lines penetrate into Ohio, and the lake shore-line connects Erie with Cleveland, etc., on the west, and Buffalo, etc., on the east. The only north-and-south line of commercial importance is the Northern Central Railroad, which connects the middle region of the State with Baltimore on the south, and through the New York works with Rochester, Niagara, Buffalo, etc., on the north and northwest. Philadelphia reaches the same ports by her roads through the coal region. Another cross line is being built between Pittsburg and these lake termini; nor will any great length of time elapse before Pittsburg and Baltimore will have a direct connection through the Pittsburg and Connellsville Railroad, which is destined to connect at Cumberland, Md., with the Baltimore and Ohio Railroad. Otherwise the railroads of Pennsylvania are comparatively local, but of these there are several of importance, and many now being constructed will accommodate sections of the State which have hitherto had no appropriate outlets.

27. Pennsylvania has upward of 1,200 miles of canal and navigation improvement works or one mile to every 39 square miles of territory. These are as follows:

	Miles
Schuylkill Navigation—	
From Philadelphia to Port Carbon	108
*Delaware Division of State Canal—	
From Bristol to Easton	60
Lehigh Navigation—	
From Easton to Stoddartsville	84
Union Canal—	
From Reading to Middletown	77
Branch to Pine Grove	22
Susquehanna and Tide Water—	
From Columbia to Havre de Grace (13 m. in Md.)	32
*Main Line of State Canal—	
E. Div., from Columbia to Hollidaysburg	173
W. Div., from Johnstown to Pittsburg	103
*Susquehanna Division of State Canal—	
From Juniata to Northumberland	41
*West Branch State Canal—	
From Northumberland to Farrandsville	76
*Lower North Branch Division of State Canal—	
From Northumberland to Pittston	73
*Upper North Branch Division of State Canal—	
From Pittston to New York line	94
Junction Canal	—
Wisconisco Canal—	Miles
From Clark's Ferry to Millersburg	13
Delaware and Hudson Canal—	
From Honesdale to Hudson River (83 m. in N. Y.)	108
*Beaver and Erie Canal—	
From Beaver to Erie City	136
*French Creek Feeder—	
From near Meadville to Evansburg	21
Pennsylvania and Ohio Canal—	
From Newcastle to Akron (68 m. in Ohio)	78
Monongahela Navigation—	
From Pittsburg to Brownsville	87
Bald Eagle and Spring Creek Navigation—	
From Bellefonte to W. Branch of Susquehanna	25
Conestoga Navigation—	
From Lancaster to Safe Harbor	18
Youghiogeny Navigation—	
From McKeesport to West Newton	18
Total length	1,457
Portion in adjoining States	164
Total length in Pennsylvania	1,293

—the above table is taken substantially from one compiled by Thomas S. Fernon, Esq., of the "United States Mining and Railroad Register," and is doubtlessly accurate. Those canals distinguished by the note mark (*) are State works, while all the others belong to stock companies. The State canals have a total length of upward of 770 miles, and in conjunction with the Philadelphia and Columbia Railroad (82 miles) and the Portage Railroad (36 miles), also State works, cost the enormous sum of $32,542,267. These works, however, have never been otherwise than a burden to the State, the gross revenue up to the end of 1853 having been only $24,995,633, while the expenditures for repairs and management had been $19,447,653, and the interest on the capital $35,137,796; and still there was required $8,695,044 to complete them. Under these circumstances, the best policy of the State was to become divested of its whole interest in the works.†

28. In 1850 there were in Pennsylvania fifty-eight banks, with capital amounting to $17,926,222, and in 1855 seventy-one, with capital amounting to $22,026,596. The aggregate liabilities at the two periods consisted of—circulation $11,798,996 and $16,883,199, deposits $18,484,779 and $25,340,814, dues to other banks $5,857,740 and $4,955,485, and other liabilities $156,878 and $96,792; and the assets were—loans and discounts $39,430,145 and $52,549,199, stocks $1,428,354 and $2,714,232, real estate $1,134,413 and $1,128,674, other investments $1,203,464 and $678,018, dues from other banks $4,266,916 and 5,647,642, notes of other banks $2,591,962 and $4,460,673, specie funds $2,864,944 and $155,376, and specie $4,327,394 and $6,738,650.

29. Pennsylvania has had three constitutions: those of 1776, 1790, and 1838. The last named with amendments is that now in force. It confers the right of suffrage on every white free man 21 years of age, who has resided in the State one year and paid taxes. The legislature is composed of a senate of 33 members, elected for three years (one third annually), and a house of representatives of 100 members, elected for one year. Senators must be 25 years of age, and must have been citizens for the four years preceding election, and representatives must be at least 21 years of age, and have been citizens for the three preceding years. The general election is held on the 2d Tuesday in October, and the legislature meets on the first Tuesday in January annually.

30. The governor, to whom the chief executive power is intrusted, must be a citizen resident of seven years' standing, and have attained his 30th year of age. He holds office for three years, and is elected thereto by a plurality of all votes. The administrative officers of

† The main line of the public works, comprising the State railroads and the line of canal from Columbia to Pittsburg, was sold in 1857 to the Pennsylvania Railroad Company for $7,500,000, and all the other State canals were sold in 1858 to the Sunbury and Erie Railroad Company for $3,500,000—making a total for all the works amounting to $11,000,000. At a later period the Delaware Division was resold by the Sunbury and Erie Railroad Company to a new company for $1,775,000.

the State are the secretary of the commonwealth (and *ex officio* superintendent of common schools), the deputy secretary, state treasurer, auditor-general, and surveyor-general. The three last-named officers are elective.

31. By the amended constitution, all the judges are elected by the people. The judges of the supreme court (5 in number) are chosen at large and for 15 years, the one having the shortest term to serve being chief-justice. The resident judges of the courts of common pleas and other courts of record are elected by the voters in their respective districts for 10 years, and the associate justices of common pleas for 5 years; but the governor may remove any judge for reasonable cause before the expiration of his term upon the address of two thirds of each branch of the legislature. For common pleas purposes, the State is divided into 26 districts. Philadelphia and Pittsburg have special courts.

32. The public debt of Pennsylvania, funded and unfunded, amounted in 1850 to $40,775,485, and in 1855 to $40,196,994. The productive property belonging to the State was in the two years $31,112,735 and $35,744,271. The principal sources of income are from tax on property and tolls on the public works, bank, stock, and inheritance taxes, excise and licenses, tonnage and passenger tax, etc. The expenditures are disbursed principally on account of the public debt and public works, government, schools, etc. The total resources of the treasury in 1850 (including a balance from 1849, $926,207) was $5,364,338, and in 1855 (including a balance from 1854, $1,240,928) was $6,631,402. The total expenditures in 1850 (including interest on debt, $2,004,714, and expenses of public works, $1,488,799) amounted to $4,367,054, and in 1855 (including interest, $2,077,039, and expenses of public works, $1,838,791) to $5,385,705. The value of property, real and personal, taxable for State purposes in 1850 was $492,898,829, and in 1855, $531,731,304. The total value of property in the same years, however, was $772,486,120 and $1,031,731,304. The number of taxable inhabitants in 1855 was 565,146. The principal institutions in part or wholly supported by the State are the State Lunatic Asylum at Harrisburg, the Institution for the Blind at Philadelphia, the Pennsylvania Institution for the Deaf and Dumb at Philadelphia, the Pennsylvania Hospital for the Insane at Philadelphia, the Retreat for Imbecile Children at Germantown, the State prisons and houses of refuge at Philadelphia and Pittsburg, etc.

33. The whole number of children attending school in Pennsylvania in the years 1849–50 was 504,610 or one in every 4.58 of the total population. The school statistics in June, 1850, exhibit the condition of education as follows:

Classification of Schools.	Institutions.	Teachers.	Scholars.	Income.
Primary and public schools	9,061	10,024	413,706	$1,348,249
Academies and private schools	524	914	23,751	440,977
Universities and colleges	22	134	3,520	286,805

—making a total of 9,607 institutions, 11,072 teachers and professors, 440,977 scholars and students, and $2,076,031 income yearly. The number of persons over 20 years of age who could neither read nor write was 76,262, of which 66,928 were white persons—24,380 males and 48,548 females, and 9,344 were colored persons—4,115 males and 5,229 females; and 51,283 were Americans and 24,989 foreigners. In 1855 the number of common schools was 10,772, of teachers 13,078, and of scholars 416,129; cost $1,808,333.

34. The principal collegiate and professional institutions in the State, with their statistics, in 1855, were as follows:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
University of Pennsylvania	Philadelphia	1749	9	113	5,000
Dickinson College	Carlisle	1785	8	119	21,000
Jefferson "	Canonsburg	1802	10	208	12,000
Washington "	Washington	1806	6	73	4,000

—and there are two female medical schools in Philadelphia.

35. The whole number of churches in this State in 1850 was 3,596, which had accommodation for 1,576,245 persons, and owned property to the value of $11,586,315. The most numerous denominations in this State are the Presbyterian, Methodist, Lutheran, Baptist, and German Reformed; after these the Roman Catholic, Episcopal, and Friends, and then, but in a smaller numerical proportion, the Moravian, Union, and Mennonite, and the many minor sects. This classification is founded on the church accommodation provided for the several denominations, in which the Presbyterian has 360,000 and the Methodist 341,858, the Lutherans 261,502, and the Baptist and German Reformed respectively 128,458, and 105,793 sittings; while the Roman Catholics have 89,501, the Episcopal 57,574, and the Friends' Society 61,274 only. Of the other denominations the Moravian is the largest, having 33,015 sittings, the Union Church 27,700, and the Mennonite 23,580. None of the others have 10,000 sittings.

36. Harrisburg, the capital, occupies an elevated site on the left bank of the Susquehanna, 106 miles west-by-north Philadelphia, and 98 miles north Baltimore. Latitude 40° 16′, and longitude 76° 50′. It is a handsome city, and the center of a considerable commerce, both by river, canal, and rail, and is of some manufacturing importance. The principal public building is the State Capitol, which occupies an eminence in its northern section. It is a brick building, 180 feet long by 80 feet wide, with a portico in front supported on six columns, and is surmounted by a dome, from which there is a wide and beautiful view of the mountain and river scenery of the vicinity. On either side is a smaller building, uniform in design, containing the rooms of the several department officers. The other principal edifices are the State Arsenal, the County Prison, Masonic Hall, and numerous schools and churches. Among the manufactures carried on here the most conspicuous are those of iron and pottery. The great Pennsylvania Railroad line between Philadelphia and Pittsburg passes through the city, and is here crossed by the Northern Central Railroad, extending northward from Baltimore, and these are joined in close neighborhood by the Dauphin and Susquehanna and the Lebanon Valley railroads. The river is here crossed by a noble bridge, 2,876 feet long, which connects the city with Bridgeport, the northeastern terminus of the Cumberland Valley Railroad. Population 7,834.

PHILADELPHIA HIGH SCHOOL.

37. Higher up the river, and on the line of the Northern Central Railroad, are the flourishing towns of Millersburg, Trevorton, Sunbury, Milton, etc., all of which are noted coal depôts, and connected with the mining districts by railroad. At Milton diverges the Catawissa Railroad to Philadelphia, and at Sunbury the great Sunbury and Erie Railroad, which is to connect Eastern Pennsylvania with Lake Erie; and which, at Williamsport, forms a junction with lines to Lake Ontario, Buffalo, and Niagara Falls. The port of Erie, the western terminus of the line, is the only available lake port in the State, and is fast rising in commercial importance, being also on the shore-line of railroads between Buffalo and Cleveland. Population in 1850, 5,858; in 1855, about 10,000. It is also connected with the Ohio River by canal, and a railroad is being built to Pittsburg, and another eastward, to connect with the New York and Erie Railroad.

38. Pittsburg is situated at the confluence of the Alleghany and Monongahela, the two great constituents of the Ohio. Latitude 40° 32′, and longitude 80° 2′—353 miles west Philadelphia by the Pennsylvania Railroad. The site is a triangular plain, and backed by elevations, and in its outline is not very dissimilar to that of New York city. The streets are built in line with the rivers. It is a large city, but too small for the increase of population, and hence we find numerous towns and villages on the opposite banks, which are, in fact, but the outpourings of the metropolis. Among these Alleghany City, west of the Alleghany, is the largest, and in 1850 had 21,261 inhabitants. The other principal ones are Manchester and Birmingham. The population of Pittsburg in 1850 was 46,601. In January, 1853, a local census gave the population of Pittsburg and suburbs at 110,241, and at the present time (1856) it is probably 140,000. In commercial and industrial pursuits the suburbs are identified with the city, and ought to be considered, though under separate municipalities, as parts of it. Pittsburg is a well-built place, chiefly of brick, and in the east section is remarkably handsome. The use of bituminous coal in the factories, however, giving forth dense smoke, beclouds the atmosphere, and by discoloring the buildings gives them a dingy appearance.

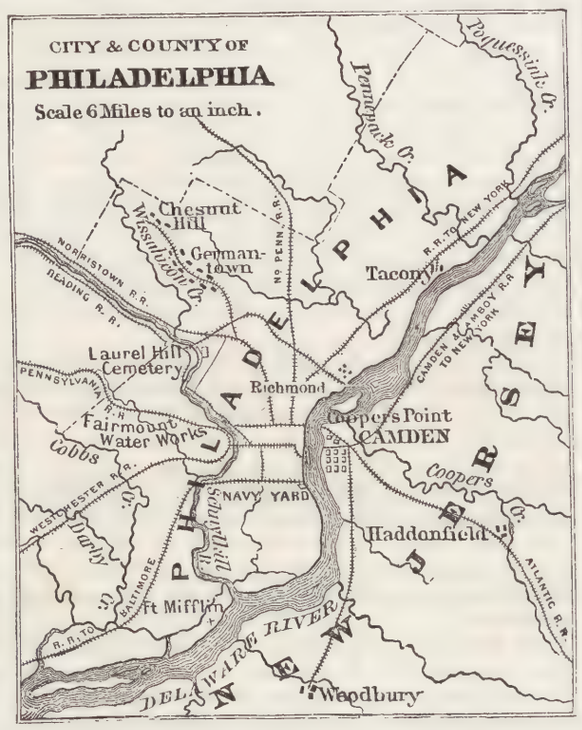
39. Many of the public edifices are fine specimens of architecture. The Court House is a massive stone structure, 165 feet long and 100 feet deep, adorned in front with a portico, the dome rising 148 feet above the ground; and the Custom House is also a large building of freestone. Among other notable edifices are the market-houses, theater, and the hotels, several of the last named being among the finest in the world. The Western State Penitentiary is located in Alleghany City, and the United States Arsenal at Lawrenceville, two or three miles above the city.

40. In all there are upward of 100 churches, of which more than half are in the city proper; among these the most conspicuous are the Roman Catholic Cathedral and St. Peter's (Episcopal). These churches and the Court House occupying the summit of Grant's Hill, are the first objects seen on approaching the city. The principal benevolent institutions are the Mercy and Western Pennsylvania hospitals, a United States Marine Hospital, and several others supported by private contributions. There is also a fine house of refuge and the city and county poor-houses. Among the literary institutions of Pittsburg the most noted are the theological seminaries, one in the city proper, and the other in Alleghany City. The Western University was destroyed by the great fire of 1845, and has not again been built. Elementary and high schools of all descriptions are numerous, and there are several literary and scientific associations.

41. Pittsburg is distinguished for its vast manufactures and its extensive commerce. Its vicinity abounds with the raw material—iron, coal, and limestone, and its site, at the head of the Ohio, gives it facilities for an indefinite extension of its commerce, while railroads link it to the cities in every direction. Nearly 500 steam-engines are at work doing the behests of its mechanics. In 1855 there were in the district 22 rolling mills, with 180 puddling furnaces,

120 heating furnaces, and 250 nail machines, which annually worked up 100,000 tons of iron into bar, rod, hoop, boiler, and sheet iron, bar and sheet steel, nails, spikes, shafts, anchors, axles, etc., employing about 3,000 hands and a capital of $5,000,000. There were also 40 founderies with machine shops, and about 20 copper-smelting establishments, with numerous other large establishments connected with its metallic manufactures. Besides these there were extensive factories and mills producing paints, rifles, white-lead, soda, linseed-oil, chemicals, flour, glass, cotton goods, spirits, paper, ropes, etc., and a great variety of minor articles. In the total the manufactured products of the district are estimated at $30,000,000 annually.

INTERIOR OF A FORGE.



42. The estimated amount of merchandise arriving and departing Pittsburg by the Ohio River is 800,000 tons, not including the lumber and coal, but including these, about 1,800,000 tons. Domestic manufactures exported in 1855 were valued at $130,000,000. Besides this vast commercial movement, there is a large additional commerce by the canals and by the railroads centering here, which extend in every direction to the extremities of the Union. Pittsburg communicates with Alleghany City by several bridges, and with Birmingham by a suspension bridge and steam ferry. A railroad bridge has also been built over the Alleghany, so as to effect a junction between the Pennsylvania and the Pittsburg, Fort Wayne and Chicago railroads, by which an unbroken line of railroad is formed between Philadelphia and Chicago.

43. The site of Pittsburg was formerly occupied by Fort Du Quesne, a French trading-post built in 1754, and destroyed by the English in 1758. As a town its settlement dates from 1765. In 1804 it was incorporated a borough, and in 1816 it was chartered a city. In 1845 a great part of the city was destroyed by fire, but still its prosperity was unchecked, and its increase in population and wealth has since been extraordinary.

44. Philadelphia, at the eastern end of the State, is its only port having an outlet seaward. It ranks the second city of the Union. Its site is between the Delaware and Schuylkill, about six miles above their confluence, and 96 miles from the ocean, in latitude 39° 57′, and longitude 75° 10′.

45. The surface is generally a plain extending between the rivers, with streets running from one to the other, and intersected by other streets at right angles. The ground ascends to the north, and affords fine sites for villas, and around the whole city are extensive suburbs. The plan of the city was projected by Penn, its founder. Independence Square is the only great park in the thickly populated part of the city. Otherwise there are five, viz., Franklin, Penn, Rittenhouse, Washington, and Logan, besides several promenades in the vicinity, at the water-works, Lemon Hill, etc.

46. Among the public buildings are comprised many noble structures. In the Girard College, Philadelphia possesses the finest specimen of Grecian architecture in the United States. It is built of marble, and consists of a main edifice surrounded by a colonnade of 34 columns, 55 feet high and 6 feet in diameter, and several detached buildings, also of marble and in suite. The whole is surrounded by a stone wall 10 feet high and inclosing 41 acres. The cost of this institution has been two million dollars, and, in accordance with the will of Mr. Girard, a French merchant of the city, and from whose beneficenee it has been built and endowed, is devoted to the education of orphans. The other most notable buildings are the Custom House (formerly the United States Bank), the United States Mint, the Merchants' Exchange, the old State House (interesting on account of its historical associations), the Musical Fund Hall, etc. On the Delaware, south of the city, is the United States Navy Yard, which occupies about 12 acres, and nearly opposite, on the Schuylkill, is the Naval Hospital, a fine structure of marble.

47. Among the charitable institutions the Pennsylvania Hospital, founded in 1752, and its offshoot, the Insane Hospital, stand prominent. Wills' Hospital, for diseases of the eye, and the Preston Retreat, for lying-in-women, are also noble institutions; and besides these Philadelphia has four dispensaries, the State institutions for the deaf and dumb and the blind, and several hospitals and asylums belonging to the various religious denominations and civic associations.

48. The churches of Philadelphia, about 300 in number, are many of them large and substantial structures, and recently several costly and highly ornamented church edifices have been erected. Public schools are numerous and highly efficient to their purpose. At the head of these stand the Normal School and High School, the latter a popular college, the benefits of which are free to advanced pupils selected from the subordinate schools. There is also a large number of private schools and academies. The collegiate establishments are the University and several medical schools; and Philadelphia also boasts of many valuable libraries, literary associations, and societies for the promotion of the fine arts, etc. It has four theaters. The city is well supplied with water and lighted with gas, and is noted for its extreme cleanliness. The water supply of the city is chiefly brought from the Fairmount Works, on the Schuylkill, which have capacity to supply 5,000,000 gallons daily.

49. As a manufacturing city Philadelphia occupies a high position. In 1850 the capital invested in this branch of industry was $33,737,911, and the numbers employed were 43,296 males and 15,803 females. The most distinguishing productions are locomotive engines, steam machinery, chemicals, jewelry, iron work of all descriptions, cotton and woolen goods, cabinet furniture, etc., and almost every article of ornament or utility is more or less manufactured. Ship-building is also carried on to a considerable extent. In commerce Philadelphia ranks next to New York, New Orleans, and Boston, or the fourth in the United States. Its seaward trade, however, is far behind its coasting and inland trade in importance. In 1853 its shipping amounted to 252,451 tons. Regular lines of steamships are established between Philadelphia and the principal commercial cities along the Atlantic sea-board, and either directly or indirectly it is connected by railroad and canal with all parts of the Union.

50. The city is divided into 24 wards, and governed by a mayor and two councils. It has one of the best police bodies in the United States. The expenses of the government amounted in 1855 to $4,350,324, of which $2,026,994 was raised by taxes and the remainder from rents of city property, water, wharves, markets, etc. The total value of real estate subject to taxation was $155,260,000. The city debt amounted to $15,697,455, and the city property was valued at $16,681,234.

51. Philadelphia was founded by William Penn, in 1682. Here met nearly all the Revolutionary congresses; here the Declaration of Independence was promulgated on the 4th July, 1776; here met the convention that formed the present constitution, and here Congress assembled for nearly 10 years after its establishment.

INDEPENDENCE HALL.

52. On the opposite bank of the Delaware are Camden and Gloucester, which may be considered as suburbs. North of the city proper is Richmond, the greatest coal depôt of the world, and the terminus of the Philadelphia and Reading Railroad, which brings down from the Schuylkill mines upward of 3,000,000 tons of anthracite yearly, and which is distributed from this port. Philadelphia, in 1850, contained 408,762 inhabitants.

53. The other principal towns in Pennsylvania are Reading, Easton, Pottsville, Mauch Chunk, Scranton, Wilkesbarre, etc., in the northeast; Germantown, Norristown, Westchester, Lancaster, Columbia, etc., on or near the Philadelphia and Columbia Railroad; Carlisle and Chambersburg, on the Cumberland Valley Railroad; and York, on the Northern Central Railroad. Otherwise there are a large number of interior towns, many devoted to mechanical industry, mining, and commerce, but chiefly the centers of agricultural regions.

54. Reading, on the left bank of the Schuylkill, 58 miles northwest Philadelphia by railroad, is a well-built town, and in 1850 had 15,743 (now 20,000) inhabitants. It contains extensive iron works and other establishments, and is the seat of a large trade. The Lebanon Valley Railroad connects it with Harrisburg, 54 miles west, and the Philadelphia and Reading road with Philadelphia and the Schuylkill mining region. A railroad is also projected toward Easton, on the Delaware, which is the outlet of the Lehigh mines, and a city of great importance, both as relates to commerce and manufactures. Opposite, in New Jersey, and connected with it by a railroad bridge, is Phillipsburg, the western terminus of the Central Railroad of New Jersey, and intersected by the Belvidere Delaware Railroad. Farther up the Delaware, at the Water Gap, the Delaware, Lackawanna, and Western Railroad crosses the river and proceeds to and beyond Scranton, a new town which has within a few years been singularly developed, and become one of the most important mining towns in the northeast. Eastward of this, and connected with it by railroad, are the mining and commercial towns Carbondale and Honesdale, which have connection with the Hudson River by the Delaware and Hudson Canal.

55. Leading west from Scranton by the Lackawanna and Bloomsburg Railroad are Kingston and Wilkesbarre, on opposite sides of the Susquehanna, both important mining towns. South of these, by railroad, is Whitehaven, a town extensively engaged in the coal and lumber trade. It is the northern terminus of the Lehigh navigation. Mauch Chunk, on the Lehigh, is also a town of great importance, and the depôt of an extensive mining region. It is connected with Easton by the Lehigh Valley Railroad, and with Philadelphia by the North Pennsylvania Railroad, completed to Bethlehem in 1857. Population 6,284.

56. Tamaqua, on the Little Schuylkill, and to which there is a railroad from Mauch Chunk, is another important mining center, and in 1850 had 3,080 inhabitants. It is on the line of the Little Schuylkill Railroad, which joins the Philadelphia and Reading Railroad at Port Clinton. Pottsville, 15 miles north Port Clinton, and 93 miles northwest Philadelphia by railroad, is situated on the Schuylkill. It is the center of an immense coal mining region, the mineral being brought here by numerous branch railroads, and exported by the Philadelphia and Reading Railroad and the Schuylkill navigation. It was founded in 1825, and in 1850 had 7,515 inhabitants.

57. Lancaster, 68 miles west Philadelphia by railroad, is situated in the most populous

and wealthy agricultural district of the State, and for many years was the largest inland town of the United States. It is noted for its manufactures of rifles, axes, carriages, etc., and has several steam cotton factories. It is also the seat of Franklin College. The inhabitants are mostly of German descent, and in 1850 numbered 12,369. The Lancaster and Harrisburg Railroad gives this city access to the capital and the West.

58. Columbia, on the Susquehanna, and at the terminus of the Philadelphia and Columbia Railroad, 80 miles west Philadelphia, is the chief depôt of the lumber rafted down the Susquehanna. The eastern division of the Pennsylvania Canal also terminates here, and by a branch of the Lancaster and Harrisburg Railroad it communicates with the capital, and by the Wrightsville and Gettysburg Railroad with York. The river is spanned by a handsome bridge, 1½ miles long, which connects the town with Wrightsville, on the opposite bank. Population (1850) 4,140.

59. York, on the Northern Central Railroad, and by railroad 13 miles west Columbia, is a neat and substantial town, and contains many handsome buildings. The vicinity is populous and fertile. Population (1850) 6,863. Gettysburg is a flourishing town, 114 miles west Philadelphia, and 36 southwest Harrisburg. It is the seat of Pennsylvania College and of the Lutheran Theological Seminary. Carriages are the chief manufacture. A railroad to Hanover is projected, which will connect the town with Philadelphia, Baltimore, etc.

60. Carlisle is a handsome place, 28 miles west-by-south Harrisburg, and on the line of the Cumberland Valley Railroad. It is well-built, and is the seat of Dickinson College, and also of a United States cavalry barracks. Population (1850) 4,581. Chambersburg, 34 miles southwest by railroad, is situated on Conecocheaque Creek, and is surrounded by a highly cultivated and populous country, forming a part of the great limestone valley lying along the southeast base of the Blue Mountains. It has manufactures of iron, wool, cotton, paper, flour, etc. The Franklin Railroad connects it with Hagerstown, Md., and a railroad is proposed to a junction with the Pittsburg and Connellsville Railroad. Population (1850) 3,335.

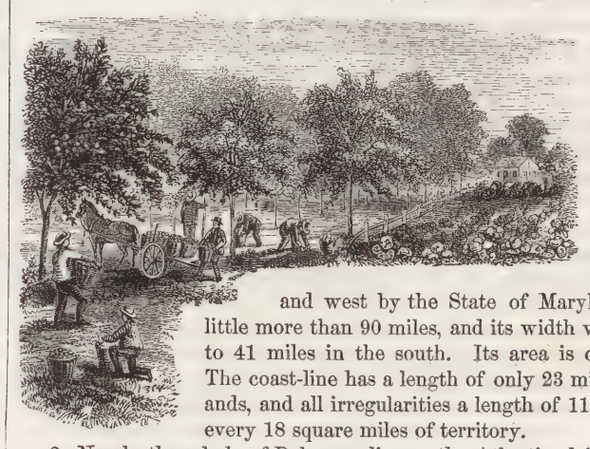
61. In the extreme southwest of the State is the town of Washington, rapidly rising in importance, and important also as the junction of the Chartiers Valley and Hempfield railroads.

62. Pennsylvania is the only State of the Union which bears and transmits to future ages the name of a private individual. William Penn, the illustrious founder of Pennsylvania, a name given to the infant colony by Charles II., was the son of Admiral Penn, who in the year 1655 acquired distinction as a commander in the conquest of Jamaica and in the war with the Dutch. At an early period of life Penn had joined the Quakers, who began about that period to attract public attention, and it seems to have been the intolerance manifested toward the sect that first turned his mind toward America. He and some others purchased a large quantity of land in New Jersey, but becoming dissatisfied, he formed the design of acquiring a separate estate. The crown was indebted to his father's executors in the sum of about £16,000, and as an acquittance for this a large tract was granted to him. His charter conveyed to him all that tract of country bounded on the east by the river Delaware, extending westward five degrees, and north and south between the 40th and 42d parallels, except an area around Newcastle circumscribed by a radius of 12 miles. From want of sufficient attention to former charters, this grant interfered both with that of Maryland on the south, and with the claims of Connecticut on the east, and hence arose contentions which disturbed the repose of the colonies for a century afterward.

63. In May, 1681, the proprietary sent over Markham, with a few others, to take possession of the territory, and in July he sold 20,000 acres to a company of merchants, at the rate of £20 the thousand acres, entering into articles of agreement with them, entitled "Conditions and Concessions." In the following year Penn published his "Frame of Government," by which the supreme power was to be vested in a governor and general assembly, consisting at first in the whole body of the people, and afterward in a house of representatives. A provincial council was established, consisting of 72 persons, to be chosen by the freemen. The governor, possessed of three votes, presided in this council, which prepared and digested all laws, leaving to the people the entire right of rejecting or affirming. This constitution was after awhile laid aside, and another, resembling those established in the other provinces, was adopted.

64. In October, 1682, Penn, accompanied by about 2,000 settlers, arrived at Newcastle, on the Delaware. He had previously acquired from the Duke of York a conveyance of the land at present included in the State of Delaware. His first step on landing was to convoke an assembly, which was held at Upland (now called Chester), in December, 1682. In a short session of three days, a constitution modifying that drawn up by Penn in England was adopted, and several important laws passed. Among other provisions, that great principle, to an adherence to which the province owed much of its prosperity, was adopted, that "none acknowledging one God, and living peaceably in society, should be molested for his opinions or practice, or compelled to frequent or maintain any ministry whatsoever." Another principle of Penn's system, equally novel and praiseworthy, regarded the treatment of the Indians. Soon after his arrival he summoned them to a council, and treating with them on an amicable and equal footing, as men and brethren, obtained from them, in return for valuable presents, a cession of as much land as his exigencies required. The same course was pursued in his subsequent intercourse with them, and it was seen with surprise by mankind that kindness and good faith were as useful assistants as the sword in the affairs of a colony. No one of the colonies made such rapid advances in prosperity as Pennsylvania. The salubrity of the climate and the general fruitfulness of the soil had some influence, but the moral attractions predominated. The persecutions at home drove thousands to a place where religious worship was free, and the prospect of enjoying equal rights in civil matters, attracted from the continent of Europe a vast number of industrious and moral emigrants.

PENN'S HOUSE AS IT WAS.



65. The city of Philadelphia was founded at an early period after the arrival of the first settlers, and the second assembly of the colony was held at this place, in April, 1683. Among other important laws adopted by this assembly was one abrogating the common law of England respecting descents, and distributing the estates of persons dying intestate among the children, giving to the eldest son, however, a double share. The Revolution in England produced some change in the government of Pennsylvania. Penn, being suspected of being disaffected toward the House of Orange, was suspended from the privilege of appointing a deputy for his province; and in 1692 Pennsylvania was annexed to New York and subjected to the administration of the governor of that province. Two years after, however, the proprietary was reinstated, and appointed a new governor. Notwithstanding the pacific disposition of the governor and people, and the general concordance of their opinions, Pennsylvania proved to be no Utopia for the worthy proprietary. Bickerings about the constitution or the laws or the manner of disposing of the lands almost constantly existed. The charter had twice been altered, but the colonists were still discontented. A third charter was given them in 1701, which provided that the assembly should consist of deputies from each county, and that it should have the right to originate, amend, or reject all bills; that the governor should nominate his own council, exercise the whole executive power, and have a negative on the proceedings of the assembly. The delegates from Pennsylvania assented to this constitution, but those from "the Three Lower Counties on the Delaware," as they were called, refused to adopt it, and seceded from the assembly. From this period the Three Counties had a distinct assembly, though they were subject to the same governor as Pennsylvania. The constitution thus adopted continued in force until the Revolution.

66. Penn died in 1718 at the age of 74 years. Since his founding the State that immortalizes his name, his life had been a uniform scene of vexation and disquiet. His private fortune had materially suffered by his advances to promote the infant colony, and at one time he was compelled to submit to a temporary deprivation of liberty. He left, however, to his descendants an inheritance of great value, which they enjoyed until the overthrow of the British power, when the Commonwealth became the possessor, and as an indemnification granted them an ample sum of money.

67. From the death of Penn the history of the colony is little more than a narrative of petty quarrels between the proprietary governors and the assembly. The chief subject of dispute arose from the lands of the proprietary, which it was wished to exempt from taxation, to which other lands were liable. The assembly resisted the exemption, and this disagreement frequently prevented the passage of necessary laws. In 1749 an important treaty was made with the Indians of the Six Nations at Philadelphia, in which, for goods of considerable value, they granted to the proprietary all the lands on the Susquehanna, south as far as the boundary of Pennsylvania and north to the Kittatinny Hills or Blue Mountain. The whole Indian title to lands within the State was subsequently merged.

68. A large portion of the inhabitants of Pennsylvania were Quakers, but notwithstanding their peaceful inclinations the colony opposed with as much zeal as her sister colonies the arbitrary measures of the British government which led to the Revolution. The first congress of deputies from the States and most of the subsequent sessions of the same assembly were held in Philadelphia, and it was at the same place that the Declaration of Independence was adopted and proclaimed. During a considerable part of the war the State was the theater of hostilities. On the Declaration of Independence the proprietary government was abrogated, and the people by their representatives formed a new constitution. The form of government adopted at this period was found after the peace to be liable to serious objections. Two parties then arose, the republicans and the constitutionalists—the former, desiring a constitution in which the legislative power should be exercised by two branches and the executive invested in a single person, finally triumphed, and in 1790 a constitution similar to that of the United States was adopted. In 1794 an insurrection broke out in four of the western counties, in opposition to the law of the United States imposing a tax on spirits. From this, called the "Whisky Insurrection," serious consequences were at first threatened, but by a happy union of firmness and lenity on the part of President Washington the revolt was quelled. In Northampton County, in 1797, some deluded persons attempted to resist the process of the marshal, but the power of the laws again triumphed. In 1799 the public offices and the sittings of the legislature, which from the settlement of the colony had been held at Philadelphia, were removed to Lancaster, and in 1812 they were transferred from Lancaster to Harrisburg, the present capital.

STATE OF DELAWARE.

1. Delaware occupies the northeastern portion of the peninsula between the Delaware and Chesapeake, and lies between latitudes 38° 28′ and 39° 47′ north, and longitudes 74° 56′ and 75° 46′ west; and is bounded on the north by the State of Pennsylvania, on the east by Delaware River and Bay and the Atlantic Ocean, and on the south and west by the State of Maryland. In length Delaware is a little more than 90 miles, and its width varies from 12 miles in the north to 41 miles in the south. Its area is computed at 2,120 square miles. The coast-line has a length of only 23 miles, but including the bays, islands, and all irregularities a length of 118 miles, or one mile of coast to every 18 square miles of territory.

2. Nearly the whole of Delaware lies on the Atlantic plain. The northern part, however, as far south as Christiana Creek, belongs to the primary tracts, and is hilly and somewhat rugged; but there are no hills exceeding 500 feet in height above the ocean. South of the

creek above named, the surface is an almost perfect level, the general slope being toward the Delaware River and the ocean. In the southwest the slope is toward the Chesapeake; and near the western boundary a table-land or low sandy ridge, nowhere more than sixty or seventy feet in height, passes through the State nearly north and south, and forms the watershed of the peninsula. This table-land abounds with swamps, in which most of the rivers and streams have their sources, some flowing west into the Chesapeake and others east into the Delaware. At the southern extremity of the State is the Cypress Swamp, a morass twelve miles in length and six in width. This swamp contains a great variety of trees and evergreen shrubs, and is infested with wild animals and noxious reptiles. The low shore along the Delaware and Atlantic is in many parts marshy, and long sandy beaches inclose shallow bays or more properly lagoons.

3. The rivers of Delaware are inconsiderable. The Choptank, Nanticoke, and Pocomoke, the head waters of which are within Delaware, have the greatest length of their courses in Maryland, and flow into the Chesapeake. Though none of these streams have great depth, most of them have a few miles of navigation for small craft from their mouths. The Brandywine, which rises in Pennsylvania, receives Christiana Creek at Wilmington, and becomes navigable for large ships, and small vessels go up the Christiana some considerable distance. Appoquinnimink River, Duck Creek, Jones' Creek, Murder Kill, Mispilion Creek, Broad Kill (the Hœrenkill of the Dutch), and Indian River, are the other principal streams, all of which are affluents of the Delaware.

4. Delaware Bay is a fine estuary, about 60 miles in length by 25 or 30 miles in greatest width, but contracting toward the north to less than five miles, and where it opens to the sea, between Cape May (latitude 38° 55′ 49″ north, and longitude 74° 57′ 39″ west) and Cape Henlopen (latitude 38° 47′ 54″ north, and longitude 75° 6′ 9″ west), the width is not more than fifteen miles. The main channel admits the largest vessels to the head of the bay and into the river, having from 35 to 75 feet of water; but is made rather tortuous and intricate by the numerous shoals which nearly fill the central portion. A breakwater consisting of two piers, opposite Lewestown, above Cape Henlopen, is of important service to the navigation of the bay, sheltering it from the fury of the waves which roll in here with great violence, and protecting it from the masses of floating ice brought down by the ebb tides. Rehoboth Bay, nine miles south of Cape Henlopen, is a spacious but shallow basin at the mouth of Indian River, not admitting vessels of more than six feet draft. It is inclosed by a long sand-beach, which protects it from the ocean.

5. In the northern part of the State, along the Delaware River and Bay, and for eight or ten miles inland, the soils are generally rich clays; from thence to the swamps the soil is light and sandy, and of an inferior quality; and the central and southern parts have also a sandy soil, which gradually becomes more unproductive as the south is approached. Bog iron ore is found in the swampy tracts of the latter section. Shell marl, highly valuable in agriculture, also occurs abundantly; and in the north is found kaolin or porcelain clay, which has supplied the Philadelphia works with that valuable earth. The climate of Delaware is in general mild, and highly favorable to agricultural pursuits. The northern and more elevated region has a remarkably salubrious atmosphere, but where the land is swampy, as in the southern parts of the State, endemic sicknesses prevail to a considerable extent. The natural productions are similar to those of the middle region of the Atlantic States. Some large timber grows in the north.

FARMING SCENE.

6. In 1850 Delaware contained 91,532 inhabitants, or 43.18 to the square mile or 0.39 per cent. of the total population of the Union. This was distributed as follows:

Counties.	Population.	County Seats.	Counties.	Population.	County Seats.	Counties.	Population.	County Seats.
Kent	22,816	Dover.	Newcastle	42,780	Newcastle.	Sussex	25,936	Georgetown.

—and consisted of 15,439 families inhabiting 15,290 dwellings. Of the total population 71,169 (77.75 per cent.) were whites—35,746 males and 35,423 females, 18,073 free colored—9,035 males and 9,038 females, and 2,290 slaves—1,174 males and 1,116 females: and of the free population (89,242), 83,968 (94.09 per cent.) were Americans, of whom 72,351 were born in this State; 5,211 (5.84 per cent.) were foreigners, and 63 were of unascertained origin. The number of natives of Delaware in other States was 31,965. In 1790 Delaware had 59,096 inhabitants; in 1800, 64,273; in 1810, 72,674; in 1820, 72,749; in 1830, 76,748; in 1840, 78,085, and in 1850 (as above), 91,532. In 1855 the population was estimated at 97,295.

7. Of 22,061 free male persons over 15 years of age engaged in industrial pursuits in 1850, the classification was as follows: 5,633 in commerce, trade, manufactures, mechanic arts, and mining; 7,884 in agriculture; 6,663 in labor not agricultural; 743 in sea and river navigation; 251 in law, medicine, and divinity; 581 in other pursuits requiring education; 124 in government civil service; 69 in domestic service, and 113 in unclassified occupations.

8. Delaware is generally considered as an agricultural State; but, in truth, it has a very varied industry, being agricultural in the south and manufacturing in the north. Its whole products in 1850 were valued at $85 27 *per capita*, being about half the ratio as presented by Massachusetts; but in Delaware the value of the productions of agriculture and manufactures are nearly equal, while in Massachusetts manufactured products are ten times that of its agricultural products. Twenty other States, however, have a *per capita* less than Delaware. With foreign commerce it has little to do, but its home trade and its trade with its neighbors is large and constantly increasing, with the greater facilities it enjoys in its railroads and other works, and the canal across its territory is the highway of a large trade between the Delaware and Chesapeake. On the whole, it is one of the most prosperous States of the Union, and what is remarkable, its government is supported without the imposition of the smallest tax on the community.

9. In 1850 Delaware contained 6,063 farms, averaging to each 158 acres, and containing in the aggregate 956,144 acres, or more than two thirds of the whole surface. Of the inclosed lands 580,862 acres were improved, and 375,282 acres were unimproved; and the whole was valued at $18,880,031, or each farm at $3,114. The value of implements and machinery was $510,279, or on the average $84 to each farm.

10. The principal cereal crops in Delaware are Indian corn, oats, and wheat. The cereal crops of 1840 and 1850 were as follows:

1840	wheat,	315,165	oats,	927,405	Indian corn,	2,099,359	barley,	5,260	rye,	33,546	buckwheat, 11,299
1850	"	482,511	"	604,518	"	3,145,542	"	56	"	8,066	" 8,615

—making in 1840 a total of 3,392,034 bushels, and in 1850 a total of 4,249,308 bushels. In 1850 the hay crop amounted to 30,159 tons; that of peas and beans to 4,120 bushels; and that of potatoes to (Irish 240,542, and sweet 65,443) 305,985 bushels. The value of market-garden products was $12,714, and of orchard products $46,574. The peaches of Delaware are highly prized in the markets, and are largely cultivated.

11. The description of livestock and the number of each in 1840 and 1850 was as follows:

1840	equines,	14,421	neat cattle,	53,883	sheep,	39,247	swine,	74,228
1850	"	14,643	"	53,211	"	27,503	"	56,261

—of the equines in 1850, 13,852 were horses and 791 asses and mules, and of the neat cattle, 19,248 were milch cows, 9,787 working oxen, and 24,166 other cattle. The whole were valued at $1,849,281, and the value of animals slaughtered in 1849–50 was $373,665. The products of animals consisted of—butter, 1,055,308, and cheese, 3,187 pounds, and the wool crop amounted in 1840 to 64,404, and in 1850 to 57,768 pounds.

12. The total value of agricultural products in 1840 is stated at $2,877,350, and in 1850 at $3,117,565.

13. Delaware in 1850 contained 531 manufacturing, mining, and mechanic establishments, using a capital of $2,978,945, and employing 3,237 males and 650 females. The value of raw material consumed in the year had been $2,864,607, and the cost of labor $936,924. The products of the year are stated at $4,649,296. The principal manufactures of this State are machinery and locomotives, carriages, gunpowder, paper, etc., and manufactures specified in the census returns are as follows:

12 cotton-mills	with capital	$460,100	and products	$538,439
8 woolen-mills	"	148,500	"	251,000
13 cast-iron works	"	373,500	"	269,462
3 wrought-iron works	"	75,000	"	38,200
16 tanneries	"	99,350	"	163,742

In 1810 the products of the manufactures of this State were valued at $2,004,912; in 1820 at $1,318,891; in 1830 at $1,991,000; in 1840 at $2,709,068; and in 1850 (as above) at $4,649,296.

14. The value of home-made goods manufactured in 1840 was $62,116, and in 1850 $38,121.

15. The direct foreign trade of Delaware is insignificant, and in some years it is "nil." None was returned in the reports for 1850. In 1855 the imports were stated at $5,821, and the exports at $63,087, and in that year only a single vessel of 144 tons entered, and 12 vessels (2,444 tons) cleared, all American tonnage. The shipping owned in the State in 1850 amounted to 16,719 (2,774 steam) tons. Of this shipping there was registered in 1850 1,651 tons, and in 1855 2,475 tons, the remainder being enrolled and licensed tonnage, and employed in the coasting trade. The shipping built in the State in 1840 was 1,848 tons, and in 1855 5,477 tons, all built at Wilmington. The only other port is Newcastle.

16. The domestic trade is carried on by coasting vessels and by railroad. Its course is generally to and from Philadelphia. The State has also a valuable transit trade, its canal and railroad crossing the neck of the peninsula forming a great commercial route between the Delaware River and Chesapeake Bay, or between Philadelphia and Baltimore, steamers connecting at both ends of the transit ways.

17. The total length of railroad in the State in 1855 was 106 miles; or one mile to every 20 miles of surface. These are the Delaware Railroad, extending from its junction with the Newcastle and Frenchtown Railroad to Seaford, through the length of the State, 71 miles, and with its connections forming a route from Wilmington to Seaford of 85 miles; the Newcastle and Frenchtown Railroad, between the two places, 16 miles, and the Newcastle and Wilmington, 4.66 miles from Newcastle to a junction with the Philadelphia, Wilmington and Baltimore Railroad, 7 miles west of Wilmington. The last named crosses the State in the north, and gives it an additional communication with Baltimore and Philadelphia. The Chesapeake and Delaware Canal connects the waters on either side of the peninsula by a channel navigable for sea-going vessels, and extends from Delaware City, 46 miles below Philadelphia to Back Creek, a navigable branch of Elk River, in Maryland, 13½ miles. This important work was completed in 1829, at a cost of $2,250,000. It is 66 feet wide at the top, with a depth of 10 feet, and has two tide and two lift locks. These are all the completed works in Delaware; but there are others projected and in progress, the objects of which are principally to form a direct line from New York and Philadelphia to Norfolk, in Virginia, and incidentally to afford accommodation to the agriculturists of the southern section.

18. On the 1st January, 1851 and 1856, Delaware had respectively nine and eleven banks, having aggregate capital amounting to $1,293,185 and $1,493,185. Their liabilities at the same periods consisted of—circulation, $833,960 and $1,192,204; deposits, $502,755 and $852,164; and miscellaneous, $170,873 and $133,303. Their assets were as follows: loans and discounts, $2,264,313 and $2,906,253; stocks, $52,986 and $44,086; real estate, $117,981 and $137,524; specie funds, $51,022 and $156,055; specie, $159,773 and $180,051; and all other assets, $383,145 and $430,723.

19. The present constitution of Delaware gives the right of voting to all free white male citizens 21 years old, and who have resided in the State one year and in the county one month. The legislature, styled the General Assembly, consists of a senate and house of representatives. Senators, three from each county, and who are chosen for four years, must be at least 27 years old, and possessed of 200 acres of freehold land in the county, or of an estate therein worth $1,000. Representatives must be at least 24 years old, and

Madison Culpeper Warrenton Leonards

are chosen for two years. The legislature meets at Dover on the first Monday in January, biennially.

20. The governor (elected for four years by a plurality of votes) must be at least 30 years old, a citizen of the State for twelve years next before the first meeting of the legislature after his election, and an inhabitant for the last six years. The president of the senate, the speaker of the representatives, and the secretary of state are successively alternates to fill the office should it become vacant by death or disability of the governor; but in case the office be filled by the secretary of state the general assembly, at its next session, chooses a governor *ad interim*. If the governor elect die, decline, etc., the governor in office continues until a new election is had. The secretary of state is appointed by the governor. The general elections are held on the second Tuesday of November.

21. The judiciary consists of a superior court, court of chancery, orphans' courts, and probate courts. There are five judges in the State, one of whom is chancellor and president of the orphans' court, and of the other four, one is chief-justice of the State, and three associate justices, one resident in each county. The chief-justice and two of the associates form the superior court and court of general session, and all the judges, except the chancellor, form the court of oyer and terminer. The court of errors and appeals is composed of three or more of the judges. The orphans' courts consist of the chancellor and the associate judge of the county. Judges are appointed and hold office during good behavior. The probate courts are held by the registers of wills, with appeal to the superior court, and all proceedings are in writing.

22. The constitution provides that no act of incorporation shall be passed without a two-third vote, unless it be the renewal of an existing incorporation; and all acts are to contain a power of revocation by the legislature. No act hereafter passed shall be in force longer than twenty years without a re-enactment of the legislature. No person belonging to the military, naval, or marine service of the United States can gain such a residence as will entitle him to vote, by being stationed at any military or naval post in the State.

23. In 1850 the whole income of the State amounted only to $31,863, and the expenditures to a sum $5,071 less than the income. In 1855 the receipts amounted to about $55,000, and the expenditures to about $45,000. The income is derived from corporation taxes, dividends, and interest on loans, etc. In this respect Delaware is happily situated, and meets all its expenses without recourse to taxation. The State has permanent resources amounting to $350,638, and a school fund amounting to $435,506. It has no public debt.

24. In 1850 a total of 14,403 children were in attendance at the schools of this State, being in the ratio of one to every 6.36 of the whole population; and on the 1st June of that year the school statistics presented the following figures:

Institutions.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	194	214	8,970	$43,861
Academies and private schools	65	94	2,011	11,125
Collegiate institutions	2	16	144	17,200

—making a total of 261 schools, 324 teachers, 11,125 scholars, and $72,186 income. The number of adults unable to read and write was 10,181, namely, 4,536 whites, 5,645 free colored, or 9,777 Americans and 404 foreigners. In 1855 there were in the State 236 public schools attended by 10,230 scholars, and the income in that year amounted to $57,738, of which $49,469 were expended.

25. The collegiate institutions of Delaware in 1855 were as follows:

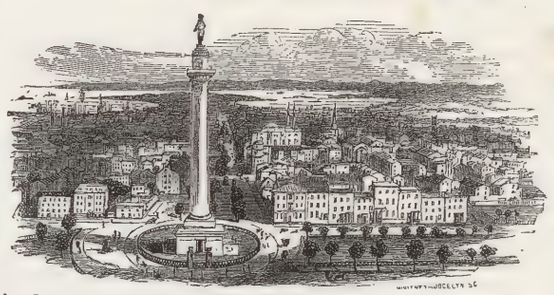
Institutions.	Location.	Founded.	Teachers.	Students.	Libraries.
Delaware College	Newark	1833	7	87	7,500
St. Mary's (R. C.) College	Washington	1847	9	110	4,800

26. In 1850 Delaware contained 180 churches, with accommodation for 55,741 persons; and the value of the property held by them in the aggregate was $340,345. The principal religious denominations are the Methodist (to which church a full half of the population belongs), Presbyterian, and Episcopalian; and next to these in point of numbers the Baptist, Quaker, and Roman Catholic. Churches of other denominations are very insignificant.

27. Dover, the capital, is situate on high ground between the two principal branches of Jones' Creek, 10 miles from its entrance into Delaware Bay, and 50 miles south of Wilmington. It is a neat, regular town with a large public square, on which stands the State House and other public buildings. Population about 1,000.

28. Wilmington, on the Philadelphia, Wilmington, and Baltimore Railroad, is a port of entry and a large manufacturing city. It is situate between Brandywine and Christiana creeks, one mile above their junction. Manufactures of various kinds are carried on, and it has also a considerable commerce and transit trade. Population 13,979. The Brandywine is navigable for merchantmen, and Christiana Creek for vessels drawing eight feet water. On the former are numerous extensive flouring-mills.

29. Newcastle is situate about five miles south-southwest of Wilmington, and is also a place of considerable manufacturing industry. It is connected with Wilmington by railroad, and is also the eastern terminus of the Newcastle and Frenchtown Railroad. The manufactures carried on are various, and include machinery, etc. Population 1,202.



30. Delaware City is the eastern terminus of the Chesapeake and Delaware Canal, where it meets the river. It is a small town, but has an active trade. Population 908. Port Penn has 273 inhabitants. None of the other places have more than 200 inhabitants.

31. Lord De La War, Governor of Virginia, appears to have been the first to enter the bay which thence took his name. This was in 1610. The Dutch, from whom the names of its capes are derived, frequented it soon after, and had a post at Hœrenkill, but the precise date of their arrival is uncertain. The bay was by them called Nieuw Port Mey or Gœdyn's Bay, and the river Zuyd Rivier or South River.

32. The Swedish West India Company, chartered in 1635 by Oxenstiern, sent out in 1637 a ship with a body of colonists under Peter Menewe or Minuits. In the following year Minuits seated himself on the Maniques, now Brandywine River, and there built Fort Christina. The Dutch, however, had never relinquished their claim in this region, and in 1651 they built Fort Cassimer on the site of Newcastle. The subsequent settlements of the Swedes were mostly within the present limits of Pennsylvania, where New Gottenburg (Nya-Gœtheborg), the capital of New Sweden (Nya-Sveriga), was founded on the island of Tinicum. In 1655 a small force from New Amsterdam reduced the Swedish settlements, which were incorporated with New Netherlands, and with that colony taken possession of by the English in 1664.

33. The settlements on the Delaware, although this region fell within the chartered limits of Maryland, were attached to the province of New York until 1681, when they were purchased of the Duke of York by William Penn, who annexed them to Pennsylvania under the name of the "Territories or the Three Lower Counties on the Delaware." They continued subordinate to that province, though with a distinct legislature, from 1701 until 1776, when Delaware declared itself an independent State, and a constitution was framed by the inhabitants thereof. In 1792 a new constitution was framed, which was modified in 1802, in 1831, and in 1838.

STATE OF MARYLAND.

1. Maryland is situated between latitudes 37° 50′ and 39° 43′ north, and longitudes 75° 4′ and 79° 33′ west; and is bounded on the north by Pennsylvania, on the east by Delaware and the Atlantic Ocean, and on the south, southwest, and west by Virginia, from which it is separated mainly by the Potomac River. The greatest extent of the State, east and west, is about 200 miles, with a width varying from a few miles to 120 miles. The land area is computed at 11,124 square miles; including the waters of Chesapeake Bay the whole area is 13,959 square miles.

2. Maryland presents to the ocean a front of only 33 miles, but with the shore-line of the bays, islands, and all irregularities its shore-line measures 509 miles, or about one mile of shore to every 22 miles of surface.

3. Maryland is naturally divided into two distinct physical regions: the one an elevated region, traversed by various ridges of the Alleghanies; and the other, lying below the lower falls of the rivers, a level country, scarcely rising above the adjacent waters. The latter of these regions is subdivided into two unequal parts by Chesapeake Bay, which are known as "Western Shore" and "Eastern Shore."

4. The "Eastern Shore" forms a part of that long peninsula which, projecting southward toward and into the Atlantic Ocean, divides the waters of the Chesapeake from those of Delaware Bay. Throughout, the soils are more or less sandy. Few rocks are found in any part, and the mineral deposits consist chiefly of bog-iron ore, chromes, etc., with aluminous and magnesian earths. In the north, however, the surface is rugged, and has a rocky substratum—the rocks chiefly sandstone and slate. Marl, shell-lime, marsh-mud, peat or turf, and other agents used as fertilizers, abound. The climate is genial, and, with exceptions, the country enjoys a salubrious atmosphere. The growths consist principally of oaks of various species, hickory, chestnut, pine, locust, walnut, cedar, gum, beech, and a great variety of shrubs and herbaceous annuals. Wheat and Indian corn are the staple agricultural products, and in the more southern counties the cotton plant is said to succeed well.

5. The "Western Shore" consists of another peninsula lying inland between the Potomac and Chesapeake, and up to the line of the river falls. In its general features, soil, and productions it closely resembles the section of country already described. It constitutes the great tobacco-growing region of Maryland.

6. The leading geographical feature of the northwestern part of this section is the ledge of primitive rock which runs from the west bank of Potomac River, in Montgomery County, northeastwardly to the Susquehanna River, where it crosses the north line of the State. This ledge forms a natural boundary between the alluvial region and the mountainous district of Maryland.

7. The latter-named district—an elevated region—is traversed by various ridges of the Alleghanies, and in many parts is extremely wild and rugged. This section extends along the left bank of Potomac River to the western boundary of the State. From the eastern base of the primitive ledge, which is in fact a lower branch of the Alleghany chain, the surface gradually rises to the head waters of the Potomac River, 2,000 feet or more. This represents the rise from tide-water at Baltimore to the dividing grounds in Alleghany County, between the waters of the Potomac and those falling into Ohio River.

8. The principal rivers of Maryland are the Potomac, on its southern border; the Patuxent, the Severn, and the Patapsco, which flow from the western shore; the Susquehanna, which has its lower course in Maryland; the Elk, Chester, Choptank, Nanticoke, and Pocomoke, which flow from the eastern shore. The Potomac, common also to Virginia, is the most important of these. It has its rise in the recesses of the Alleghanies, and reaches the bay between Point Look-out and Smith's Point. This river is seven and a half miles wide at its mouth, and navigable for the largest ships to Washington, 300 miles. Above this point navigation is obstructed.

9. The Patuxent is the longest river within the State. It rises in the northern part of Montgomery County, and flows in a generally south direction to Chesapeake Bay, which it reaches 18 miles north of Point Look-out. It is navigable to Nottingham, 50 miles, for vessels of 250 tons. The Patapsco rises from South-East Mountain, and thence continues in a southeastern course to the bay. It is navigable for large vessels to Baltimore, 14 miles from its mouth, and for smaller vessels to Elkridge Landing, 8 miles farther up.

10. The Susquehanna is properly a river of Pennsylvania; it reaches the Chesapeake a few miles north of the mouth of Patapsco River.

11. The rivers from the eastern coast are navigable only in the lower part of their course, and, except the Pocomoke and Nanticoke, are rather the estuaries of numerous creeks than rivers in themselves.

12. Rising westward of the Alleghanies is the Youghiogeny, the only river of Maryland that does not empty its waters into Chesapeake Bay and the Atlantic. It flows northward into the Monongahela River, and thence its waters are carried through the Ohio and Mississippi to the Gulf of Mexico.

13. Chesapeake Bay is a noble sheet of water; its entrance, between Cape Charles and Cape Henry, is 15 miles wide, and opens from east to west; but on penetrating the land, it suddenly changes its direction, and stretches south and north over a distance of 180 miles, with a width in the southern part of 20 to 30 miles, and in the northern part of about 10 miles. It is throughout navigable for large vessels. The entire coast is deeply indented, and numerous islands line the shores.

14. The Atlantic coast presents a striking contrast when compared with that of the Chesapeake. Between the ocean and the mainland is a prolonged sandy beach, extending the whole length of that portion of Maryland facing the ocean. This sand beach varies from a few yards to a quarter of a mile or upward in breadth, and incloses a narrow shoal bay. Some outlets that formerly existed in this beach, and admitted the sea, are closed, and the waters of the bay have become comparatively fresh.

15. The whole lower regions of Maryland are referable to a recent geological period. The head of tide-water forms the limit of these new formations. On the western borders of this all the great rivers descend by falls and rapids, and here navigation is stayed, and large cities have been built. Westward is a belt of stratified metamorphic rocks, which ranges nearly parallel with the Atlantic coast. These rocks include gneiss, slates, granite, limestone, and serpentine. The beds of the rivers which pass through this region, which is from 20 to 30 miles broad, are in deeply-cleft valleys, with rounded or abrupt sides, that afford small tracks of alluvial soil. In an economic point of view these rocks are exceedingly valuable, and form an excellent and indestructible material for ordinary buildings, and yield iron ore, chrome, magnesia, and other useful minerals. West of Frederick these metamorphic rocks are covered with uncomformable beds of red sandstone. These consist of dark reddish-brown argillaceous sandstones, of crumbly brown shales, and coarse conglomerates. The beds occurring along the northwestern margin of the formation have frequently the character of coarse conglomerates, made up of pebbles derived from a great variety of rocks. The beds of rocks on the Potomac, which furnished the material from which the columns of the House of Representatives at Washington have been constructed, belong to this formation, and to this belong the most important localities of copper ore in Maryland.

16. Passing this formation, which occupies a narrow trough in the metamorphic rocks, and proceeding westward, we approach the great Alleghany Mountains. The ridges of this chain consist of a succession of concave and convex strata. The most important feature in their geology is the occurrence among the strata of the carboniferous formation, and its included beds of coal and ores of iron. The carboniferous strata composing the coal series of Cumberland dip on every side toward the center of the trough. The successive beds have been compared in shape to a great number of Indian canoes placed one within the other. The thickness of the coal formation is immense. The gross amount of coal in this basin has been estimated at 6,305,137,827 tons, two thirds of which are available without draining. The analysis of Cumberland coal shows it to be of the kind denominated dry or close burning, or intermediate between the fat coal of Pittsburg and the anthracite of Pennsylvania. Numerous other useful minerals exist, and these in process of time will become, like the coal and iron, important elements in the physical welfare of the State.

17. In 1850 Maryland contained 583,034 inhabitants, or 52.41 to the square mile, or 2.51 per cent. of the total population of the United States. This population was distributed as follows:

Counties.	Population.	County Seats.	Counties.	Population.	County Seats.	Counties.	Population.	County Seats.
Alleghany	22,769	Cumberland.	Charles	16,162	Port Tobacco.	Prince George	21,549	Up. Marlboro'.
Anne Arundel	32,893	Annapolis.	Dorchester	18,877	Cambridge.	Queen Anne	14,484	Centreville.
Baltimore	210,646	Baltimore.	Frederick	40,987	Frederick.	St. Mary's	13,698	Leonardstown
Calvert	9,646	Pr. Frederick.	Harford	19,256	Bel-Air.	Somerset	22,456	Princess Anne
Carolin	6,692	Denton.	Howard	(*new.*)	Ellicott's Mills	Talbot	13,811	Easton.
Carroll	20,616	Westminster.	Kent	11,386	Chestertown.	Washington	30,848	Hagerstown.
Cecil	18,939	Elkton.	Montgomery	15,860	Rockville.	Worcester	18,859	Snow Hill.

—and consisted of 87,384 families inhabiting 81,708 dwellings. Of the total population 417,943 (71.69 per cent.) were whites—211,187 males and 206,756 females, 74,723 free colored—35,192 males and 39,531 females, and 90,368 slaves—45,944 males and 44,424 females; and of the population (492,666) 438,916 (89.89 per cent.) were Americans, of whom 400,594 were born in this State; 53,288 (10.82 per cent.) foreigners, and 462 of origin not ascertained. In other States there were 127,799 natives of Maryland. In 1790 this State contained 319,728 inhabitants; in 1800, 341,548; in 1810, 380,546; in 1820, 407,350; in 1830, 447,040; in 1840, 470,019, and in 1850 (as above), 583,034. In 1855 the population was estimated at 639,580.

18. Of 124,876 free male persons over 15 years of age returned in the census of 1850 as engaged in industrial pursuits—47,616 were engaged in commerce, trade, manufactures, mechanic arts, and mining; 28,588 in agriculture; 32,108 in labor not agricultural; 67 in the army; 9,740 in sea and river navigation; 2,059 in law, medicine, and divinity; 2,442 in other pursuits requiring education; 963 in government civil service; 1,021 in domestic service, and 278 in unclassified occupations.

19. In industrial pursuits Maryland presents three essentially different localities: in the west its chief industry is coal and iron mining; in the south agriculture, and in the north manufacturing and commercial. Baltimore is the center of the latter district and Cumberland of the mining district. The whole productions of the State in 1850 averaged $83 85 *per capita*, and the value of manufactured products was twice that of the products of agriculture. As a commercial State, Maryland ranks next to Pennsylvania, and occupies the fifth place in the Union. It has every facility in its chief harbor, and since the completion of its public works, which open up the interior, its career has been one of increasing prosperity. Without these Baltimore could not have attained the important position it now enjoys.

20. In 1850 Maryland contained 21,860 farms and plantations, measuring 4,634,356 (improved 2,797,905 and unimproved 1,836,445) acres, or about two thirds the whole area of the State, and valued at $87,178,545. Thus each farm on the average contained 212 acres, and was valued at $3,988. The aggregate value of farming implements and machinery was $2,463,443, or $113 to each farm.

21. The principal cereal crops consist of Indian corn, wheat, and oats, and the tobacco crop is only exceeded by those of Virginia and Kentucky. The amounts (bushels) of the cereal crops in 1840 and 1850 were as follows:

1840	wheat,	3,345,680	rye,	723,577	oats,	3,584,211	corn,	8,233,086	barley,	3,594	buckwheat, 73,606
1850	"	4,494,680	"	226,014	"	2,242,151	"	10,749,856	"	745	" 103,671

—making in 1840 a total of 15,913,654 bushels, and in 1850 a total of 17,817,119 bushels. The tobacco crop in 1840 amounted to 24,816,012, and in 1850 to 21,407,497 pounds. The other principal crops in 1850 were as follows: potatoes (Irish 764,939 and sweet 208,993) 973,932 bushels; hay 157,956 tons; clover seed 15,217, and other grass seed 2,561 bushels; peas and beans 12,816 bushels, etc. The value of market-garden products was $200,869, and of orchard products $164,051.

TOBACCO PLANT.

22. In the same years the livestock of the State consisted of and numbered as follows:

1840	horses, etc.,	92,220	neat cattle,	225,714	sheep,	257,922	swine,	416,943			
1850	"	81,328	"	219,586	"	177,902	"	352,911			

—of the equines in 1850, 75,684 were horses and 5,644 asses and mules; and of the neat cattle 86,856 were milch cows, 34,135 working oxen, and 98,595 other cattle. The whole in 1850 was valued at $7,997,634. The products of animals consisted of—butter 3,806,160, and cheese 3,975 pounds; and the wool crop, which in 1840 amounted to 488,201 pounds, amounted in 1850 to 477,438 pounds. The value of animals slaughtered in the last census year was $1,954,800.

23. The total value of agricultural products in 1839–40 is stated at $14,015,665, and in 1849–50 at $16,296,199.

24. In 1850 there were in this State 3,708 manufacturing and other industrial establishments. These had an aggregate capital of $14,753,143, and gave employment to 22,641 males and 7,483 females. The value of raw material consumed in the year then ending was $17,326,734, and the amount paid as wages was $7,374,672; and the value of the products manufactured was $32,477,702. The statistics of the principal manufactures were as follows:

24 cotton mills	$2,236,000	capital	2,022	hands	$2,120,504	products.
38 woolen mills	244,000	"	362	"	295,140	"
18 pig iron works	1,420,000	"	1,370	"	1,056,400	"
16 cast "	359,000	"	761	"	685,000	"
17 wrought "	412,050	"	468	"	771,431	"
34 breweries and distilleries	247,100	"	131	"	328,750	"
116 tanneries	628,900	"	479	"	1,103,139	"
245 flouring mills	1,883,460	"	502	"	4,918,576	"
3 mining—coal*	605,000	"	210	"	196,675	"
21 " —iron	34,700	"	274	"	171,675	"

The manufactures of Maryland in 1810 produced goods to the value of $8,879,861; in 1820 to $5,027,336; in 1830 (no returns); in 1840 to $13,509,636, and in 1850 (as above) $32,477,702.

25. The value of goods manufactured in families in 1840 was $176,050, and in 1850 $111,828.

26. The value of exports to foreign countries in 1850 amounted to (domestic produce $6,589,481) $6,967,353, and in 1855 to (domestic produce $9,882,218) $10,395,984; and the value of foreign goods imported in the two years was $6,124,201 and $7,788,949. The shipping employed in the foreign trade in the years respectively was as follows:

	Cleared.		Entered.	
	1850.	1855.	1850.	1855.
American	89,296 tons	111,096 tons.	70,427 tons	121,337 tons.
Foreign	37,523 "	47,494 "	29,161 "	43,790 "
Total	126,819 "	158,590 "	99,588 "	165,127 "

The total shipping owned in the State in 1850 amounted to 193,087 tons, of which 90,669 tons were registered and 13,457 steam tonnage; and in 1855 to 234,785 tons, of which 112,262 tons were registered and 16,575 tons navigated by steam. The amount of shipping built in 1850 was 15,964 tons, and in 1855, 22,524 tons.

27. The following table exhibits the progress of the commerce and navigation of the State for the past 10 years:

Years.	Commerce.		Navigation.		Shipping Owned.		Shipping Built.
	Exports.	Imports.	Cleared.	Entered.	Registered.	Total.	
1846	$6,869,055	$4,042,915	— tons	— tons	— tons	— tons	— tons
1847	9,762,244	4,432,314	— "	— "	— "	— "	— "
1848	7,129,782	5,343,643	— "	— "	— "	— "	— "
1849	8,000,660	4,976,731	149,928 "	110,068 "	79,682 "	173,021 "	17,462 "
1850	6,967,353	6,124,201	99,588 "	126,819 "	90,669 "	193,087 "	15,964 "
1851	5,635,786	6,650,645	105,789 "	124,027 "	95,676 "	204,545 "	18,027 "
1852	6,667,861	6,719,986	128,243 "	128,021 "	96,346 "	206,243 "	18,158 "
1853	7,906,459	6,330,078	143,596 "	119,089 "	92,804 "	206,086 "	16,901 "
1854	11,782,692	6,787,552	174,207 "	156,448 "	103,970 "	220,208 "	20,353 "
1855	10,395,984	7,788,049	165,127 "	158,590 "	112,262 "	234,785 "	22,524 "

28. The domestic trade is extensive and is constantly being increased by the opening of new channels into the interior. Baltimore is now connected by railroad with Wheeling and Parkersburg on the Ohio, and will at no distant period be connected directly with Pittsburg, affording it ample access to the interior States; eastward with Philadelphia, New York, etc.; northward with Harrisburg and Williamsport, and southward with Washington and all the principal places in the south and southwest. The total length of railroad actually within the State in 1855 amounted to 430 miles, being one mile of road to every 25.9 square miles of surface or to every 1,534 of the total population. The Chesapeake and Ohio Canal follows the valley of the Potomac from Cumberland, the center of the western mining region, to Georgetown, D. C., and Alexandria, Va., and has a total length of 198 miles. A part of the Susquehanna and Tide-Water Canal is also within this State, and also a part of the Chesapeake and Delaware Canal. By means of these routes the products of the interior are collected on the Chesapeake, which, for the purposes of commerce, serves as a great inland lake, and which is connected by canals with the Delaware and Hudson rivers. The coasting trade is commensurate with the great facilities offered by these waters and their connections, and employs

* The following quantities of coal have been delivered from the mines of this State in the years named: 1842, 1,708 tons; 1843, 10,082 tons; 1844, 14,890 tons; 1845, 24,653 tons; 1846, 29,795 tons; 1847, 52,940 tons; 1848, 79,571 tons; 1849, 142,449 tons; 1850, 196,848 tons; 1851, 257,679 tons; 1852, 334,178 tons; 1853, 533,980 tons; 1854, 649,299 tons; 1855, 664,304 tons; 1856, 719,221 tons; 1857, 572,467 tons.

a large tonnage, and regular steam communication is maintained with all the great sea-board cities. Baltimore, its chief port, indeed, is one of the great receiving and distributing centers of the domestic as well as the foreign commerce of the Union.

29. In 1851 Maryland contained twenty-five and in 1856 thirty-one banking institutions, with aggregate capital amounting to $8,123,881 and $13,600,188 in the years respectively. The assets at the two periods consisted of—loans and discounts, $14,900,816 and $20,616,005; stocks, $760,417 and $644,600; real estate, $405,245 and $318,896; other investments, $768 and $698,890; dues from other banks, $1,173,200 and $1,649,166; notes of other banks, $965,796 and $1,482,744; specie funds $78,552 and $82,961, and specie, $2,709,699 and $3,398,101; and the liabilities were—circulation, $3,523,869 and $5,297,983; deposits, $5,838,766 and $8,370,345; dues to other banks, $1,923,206 and $1,924,756, and other liabilities, $9,895 and $938,108.

30. The government is based on the constitution ratified by the people on the 4th July, 1851, and which supplanted the original State constitution of 1776. This, the fundamental law of the State, provides that every free white male citizen of the United States 21 years of age, and who has resided in the State one year and in his precinct six months, is qualified to vote for all elective officers. The general election is held on the first Wednesday in November.

31. The legislative body is composed of a senate of 22 members, chosen for four years, and a house of delegates of 74 members, chosen from districts for two years. Members of both houses must have resided in the State for three years, and in the district for which elected for the last year thereof; and senators must be at least 24 and delegates 21 years of age. The legislature meets at Annapolis on the first Wednesday in January every second year.

32. The governor is chosen by a plurality of votes, and his term commencing on the second Wednesday of January, continues for four years. He must be 30 years of age, a citizen of the United States, and have resided in the State for five years, and in the district from which elected for the three years preceding election. For the purposes of electing the governor the State is divided into three gubernatorial districts—east, middle, and north. In case of death or disability of the governor the president of the senate, and after him the speaker of the house, succeeds to the executive, and holds until a governor is elected by the people. The executive officers, viz., the secretary of state, state treasurer, controller, etc., are appointed by the governor.

33. The judicial power of the State is vested in a court of appeals and circuit court. The court of appeals has appellate jurisdiction only. Its judges, four in number, are elected for 10 years from districts by the voters therein, and must be 30 years of age, citizens of five years' standing, and residents of the districts from which elected. The governor, with the advice and consent of the senate, designates one of the four judges as chief-justice. For circuit court purposes the State is divided into eight districts, each of which elects a judge for 10 years, who must be a citizen of the United States, and have resided in his respective district for the two years preceding. Baltimore City forms the fifth district, and has three courts, each with a separate judge, viz., the superior, common pleas, and criminal courts. Each county and Baltimore City elects three persons as judges of the orphans' court, to hold office for four years; a register of wills for six years; justices of the peace, two sheriffs, and constables, for two years. Attorneys for the commonwealth are chosen in each county by the people for four years.

34. The revenues of Maryland are derived chiefly from direct and specific taxation, licenses, lotteries, and interest and dividends on investments, etc. In the fiscal years 1850 and 1855 the total resources of the treasury amounted to $1,712,879 and $1,823,444, and the disbursements for the same years to $1,467,470 and $1,230,508. The public debt amounted in 1855 to the nominal sum of $14,949,588; but of this $3,676,065 were held by the sinking fund, and including this the sum of $5,269,856 was the whole amount on which the State paid interest. The larger portion of the debt, viz., $9,679,732, consisted of moneys invested in productive public works, the interest or dividends on which were regularly paid. Thus the whole productive property of the State amounted in 1855 to $13,355,797. The State also possesses property at present unproductive valued at $13,642,446, and a school fund amounting to $181,167. The valuation of taxable property in the State in 1850 was $196,603,625, and in 1855 to $243,933,446.

35. The number of children returned by the census of 1850 as attending school was 62,063 (of which 1,616 were free colored), or one in every 7.94 of the free population. The statistics of the educational institutions of the State on the 1st June of the same year were as follows:

Institutions.	Numbers.	Teachers.	Scholars.	Income.
Primary and public schools	898	986	33,111	$218,836
Academies and private schools	223	503	10,787	232,341
Universities and colleges	13	98	1,127	113,714

—making a total of 1,134 schools, 1,587 teachers, and 45,025 scholars, with an annual income amounting to $564,891. The total of persons over 20 years of age who could not read and write was 41,877, of which number 38,426 were natives and 3,451 foreigners, and 20,815 were white persons and 21,062 free colored persons.

36. The principal collegiate and professional institutions in the State, with their statistical condition in 1855, are as follows:

Institutions.	Location.	Founded.	Teachers.	Students.	Libraries.
Washington College	Chestertown	1783	5	70	1,500
St. John's College	Annapolis	1784	6	43	3,500
St. Mary's College	Baltimore	1799	20	—	22,000
St. Charles College	Ellicott's Mills	1805	4	122	600
Mount St. Mary's College	Emmettsburg	1830	24	126	4,500
College of St. James	Washington Co.	1842	14	38	5,600
St. John's College	Frederick City	1850	6	60	3,000
St. Mary's Theolog. Seminary	Baltimore	1791	6	27	10,000
Mt. St. Mary's Theol. Seminary	Emmettsburg	1830	—	—	—
Novitiate of Society of Jesus	Frederick City	—	—	—	—
St. Charles Seminary	Ellicott's Mills	1805	—	—	—
Medical Depart. Univer. of Md.	Baltimore	1807	6	100	—
Washington Medical College	"	1827	6	25	—
College of Dental Surgery	"	1840	5	50	—

37. The number of churches of all denominations in 1850 was 909, with accommodations for 370,465 persons, and owning property to the value of $3,947,884. The Methodist denomination is by far the most numerous, constituting one half the whole population; next in numbers is the Episcopal, claiming one sixth the whole, and the Roman Catholic numbering about a tenth. After these in point of numbers come the Presbyterians, Lutherans, Baptists, and German Reformed, holding from 25,000 to 15,000 sittings, and the Friends with about one half the latter number. The Jews have three synagogues at Baltimore, and the Unitarians and Universalists are in small numbers.

38. Baltimore is the metropolitan city, and the largest and chief commercial place in the State: Annapolis is the capital. The other considerable towns are Cumberland, Frederick City, Ellicott's Mills, Hagerstown, Havre de Grace, Port Deposit, Easton, Elkton, etc.

39. Baltimore, in point of population the third city of the Union, is situated on a bay on the north side of the Patapsco River, 12 miles from its entrance into Chesapeake Bay, and 200 miles from the ocean by ship channel. Latitude 39° 17′ 48″, and longitude 76° 36′ 39″. The city is pleasantly situated on a slightly undulating ground, and some of the elevations in the vicinity command fine scenery. As laid out, it includes four miles square, and is built around the bay and harbor. The streets are regular and spacious, the buildings mostly of brick, and several of them exhibit beautiful architectural combinations. Jones' Falls, a small stream from the north, divides the city into two parts, and over it are extended several handsome stone and wooden bridges. The harbor is capacious and safe, and consists of an inner basin and an outer harbor—the latter at Fell's Point, and accessible to the largest ships. The entrance is commanded by Fort McHenry.

40. The principal public buildings are the City Hall, the Court House, the State Penitentiary, County Prison and House of Refuge, the Merchants' Exchange, the Roman Catholic Cathedral (the finest in the Union), and numerous buildings devoted to collegiate, academic, and other literary and educational purposes. In 1850 there were in the city 4 colleges, 67 academies, and 71 primary and public schools. The University, St. Mary's College, and the Washington Medical College are the principal of these institutions. In the same year there were 99 churches of all denominations. The monuments of Baltimore and its numerous fountains are distinguishing features in the adornments of the city.

CITY OF BALTIMORE.

41. As a commercial city, Baltimore is only second to New Orleans among the Southern ports. It has an immense foreign trade, chiefly with Brazil and the West Indies, and also with continental Europe. Its coasting and inland trades are also very extensive, and, since the completion of the Baltimore and Ohio Railroad to the West, it has become the great depôt of the Cumberland coal regions. The same road has opened to it a large share of Western trade. The Northern Central Railroad brings down the coal of central Pennsylvania, and with its northern connections brings the city into direct communication with the commercial ports of lakes Ontario and Erie. Baltimore has also an additional Western trade, *via* the Pennsylvania Railroad. Otherwise it has direct railroad communication with the east and northeast and with the south and southwest. Its steamship connections extend to all the ports between Boston and Charleston, inclusive. These great routes of communication unite the city with every part of the Union, and insure a rapid and certain transit to its ever-increasing trade. The principal exports are flour and tobacco; for the first it is one of the principal, and for the latter the chief market of the world. The shipping owned in the port in 1850 amounted to 140,019 tons, and in 1855 to 183,108 tons; and the shipping built in the years next previous to those dates amounted respectively to 11,683 tons and 18,816 tons. The vessels built here under the name of Baltimore clippers are remarkable for their speed, and, as privateers, made a great figure in the last war with Great Britain.

42. As a manufacturing city, Baltimore has long been conspicuous, and at the present day ranks among the great industrial communities of the Union. In 1850 it had 2,243 several establishments, employing 20,486 hands and a capital of $6,541,922; and producing goods to the value of $20,416,511 annually. Since this date its manufactures have largely increased, and, if commensurately with the population, the sum of products would, at the present time, be about 27 or 28 million dollars annually. Of the establishments in 1850, 71 were blacksmith, 356 boot and shoe, 111 cabinet-ware, 120 cigar, 238 clothing, 26 coach and carriage, 10 brass founding, 13 iron founding, 10 gunsmith, 12 machinery, 10 piano-forte, 17 printing and publishing, 24 sail-making, 21 ship-building, 16 ship-smith, 31 silversmith, 19 stove, 15 weaving, 21 wheel-wright, 10 whitesmith, etc.—the remainder various and of common interest. Within and around the city there are more than 60 flouring-mills, chiefly on the Patapsco and Jones' Falls. Baltimore has a Board of Trade and numerous banks and insurance offices.

43. In 1850 the total valuation of taxable property was $80,237,960, and in 1855, $106,770,000. The corporate debt, chiefly contracted in providing for internal improvements, amounted to $11,672,889. The city is bountifully supplied with pure and wholesome water from public springs and fountains, but derives its great supply from an elevated part of Jones' Falls, from which the water is conducted through an aqueduct to a reservoir, whence it is distributed through pipes.

44. Baltimore was first laid out as a town in 1729, and in 1765 contained only 50 houses. In 1797 it received a city charter. With few interruptions, but with great disabilities, its course has since been onward; and since the completion of its great works of internal improvement its increase in population and wealth has been exceedingly rapid. In 1790 the city contained 13,530 inhabitants; in 1800, 26,514; in 1810, 46,455; in 1820, 62,738; in 1830, 80,620; in 1840, 102,513; in 1850, 169,054; and in 1855, 218,316.

45. Annapolis, the State capital, is a sea-port on the south bank of the Severn River, two miles from its entrance into Chesapeake Bay, and 26 miles south-by-east Baltimore. Latitude 38° 58′ 40″, and longitude 76° 29′ 9″. It is connected by railroad with Washington and Baltimore, but is a place of little trade, and as a port is only visited by coasting vessels. The principal buildings are the State House, the United States Naval Academy, and St. John's College, formerly a Roman Catholic, but now an Episcopal, institution. The Naval Academy was first established here in 1815, and has usually from 100 to 120 students qualifying themselves to become officers in the national navy. Population (1850) 3,011.

46. Ellicott's Mills, on the Patapsco, 12 miles above Baltimore, and on the line of the Baltimore and Ohio Railroad, is the great center of the flour-mills of the Baltimore district, and in 1850 contained 1,059 inhabitants. The scenery for miles around is remarkably beautiful. Port Tobacco, southwest of Annapolis, and at the head of a small bay which sets up from the Potomac River, was formerly of some importance, but at the present time has scarcely 300 inhabitants. As its name imports, its chief trade is in tobacco, the staple product of the peninsula between Chesapeake Bay and the Potomac. Otherwise than this there are no towns south of Annapolis requiring notice.

47. Toward the northeast, and at the mouth of the Susquehanna, is Havre de Grace. Here the Philadelphia, Wilmington and Baltimore Railroad crosses the river and the Tide-Water Canal terminates, making it the depôt of a considerable trade, and in the fishing season many of the inhabitants engage in the fisheries of the bay. Population (1850) 1,336. In 1814 Havre was sacked and burned by the British under Admiral Cockburn. Port Deposit, on the opposite shore of the Susquehanna, six miles up the river, and at its lowest falls, is eligibly situated for commerce, and is the southern depôt of the Susquehanna lumber trade. In the vicinity there are large quarries of granite, which are successfully worked. Population about 500. A branch of the Philadelphia, Wilmington and Baltimore Railroad comes up to this place.

48. The other towns of the Eastern Shore are—Elkton, at the junction of the branches of Elk River, and on the Philadelphia, Wilmington and Baltimore Railroad, a thriving town; Frenchtown, a little south of Elkton, a landing-place and station on the Newcastle and Frenchtown Railroad, which connects the steam navigation of the Chesapeake and that of the Delaware; Delaware City, at the outlet of the Delaware and Maryland Canal; Chestertown, a small port on Chester River, 30 miles from Chesapeake Bay, and the seat of Washington College; Easton, on an affluent of the Choptank, and the largest town on the Eastern Shore, etc. These and other towns in this region are of local importance, but none of them contain above 1,500 inhabitants.

49. Frederick City is situated on Carroll Creek, a feeder of the Monocacy, and is connected with the Baltimore and Ohio Railroad by a branch three miles long. It ranks as the second city in the State, and being in the center of a rich agricultural country, has become a market of great importance. Population (1850) 6,028. It is one of the chief centers of Roman Catholic institutions in the State. Hagerstown, about 20 miles northwest, is also a thriving agricultural town, and is connected with the Pennsylvania railroad system by the Franklin Railroad. Population 3,884.

50. The only other town of note in western Maryland is Cumberland, the center of the Alleghany mining districts. It is situated on the north bank of the Potomac, and on the line

CUMBERLAND AND THE SITE OF OLD FORT CUMBERLAND.

of the Baltimore and Ohio Railroad, 178 miles from Baltimore, and at the present terminus of the Chesapeake and Ohio Canal. The Pittsburg and Connellsville Railroad will also ultimately come in at this point. The principal materials of the trade of Cumberland are coal and iron, which so abound in this vicinity, and which are brought to this depôt from the mines by several branch railroads. The coal of this region is semi-bituminous, and is largely consumed by steamers; and, since the opening of the lines of transit to Baltimore and Alexandria, it has been extensively shipped for those ports. The total quantity sent to market in 1856 was 709,329 tons, of which quantity 503,129 tons were brought to market by the Baltimore and Ohio Railroad, and 206,200 tons by the Chesapeake and Ohio Canal. In 1842 only 1,708 tons were mined. Cumberland has also a large general trade. Population (1850) 6,067; in 1855 about 10,000 or 12,000.

51. Maryland was originally settled by Roman Catholics. The territory was granted to Lord Baltimore in 1633, and the first colonists, under Leonard Calvert as governor, arrived at St. Mary's early in 1634. These consisted of about 200 persons, who sought America as a refuge from religious persecution at home. Here they instituted toleration to all creeds, and hence their numbers were rapidly increased. The colony prospered, interrupted only by occasional irruptions of the Indians, until the accession of Cromwell to power in England, when the Baltimores were superseded in the government. The Restoration reversed this attitude of the parties, and restored the proprietary. Again, in 1688, the proprietary was set aside, but was again reinstated in 1716, and continued in power until the commencement of the American Revolution, when the people framed a State constitution. In the subsequent wars the country suffered much from hostile marauders, and in the wars of 1812 her shores were barbarously ravaged. Since the latter period Maryland has been highly prosperous, and may now be considered as one of the most wealthy and industrious of the Southern States.

DISTRICT OF COLUMBIA.

PRESIDENT'S RECEPTION.

1. The District of Columbia, seat of the general government of the United States, is situated on the Maryland bank of the Potomac, 124 miles above the mouth of the river, and contains about 60 square miles.

2. The surface is diversified by hills and valleys, and in some parts the hills are sufficiently high to command extensive views of the surrounding country. The soil is of average fertility The Potomac washes its western boundary; and two of its tributaries—Rock Creek, from the north, and which separates Washington from Georgetown, and Eastern Branch, from the northeast, on the north bank of which Washington is built—disembogue within the District. The Potomac also receives within its limits several smaller affluents, one of which, the Tiber, flows through the capital. The capacities of the Potomac are sufficient for ships of the largest tonnage. The climate is moist and warm, and in consequence of local miasms not very salubrious.

3. The District comprises the county of Washington, which in 1850 contained 51,687 inhabitants, viz.: 37,941 whites, 10,059 free colored, and 3,687 slaves. The population in 1855 was estimated at 60,857.

4. As originally laid out, the District contained 100 square miles, and included what is now the county of Alexandria in Virginia. The population of the District thus constituted was in 1800, 14,093; in 1810, 24,023; in 1820, 33,039; in 1830, 39,834; and in 1840, 43,712. Had the same organization existed in 1850, the District would have contained 61,695 inhabitants.

5. Of the free population (1850), 42,956 (89.49 per cent.) were Americans, of which number 24,967 were natives of the District, and 17,989 natives of other sections of the Union; 4,967 were of foreign birth, and 77 of unknown origin. The number of free persons born in the District and residing in other sections was 7,269.

6. The employed free male population over 15 years of age numbered 11,209, of which 6,128 were engaged in commerce, trade, manufactures, mechanic arts, etc., 421 in agriculture, 2,535 in labor not agricultural, 91 in the army, 186 in sea and river navigation, 330 in law, medicine, and divinity, 436 in other pursuits requiring education, 559 in government civil service, 507 in domestic service, and 16 in other employments.

7. The number of farms in the District in 1850 was 267, covering 27,454 acres or 72.5 per cent. of the whole surface. Of this 16,267 acres were improved and 11,187 unimproved, and the whole was valued at $1,730,460, while the value of implements and machinery thereon was $40,220. Thus the average size of farms was 103 acres, and the average value of each $6,632.

8. The cereal crops consisted of—wheat 17,370, rye 5,509, oats 8,134, Indian corn 65,230, barley 75, and buckwheat 378 bushels. The potato crop amounted to 31,789 (28,292 Irish and 3,497 sweet) bushels; that of beans and peas to 7,754 bushels, and that of hay to 2,279 tons. The produce of market gardens was valued at $67,222, and of orchards at $14,843.

9. The livestock upon farms in the same year consisted of—horses 824, asses and mules 57, milch cows 813, working oxen 104, other cattle 123, sheep 150, and swine 1,635; and in the aggregate was valued at $71,643, and during the year preceding, the value of animals slaughtered amounted to $9,038.

10. The total value of agricultural products in 1840 was $138,425, and in 1850, $193,601.

11. The number of establishments engaged in manufactures, mining, and the mechanic arts in 1850 was 395, with an aggregate capital of $888,965, and giving employment to 2,176 hands. The value of raw material, fuel, etc., consumed by these in the year had been

$1,339,146, the cost of labor $616,152, and the value of products $2,493,008. In 1810 the value of manufactured products amounted to $930,650, in 1820 to $704,620, in 1830 (no returns), in 1840 to $1,598,430, and in 1850 (as above) to $2,493,008. The value of goods manufactured in families in 1840 was $1,500, and in 1850 $2,075.

12. Georgetown is the only port of entry. In the years ending 30th June 1850 and 1855, the value of exports to foreign countries was $80,388 and $36,143, and of imports $59,819 and $24,699. The shipping cleared in the same years was 1,720 and 2,444 tons, and the shipping entered 1,414 and 2,185 tons. The shipping owned in 1840 amounted to (1,949 steam) 17,010 tons, and in 1850 (4,128 steam) 34,530 tons; and the shipping built amounted to 288 and 1,668 tons. The principal foreign trade of the District is with the West Indies.

13. It can not be supposed that the District produces any surplus for exportation, and hence its domestic trade consists almost entirely in the transportation of supplies for consumption within its own borders. The means are ample both by water and land. Almost the whole of its tonnage is employed in the coasting trade, and steamers ply regularly in connection with the Southern railroads and to and from the principal places on the river. The District indeed is a principal entrepôt of Southern travel, being the terminus of a branch railroad from Baltimore, and the central point of other roads completed and in progress, pointing to the West and South, having their actual termini at Alexandria, to which a short line has been lately opened from Washington; and the Chesapeake and Ohio Canal which terminates at Alexandria crosses the Potomac at Georgetown. These avenues give it access to every part of the Union, and accommodate the large numbers of persons who annually visit the seat of the national government, and fulfill the further obligation of supplying them with the necessaries of life during their sojourn.

14. The government of the District is under the sole authority of the National Congress, and its expenses are defrayed from the general treasury. It has no representative in Congress (though it is probable that its demands for such will at no distant period be complied with), nor any voice in the election of the President of the Union. The fundamental laws besides the constitution of the United States to which its government is subject, are those which were in force in Maryland at the period of the cession of its jurisdiction to the federal authorities. The local judiciary consists of a circuit and a criminal court, and an orphan's court for the county.

NATIONAL OBSERVATORY.

15. The total number of persons returned as attending school in 1850 was 6,570 or one in every 7.3 of the total free population. The general statistics of schools on the 1st June of that year exhibit the following figures:

Classes of Schools.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	22	34	2,169	$14,232
Academies and private schools	47	126	2,333	84,040
Universities and colleges	2	36	218	24,000

—making a total of 71 schools, 196 teachers, and 4,720 scholars, and an annual income of $122,272.

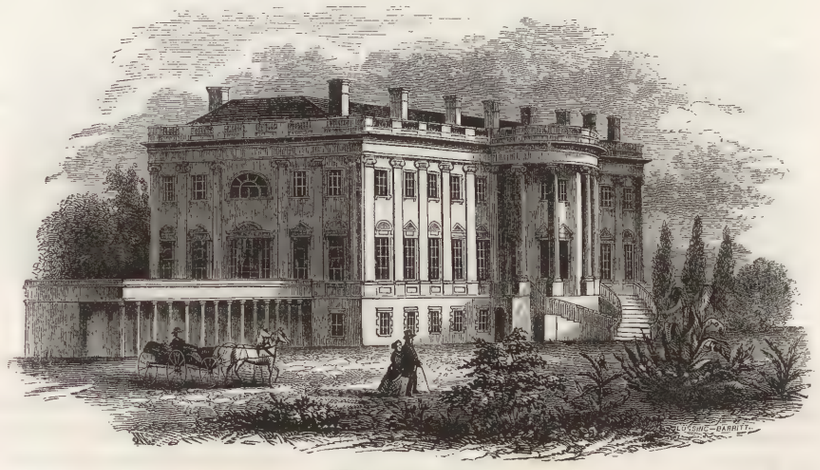
16. The collegiate and professional institutions of the District are the Columbia and Georgetown colleges, and the medical school attached to each. The condition of these in 1855 was as follows:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
Columbia College	Washington	1821	8	70	8,000
Georgetown College	Georgetown	1792	18	256	25,000
National Medical College	(Columbia College)	1821	7	17	Col. Lib.
Medical Department	(Georgetown College)	1850	8	26	"

17. The most numerous religious denomination in the District is the Methodist, which absorbs a full third of the whole population. The Episcopal and Roman Catholic denominations include each one fifth of the population, and the Baptist one sixth. The Lutherans, Unitarians, Friends, etc., are in smaller proportions. The whole number of churches in 1850 was 46, with 34,130 sittings, and valued at $363,000.

18. Washington, the federal capital and seat of government, is situate on the left bank of the Potomac, between Rock River and the Anacostia or Eastern Branch, 300 miles from the ocean. Latitude 38° 56′ north, and longitude 77° 2′ west of Greenwich. The site has an undulating surface, and is surrounded by an amphitheater of hills of moderate elevation, covered with trees and shrubbery, and commanding from many points fine views of the picturesque scenery of the "River of Swans." The environs abound in the most eligible sites for villas and country residences.

19. The city extends northwest and southeast about four miles and a half, and east and south about two miles and a half. The streets run north and south, and east and west, crossing at right angles, with the exception of fifteen, which point to the States of which they severally bear the names. The public buildings occupy the most conspicuous sites. The Capitol commands the streets called Maryland, Delaware, and Pennsylvania avenues, and the President's Mansion, Pennsylvania, Vermont, New York, and Connecticut avenues. Pennsylvania Avenue stretches from Georgetown to the Eastern Branch, about four miles, and between the Capitol and Mansion is 160 feet wide. The other streets have a width of 70 and 100 feet; but on the whole the surface (about 3,016 acres) is as yet very little built upon. Washington, indeed, has been not inaptly described as a "city of magnificent distances." The other public buildings are—the edifice of the State Department, the Treasury Buildings, the War and Navy Offices, the Offices of the Interior Department, the General Post Office, the National Observatory, the Arsenal and Navy Yard, the Smithsonian Institution, the Coast Survey Office, the City Hall, several colleges, etc.

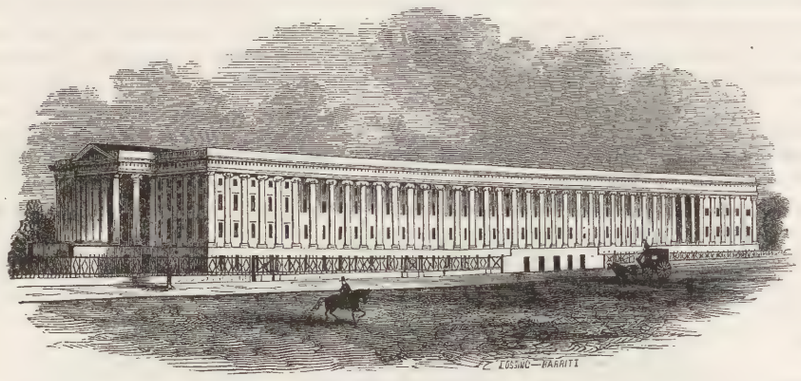


20. The Capitol is situate on an area of 30 acres, inclosed by an iron fence, and is so elevated as to command an extensive view. Its erection was commenced in 1793; but the works were suspended during the embargo, and much that had been accomplished was subsequently destroyed by the British, so that in 1815 it was found necessary to reconstruct the whole edifice. The exterior exhibits a rusticated basement of the height of the first story, and the two others are comprised in a Corinthian elevation of pilasters and columns. These columns, which are 30 feet in height, form an advancing portico on the east 160 feet in extent, the center of which is crowned with a pediment of 80 feet span; while the receding loggia, 100 feet in extent, distinguishes the center of the west front. The building is surrounded by a balustrade of stone, and covered with a lofty dome in the center and a low dome on each wing. The dimensions of the building are: length of front 352 feet 4 inches, depth of wings 121 feet 6 inches, and height to top of central dome 145 feet. The cost has been about two million dollars. Two additional wings are now being added, each 238 by 140 feet, and when completed the Capitol, including the space between the wings, will cover

NATIONAL CAPITOL.

an area of four acres and a half. The corner-stone of the extension was laid on the 1st July, 1851. The Senate Chamber is in the second story of the north wing, of a semicircular form, 75 feet long and 45 feet high. The walls are partially covered with drapery, and it is adorned by a fine portrait of Washington. The Hall of Representatives is also of a semicircular form, but much larger than the Senate Chamber. It is in the second story of the south wing, and is 96 feet long and 60 feet high, and surrounded by 24 breccia columns, with capitals of white marble and surmounting a base of freestone. The dome is painted in imitation of the Pantheon at Rome. The Rotunda occupies the center of the building, and is 96 feet in diameter and in height, and is adorned with bas-relievos, sculpture, and paintings illustrative of the early history of the country. Besides these apartments the Capitol contains the Congressional Library, the Supreme Court rooms, and numerous offices connected with congressional business. The Capitol grounds are not only extensive, but are kept in the very neatest order, constituting one of the pleasantest promenades in the metropolis. They are adorned with a great variety of American trees; and fountains and basins of pure water enliven them in various parts, and their interest is enhanced by groups of historical statuary.

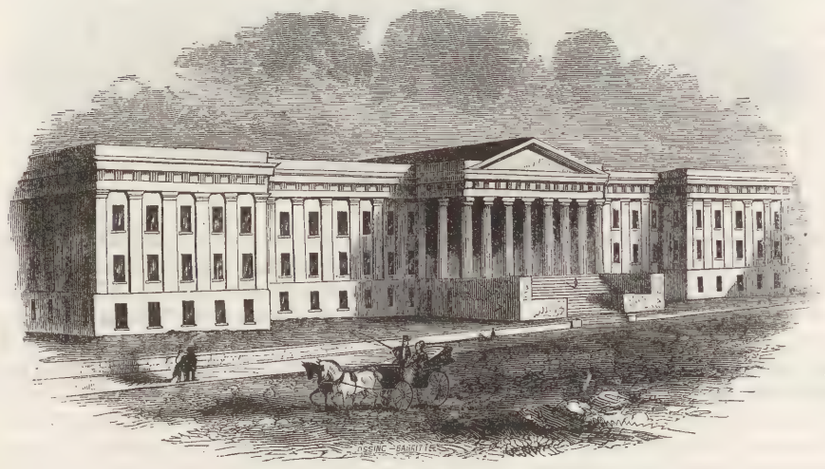
21. The Executive Mansion stands about one mile from the Capitol, and occupies the center of a plot of 20 acres. The grounds are partially laid out in gardens, etc., but are still in an unfinished state. The Mansion has a front of 170 feet and is 86 feet deep, and is built of white freestone, with Ionic pilasters, comprehending two lofty stories crowned with a balustrade. The north front is ornamented with a lofty portico of four Ionic columns in front, and projecting with three columns. The outer columniation is for carriages and the



EXECUTIVE MANSION.

middle for foot passengers—the steps from both leading to a broad platform in front of the door of entrance. The garden front has a rusticated basement. The interior arrangements are elegant and convenient, and well adapted to the various purposes for which the building was designed. In the center of a small square in front of the Mansion stands a bronze statue of Thomas Jefferson, and in Lafayette Square, on the opposite side of Pennsylvania Avenue, is seen the equestrian statue of General Jackson.

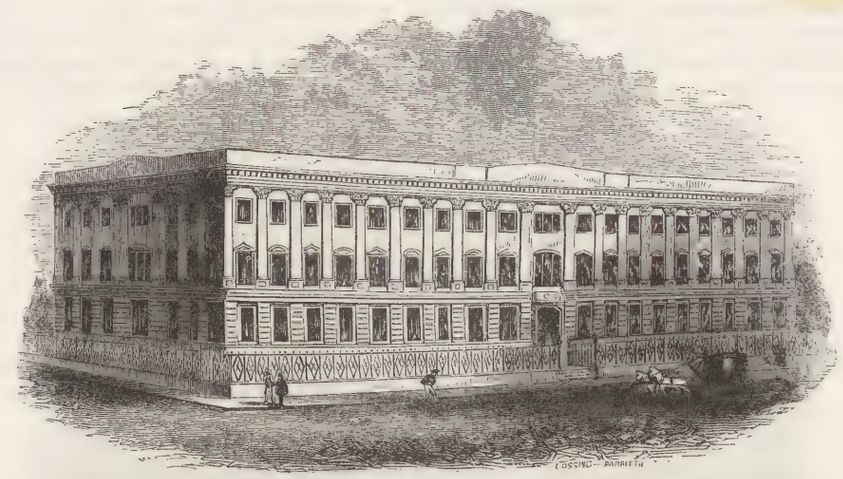
22. The buildings of the State Department, to the northeast of the Executive Mansion, and within the same inclosure, are plain and of brick. They are 160 feet long and 55 feet wide, two stories high, and contain in all 32 rooms. In this building all the diplomatic business of the country is transacted.



23. The Treasury buildings stand at the eastern extremity of the President's Square, so

TREASURY BUILDINGS.

called, and is a stone edifice 459 feet long and 170 feet wide. In front it has an imposing colonnade. The War Office occupies the northwest corner of the square, and is precisely similar in design to the State Department buildings. The buildings occupied by the Navy Department lie directly west of the President's Mansion, and in the War Office buildings.



24. The Interior Department, half a mile from the Mansion, has very extensive buildings,

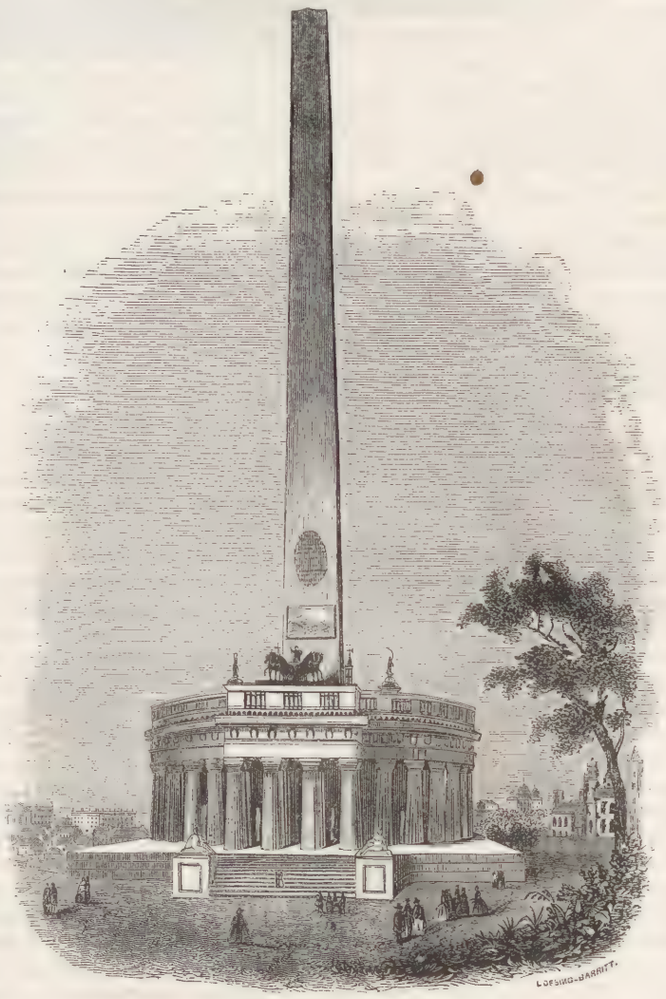
PATENT OFFICE.

but as yet these are unfinished; the Patent Office, one of its branches, however, is completed, and constitutes one of the most important and interesting buildings in Washington.

25. The General Post Office occupies a central position near the Department of the Interior. It is of white marble and after the Corinthian order, three stories high, and in extent 204 by 102 feet. The attorney-general occupies apartments in the Treasury buildings. In these several buildings the whole administrative business of the nation is transacted.

GENERAL POST OFFICE.

26. The National Observatory is situate on the banks of the Potomac, toward Georgetown. It is connected with the Naval Department, and the force employed at it consists principally of naval officers. Besides the ordinary duties of the establishment, the employees have the custody of all the nautical books, charts, and instruments belonging to the navy. Here, also, are conducted the celebrated researches connected with the "wind and current charts." As an observatory, it ranks next to those of St. Petersburg and Greenwich, and its longitude (77° 2′ 48″ west from Greenwich) is the prime meridian of American geographers.



27. The Arsenal occupies a fine position on Greenleaf's Point, at the junction of the Anacostia with the Potomac, and on this account it enjoys great facilities for receiving and shipping ordnance and other military stores. The machinery employed in this establishment is very complete, and it contains an extensive model armory of both new and old implements of destruction. In the "gun lot" are seen innumerable trophies brought from our battle-fields—Saratoga, Yorktown, Niagara, and Mexico. The Navy Yard is located on the Anacostia, and covers an area of about 20 acres, inclosed by a substantial brick wall. The mechanical operations of this establishment are various and extensive, and the skill of the workmen and the excellence of the materials employed have been satisfactorily tested on every sea. On the western side of the yard is the pyrotechnical laboratory. The grounds are beautifully laid out, and the whole preserved in excellent order.

28. The Smithsonian Institution has a noble edifice, and is unquestionably one of the greatest attractions of the metropolis. It was founded upon a bequest of more than half a

SMITHSONIAN INSTITUTE.

million dollars made to the United States by an Englishman named John Smithson. The object of the bequest, according to his will, was "to found at Washington, under the name of the Smithsonian Institution, an establishment for the increase and diffusion of knowledge among men." On the 1st July, 1836, Congress solemnly accepted the trust, but it was not before 1846 that the Institution was established. It is situated on the mall below the Capitol, and has extensive grounds laid out into gardens, etc. The style of the building is Romanesque, the material a reddish freestone, and its dimensions—length 450 feet, and width 140 feet, and it has nine towers, varying from 75 to 150 feet in height. The library room is capable of holding 100,000 volumes, and its lecture-room, museum, gallery of art, and laboratories are also capacious and appropriate for their several uses.

WASHINGTON MONUMENT.

29. The National Medical College and the Columbia College are the highest schools of the capital, and were incorporated by Congress. The Columbia College is beautifully situated on an eminence, and is a fine brick edifice. It has a good library, a valuable philosophical apparatus, and other means and facilities for pursuing a liberal course of studies. The National Institute was founded in 1840, and has for its object the promotion of general science. It holds its meetings and

has its head-quarters at the Patent Office. Although a recent foundation it has already a library of 5,000 volumes, with a rich collection of maps, charts, manuscripts, medals, coins, etc. Public education is provided for in free and primary schools, and select schools and seminaries are numerous.

30. Among the artistic adornments of the capital the Washington Monument, though still unfinished, occupies the first place. It stands on the mall between the Executive Mansion and the Potomac, and embraces the idea of a grand circular colonnaded building, 250 feet in diameter and 100 feet high, from which springs an obelisk shaft 70 feet at the base and 500 feet high. The vast rotunda forming the grand base of the monument is surrounded by 30 columns of massive proportions, and surmounted by an entablature and balustrade. Over the columns severally are sculptured the escutcheon of each of the United States, while over the central portico are emblazoned the coat of arms of the Union. Around the rotunda are stationed statues of the signers of the Declaration of Independence, and in niches statues of the fathers of the Revolution; and directly opposite to the entrance is placed the statue of Washington himself. The interior of the shaft is embellished with a great variety of inscriptions and bas-relievos, and in the center is the tomb of the great chief. The whole forms a most majestic edifice, and is destined to testify to future generations the veneration of a grateful people for the patriot whose deeds shed such a halo of glory over the American name.

31. There is no want of excellent hotels in Washington. These are a necessary concomitant in a city having so large a transient population; and at these the families of many members of Congress reside during the annual sessions. With one or two unimportant exceptions they are all located on Pennsylvania Avenue. Respectable boarding-houses are also numerous, and, indeed, a very large portion of the permanent residents derive their material means from this sort of industrial pursuit. But Washington is remarkably deficient in places of amusement, and as a consequence the temporary sojourner, lacking more innocent pastimes, resorts too often to the gaming-table and drinking-saloon.

32. In 1850 the population of the city was 40,001. When Congress is assembled many thousands are added from all parts of the Union. In 1800 the population was 3,210; in 1810, 8,208; in 1820, 13,247; in 1830, 18,827; and in 1840, 23,364.

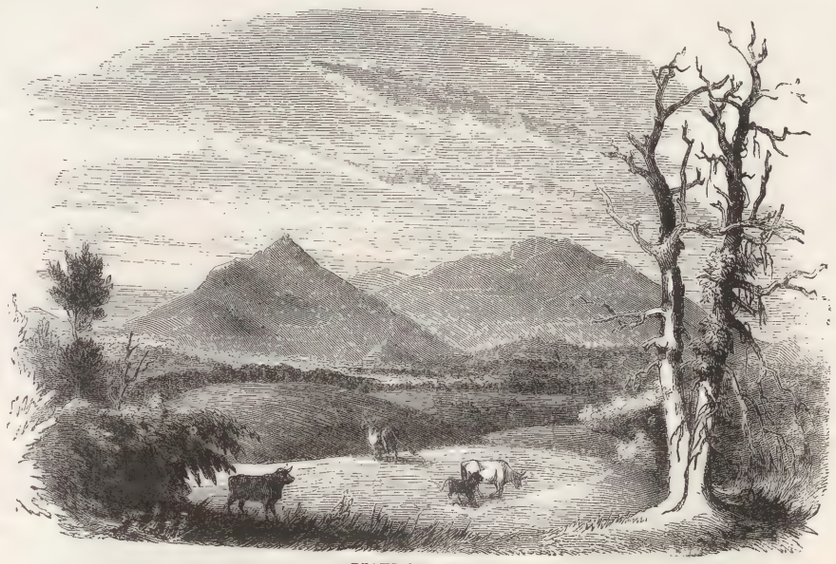
33. Georgetown is divided from Washington by Rock Creek. The heights of Georgetown are lofty eminences overlooking the city from the north and west, and along these are many splendid villas and extensive garden plots. The city below the heights presents many objects of attraction—its ancient college, its nunneries, and the splendid aqueduct which carries the canal over the Potomac. The college buildings are spacious, and contain a library of 25,000 volumes. The Nunnery or Convent of the Visitation is situate on the heights, and adjacent thereto are the bishop's residence, an elegant chapel, etc., and a part of the grounds are laid out as a botanic garden. Among other places of note is the Oak Hill Cemetery, with a beautiful chapel and porter's lodge. This was laid out in 1849. Georgetown was formerly a port of some note and considerable trade, and is still a thriving and busy place. It is the only port of the District. In 1810 its population was 4,988; in 1820, 7,360; in 1830, 8,441; in 1840, 7,312; and in 1850, 8,366.

34. The District of Columbia was established as the permanent seat of the federal government in 1791. The site included a part of Maryland, which was ceded to the United States on the 23d December, 1788, and a part of Virginia, which was ceded on the 3d December, 1789. The two portions comprised a square of 10 miles or 100 square miles. The erection of the Capitol was commenced in 1793, and the government, which had hitherto been domiciled at Philadelphia, removed to the District in 1800. The progress of the District in population and wealth, as also in magnificence, has been commensurate with the progress of the country generally. That part of the District ceded by Virginia was retroceded in 1846.

STATE OF VIRGINIA.

MOUNT VERNON.

1. Virginia, the largest of the Atlantic States, is situated between the latitudes 36° 30′ and 39° 43′ north, and the longitudes 75° 10′ and 83° 33′ west. This State is bounded on the north by Pennsylvania and Maryland, on the east by Maryland and the Atlantic Ocean, on the south by North Carolina and Tennessee, and on the west by Kentucky and the Ohio River, which latter separates Virginia from the State of Ohio.



2. The greatest length of the State east and west measured on the southern boundary, is 432 miles; but the general length does not exceed 360 miles, and the general breadth north and south is about 225 miles. In the northwest, a narrow tongue of land between the western line of Pennsylvania and the Ohio River projects beyond the general limit of the State, and as far north as 40° 38′ north latitude. The area included within these limits is estimated at 61,352 square miles or 2.1 per cent. of the whole superficies of the United States.

3. The shore line of Virginia toward the ocean has an absolute length of only 116 miles; but including the shores of bays and all irregularities, the length is 348 miles, and if the islands be included, 654 miles. This gives one mile of coast to every 93.9 square miles of surface.

4. Virginia is naturally divided into four districts or sections: viz., the Tide-Water, the Piedmont, the Valley, and the Trans-Alleghany sections. These form also civil divisions.

5. The "Tide-Water section" is similar to the whole Atlantic coast of the Southern United States—a low, sandy plain, interspersed with marshes, overgrown with pitch-pine, and very unhealthy. This tract has a width of 110 to 130 miles, and extends up to the lower falls of the rivers.

6. The "Piedmont section" is that belt of country between the head of tide-water and the Blue Ridge. The surface is uneven, and becomes more and more so as the mountains are approached. The soil is also somewhat sandy, and in the more western parts is stony and broken; but on the margins of the rivers are extensive alluvions of great fertility and productiveness. Beyond this the country is mountainous, traversed by successive ridges of the Alleghanies, which in Virginia occupy a greater breadth of country than in any other State.

PEAKS OF OTTER.

7. The "Valley section" embraces all the country between the Blue Ridge and the Alleghany Ridge. Between these are long, elevated valleys, parallel with them, often of considerable breadth, and containing some of the best and most pleasant lands in Virginia.

8. The "Trans-Alleghany section" extends from the Alleghany Ridge to the Ohio River. The general slope of the country is westward, but it is traversed by several chains, the principal of which is Laurel Mountain. The Trans-Alleghany section is a fine country, adapted in soil and climate to the successful culture of the grains, roots, tobacco, etc.; nor is it only a great agricultural region, but it is rich in minerals, and has forests covering a wide extent of country, indicating its value in an economic point of view. In the old settlements the soils have been exhausted by a vicious system of tillage, while here the virgin earth responds bountifully to the labor of the husbandman. The Tide-Water and Piedmont sections are chiefly engaged in the production of Indian corn and tobacco. Cotton is also produced in these sections. In the great valley the crops are the same, except that wheat takes the place of cotton, and the system of agriculture is superior to that followed in the lower country.

9. Virginia has noble rivers and streams, useful as channels of commerce or for industrial purposes. With few exceptions, the Ohio, west, and Chesapeake Bay, east of the mountains, are the recipients of the waters of the whole State.

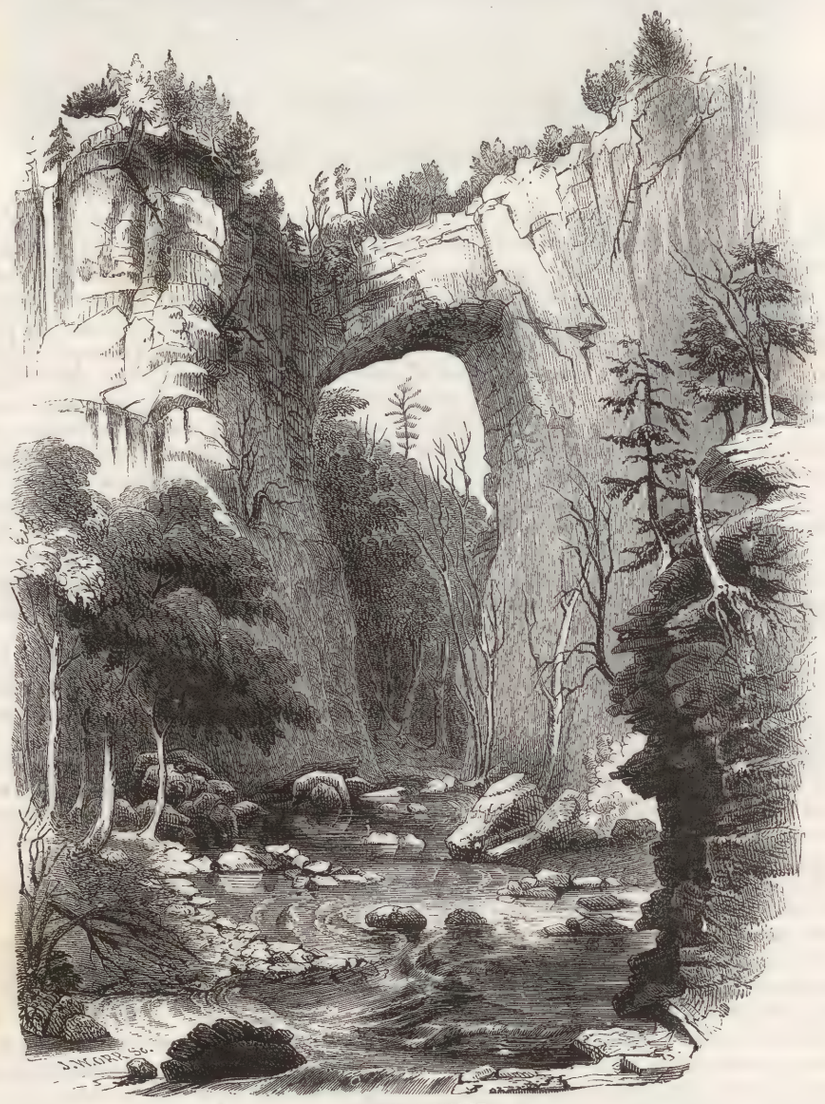
10. The Potomac rises in the Alleghanies but a few miles from the Youghiogheny, and forces its way through several intermediate mountain chains to the Piedmont district, where it is broken by falls nine miles above Georgetown, at which place it reaches tide-water, and about 100 miles below, after a course of more than 300 miles, it reaches the Chesapeake. At Alexandria, 290 miles from the ocean, it is one mile and a quarter wide, and below that city gradually expands, until at its mouth it forms a broad estuary, seven and a half miles wide. Ships of the line ascend it to Washington, but above this it is obstructed by falls and rapids. The principal tributaries of the Potomac are its South Branch, the Great Cacapon, and the Shenandoah.

11. The Rappahannock has its sources in the Blue Ridge, and receives the Rapidan from the same ridge; and falling over the primary ledge at Fredericksburg, 100 miles from its mouth, reaches Chesapeake Bay by a large estuary, 25 miles below the entrance of the Potomac.

12. York River, formed by the union of the Pamunky and Mattapony, partakes rather of the character of a long, narrow bay than of a river; from the junction, 40 miles to the bay, it is from two to four miles wide, and large vessels pass to Yorktown.

13. James River, the principal river of Virginia, rises by several head streams from the Alleghany Mountains; after receiving the Cow Pasture and the Calf Pasture rivers, it forces its way through the Blue Ridge, and falling over numerous pitches, meets the tide at Richmond, 100 miles from its mouth. The only considerable tributary of this river, east of the Blue Ridge, is the Appomattox, which carries seven feet of water to Petersburg, 12 miles.

14. The Meherrin and Nottoway are small rivers, which unite in North Carolina, and form the Chowan. The Roanoke is formed in Virginia by the junction of the Dan and Staunton rivers, two rapid mountain streams, which rise—the former in the Blue Ridge, and the latter in North Mountain.



15. The great rivers of western Virginia are the Monongahela, one of the constituents of the Ohio, the Kanawha, the Guyandotte, the Big Sandy, etc. The Monongahela is formed in Virginia, by the union of the West Branch and Tygart's Valley River, and beyond the Pennsylvania line it receives Cheat River. The Kanawha, the principal river of this section, rises in the Blue Ridge, in North Carolina, and bears the name of New River until it unites with Gauley River, an affluent from Greenbrier Mountain. The Greenbrier, above the latter, and the Elk and Coal rivers below it, are its principal tributaries. The Guyandotte and Big Sandy enter the Ohio below the Kanawha; and the Holston and Clinch, which drain the southwestern section of the great valley, pass into Tennessee, and uniting at Kingston form the Tennessee River.

16. Virginia is an almost boundless field of mineral wealth, and among its principal products are gold, copper, lead, iron, coal, salt, and a variety of rocks suitable for building, and clays and earths useful in the arts.

17. The first coal-field is found extending from the Pamunky, by Richmond, to the Appomattox, a distance of 45 miles, with a breadth of one or two miles to eight. The coal is bituminous, in seams of enormous thickness, being 30, 40, and even 60 feet thick, and of excellent quality. Coal has also been found on both sides of the Upper Appomattox. Anthracite is found in the valley, from the Potomac to James River, south of which are bituminous deposits.

18. Beyond the Alleghanies the deposits of bituminous coal are very extensive, and these derive additional value from their being associated with not less important beds of iron and salt. At Wheeling, on the Ohio, and for 14 miles down the river, the bank presents an uninterrupted bed of highly bituminous coal, upward of 16 feet thick. The Wheeling Basin, indeed, extends for 30 miles up and down the river in Ohio and Virginia. Another vast field stretches from Clarksburg, on the Monongahela, to Pittsburg, and far beyond, to the northeast, in Pennsylvania, and another valuable field is found at the head waters of the north branch of the Potomac. There are also coal seams, associated with salt springs, on the Little Kanawha, and springs of petroleum occur in the same tract. On the Great Kanawha is a very rich and extensive coal-field; and on Coal, Gauley, and other rivers of western Virginia, beds of this mineral are frequently brought to view.

19. The salines of Virginia are almost wholly in the west. Salt springs occur on the Holston, New River, and the Greenbrier; but the most important works are on the Great and Little Kanawha. The mountain section of the State abounds with sulphur and other mineral springs, which are frequented in the summer season by invalids and pleasure seekers.

NATUEAL BRIDGE.

20. Bold scenery is one of the distinguishing features of Virginia. At Harper's Ferry, where the Potomac breaks through the Blue Ridge, the disruption has left behind it indelible marks. The Natural Bridge, below Lexington, is "the most sublime of nature's works." Everywhere in the Great Valley, and among its mountain borders, are found spectacles of grandeur and sublimity. Madison's and Weir's caves, both near Staunton, are vast caverns, the first extending 300 feet into the earth, branching into subordinate caverns, and terminating in two basins of water, of about 30 or 40 feet in depth; and the other 1,260 feet, and containing upward of 20 large rooms, besides numerous passages and galleries. Stalactites and stalagmites adorn these with a profusion of festoons and folds like tapestries, and represent statues, thrones, towers, columns which glitter in halls and chambers, such as nature only could design, and quite beyond the art of man.

21. In 1850 Virginia contained 1,421,661 inhabitants, or 23.17 to each square mile, or 6.13 per cent. of the total population of the Union. This population was distributed as follows:

Counties.	Population.	County Seats.
Accomac	17,890	Drummond T.
Albemarle	25,800	Charlottesville
Alexandria	10,008	Alexandria.
Alleghany	3,515	Covington.
Amelia	9,770	Amelia C. H.
Amherst	12,699	Amherst C. H.
Appomattox	9,193	Clover Hill.
Augusta	24,610	Staunton.
Barbour	9,005	Phillippa.
Bath	3,426	Warm Springs
Bedford	24,080	Liberty.
Berkeley	11,771	Martinsburg.
Boone	3,237	Ballardsville.
Botetourt	14,908	Fincastle.
Braxton	4,212	Suttonsville.
Brooke	5,054	Wellsburg.
Brunswick	13,894	Lawrenceville
Buckingham	13,837	Maysville.
Cabell	6,299	Barboursville.
Calhoun	(*new.*)	—.

York	4,460	Yorktown.

—and consisted of 167,530 families inhabiting 165,815 dwellings. Of the total population 894,800 (62.94 per cent.) were whites—451,300 males and 443,500 females, 54,333 free colored—26,002 males and 28,331 females, and 472,528 slaves—240,562 males and 231,966 females; and of the free population (949,133) 926,154 (97.58 per cent.) were Americans, of whom 872,923 were born in this State; 22,394 (2.36 per cent.) foreigners, and 585 of origin not ascertained. The number of Virginians living in other States of the Union was 388,059. In 1790 Virginia contained 748,308 inhabitants; in 1800, 880,200; in 1810, 974,622; in 1820, 1,065,379; in 1830, 1,211,405; in 1840, 1,239,797; and in 1850 (as above), 1,421,661. The population in 1855 was estimated at 1,527,837.

22. The number of free male persons over 15 years of age engaged in industrial pursuits in 1850 was 226,875. Of these 52,675 were engaged in commerce, trade, manufactures, mechanic arts, and mining; 108,364 in agriculture; 48,338 in labor not agricultural; 274 in the army; 3,263 in sea and river navigation; 4,791 in law, medicine, and divinity; 5,622 in other pursuits requiring education; 1,491 in government civil service; 79 in domestic service, and 1,978 in unclassified occupations.

23. Virginia is a great agricultural State, and has also considerable manufactures and a valuable commerce and domestic trade. It staples are tobacco and flour, and oysters, for which its shores are famous. In the aggregate value of its productions, agricultural and general, it is only surpassed by four other States, viz., New York, Pennsylvania, Ohio, and Massachusetts; but in proportion to its population its productive power is surpassed by twenty-four States, having been in 1850 only at the rate of $59 42 *per capita*. Virginia, however, is rapidly progressing, and by means of an extensive but as yet unfinished system of public works, is preparing the way to a renewed prosperity, and the re-attainment of that proud position it once held as the great State of the American Union.

24. In 1850 there were in Virginia 77,013 farms and plantations, occupying 10,360,135 acres of improved and 15,792,176 acres of unimproved land, or a total of 26,152,311 acres, or two thirds of the whole area of the State. The cash value of these farms, etc., was $216,401,543, and of the implements and machinery thereon $7,021,772.

25. The livestock owned in the State in 1840 and 1850 comparatively was as follows:

1840	equines,	326,488	neat cattle,	1,024,148	sheep,	1,293,772	swine, 1,992,155
1850	"	293,886	"	1,076,269	"	1,310,004	" 1,829,843

The equines in 1850 consisted of 272,403 horses and 21,483 mules and asses, and the neat cattle of 317,619 milch cows, 89,513 working oxen, and 669,137 other cattle. The total value of the livestock in the latter year was $33,656,659, and the value of the animals that had been slaughtered in the year was $7,502,986; and the quantity of cheese produced had been 436,292, of butter 11,089,359, and of wool 2,860,765 pounds. In 1840 the wool crop amounted to 2,538,374 pounds.

26. The production of the cereals (bushels) in 1840 and 1850 compared thus:

1840	wheat,	10,109,719	rye,	1,482,799	oats,	13,451,062	corn,	34,577,591	barley,	87,430	buckwheat,	243,822
1850	"	11,212,616	"	458,930	"	10,179,144	"	35,254,319	"	25,437	"	214,898

—and other food crops in 1850 consisted of potatoes 3,130,567 (Irish 1,316,933, and sweet

1,813,634) bushels, and beans and peas 521,579 bushels, etc.; and the crop of hay amounted to 369,098 tons, with 29,727 bushels of clover-seed, and 23,428 bushels of other grass-seed.

27. Tobacco, the great staple of Virginia agriculture, was produced to the extent—in

A VIRGINIA TOBACCO PLANTATION.

1840 of 75,347,106, and in 1850 of 56,803,227 pounds, being 34 and 28 per cent. of the crop of the whole United States in the years respectively.

28. In addition to these Virginia also produced in 1850 the following: cotton, 1,578,800 pounds; rice, 17,154 pounds; flax, 1,000,450 pounds; hemp, 378,000 pounds; beeswax and honey, 249,422 pounds; maple-sugar, 1,227,665 pounds, etc.; and the products of market gardens were valued at $183,047, and of orchards at $177,137.

29. The total value of agricultural products in 1840 was $48,644,905, and in 1850, $52,512,452.

30. The following table exhibits the condition of the miners, manufacturers, and mechanic arts of this State in 1850, and the progress of this branch of industry for a series of years:

Branches.	Number of Works.	Capital Invested.	Value of Raw Material.	Hands Employed.	Cost of Labor.	Value of Goods Produced.
Cotton mills	27	$1,908,900	$828,375	2,963	—	$1,486,384
Woolen mills	121	392,640	488,899	668	—	841,013
Iron works—pig	29	513,800	158,307	1,129	—	521,924
" —cast	54	471,160	297,014	819	—	674,416
" —wrought	38	747,811	531,325	1,131	—	1,098,252
Distilleries, etc	60	100,915	—	131	—	247,360
Tanneries	341	676,983	—	906	—	894,876
Salt works	40	1,269,900	234,623	1,297	—	700,466
Not specified	4,031	12,028,784	15,564,890	20,065	—	23,240,696
Total	4,741	$18,109,993	$18,103,433	29,109	$5,413,764	$29,705,387

—in 1810 the value of products was $16,806,096; in 1820 (incomplete returns), $6,686,699; in 1830 (no returns); in 1840, $18,242,936, and in 1850 (as above), $29,705,387. Among the non-specified manufactures is that of tobacco, which is one of the most important. Richmond, Norfolk, Petersburg, Lynchburg, Staunton, and Wheeling are the principal seats of manufacturing industry. To these may be added Harper's Ferry and Alexandria on the Potomac.

31. The value of home manufactured goods produced in 1840 was $2,441,672, and in 1850, $2,156,312.

32. The coast fisheries and those of Chesapeake Bay are very valuable, but are not operated to any considerable extent. The oyster fishery, however, is a source of great profit, and so extensive are the beds that their area is estimated at 2,000 square miles. In 1855 no less than 14,400,000 bushels were taken, which at 30 cents were valued at $4,800,000, and the boats employed in this business amounted to 90,000 tons.

33. In direct foreign commerce Virginia occupies among the States the tenth rank. In 1850 and 1855 its exports amounted to $3,415,646 and $4,379,928, and its imports to $426,599 and $855,405. In the same years the shipping cleared amounted to 65,458 and 71,732 tons, and the shipping entered to 30,965 and 66,740 tons. The amount of shipping owned in the State in 1850 was 74,071 (registered 18,042 and steam 8,725) tons, and in 1855 (registered 25,811 and steam 9,598), 127,319 tons; and in these years the shipping built measured 3,584 and 4,603 tons. The separate tonnage on the Atlantic and on the Ohio, and the ship-building in the two sections was as follows:

	Total Tonnage.		Steam Tonnage.		Tonnage Built.	
	1850.	1855.	1850.	1855.	1850.	1855.
Ports of the Atlantic	68,138	121,832	2,792	4,111	1,957	4,155
Wheeling, on the Ohio	5,933	5,487	5,938	5,487	885	448

—Norfolk and Richmond are the principal sea-ports, and in a more restricted sense, Alexandria, Camden, and Petersburg. Wheeling is the chief port on the Ohio.

34. The coasting and internal trade of the State is far more extensive and valuable than the foreign trade. The great bulk of the products are carried to Baltimore, Philadelphia, and New York by steamers and other coasting vessels, and thence exported, and by the same routes foreign goods are brought into the State; and hence what is absolutely Virginia commerce is credited to the ports through which it trades with foreign countries. This arrangement, however, gives to the coasting trade an unprecedented activity, and is a source of wealth to the shipowners. The internal trade is carried on chiefly by means of railroads and canals, which have already been carried beyond the mountains, and several of these works have also direct connection with the northern sea-port towns, and in other directions with the south and southwest. The Ohio trade is monopolized by Wheeling and Parkersburg, and is entirely diverted from the ports of Virginia by the railroads from these points to Baltimore, etc. Great efforts, however, are now being made to direct the whole commerce of the State to its own sea-ports, and for this purpose railroads are in the course of construction in the proper direction, and which when completed will probably enable Virginia to regain to itself the position it enjoyed, during the period of its entire history, of ranking among the first commercial States of the Union.

35. The railroads now (1855) in operation within the State have a total length of 1,500 miles, being one mile of road to every 40 miles of surface, or to every 1,000 of the total population. The principal lines have an east-and-west direction—in the north the Baltimore and Ohio Railroad, in the middle the Central and its projected continuation, the Covington and Ohio Railroad, and in the south the Petersburg and Knoxville line. The great north-and-south line crosses the State through Petersburg, Richmond, etc.; and from Alexandria railroads partly built extend to the interior northwest toward the Ohio, and southwest to Gordonville, Lynchburg, etc., and *via* Manassas Gap to Staunton, etc.; and from Richmond and Petersburg other lines seek the sea-board. The principal canals in the State are the James River and Kanawha, already completed from Richmond to the Blue Ridge, and to be extended to the Ohio; the eastern portion of the Chesapeake and Ohio Canal, which terminates at Alexandria, and a portion of the Dismal Swamp Canal, which opens a navigable passage between James River and Albemarle Sound.

36. In 1850 Virginia had thirty-seven and in 1855 fifty-seven banks, with capital in the respective years amounting to $9,824,545 and $13,600,188. The assets at the two periods consisted of—loans and discounts, $19,646,777 and $25,319,948; stocks, $269,914 and $2,647,366; real estate, $764,282 and $807,981; specie, $2,928,174 and $3,151,109, and other assets, $2,718,303 and $3,326,924; and the liabilities of—circulation, $10,256,997 and $13,014,926; deposits, $4,717,732 and $6,204,340, and other liabilities, $308,841 and $700,597.

37. The government is based on the constitution of 1851. The right to vote is conceded to every white male citizen twenty-one years of age, who has resided in the State two years and in the county or city one year next preceding an election. Votes are given *viva voce*, and not by ballot. The general election is held on the fourth Thursday in April.

38. The legislature consists of a house of delegates with 152 members, elected for two years, and a senate with 50 members, elected for four years, one half biennially. All qualified voters are eligible for election to these offices. The sessions of the legislature are biennial, and commence on the first Monday in December.

39. The governor and lieutenant-governor are elected for four years, and enter upon their functions on the first January next after election. These officers must have attained the 30th year, be citizens of the United States and of the State, and the governor during his term of office must reside at the seat of government. The chief administrative officers are elected by joint vote of the general assembly for two years.

40. The judiciary is vested in a supreme court, district courts, and circuit courts. In each circuit (21 in number) one judge is elected for eight years, and holds two circuit courts in each county of his circuit annually. In each district (10 in number) two district courts are held annually by the judges of the circuits constituting the district, and the judge of the supreme court of the section in which the district is situated. In each section (5 in number) a judge is elected for 12 years, and the five judges so elected constitute the supreme court, which holds three terms at Richmond and one at Lewisburg annually. For county court purposes each county is divided into districts, and each district elects four justices for four years. This court is held monthly in each county.

41. The principal public institutions supported in part or whole by the State are the State lunatic asylums at Staunton and Williamsburg, the Deaf and Dumb and Blind Asylum at Staunton, the State Penitentiary at Richmond, the Virginia Military Institute at Lexington, the University of Virginia near Charlotteville, etc., etc.

42. The operations of the treasury for the year ending Sept. 30, 1855, were as follows:

	Resources.	Expenditures.
Balance from last year	$321,346	—
General account	2,146,958	$2,182,330
Literary fund	117,753	169,648
Public works	1,757,691	1,868,924
Sinking fund	1,600,027	1,707,043
Total	$5,943,775	$5,922,451

The chief sources of income are taxes (which in this year amounted to $1,307,316), loans for public works, dividends, etc.

43. The public funded debt on the 1st July, 1856, amounted to $26,001,012, and the annual interest thereon to nearly $1,500,000. The contingent debt amounted to $3,898,500, making with the funded debt a total of $27,899,512. The resources of the State consisted of—bank stock, $3,808,220; stock in internal improvement companies, $18,359,226; bonds in internal improvement companies, $630,675; loans to internal improvement companies, $4,886,000, etc.—amounting in the aggregate to $27,686,621; and the available capital of the Literary Fund amounted to $1,641,758. The total value of taxable property in the State in 1855 was $530,994,897.

44. The number of children attending school in 1849–50 was 109,775, or one in every 8.64 of the total free population. The condition of the schools on the 1st June, 1850, was as follows:

Classification.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	2,930	2,997	67,353	$314,625
Academies and private schools	317	547	9,068	234,372
Universities and colleges	12	73	1,343	159,790

—making a total of 3,259 institutions, 3,617 teachers, and 77,764 scholars, with an annual income amounting to $708,787.

45. The principal collegiate institutions and their statistics in 1855 are noted in the following table:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
William and Mary College	Williamsburg	1692	6	82	5,600
Hampden-Sidney "	Prince Edward Co	1783	5	95	8,500
Washington "	Lexington	1783	6	71	11,000
University of Virginia	Charlotteville	1819	16	366	25,000
Randolph-Macon College	Mechlenburg Co.	1832	7	103	10,000
Richmond "	Richmond	1832	6	167	6,000
Emery and Henry "	Washington Co.	1833	5	54	3,000
Rector College	Taylor Co.	1839	4	57	2,800
Virginia Military Institute	Lexington	1839	13	162	6,000
Bethany College	Bethany	1841	6	140	3,600
Roanoke "	Salem	—	—	—	—
Piedmont University	Liberty Co.	—	—	—	—
Prot. Epis. Theological Seminary	Fairfax Co.	1823	4	41	7,000

Winchester Medical College	Winchester	1846	5	—	—

46. The number of free persons in Virginia of 15 years of age and upward who could not read and write in 1850 was 88,520, of which 87,383 were natives and 1,137 foreigners, and 77,005 were whites and 11,515 free colored persons.

UNIVERSITY OF VIRGINIA.

47. The predominant religious denominations of this State are the Methodists, Baptists, and Presbyterians, and next in relation to numbers the Episcopalians. The Roman Catholics are comparatively few in number, and the adherents of other religions less numerous than in most of the other States. The total number of churches of all denominations in 1850 was 2,383, with accommodation for 856,436 persons, and holding property to the value of $2,856,076.

48. The principal cities and towns of Virginia are Richmond, Norfolk, Portsmouth with Gosport, Petersburg, Alexandria, Fredericksburg, Winchester, Lynchburg, and Wheeling. The progress of these places in population has been as follows:

Cities.	1790.	1800.	1810.	1820.	1830.	1840.	1850.	1855.
Richmond	3,761	5,737	9,735	12,067	16,060	20,153	27,570	32,389
Petersburg	2,828	3,521	5,668	6,690	8,322	11,136	14,010	15,500
Norfolk	2,959	6,746	9,183	8,478	9,814	10,920	14,326	18,000
Portsmouth	1,702	—	—	—	—	6,477	8,936	10,000
Fredericksburg	—	—	—	—	3,307	3,974	4,061	4,500
Alexandria	—	5,071	7,227	8,218	8,263	8,459	8,734	9,000
Lynchburg	—	496	—	—	—	6,395	8,071	10,000
Wheeling	—	—	914	1,567	5,221	7,885	11,391	14,136
Winchester	—	2,128	—	—	—	3,454	3,857	4,000

—and other principal places with their population as in 1850 are—Charleston, Kanawha Co., 1,050; Charlestown, Jefferson Co., 1,507; Danville, Pittsylvania Co., 1,514; Harper's Ferry, Jefferson Co., 1,747; Leesburg, Loudon Co., 1,691; Lexington, Rockbridge Co., 1,743; Martinsburg, Berkeley Co., 2,190; Parkersburg, Wood Co., 1,218; Shepherdstown, Jefferson Co., 1,361; Staunton, Augusta Co., 2,500; Williamsburg, James City Co., 877.

49. Richmond, the chief city and seat of government, is situated on the north bank and at the lower falls of James River. Latitude 37° 32′ 17″, and longitude 77° 27′ 28″. It is one of the most beautiful towns of the Union, and environed by a varied and interesting scenery. The city is built on several elevations, the most noted of which are Shockoe and Richmond hills, between which runs Shockoe Creek. The streets running parallel with James River are alphabetically named, A Street being on the river. These are intersected by others at right angles, named numerically. The principal thoroughfare is Main or E Street, which is the center of business. The chief public edifices are built on Shockoe Hill, in the western part of the city, and the Capitol, from its size and elevated position, is the most conspicuous object in the city. This is also the fashionable quarter.

CITY OF RICHMOND.

50. The Capitol stands on a square of about eight acres, is adorned with a portico of Ionic columns, and contains a marble statue of Washington, taken from life by Houdon. The City Hall is a costly building, in the Doric style. At an angle of Capitol Square, and at a little distance from the Capitol, is the governor's official residence. The Penitentiary, in the western suburbs, and facing the river, is a massive structure, 300 feet long and 110 feet deep. The city also contains the county court-house, a jail, a fine armory, two market-houses, a theater, an orphan asylum, etc., with about 30 churches and numerous educational institutions, among which are prominent Richmond College (Baptist) founded in 1832, St. Vincent's College (Roman Catholic), and the Medical Department of Hampden and Sidney College, founded in 1838.

51. Richmond owes its present flourishing condition to its river facilities, the immense water-power supplied by the falls, and the energy with which its citizens have extended their works of improvement into the interior. It is alike the manufacturing and commercial metropolis of the State. The river is navigable to this port for vessels drawing 10 feet of water, and those drawing 15 feet may ascend it to within three miles of the city.

52. North and south its railroad connections are complete, and westward both railroad and canal have already been carried to the Blue Ridge, with the ultimate project of reaching the Ohio River. Southwest the railroad extends to Danville, and will soon be in connection with the railroad system of North Carolina. The Richmond and York River Railroad, now being built, will give the city a direct seaward outlet, and another route to the sea-board will be furnished, *via* Petersburg, by a railroad to Norfolk. Its communications by steamers are—with New York and Philadelphia semi-weekly, and with Baltimore and Norfolk daily.

53. The chief articles of export are tobacco, wheat, and flour. The quantity of tobacco inspected here in 1852 was 24,119 hogsheads, which is chiefly shipped to England, France, Italy, Bremen, and Holland. The direct foreign trade, however, is comparatively limited, and transacted chiefly through Baltimore, Philadelphia, and New York, the freighting business between Richmond and those ports being commensurately extensive and valuable.

54. As a manufacturing city, Richmond, as before stated, has eminent facilities. From the commencement of the rapids, a few miles above the city, to tide-water the river descends 100 feet. The vast water-power thus created has of late years attracted general attention, and many extensive industrial establishments have been built along the river. The principal products are flour, tobacco, textile goods, paper, machinery, and ironware. The flouring-mills of this city have a wide celebrity, and their brands are noted in every market. There are upward of fifty tobacco factories, many of them very extensive, and the city has also become noted for its railroad machinery and iron manufactures generally. Richmond has three banks, with a capital of $2,500,000, and several insurance offices.

55. On the opposite side of the river, and connected with it by three bridges, are the suburban villages of Manchester and Spring Hill, together containing about 3,000 souls.

56. North of Richmond, by the Richmond, Frederick and Potomac Railroad, 60 miles, is the city of Fredericksburg, a thriving place on the Rappahannock River, at the head of tide. Its trade is chiefly in tobacco and flour. Petersburg, 22 miles south Richmond by railroad, is situated on the Appomattox, and may be considered as the natural port of Lynchburg, with which it is connected by the South Side Railroad. The river affords excellent water-power, and there are numerous manufacturing establishments on its banks. It is one of the great tobacco markets of Virginia, and in point of population the third city of the State.

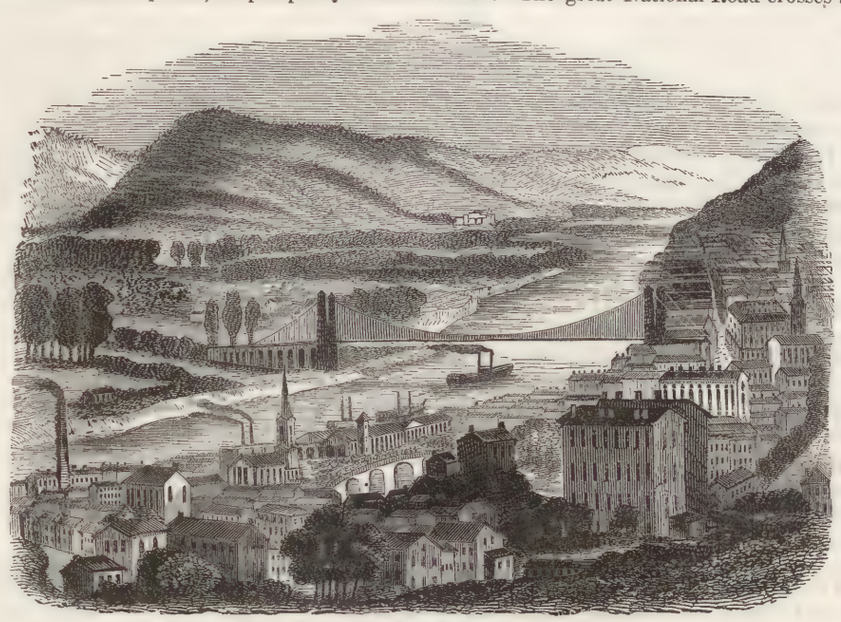
57. A railroad, now in course of construction, will connect this city with Norfolk, the chief sea-port of the State for foreign commerce. This city is situated on the north bank of Elizabeth River, eight miles from Hampton Roads, 32 miles from the sea, and 160 miles from Richmond. Latitude 36° 50′ 50″, and longitude 76° 18′ 47″. The river, which is here nearly a mile wide, separates it from Portsmouth and Gosport, in connection with which it is the most important naval station in the United States. The harbor is safe, capacious, and of easy access, admitting the largest vessels to its wharves. The site is almost level and very low; but the city is well built, chiefly of brick, and is lighted with gas. The principal public buildings are the City Hall, a Military Academy, Mechanics' Hall, and the churches, fifteen in number. The trade of the port is facilitated by the Dismal Swamp Canal, which opens a communication between Chesapeake Bay and Albemarle Sound, and by the Seaboard and Roanoke Railroad, which connects it with the interior. Consequent on these improvements, the city has rapidly progressed, and within the few last years substantial warehouses, wharves, etc., have been constructed. The entrance to the harbor is protected by forts Calhoun and Monroe. Norfolk has regular steamboat communication with Baltimore, Philadelphia, and New York, and also with Richmond; and there is a route projected to Cape Charles by steamboat, and thence north by railroad through the Delaware peninsula.

58. Portsmouth, on the south bank of Elizabeth River, is situated immediately below the junction of its branches, and is the terminus of the Seaboard and Roanoke Railroad. Its suburb, Gosport, is the seat of the United States Navy Yard and dry-dock. In the vicinity there is also a fine naval hospital. The business of Portsmouth is altogether commercial. It is in constant communication with Norfolk by steam-ferry; and a daily line of steamboats gives it direct communication with Richmond.

59. Alexandria, formerly in the District of Columbia, from which it was dissevered in 1846, is a port of entry on the Potomac River, seven miles below Washington. The river, here a mile wide, forms a commodious harbor, and is deep enough for the largest ships. The city is situated on an undulating plain; the streets cross at right angles, and are generally well-paved and lighted with gas. There are no remarkable public buildings, but about a dozen churches and several good schools. Alexandria is one of the great coal ports of the Maryland mining region, and has also a considerable trade in tobacco and other agricultural produce. It is connected with the interior by the Chesapeake and Ohio Canal and the Orange and Alexandria and Manassas Gap railroads; and a railroad has recently been constructed to connect it with Washington. A railroad, under the title of Alexandria, Loudon and Hampshire Railroad, is now being constructed westward toward the Ohio. These works have been of great advantage to the port. Nine miles below Alexandria is Mount Vernon, the former residence of Washington and the site of his tomb.

60. Harper's Ferry, at the confluence of the Shenandoah with the Potomac, where the

united stream breaks through the Blue Ridge, is no less noted for its grand scenery than for its peculiar industry. The village is the seat of a federal armory, at which a vast amount of small-arms are annually manufactured, and otherwise it has considerable manufactures and a



HARPER'S FERRY.

large trade. At this point the Winchester and Potomac Railroad joins the Baltimore and Ohio line, and together these important lines afford to it excellent facilities for commerce.

61. Lynchburg, the principal town in the interior, is situated on James River (here 200 yards wide, and affording great water-power), and is reached from Richmond by the James River Canal, and from Petersburg by the South Side Railroad. Westward the Virginia and Tennessee Railroad extends to the Tennessee line, and there connects with the railroad system of that State. The canal passing through this city extends to Buchanan, and will ultimately be carried to the Ohio River. These lines of trade are sought by a wide region, and make Lynchburg a chief depôt of the internal trade of the State. The great staple of the city is tobacco, which is extensively manufactured and exported to Richmond and Petersburg.

62. Charlotteville is situated on the Rivanna River, 80 miles west-by-north Richmond, and about 60 miles north from Lynchburg. It is a thriving town, having connections east and west by the Virginia Central Railroad, and north and south by the Orange and Alexandria Railroad. One mile west of the town is the University of Virginia, founded in 1819, under the auspices of Jefferson, and about three miles distant is Monticello, the residence of the author of the Declaration of Independence. Gordonsville, 20 miles east of Charlotteville, is the point of connection of the Orange and Alexandria and the Central railroads, and a thriving town. West of Charlotteville, 41 miles, is Staunton, the seat of the Western Lunatic Asylum and of the Virginia Institution for the Deaf and Dumb and Blind. This is one of the most important towns of Virginia. In the limestone formation of this region extensive caverns occur, the most noted of which is that of Weyer's Cave, 18 miles northeast the town.

63. Wheeling, on the Ohio River, 95 miles below Pittsburg, and 632 feet above sea-level, is the most considerable town of western Virginia. Latitude 40° 7′, and longitude 80° 42′. The site is a narrow alluvial tract, overlooked by precipitous hills, and extending about two miles along the stream. It has already a large commerce, and when its great railroad connections are completed, its prosperity will be secured. The great National Road crosses the

CITY OF WHEELING.

river at Zane's Island, opposite the city, by a wire suspension bridge, the span of which is 1,010 feet. Wheeling is also the western terminus of the Baltimore and Ohio and of the Hempfield railroads, and on the opposite bank of the river are the termini of several railroads —from Cincinnati, Columbus, Cleveland, etc. These lines will eventually be connected by a bridge over the river. Steamboats have regular communication with all the river towns up and down. The hills back from the city contain inexhaustible beds of coal, which supply abundance of fuel for these and the manufacturing establishments within and around it, which have already become very important auxiliaries to its prosperity.

64. Parkersburg, 97 miles below Wheeling, is the western terminus of the Northwestern Railroad, practically a southern arm of the great Baltimore and Ohio Railroad. The town is built at the confluence of the Little Kanawha with the Ohio, and has for many years claimed superior importance among the river towns as a commercial mart. Point Pleasant, above the mouth of the Great Kanawha, is a small village at the present day, but, being the terminus of the northern arm of the Covington and Ohio Railroad, has every prospect of becoming a prosperous commercial town. Charleston, on the Great Kanawha, 60 miles from its mouth, is the center of the salt region of western Virginia.

65. The first settlement was made at Jamestown, in April, 1607, and this was the first permanent English settlement in America. The government was originally administered by a council of seven persons, with a president chosen from among their number, but afterward by a governor appointed by the king. Subsequent to the Revolution of 1688 Virginia long enjoyed a prosperous tranquillity. On the approach of the American Revolution the eloquent statesmen of Virginia were among the first to oppose English oppression. In June, 1776, a State government was established. Throughout the struggle for liberty Virginia bore a most prominent part, and within its limits took place the surrender of Cornwallis. Within the last few years the progress of the State has been more rapid than at any former period.

STATE OF NORTH CAROLINA.

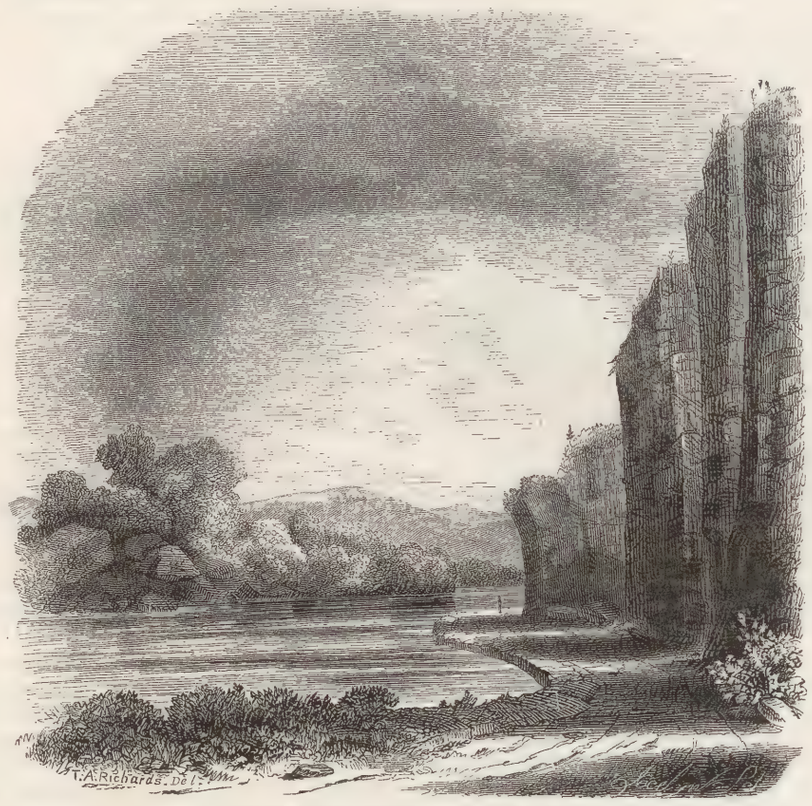
DISMAL SWAMP CANAL.

1. North Carolina lies between latitudes 33° 50′ and 36° 30′ north, and longitudes 75° 25′ and 84° 30′ west, and is bounded on the north by Virginia, on the east and southeast by the Atlantic Ocean, on the south by South Carolina and Georgia, and on the west by the Alleghany Mountains, which separate it from Tennessee.

2. The greatest length of the State, east and west, is about 450 miles, and its greatest breadth, which occurs in the meridian of Cape Fear, is 184 miles. The average breadth, however, is not more than 120 miles. Its area is computed at 50,704 square miles, or 1.73 per cent. of the whole of the United States territory. The continental coast-line has a length of 320 miles, but including the shore-line of its bays and other irregularities a length of 1,089 miles, or one mile to every 46.5 square miles of surface.

3. The maritime section of North Carolina forms, as it were, a chaos of land and water. The entire coast is lined with low, narrow sand islands, broken at intervals, and forming communications between the ocean and the lagoons which lie between the islands and the mainland. South of Cape Lookout these inlets are numerous and the lagoons narrower; north of that headland the converse obtains. Extensive shoals extend from the shore seaward, and, with the lagoons, the bars and banks are constantly changing their position. Furious gales, too, are prevalent.

4. From the sea-coast, for a distance of 60 or 80 miles, the country is perfectly level, traversed by sluggish and muddy streams, and abounding in swamps and marshes. The soil, except along the banks of the streams, where it is sometimes fertile, is sandy and barren. The swamps cover an area equal to one tenth part of the whole State. The Great Dismal Swamp, partly in this State and partly in Virginia, is 30 miles long, and from 10 to 12 broad, extending over 100,000 acres. In some places it is densely covered with cedars, pines, and cypress, and in others is impervious on account of tall and rank grasses and undergrowths. In the center is Lake Drummond, 20 miles in circuit. The soil is covered knee-deep with water, and consists chiefly of a soft, yielding bog. Similar in its character, and nearly as large, is Alligator Swamp, on the peninsula between Albemarle and Pamlico sounds. There are other swamps farther south. Many have been drained, and the recovered lands are excellent for rice and cotton.



5. Advancing into the country, its physical aspect becomes more and more changed. The land now rises into small hills, stones appear on the surface, and the streams ripple in their courses. For 40 miles behind the flat region there extends, as far as the lower falls of the rivers, a belt of land of a surface moderately uneven, with a sandy soil, of which pitch pine is the natural growth. Above the falls the surface is undulated, and still farther, beyond the Yadkin and the Catawba, is an elevated region, forming part of the great central plateau or table-land of the United States, 1,000 to 2,000 feet above the sea-level. The peaks of the Blue Ridge of the Alleghanies tower high above this. Clingman's Peak, the highest summit east of the Rocky Mountains, has an elevation of 6,941 feet; and Mitchell's Peak rises to the height of 6,732 feet. Both are culminations of the same (the Black) mountain knot. Roan Mountain, the summit of which is a broad meadow, is 6,270 feet high; Grandfather Mountain 5,788 feet, and Table Mountain 3,420 feet. Mount Ararat, or Pilot Mountain, in Surry County, is cylindrical in form, and its ascent nearly perpendicular. King's Mountain, another isolated hill, partly in South Carolina, is celebrated as the site of a battle fought in 1780. Between the mountains in the west the soil is productive, and being well grassed, forms extensive pastures.

6. The rivers of North Carolina, though of goodly dimensions, are not navigable for large vessels. Many lose themselves in lagoons difficult of access. The principal river, the course of which lies wholly within the State, is Cape Fear River; it is formed by the Haw and Deep, which rise near the north boundary, and is the only large stream that flows direct to

the ocean. It falls over the first ledge to the low country at Averasboro'; at Fayetteville it can be navigated by large boats, and above Wilmington it forms two branches, which reunite below that town, and hence flows on in a broad, sluggish stream. Its channel, however, has been contracted, and at Wilmington it has now 12 or 13 feet of water, with 10 to 14½ feet on the bar of the main entrance. The direction of its flow is southeast, and the length of its course about 280 miles.

7. The Chowan and Roanoke rivers flow into Albemarle Sound; the former, which is made by the union of the Nottoway and Meherrin, admits small vessels to Murfreesboro', and the latter is navigable for sound craft for 30 miles. Both are navigable for boats a greater distance. The Tar and Neuse empty into Pamlico Sound. The Waccamaw passes into South Carolina; the Lumber and Yadkin also pass into that State, in which they are known as Great and Little Pedee.

8. The Catawba, which rises in the Blue Mountains, also flows into South Carolina, and there takes the name of Wateree. From the western slope of the same mountains flow New River, the Watauga, the French Broad, the Little Tennessee, and the Hiwassee, the waters of which, cutting through the Iron or Smoky Mountains, are ultimately carried off, and mingle with those of the Ohio and Mississippi, and join the ocean at a distance of 1,500 miles from the outlets of the waters rising from the opposite slope, and emptying into the Atlantic.

CHIMNEY ROCKS AND FRENCH BROAD RIVER.

9. To the northward, between the mainland and Narrow Beach Island, stretching down from Cape Henry, lies Currituck Sound, 50 miles long, and from 2 to 10 broad. West of this, running inland, is Albemarle Sound, 60 miles long, and from 5 to 15 broad; its waters are fresh, and not subject to tidal influences. These two sounds communicate with Pamlico Sound, which lies south of Currituck; it is 86 miles long, and from 10 to 20 wide, with a general depth of 20 feet, but shoals abound within it. It opens to the ocean through Ocracoke Inlet, the only navigable pass north of Cape Lookout. Beaufort or old Topsail Inlet, west of the cape, has 20 feet water, and is the best pass on the coast, and Beaufort the most eligible harbor in the State. Cape Lookout and Cape Fear indicate by their names the dangers that surround them. But the most formidable headland is Cape Hatteras, the elbow of a triangular island forming the seaward limit of Pamlico Sound. The whole series of islands which beset this coast are barren and desolate.

10. The low country consists of deposits of sand, similar and belonging to the same age (tertiary) as those of eastern Virginia and Maryland. These beds contain few minerals, but abound in shell deposits, marl, fossiliferous limestone, and bog-iron ore. A ledge of micaceous rock forms the line which divides the low from the upper country. West of this there is a belt of mica slate, chlorite slate, gneiss, and granite, and among the minerals of this section are hematitic iron ores, plumbago, and occasionally soapstone and serpentine. This strip is succeeded by a belt of sandstone, running southwesterly from Granville across the State. Freestones and grindstones are abundant in this formation, which also contains argillaceous iron and extensive coal measures. Next to this is situate the great slate formation, about 20 miles in breadth, and running in a direction northeast and southwest across the country. Within this district are also found numerous beds of porphyry, soapstone, serpentine, greenstone, and hone or whetstone slate. After the slate formation there succeeds next another belt of primary rocks, reaching nearly to the Blue Ridge, and in this is comprised the "gold region." The gold region of the Atlantic States is broader and more productive in this State than in any other. Iron ore is also found abundantly, chiefly in the form of magnetic oxyd. The coal-fields of North Carolina, chiefly in Chatham and Moore counties, and along the valley of Deep River, occupy a space of 200 square miles. Iron ore is found in juxtaposition with the coal measures, or overlying them. The State is also exceedingly rich in copper ores.

11. The climate is much influenced by the diversified character of the surface; in the low country the atmosphere is hot and moist. The western section, where the land is elevated, is, on the contrary, cold and dry. The interior has a climate approximating to both extremes, according to locality. The seasons throughout the State, however, are much less extreme than in the States north and south. The pine forests of North Carolina cover nearly the whole eastern section. In the plain this tree is almost the exclusive natural growth; in the swamps it attains an extraordinary bulk. Cedars and cypresses are abundant in the swamps. These forests contribute greatly to the general wealth, and furnish not only lumber for exportation, but nearly all the resinous matter used in the United States. In the elevated parts the growths are the oak, elm, walnut, cherry, lime, etc., and the maple, poplar, and some others, are indigenous in every section.

PINE FOREST.

12. In 1850 North Carolina contained 869,039 inhabitants, or 17.17 to the square mile, or 3.75 per cent. of the whole population of the Union. This population, which consisted of 105,451 families inhabiting 104,996 dwellings, was distributed into the counties as follows:

Counties.	Population.	County Seats.
Alamance	11,444	Graham.
Alexander	5,220	Taylorsville.
Anson	13,489	Wadesboro'.
Ashe	8,777	Jefferson.
Beaufort	13,816	Washington.
Bertie	12,851	Windsor.
Bladen	9,767	Elizabeth.
Brunswick	7,272	Smithville.
Buncombe	13,425	Ashville.
Burke	7,772	Morgantown.
Cabarras	9,747	Concord.
Caldwell	6,317	Lenoir.
Camden	6,049	New Lebanon.
Carteret	6,939	Beaufort.
Caswell	15,269	Yanceyville.
Catawba	8,862	Newton.
Chatham	18,449	Pittsboro'.
Cherokee	6,878	Murphy.
Chowan	6,721	Edenton.
Cleveland	10,396	Shelby.
Columbus	5,909	Whitesville.
Craven	14,709	Newbern.
Cumberland	20,610	Fayetteville.
Currituck	7,236	Currituck.
Davidson	15,320	Lexington.
Davie	7,866	Mocksville.
Duplin	13,514	Kenansville.
Edgecombe	17,189	Tarboro'.
Forsyth	11,168	Winston.
Franklin	11,713	Louisburg.
Gaston	8,073	Dallas.
Gates	8,426	Gatesville.
Granville	21,249	Oxford.
Greene	6,619	Snow Hill.
Guilford	19,754	Greensboro'.
Halifax	16,589	Halifax.
Haywood	7,074	Waynesville.
Henderson	6,853	Hendersonville
Hertford	8,142	Murfreesboro'.
Hyde	7,636	Swan Quarters.
Iredell	14,719	Statesville.
Jackson	(new.)	Webster.
Johnson	13,726	Smithfield.
Jones	5,038	Trenton.
Lenoir	7,828	Kingston.
Lincoln	7,746	Lincolnton.
McDowell	6,246	Marion.
Macon	6,389	Franklin.
Madison	(new.)	Marshall.
Martin	8,307	Williamstown.
Mechlenburg	13,914	Charlotte.
Montgomery	6,872	Troy.
Moore	9,342	Carthage.
Nash	10,651	Nashville.
New Hanover	17,668	Wilmington.
Northampton	13,335	Jackson.
Onslow	8,283	Onslow C. H.
Orange	17,055	Hillsboro'.
Pasquotank	8,950	Elizabeth City.
Perquimans	7,382	Hertford.
Person	10,781	Roxboro'.
Pitt	18,397	Greenville.
Polk	(new.)	Columbus.
Randolph	15,832	Ashboro'.
Richmond	9,818	Rockingham.
Robeson	12,826	Lumberton.
Rockingham	14,495	Wentworth.
Rowan	18,870	Salisbury.
Rutherford	13,550	Rutherfordton
Sampson	14,585	Clinton.
Stanley	6,922	Albemarle.
Stokes	9,206	Germantown.

	8,205	Burnsville.

—of the total population 553,028 (63.64 per cent.) were whites—273,025 males and 280,003 females, 27,463 free colored—13,298 males and 14,165 females, and 288,548 slaves—144,581 males and 143,967 females; and of the free population (580,491) 577,750 (99.52 per cent.) were born in the United States, of whom 556,248 in this State; 2,524 (0.43 per cent.) were foreigners, and 217 were of unascertained nativity. The number of persons born in North Carolina and resident in other States was 283,077. In 1790 North Carolina had 393,751 inhabitants; in 1800, 478,103; in 1810, 555,500; in 1820, 638,829; in 1830, 737,987; in 1840, 753,419, and in 1850 (as above), 869,039. In 1855 the population was estimated at 922,979.

13. The number of free male persons over 15 years of age engaged in industrial pursuits in 1850 was 139,387—of these 30,613 were engaged in commerce, trade, manufactures, mechanic arts, and mining; 81,982 in agriculture; 28,560 in labor not agricultural; 1,659 in sea and river navigation; 2,263 in law, medicine, and divinity; 3,447 in other occupations requiring education; 570 in government civil service; 46 in domestic service, and 247 in unclassified occupations.

14. North Carolina is an agricultural State, but its industry is also much diversified. Its foreign commerce is comparatively small, but its internal trade is considerable, and several valuable manufactures, and mining operations are at the present day occupying public attention. Lumbering and the manufacture of naval stores are also distinguishing industries.

15. Copper, coal, and iron are the chief objects of the miner in North Carolina. Gold is also obtained in considerable quantities. Within the past few years the copper mines have been worked with success. Coal and iron, chiefly in the neighborhood of the constituents of Cape Fear River, are largely deposited, and are of excellent quality. These, as also the copper mines, are operated by incorporated companies.

16. The number of farms and plantations in North Carolina in 1850 was 56,963, covering 5,453,975 acres improved and 15,543,008 acres of unimproved land, or a total of 20,996,983 acres, being about two thirds of the whole surface. The total value of these lands was $67,891,766, and the value of implements and machinery thereon $3,931,532.

17. The cereal crops in 1840 and 1850 were (bushels) comparatively as follows:

1840	wheat,	1,960,855	rye,	213,971	oats,	3,193,941	corn,	28,893,763	barley,	3,574	buckwheat,	15,391
1850	"	2,130,102	"	229,563	"	4,052,078	"	27,941,051	"	2,735	"	16,704

—the potato crop amounted in 1840 to 2,609,239 and in 1850 to 5,716,027 (Irish 620,318 and sweet 5,095,709) bushels, and that of peas and beans in 1850 to 1,584,252 bushels.

18. The commercial staples of the State are tobacco, cotton, and rice. The production (pounds) in 1840 and 1850 was as follows:

1840	tobacco,	16,772,359	cotton,	51,926,190	rice (clear),	2,820,388
1850	"	11,984,786	"	20,218,000	" (rough)	5,465,868

—and in 1850 flax was produced to 593,796 pounds, and hemp to 39 tons. The other most characteristic staples of North Carolina are tar, resin, cordwood, etc., and the peanuts of commerce are chiefly brought from this State.

19. Otherwise the following are among the enumerated products of 1850—hay 145,653 tons, and beeswax and honey 512,289 pounds. The value of the products of market gardens in 1850 was $39,462, and of orchards $34,348.

20. The amount of livestock in the State in 1840 and 1850 is compared in the annexed:

1840	equines, 166,608	neat cattle,	617,371	sheep,	538,279	swine	1,649,716
1850	" 173,952	"	693,510	"	595,249	"	1,812,813

—in 1850 the equines consisted of 148,692 horses and 25,259 asses and mules, and the neat cattle of 221,799 milch cows, 37,309 working oxen, and 434,402 other cattle. The value of the whole livestock of 1850 was $17,717,647; and the value of animals slaughtered in the year had been $5,767,866. Butter 4,146,290 pounds, cheese 95,921 pounds, and wool 970,738 pounds, are enumerated in the census as the products of animals.

21. The total value of agricultural products in 1840 was $24,727,297, and in 1850 $31,712,146.

22. The number of mining, manufacturing, and mechanic establishments in this State in 1850 was 2,604, with an aggregate capital of $7,252,225, and employing 12,449 hands. The cost of the raw material consumed in the year was $4,805,463, and of labor $1,796,748; and the value of the manufactures produced was $9,111,245. About an eighth of the capital invested is employed in the cotton manufacture. In 1840 the aggregate manufactures of the State were valued at $5,821,323. Wilmington is the chief seat of this branch of industry.

23. The exports of North Carolina consist principally of naval stores, lumber, cotton, etc. The value of the exports from this State to foreign countries for the years ending 30th June, 1850 and 1855, was $416,501, and $433,818 in the years respectively; and of its imports $323,692 and $243,083. The shipping cleared in the same years amounted to 42,232 and 35,647 tons, and entered to 30,965 and 17,065 tons; while the shipping owned in the State amounted in 1850 to 45,218 (including registered 14,732 and steam 9,157) tons, and in 1855 to 60,076 (including registered 18,424 and steam 3,968) tons. The shipping built in the State amounted—in 1850 to 2,651 tons, and in 1855 to 2,594 tons. Wilmington is the principal port, and Newbern, Edenton, Elizabeth City, Beaufort, Washington, and Plymouth are ports used in the coasting trade.

24. The comparatively small direct foreign trade of this State implies a more extensive coasting trade, and hence we find that the great bulk of its commercial material is carried north to Baltimore, New York, etc., for transhipment, and its supplies of foreign goods are imported at the same ports and re-shipped in coasters to their destination. The trade of the interior is carried on chiefly by its railroads, which extend inland from the sea-board at Norfolk, Wilmington, and Beaufort.

25. The principal lines of railroad are—Wilmington and Weldon forming a north-and-south route, the Gaston and Raleigh and Seaboard and Roanoke which extend between the capital and the port of Norfolk; the Central, and the Atlantic and North Carolina which extends from the port of Beaufort *via* Goldsboro' and Raleigh to a connection with the South Carolina railroads at Charlotte, and the Wilmington and Manchester Railroad which passes into South Carolina, and in connection with other lines connects Wilmington with the south and southwest. Thus the railroad system of this State has three direct outlets seaward, and when the roads now in progress are built its connection with the whole West will be complete. The canals of North Carolina are chiefly of local value: the Dismal Swamp Canal secures to a large section in the northeast internal communication by water between Albemarle Sound and the port of Norfolk, and is also of great value to the lumber trade of that region; and the Clubfoot and Harlow's Creek Canal connects the navigation of the Neuse with Beaufort Harbor. The Deep and Cape Fear rivers have also been improved in their navigation, and the coal region of the Deep thus opened to the sea-board.

26. In 1850 North Carolina had eighteen and in 1855 twenty-eight banks and branches, with aggregate capital amounting in the years respectively to $3,789,250 and $6,031,945. The liabilities of these institutions in the two years consisted of—circulation $4,249,883 and $5,750,092; deposits $942,098 and $1,101,113, and other liabilities $65,507 and $245,542; and the assets of—loans and discounts $6,056,726 and $11,558,430, stocks $150,000 and $123,985, real estate $127,806 and $171,037, specie $1,645,028 and $1,360,995, and other assets $1,577,526 and $1,168,609.

27. The government of North Carolina is based on the constitution of 1776 as amended in 1835. The right to vote is granted to every free white male 21 years of age, who has resided in his district 12 months, and paid taxes; but to vote for a senator the party must also have owned a freehold of 50 acres of land in the same district.

28. The general assembly consists of a senate of 50 members and a house of commons of 120 members. The elections and sessions are held biennially. Representation is apportioned every 20 years—that for the house is based on federal population, and that for the senate on taxation.

29. The governor is elected by a plurality of the votes of the qualified voters for members of the house of commons, and holds office two years. A council of seven members assists the governor. The judiciary is vested in the supreme court, the superior or circuit courts, etc. The supreme court is mainly appellate in its jurisdiction. All judges of these courts are chosen in joint ballot by the general assembly.

30. The principal institutions supported in part or wholly by the State are the Insane Asylum and the Deaf and Dumb and Blind Asylum at Raleigh.

31. The ordinary revenue of the State is derived principally from taxation, dividends, and interest on investments, etc. For the year ending 31st October, 1855, the receipts of the treasury amounted to $2,452,137, which included sales of coupon bonds $1,473,370, and temporary loans $651,497; and the disbursements amounted to $2,323,979, which included subscriptions to railroads, etc., $1,427,021, and repayment of temporary loans $526,556, etc. The ordinary expenses of the State government amount only to about $85,000 a year.

32. In 1850 the State debt amounted only to $977,000, but in 1856 to $5,209,847, of which $5,038,802 was the amount of its bonded debt. At the latter period the State held productive property to the value of $4,616,274 secured by mortgage on railroads, etc. The State also owns a school fund amounting to $1,538,995.

33. The number of children attending school in 1850 was 111,430, or one to every 5.21 of the total free population. The condition of schools on 1st June of that year was as follows:

Classification.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	2,657	2,730	104,095	$158,564
Academies and private schools	272	403	7,822	112,430
Universities and colleges	5	29	513	11,300

—making a total of 2,934 schools, 3,162 teachers, and 111,430 scholars, and the income of all amounted to $282,294. The number of free persons over 20 years of age who could not read and write was 80,423, of which 73,566 were whites, and 6,857 free colored persons; and 80,083 were natives and 340 foreigners. Thus in a free population of 580,491, North Carolina has 80,423 illiterate adults, or 13.86 per cent. of the whole number. This is a higher ratio than in any other of the United States.

34. The principal collegiate institutions in the State, with their statistics in 1855, are as follows:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
University of North Carolina	Chapel Hill	1789	15	360	15,000
Davidson College	Mechlenburg Co	1838	6	86	6,500
Wake Forest College	Forestville	1838	5	76	5,000
Law Depart. University of N. C.	Chapel Hill	1845	1	10	Univ. Lib.

35. The most numerous religious denominations in North Carolina are the Methodists and Baptists, which together include three fourths of the whole population; Presbyterians rank next and include about one tenth; and then the Lutherans, Episcopalians, Free Church, Friends, and Christian Church, and after these the German Reformed and Moravian churches. The Church of Rome has scarcely a representation, having had in 1850 only four small congregations. The whole number of churches in 1850 was 1,795, with accommodations for 572,924 persons; and the total value of church property was $905,553.

36. The principal cities and towns in the State are Wilmington, Fayetteville, Newbern, and Raleigh. Their population at various times has been as follows:

Cities, etc.	1800.	1810.	1820.	1830.	1840.	1850.	1855.
Wilmington	1,689	?	?	2,706	4,744	7,264	10,000
Fayetteville	1,656	?	3,532	2,868	4,285	4,646	5,500
Newbern	2,467	?	?	3,776	3,690	4,681	6,000
Raleigh	660	?	?	?	2,244	4,518	5,000

—and the following are also places of consideration—Oxford, which in 1850 had 1,978 inhabitants; Charlotte 2,500; Edenton 1,607; Greenville 1,893; Smithville 1,464; Plymouth 951; Ashville 502; Morgantown 558; Rutherfordton 484; Smithfield 329; Kingston 455, etc.

37. Raleigh is situated in latitude 35° 47′, and longitude 78° 48′, and 140 miles north-by-west from Wilmington. It occupies an elevated site a few miles west of Neuse River, and consists of a central square of 10 acres, from which extend four main streets, 99 feet wide, dividing the city into quarters, and in the middle of each of these is a square of four acres, from which proceed streets 66 feet wide. The State House, on the central square, is said to be the finest building of its kind in the Union except, perhaps, the new State House at Columbus, Ohio. It is ostensibly a copy of the Parthenon at Athens. The other principal buildings are the official residences, and the State Deaf and Dumb Asylum and the State Lunatic Asylum. It is a place of considerable trade; and at this point the Raleigh and Gaston Railroad connects with the North Carolina Railroad, giving the town access to the sea-board at Wilmington, Beaufort, and Norfolk, and also with the West and with the railroads of South Carolina.

38. Wilmington is situated on the east bank of Cape Fear River, just below the entrance of its north branch, 34 miles from the sea. Latitude 34° 11′, and longitude 78° 10′. It is the largest and most important city of the State. The site is low, marshy, and unhealthy, but well adapted for trade. The harbor has a shoal at its entrance, and does not admit of the entrance of vessels of more than 300 tons burden. The shipping of the district in 1850 was 15,198 tons, and in 1855, 20,162 tons. In the foreign trade the clearances in the same years were 31,098 and 26,184 tons, and the entrances 20,670 and 9,700 tons. The coasting and river trade are of far greater value than the foreign trade. The principal exports are lumber, turpentine, naval stores, peanuts, etc., amounting annually to about $5,000,000. There is daily communication with Charleston, S. C., by steamboat, and several steamboat lines to and from Fayetteville. The railroads coming in here are the Wilmington and Weldon Railroad, a link in the great Southern line, and connecting with the Charleston steamers; and the Wilmington and Manchester Railroad, which extends southwest into South Carolina, and at Kingsville, in that State, connects with the South Carolina Railroad, and at Florence with the Northeastern Railroad for Charleston. The manufactories of the town are extensive, and consist principally of saw and planing mills, turpentine distilleries, machine shops, rice mills, etc., in all employing between 20 and 25 steam-engines. The progress of the town has been more rapid of late years than formerly, owing to its added facilities for trading with the interior.

39. Fayetteville is situated at the head of uninterrupted navigation of Cape Fear River, 100 miles above Wilmington. Latitude 35° 3′, and longitude 79° 58′. It is regularly laid out in wide streets, and contains the county buildings and an arsenal of construction. It is the center of a considerable trade, which has been greatly facilitated by the improvement of the upper course of the river by locks and dams, and by the building of plank roads. The pine forests of the vicinity supply its chief exports in the form of lumber, turpentine, tar, etc., which are sent down the river to Wilmington.

40. West of Fayetteville, and on the line of the North Carolina Railroad, is Charlotte, the center of the gold mining region (and the seat of a branch of the United States Mint for the coinage of gold), and the point of connection of the North Carolina railroads and those of South Carolina; farther north is Salisbury, a thriving town and point of divergence of the Western Railroad, and still farther north are the towns of Lexington and Greensboro', from the latter of which a short railroad is projected to Danville, Va., there to connect with the Richmond and Danville Railroad. The Atlantic and North Carolina Railroad extends from Goldsboro' (where it connects with the North Carolina Railroad, and also with the Wilmington and Weldon Railroad) to Beaufort, on the Atlantic, passing through Newbern. Goldsboro' is a town on the Neuse, and was only founded in 1841; it has already a population of 2,000, and a flourishing trade.

41. Newbern is, next to Wilmington, the largest town of the State. It is situated at the confluence of the Neuse and Kent rivers, 50 miles above Pamlico Sound, in latitude 35° 20′, and longitude 77° 5′. Newbern has a considerable trade in grain, lumber, turpentine, etc., chiefly coastwise, but between 20 and 30 vessels enter and clear in the foreign trade annually. The Neuse River is navigated by steamboats for eight months in the year as far as Goldsboro'.

42. Beaufort, at the mouth of Newport River, a few miles from the sea, and 11 miles northwest of Cape Lookout, is noted for its safe and capacious harbor, the best in the State.

It has hitherto been kept back for want of means of communication with the interior, and has still but a small population. The completion of the railroad will be the signal for its advance, and its excellent port will become the scene of a busy commerce. The entrance to it is by Old Topsail Inlet.

43. The only other towns requiring notice are—Edenton, at the head of Eden Bay, where the Chowan opens into Albemarle Sound; Elizabeth City, on the Pasquotank, 20 miles above Albemarle Sound: vessels drawing seven feet ascend to this place, and it has communication with the Hampton Roads by means of the Dismal Swamp Canal; Elizabeth Town, on Cape Fear River, 40 miles above Wilmington; Greenville, on Tar River, 35 miles above Pamlico Sound; Halifax, on the Roanoke, seven miles below the great falls, and at the head of sloop navigation: it is a place of considerable trade, which is facilitated by the Wilmington and Weldon Railroad, and also by river improvements, which continue boat navigation for 130 miles above the town; Lincolnton, on the Little Catawba River, which has manufactures of cotton, paper, iron, etc.; Oxford, 40 miles north Raleigh, the seat of a Baptist female college, and a place of considerable trade; Plymouth, near the Roanoke, a few miles above Albemarle Sound: it has a large lumber trade, and is engaged in the building of coasting vessels; Smithville, on the left bank, and at the mouth of Cape Fear River, opposite Smith's Island; Tarboro', on the Tar River; Washington, at the confluence of the Tar with Pamlico River. The last-named town has a considerable coasting trade, and vessels drawing nine feet water can load and unload at its wharves. The towns of the coast region are almost wholly engaged in the export of lumber and other products of the pineries.

44. The first English settlement in America was made by Sir Walter Raleigh on Roanoke Island, in this State, in 1585, but was abandoned the following year. Two subsequent attempts at settlement also failed. In 1709 Carolina was granted by Charles II. to Lord Clarendon and others. Previously to this, however, emigrants from Virginia had settled in the north part of the province. In 1709 a German colony founded Newbern. From this period to 1729, when the king purchased the colony, many other settlements were made. The colony was now divided into two provinces, with separate governments. On the 4th of November, 1769, the Assembly of North Carolina declared against England's right to tax the colonies, and, in spite of the governor's opposition, the State was subsequently (September, 1774) represented in the first Continental Congress. The citizens of Mechlenberg County formally declared the independence of the State on the 21st of May, 1775, and by this and such acts North Carolina was among the foremost of the colonies in bringing about the Revolution. The constitution, signed at Halifax, 18th of December, 1776, is still the basis of the government. Tennessee was originally within the charter limits of North Carolina.

STATE OF SOUTH CAROLINA.

COTTON PLANT

1. South Carolina is situated between latitudes 32° 4′ and 35° 12′ north, and longitudes 78° 25′ and 83° 19′ west; and is bounded on the north by North Carolina, on the east and southeast by the Atlantic Ocean, and on the south and southwest by Georgia.

2. This State lies in the form of a triangular wedge between North Carolina and Georgia, having the ocean line for its base, which has a length of about 220 miles. The extreme extent of the State, east and west, is about 260 miles, and the area is computed at 29,385 square miles. The shore-line has a length of 220 miles, and including bays, etc., a length of 267 miles, or of one mile to every 110 square miles of surface.

3. The coast region, for 100 miles from the ocean, is covered with forests of pitch pine, intersected with swampy tracts, and permeated by sluggish streams. In this respect it assimilates the whole southeastern coast region. Beyond this, and parallel to it, is a belt of territory, called the "middle country," consisting of low sand-hills, resembling the waves of an agitated sea. This tract occasionally presents an oasis of verdure, or a plantation of maize, but otherwise it is forbidding to the agriculturist. The middle country is bounded westward by another belt called the "ridge," where the land rises by a steep and sudden elevation, and afterward continues gradually to ascend. Beyond the surface exhibits a beautiful alternation of hill and dale, interspersed with extensive forests, and watered by pleasant streams. There are a few lofty mountains in the western part, belonging to the Blue Ridge. Table Mountain, in this chain, rises to the height of 4,000 feet. King's Mountain, in York District, lies partly in North Carolina, and is an isolated eminence of inconsiderable elevation.

4. The principal rivers of South Carolina have their rise in the Blue Ridge. The Great Pedee, which bears the name of Yadkin in North Carolina, reaches Winyaw Bay, after having received the waters of Lynch's Creek and Black River from the right, and the Little Pedee and Waccamaw from the left. It is navigable for steamboats to Cheraw, above which there is a fall of 15 feet in 18 miles. The Santee, the largest river of the State, is formed by the junction of the Catawba or Wateree and the Congaree, and it reaches the sea without receiving any considerable tributary, by two mouths. Steamboats ascend it to Camden and Columbus, and by the aid of canals there is navigation for boats to the mountains. The Congaree is itself formed by the junction of two considerable navigable streams, the Saluda and the Broad rivers. The Edisto, Cambahee, and Coosawatchie are smaller streams in the southern part of the State, navigable for some distance by small vessels. Ashley River is navigable for schooners for 20 miles, and Cooper's River, which it joins at Charleston, 30 miles to the Santee Canal. Although most of these rivers are navigable, as a general thing their lower courses are shallow, and obstructed by bars.

5. The harbors of South Carolina, with few exceptions, are almost valueless to commerce; but the coast presents numerous entrances, which are accessible to small vessels, and which afford advantages to an extensive and active coasting trade. The harbor of Charleston is obstructed by a dangerous sand-bar, and that of Georgetown will only admit small craft. The harbor of Beaufort or Port Royal is the best in the State, and is sufficient to receive a navy, but is little frequented. Stone Inlet has nine or ten feet of water. St. Helena Sound is the most spacious opening for a great distance along the coast, but although about 3 miles wide and 10 long, it is too much beset by shoals to be of any great commercial value.

TABLE MOUNTAIN.

6. The southern part of the coast is skirted by a range of islands, separated from the mainland by narrow channels, which afford an inland steamboat navigation from Charleston to Savannah. These islands, like the neighboring continent, are low and flat; but are covered with forests of live oak, pine, and palmettoes, and they yield the black seed or Sea Island cotton. The long sand beaches, which border these islands toward the sea, are haunted with myriads of wild-fowl.

7. The primitive region of the western part of the State belongs to the auriferous belt of the Atlantic slope, and for a number of years past the production of gold has been such as to encourage the miner to continue his pursuits. In several cases large nuggets of native metal have been dug up, but the largest quantities have been obtained from washings. Iron is also abundant in this section, and in quality the ore is not surpassed. Coal is not found within the State.

8. Regarding the minerals used as building material, Prof. Tuomey says, "it is owing to the difference in the facilities for transportation that the granite, marble, and flag-stone of Massachusetts and Connectict are better known in Charleston and other cities, than those of South Carolina, notwithstanding the abundance and quality of the latter." * * * "Among the beautiful granites of the State, the porphyritic granite of Camden and Buffalo Creek, and the red granite near Columbia are conspicuous. Of the sienites, those found in Abbeville, Fairfield, and Lexington are the most beautiful. The former resembles the Quincy granite, and the latter is remarkable for its white feldspar, contrasting so strikingly with the black crystals of hornblende. The white and variegated marbles of Spartanburg and Laurens form excellent materials for building and ornamental purposes." * * * "Gneiss, besides furnishing an excellent building stone, is often sufficiently slaty in its structure to allow of being split into slabs. A fine quarry of this sort is open at Pickens. In the lower part of York, gneiss is found, having a similar structure: it passes into mica slate, which presents every appearance of making excellent flag-stone." * * * "The mica slate found in Fairfield is equally promising." Soap-stone of very fine quality is found at some of the above-named localities.

9. Porcelain earth abounds through the primary region, wherever the feldspathic granite is found in a state of disintegration. It occurs above Pendleton; along the base of the mountains, in Pickens; near Cherokee Ford, where it is used as a fire-clay, and on the branches of King's Creek. But the finest exposures of this earth are found in the diluvium. Sand of fine quality for the manufacture of glass is also abundant. Red and yellow ochres abound in Chesterfield; and there are many localities where the micaceous and talcose rocks occur. Many of the precious stones are also found in various parts of the State.

10. Between the primitive and alluvial formation, the State is nearly equally divided. While local differences are everywhere observable, the surface and soil of the upper districts present a great similarity; and this is equally true of the lower districts. In the former the lands are broken and hilly—in the latter level; oak is the natural growth of the one—pine of the other. Clay is the soil of much the largest portion of the State; and, except in the immediate vicinity of the ocean, is almost the universal substratum. A close, stiff land predominates generally in the southeast, and an open sand on the sea islands. The highlands of the country, above the falls of the rivers, are naturally much superior to those of the pine-covered regions, but the alluvial bottoms of the former are greatly surpassed in richness by the river swamps of the latter.

11. South Carolina is most favorably situated. Midway between the frozen regions of the north and the burning heats of the tropics, in her climate, seasons, and productions she enjoys most of the advantages of all. In richness, variety, and abundance, perhaps no part of the habitable globe, of the same territorial extent, exceeds South Carolina. Of the four great materials for human clothing—cotton, wool, silk, and flax, her soil and climate are peculiarly adapted to the first three, and in localities to the last. Of the prominent articles of food, she produces rice wheat, Indian corn, oats, rye, barley, sweet and Irish potatoes, etc.

While the woods abound in game, including deer and turkey, the ocean, which laves her southern border, and the numerous streams, both salt and fresh, that penetrate every part of her surface, yield almost every variety of the choicest fish. In relation to medicinal and culinary plants, her catalogue is large. Tobacco, indigo, and hemp were once staple commodities, and have only given place to the cotton and rice culture, which now distinguishes her economy. So remarkable, indeed, is the topographical condition of the State, that wheat and sugar-cane grow profitably side by side, and the olive and orange ripen under the care of the same family of cultivators. Wheat is cultivated as low as 32° 30′; and from bleak cold winds, the northern side of the Glassy Mountains will not produce maize.

12. In 1850 South Carolina contained 668,507 inhabitants, or 22.75 to each square mile, or 2.88 per cent. of the total population of the Union. This comprised in 52,937 families inhabiting 52,142 dwellings, was distributed into the districts as follows:

Districts.	Population.	District Seats.	Districts.	Population.	District Seats.	Districts.	Population.	District Seats.
Abbeville	32,318	Abbeville.	Fairfield	21,404	Winnsboro'.	Newberry.....	20,143	Newberry.
Anderson	21.475	Anderson.	Georgetown ..	20,647	Georgetown.	Orangeburg...	23,582	Orangeburg.
Barnwell	26,608	Barnwell.	Greenville	20,156	Greenville.	Pickens	16,904	Pickens.

—of the total population 274,563 (41.07 per cent.) were whites—137,747 males and 136,816 females, 8,960 free colored—4,131 males and 4,829 females, and 384,984 (57.59 per cent.) slaves—187,756 males and 197,228 females; and of the free population (283,523) 274,813 or 92.96 per cent.) were Americans, of whom 262,160 were born in this State; 8,662 (3.06 per cent.) were foreigners, and 48 of unascertained origin. The number of natives in South Carolina in other States was 186,479. In 1790 South Carolina had 249,073 inhabitants; in 1800, 354,591; in 1810, 415,115; in 1820, 502,741; in 1830, 581,185; in 1840, 594,398; and in 1850 (as above), 668,507. In 1855 the population was estimated at 705,661.

13. The number of free male persons over 15 years of age engaged in industrial pursuits in 1850 was 68,549. Of these 13,205 were engaged in commerce, trade, manufactures, mechanic arts, and mining; 41,302 in agriculture; 8,151 in labor not agricultural; 346 in navigation; 1,829 in law, medicine, and divinity; 3,161 in other pursuits requiring education; 372 in government civil service; 149 in domestic service, and 34 in occupations not classified.

14. In 1850 South Carolina contained 29,967 farms and plantations, which inclosed 16,217,600 (4,072,551 improved and 12,145,049 not improved) acres of land, and were valued at $82,431,684. The value of implements and machinery in use was $4,136,210.

15. The cereal crops (in bushels) of 1850 as compared with those of 1840 were as follows:

1840	wheat, 968,354	....	rye, 44,738	....	oats, 1,486,208	....	Indian corn, 14,722,805	....	barley, 3,967	....	buckwheat, 72
1850	" 1,066,277	....	" 43,790	....	" 2,322,155	....	" 16,271,454	....	" 4,583	....	" 288

—and other food crops in 1850 were potatoes (Irish 136,494 and sweet 4,337,469) 4,473,960 bushels, peas and beans 1,026,900 bushels, etc.; and the hay crop amounted to 20,925 tons.

16. The following were the staple Southern crops for the two years:

1840	cotton, 61,710,274 lbs	.....	clean rice, 60,590,861 lbs.	.....	tobacco, 51,519 lbs.						
1850	" 120,360,400 "	.....	rough " 159,930,613 "	.....	" 74,285 "						

—and in 1850 there was produced 77,000 pounds of cane sugar.

17. And among the miscellaneous productions (1850) are enumerated—beeswax and honey 216,281 pounds, wine 5,880 gallons, etc. The value of market-garden products was $47,286, and of orchard products $35,108.

18. The quantity of livestock owned in the State in 1840 and 1850 compares as follows:

1840.....	equines, 129,921	.....	neat cattle, 572,608	.....	sheep, 232,981	.....	swine, 878,532				
1850.....	" 134,654*	.....	" 777,686†	.....	" 285,551	.....	" 1,065,503				

—and the value of animals slaughtered during the year next preceding 1850 had been $3,502,637. The total value of the livestock of 1850 was $15,060,015. The quantity of butter produced was 2,981,850 pounds, and of cheese 4,970 pounds. The wool crop amounted to 487,233 (in 1840, 299,170) pounds.

19. The total value of the agricultural products of South Carolina in 1840 was $20,555,919, and in 1850 $30,068,154.

20. In 1850 there were in this State 1,431 manufacturing, mining, and mechanic establishments, in which was invested an aggregate capital of $6,056,865, and which gave employment to 7,009 hands. The value of the raw material consumed in the year was $2,809,534, and the cost of labor $1,128,432. The manufactured products were valued at $7,063,513. Among the establishments were 18 cotton-mills consuming in the year 9,929 bales of cotton, and producing goods to the value of $748,338. In 1810 the whole products of the manufactories of this State were valued at $2,216,212, and in 1840 at $4,708,120.

21. The total value of goods produced in families was—in 1840 $909,525, and in 1850 $930,703.

22. The total exports to foreign countries for the year ending 30th June, 1850, amounted to $11,447,800, and in 1855 to $12,700,250; and the total value of the imports was $1,933,785 and $1,588,542. The chief articles of export are cotton and rice. The shipping cleared in the same years amounted to 125,052 and 144,947 tons, and the shipping entered to 96,916 and 90,423 tons. The shipping owned in the State amounted in 1850 to 36,072 tons, including 17,126 tons registered and 7,455 tons steam; and in 1855 to 60,935 tons, including 34,468 tons registered and 10,602 tons steam. Ship-building is carried on to a very small extent—in 1855 only one vessel of 61 tons was built.

23. The coasting trade is very extensive, and as a large share of the commerce of the State is transacted through Northern ports, this department is of far greater value than the direct foreign commerce. The interior is traversed in every direction by railroads, which secure to it besides an ever increasing internal trade a share in the transit between the seaboard and southwest. Steamers also ply regularly to the principal ports of the Atlantic, and for several years a line has been maintained in the Cuba trade.

24. Columbia, the capital, is the center of the railroad system of this State. From this point lines diverge in every direction; to the north into North Carolina; eastward to Wilmington and Charleston, and westward *via* Anderson into Tennessee. The great Southern coast-line also passes through this State from Wilmington to Charleston and Savannah, and from Charleston a line is carried westward to Hamburg, where it joins the Georgia lines passing into Alabama, etc. Thus South Carolina has a very complete system which with its several branches spreads its arms to every section of the State, and which in conjunction with the lines of the adjoining States brings its interior into close connection with every section of the sea-board and the South and West. There are also several canals in this State which, by improving and connecting river navigation, are of great benefit to internal trade. The total length of railroad completed and in operation in 1855 was 840 miles, or one mile to every 35 square miles of surface.

25. In 1850 South Carolina had fourteen banks and branch banks with capital amounting to $13,139,571, and in 1855, twenty such institutions with capital amounting to $17,516,600. The liabilities at these two periods consisted of—circulation $8,741,765 and $6,504,679, deposits $2,322,132 and $3,068,188, due to other banks $2,047,777 and $1,100,299, and other liabilities $642,231 and $46,532; and the assets consisted of—loans and discounts $20,601,137 and $22,238,900, stocks $1,849,463 and $3,483,011, real estate $377,571 and $600,880, due by other banks $2,850,942 and $1,057,476, specie $1,711,902 and $1,228,221, and other assets $1,302,901 and $1,375,967.

26. The government of South Carolina is based on the constitution of 1790. By this instrument the right of voting is conferred on every free white male citizen 21 years of age, resident in the State two years and owning a freehold of 50 acres, etc. The general election is held on the 2d Monday of October annually.

27. The legislature consists of a senate of 45 members and a house of representatives of 124 members, and meets annually on the 4th Monday in November. Senators are chosen for four years, one half biennially, and representatives for two years, and in both cases must be citizens, residents, and freeholders, etc.

28. The governor is chosen by joint ballot of both houses for two years, and is ineligible for re-election for the next four years. He must be 30 years of age, a citizen of and for the last 10 years resident in the State, and be possessed of a freehold of the clear value of £1,500 sterling. If the office of governor become vacant it is filled by the lieutenant-governor, and after him by the president of the senate, until a new governor is elected by the legislature.

29. The judiciary consists of the court for the correction of errors, law courts of appeals, equity courts of appeals, courts of common pleas and general sessions, and courts of equity. Judges and chancellors elected by joint ballot of both houses hold their commissions during good behavior. Besides the courts enumerated, each district has its own court of ordinary; and Charleston has a special court of limited jurisdiction. For the trial of slaves and free persons of color there are courts of magistrates and freeholders, etc.

30. The revenue of the State is derived principally from taxation. For the years ending 30th September, 1850 and 1855, the income from this source amounted to $313,381 and $377,502, and the total resources for those years amounted to $600,292 and $621,693. The expenditures of the years respectively was $540,864 and $484,883. The public debt on the 1st October, 1855, amounted to $2,287,156, and the annual interest thereon to $124,476. The State is also liable as guarantee for bonds of several internal improvement companies, etc., to the amount of several millions. To meet this indebtedness the State is possessed of productive property valued at $4,683,473. The value of taxable property in the State in 1850 was $283,867,709, and in 1855 $303,434,240.

31. In 1850 the whole number of children attending the various educational institutions of the State was 40,373, or one in every 7.02 free inhabitants. The statistics of such institutions on the 1st June, 1850, were as follows:

Classes of Schools.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	724	739	17,838	$200,600
Academies and private schools.....	202	333	7,467	26,025
Universities and colleges.....	8	43	720	104,790

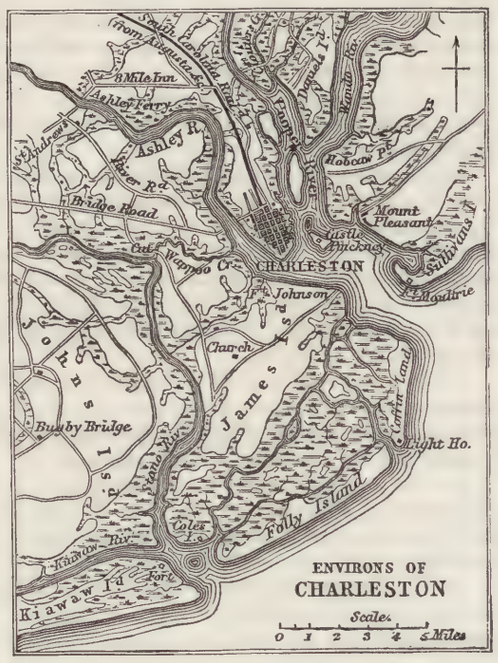
—making a total of 934 schools, 1,115 teachers, and 26,025 scholars, and an annual income of $331,415. Academies are established called Arsenal and Citadel Academies, in which the youth are practically educated in military tactics and in engineering and surveying. The number of free persons over 20 years of age unable to read and write in 1850 was 16,564, of which 15,684 were whites and 880 free colored persons, and 16,460 were Americans and 104 foreigners.

32. The principal collegiate and professional schools in South Carolina in 1855 were as follows:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
Charleston College.....	Charleston.....	1785.....	6	70.....	2,500
South Carolina College	Columbia.....	1804.....	8.....	120.....	22,000
Southern Theol. (Presb.) Sem.....	Columbia.....	1831.....	5.....	32.....	5,500
Theological (Luth.) Seminary	Lexington	1835.....	2.....	10.....	2,000
Furman Theol. (Bapt.) Sem.	Fairfield District	1825.....	2.....	30.....	1,200
Seminary of St. John Baptist	Charleston.....	1849.....	5.....	—.....	—
Med. Coll., State of S. Carolina....	Charleston.....	1833.....	8.....	158.....	—

—and among the colleges may be noted the State Military Institute at Columbia.

33. The most numerous of the religious denominations of this State are the Baptist and Methodist, together including three fourths of the inhabitants. After these rank the Presbyterian, Episcopal, and Lutheran denominations, and then the Roman Catholic, which numbers about one per cent. of the whole population. The whole number of churches in the State in 1850 was 1,182 with accommodation for 460,530 persons, and the value of church property was $2,172,246.



34. Columbia, the State capital, is situated on the left bank of the Congaree, immediately below the confluence of the Saluda and Broad rivers. Latitude 35° 57′, and longitude 81° 7′. The city stands on an elevated plain, and is regularly laid out in streets 100 feet wide. Its foundation dates from 1787. The principal buildings are the State House, which is 170 feet long and 60 feet wide, the State Lunatic Asylum, South Carolina College, etc., and the district and municipal establishments. The college edifices are extensive, but devoid of architectural merit. There is also in the city a theological school under the Presbyterians. The vicinity is a highly cultivated cotton and corn district, and the town itself the central depôt of a wide region traversed by the principal railroads of the State, which connect it with Charleston on the east; Hamburg and Georgia, etc., on the west: North Carolina on the north; and also

* Namely, 97,171 horses and 37,483 asses and mules.

† Namely, 193,244 milch cows, 20,507 working oxen, and 563 935 other cattle

with the whole northwestern part of the State. The river is navigable to the city for light draft boats. The town is well supplied with pure water.

35. Charleston, the metropolis and chief commercial city, is built on a tongue of land formed by the confluence of the rivers Ashley and Cooper, in lat. 32° 46′ 33″, and long. 79° 55′ 38″. The harbor, which is spacious and convenient, is formed by the estuary of the two rivers, and is protected from the Atlantic by Sullivan's Island on the north and Folly Island on the south. The entrance, which is between these two islands, is obstructed by a range of sand-banks, which makes two channels, by which vessels drawing 16 feet of water may enter the port, but the passage is rendered difficult and uncertain by the tides and the shifting of the sands. Cooper and Ashley rivers are from 30 to 40 feet deep: the first 1,400 and the latter 2,100 feet wide. The whole is protected by Castle Pinkney and Fort Johnson, below the city, each on an island, and by Fort Moultrie, on Sullivan's Island.

36. The site on which Charleston is built is elevated only eight or nine feet above tide, which here rises about six feet; and in the summer season is very unhealthy, especially for strangers from the north. It is a regularly built city, about two miles in length and a mile and a half in width. The streets, usually from 60 to 70 feet wide, traverse lengthwise, and from river to river crosswise, parallel with each other, and are adorned with shade trees. The dwellings are generally embowered in shrubbery and ornamented with vines, while the gardens attached to them are adorned with peach, orange, and other Southern trees. The principal buildings are those of the Medical College of the State, the Charleston College, the Literary and Philosophical Society, the Apprentices and City libraries, etc., and numerous schools and churches; also an orphan asylum, alms-house, etc.

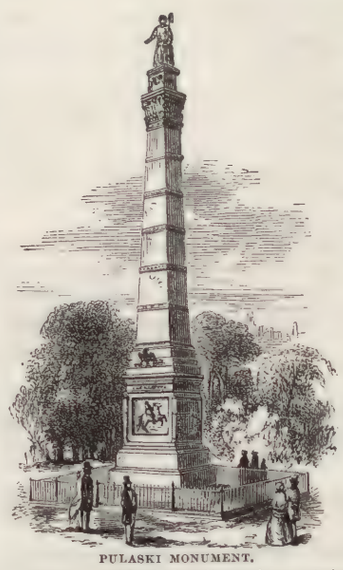
37. Charleston, though chiefly a commercial city, has also extensive industrial establishments, among which may be noted its cotton presses, engine factories, ship-yards, etc. The dry-dock at this port is capable of receiving the largest vessels with their cargoes. The chief exports of Charleston are cotton, rice, and lumber. In 1850 the clearances in the foreign trade amounted to 121,367 tons, and in 1855 to 140,014 tons; and the entrances for the same years were 96,619 and 88,833 tons. This comparatively small tonnage is accounted for by the fact that the great bulk of the trade of the city is transacted through Northern ports, and the coasting trade thus counterbalances in its extent the deficit in the foreign trade properly belonging to this port. The value of the exports to foreign countries direct does not usually exceed twelve million dollars, while the actual exports amount to thrice that sum. For carrying on this coastwise trade, there are well-provided lines of steamships plying between Charleston and the principal ports northward, namely, Baltimore, Philadelphia, New York, etc. Regular lines of packets also sail to and from the ports north and south.

CITY OF CHARLESTON.

38. The inland trade of the city is facilitated by the Santee Canal, which connects the port with the Santee River navigation, and by the very complete system of railroads which diverge from this point, and, spreading over the State, reach back to the Mississippi River. The financial institutions connected with the trade of this port are nine joint stock and six or seven private banks, with an aggregate capital of $20,000,000, and several insurance companies, also a provident institution for savings. Charleston was founded in 1672, and received a city charter in 1783. In 1790 it contained 16,357 inhabitants; in 1800, 18,711; in 1810, 24,711; in 1820, 24,780; in 1830, 30,289; in 1840, 29,261; and in 1850, 42,985. It has now (1855) at least 50,000. This is exclusive of St. Philip's Parish or the Neck, which is, however, virtually a suburb of the city, and contains 16,000 to 18,000 inhabitants. The total value of real estate in the city in 1854 was $24,192,650.

39. Georgetown, at the upper end and on the west side of Winyaw Bay, contains 2,904 inhabitants. It is the next, and, indeed, the only other, frequented port in the State after Charleston. It has comparatively little foreign commerce, but a considerable coasting trade. The harbor admits vessels drawing 11 feet of water. Beaufort, a sea-port on the west side of Port Royal River, an inlet of the Atlantic, 16 miles from the sea, has a good harbor, but, its mouth being obstructed, vessels drawing over 11 feet water can not enter it. It has little or no commerce, and the site is unhealthy: population 879.

40. Camden, on the Wateree, 31 miles northeast Columbia, is an active business place of 1,143 inhabitants, and contains the district buildings, an arsenal, masonic hall, etc. The river is here navigable for vessels of 70 tons, and the commerce of the place is further facilitated by the Camden Branch Railroad, which leaves the South Carolina Railroad at Kingsville, 37 miles south-by-west. Some manufactures are carried on; and it is noted as the scene of two engagements in the War of Independence.



41. Cheraw, at the head of steamboat navigation of the Great Pedee, is a place of some importance as a cotton mart, and is connected by railroad with Wilmington and Charleston. Florence is a small but important town on the line of the Wilmington and Manchester Railroad, 107 miles west-southwest from Wilmington; and is also the point of connection of the Cheraw and Darlington and the Northeastern railroads, 102 miles north Charleston.

42. Hamburg, on the Savannah River, opposite Augusta, Ga., with which it is connected by a bridge 1,000 feet long, and by a railroad viaduct, contained, in 1850, 1,070, and in 1855 about 2,000 inhabitants. The South Carolina and Georgia railroads connect by the bridge, and together form a portion of the great chain from Charleston to Memphis. Hamburg consists of a lower town, which lies by the river and contains the business houses, and an upper town, which stands back from and 60 to 70 feet above the lower town. It is an important cotton mart and has a large inland trade. Steamboats ply regularly to and from Savannah.

43. The other more important towns of this State are Abbeville with 1,250 inhabitants; Anderson with 1,000; Chester with 982; Cokesbury with 878; Edgefield with 2,000; Greenville with 1,305; Laurensville with 1,000; Newberry with 1,250; Spartanburg with 1,176; Sumterville with 1,356; Unionville with 554; Winnsboro' with 1,050, and Yorkville with 511.

44. In 1663 Charles II. granted to Lord Clarendon and others the province of Carolina, which had previously been attached to Virginia. In 1670 a company of colonists located at Port Royal, but removed in the year following to old Charleston, and again, in 1680, to the present site of Charleston. The government was vested in the proprietors until July, 1729, when the Carolinas were purchased by the king and formed into two separate colonies. South Carolina now received large accessions of immigrants; the colony, however, at various times, suffered greatly from Indian depredations. From 1762 to 1775, when the first constitution was formed, it enjoyed uninterrupted peace; but in the Revolution it was the scene of warfare, and many severe battles were fought within its borders. The victory of Eutaw Springs, in 1781, terminated the war within the State, and contributed much to the successful issue of the contest.

STATE OF GEORGIA.

PULASKI MONUMENT.

1. Georgia lies between latitudes 30° 22′ and 35° north, and longitudes 80° 48′ and 85° 40′ west; and is bounded on the north by Tennessee and North Carolina, on the northeast by the Savannah River and South Carolina, on the east by the Atlantic Ocean, on the south by the St. Mary's River and Florida, and on the west by Chattahoochee River and Alabama.

2. The greatest length of the State, north and south, is 322 miles, and the greatest width (on the 32d parallel) 224 miles, but from this line northward it gradually narrows. The area is computed at 58,000 square miles.

3. Georgia has a coast-line of only 128 miles, but including its bays and all irregularities its length is 480. This gives one mile of shore to every 121 square miles of land surface. The shore-line of the islands gives a farther length of 204 miles.

4. With a territory embracing the southern extremity of the great Atlantic chain of mountains, extending across them to the northwest into the valley of the Mississippi, running southwest into the cretaceous slope of the Gulf of Mexico, and occupying along their eastern base a wide belt, Georgia contains most of the important geological formations. Commencing at the Atlantic Ocean, and spreading out for 100 or 150 miles to the west, an extensive plain of tertiary formation rises from the level of the sea, and gradually swells up to the height of about 500 feet, at a line passing near the head of navigation of the rivers Savannah, Ogeechee, Oconee, and Ocmulgee, where it meets a primary formation. Between the Ocmulgee and Flint rivers it leaves the primary formation to the right, and rests on the cretaceous from a point nearly midway between Macon and Knoxville, by a line running southwest to another point between Pataula Creek and Fort Gaines, on Chattahoochee River. Bounded by the last-mentioned line to the southeast, and by the southern edge of the primary, the cretaceous formation extends from Alabama into Georgia, forming an acute triangle. The primary or non-fossiliferous, bounded on the east by the tertiary and cretaceous formations, crosses the State northeast and southwest, with a width of 160 miles at the northern limit and of 100 at the southern. The Blue Ridge range of mountains passes near its western edge, and forms the most elevated land of the State, varying in height from 1,200 to 4,000 feet. From this crest there is a gradual descent to the east, by a series of parallel and undulating ridges, until the tertiary plain is reached. On the west the descent is much more precipitous. The northwestern part of the State, bounded to the east and south by the western limit of the primary, consists of a transition or old fossiliferous formation, except the extreme northwest corner, where the carboniferous occurs.

5. Along the southern line of the State, between the head branches of the Suwanee and St. Mary's, there is an extensive swamp, or series of swamps, covered with a thick growth of bay trees, vines, and underwood, and in the wet season presenting the appearance of a wide lake containing islands of rich highland. This swamp extends over the borders into the State of Florida, and bears the Indian name of "Okefinoke." Several streams are lost in its morasses, and others, head-waters of rivers flowing to the Atlantic and Gulf of Mexico, take their rise within its limits.

Battle Fields. ⚔ 1780

Entered according to Act of Congress, in the Year 1858, by J. H. Colton & Co. in the Clerks Office of the District Court of the United States for the Southern District of New York.

6. Upward of fifty streams in the State of Georgia are enumerated as deserving and having the designation of rivers. Whether for navigation or economic purposes, her water resources are immense. The navigable rivers are the Savannah, the Alatamaha, the Oconee, the Ocmulgee, the St. Mary's, the Ogeechee, the Flint, the Chattahoochee, the Coosa, and many others. The great river of the State is the Savannah, which rises by two principal branches in North Carolina, near the sources of the Tennessee and Hiwassee on the one side, and of the Chattahoochee on the other, and after a course of about 300 miles, falls over the last

CASCADE OF THE TACOA, A TRIBUTARY OF THE HIWASSEE RIVER.

chain of rock-hills into the great plain at Augusta, to which place, 250 miles from its mouth, it is navigable for steamers, and for large ships to Savannah. Its principal tributaries are Brier's Creek and Broad River.

7. The Chattahoochee is navigable to the falls at Columbus, 300 miles from its mouth, for a great part of the year, and its whole length is nearly 500 miles. Flint River rises in the hilly country south of the Chattahoochee, and has a total length of 300 miles, of which 75 miles to the falls is open to navigation. The Oostanaula and Etowah, rising in the mountains of the north, unite their streams at Rome, whence they pass directly into Alabama under the name of Coosa.

8. The Alatamaha is formed by the junction of the Oconee and Ocmulgee, which rise in the hills south of the Chattahoochee, and flow for about 250 miles nearly parallel to each other, when the latter bends round to the east and unites its waters with those of the former. There are 12 or 13 feet water on the bar of the river at ebb-tide, and steamboats ascend the Ocmulgee to Macon, and the Oconee to Milledgeville. The Ogeechee has a course of 200 miles, of which 40 are navigated by small vessels. The Santilla, or St. Illa, has a winding course, chiefly through a low swampy region, but is partially navigable for river craft. The St. Mary's rises in a low ridge, near Okefinoke Swamp, and reaches the sea at Cumberland Sound; it has 13 feet of water on the bar at low tide, and sometimes as much as 23 in times of flood.

9. The Allapaha and Withlacoochee, principal constituents of the Suwanee River of Florida, and the Ocklockonee River, are considerable streams in the south part of the State, which empty into the Gulf of Mexico.

10. The coasts of Georgia are lined with a succession of low islands, intersected by numerous navigable channels, which afford good inland sailing. They are separated from each other by wide bays or sounds, which bear their names and receive the waters of this section. The principal islands are Cabbage, Ossaba, St. Catharine's, Sapello, St. Simon's, Jykill, Cumberland, etc. These are covered with rich plantations, and produce the long staple cotton, called, from the place of its growth, Sea Island cotton; and until lately this was the only place, eligible in climate and soil, for the growth of this important production.

11. The mineral region of Georgia is found in the primary and metamorphic formations of the spurs of the Alleghany Mountains. It is in these outliers of the main ridge that the metamorphic slates and quartz rock are found, which are productive in gold ores; and frequently in near proximity to these are deposits of hematite iron, of extraordinary extent. In the gneiss also are found veins of magnetic iron ore. Specular ores, too, like those of the Iron Mountain in Missouri, are found in the vicinity of the hematite beds, and localities of the same ore are of frequent occurrence down the course of the Chattahoochee. Limestone, sulphate of barytes, talcose and mica slate, hornblende slate, greenstone, and quartz veins containing gold are abundant throughout the mineral region. The neighborhood of the Etowah is full of mineral, and the iron ores here found equal those of the Housatonic Valley. Northwestern Georgia, indeed, is destined to become a scene of busy industry; the vast water-power, the abundance of timber, and the beauty of the climate which characterize it, will all tend to its development and success.

12. While southern and middle Georgia are parched with heat, the more northerly climate is moderate and even cold. The sky is clear and the atmosphere bracing. The soil also varies greatly. The islets that border the sea-coast have a light sandy soil. In the south are the tide swamp lands, productive of rice. On the Savannah these lands are among the finest of the State, and next to these are the lands on the Alatamaha. The inland swamps also produce rice abundantly. Black seed cotton is produced on the oak lands adjoining these. About 60 or 70 miles from the coast begin the pine lands, which are chiefly valuable for their timber and ship-stores. The middle region of the State contains land of a red loamy soil, producing tobacco, cotton, and all the grains. The lands in the southwest, between the Chattahoochee and Flint, are in general fertile, but not as durable as some other soils. Being a light sandy soil, they produce cotton, and sometimes sugar-cane, for a few years, and then become exhausted. In the northern part, that known as Cherokee Georgia, the valleys are exceedingly rich. This is peculiarly a grain country, and in the mountains the lands are well adapted to grazing. The forests produce the finest timbers, many valuable for cabinet work; and many products useful in the arts and medicine are found throughout the State.

13. In 1850 Georgia contained 906,185 inhabitants, being 15.62 to the square mile, or 3.91 per cent. of the total population of the Union. This population, consisting of 91,666 families inhabiting 91,206 dwellings, was distributed into the counties as follows:

Counties.	Population.	County Seats.
Appling	2,949	Holmesville.
Baker	8,120	Newton.
Baldwin	8,148	MILLEDGEVILLE.

—of the total population 521,572 (57.55 per cent.) were whites—266,233 males and 255,339 females, 2,931 free colored—1,375 males and 1,556 females; and 381,682 (42.13 per cent.) slaves—188,857 males and 192,825 females; and of the free population (524,503) 518,097, or 98.77 per cent., were American born, of whom 402,666 were natives of this State; 5,907 (1.13 per cent.) were foreigners, and 517 of origin unascertained. The number of Georgians in other States was 122,954. In 1790 Georgia contained 82,548 inhabitants; in 1800, 162,101; in 1810, 252,433; in 1820, 340,987; in 1830, 516,823; in 1840, 691,392, and in 1850 (as above), 906,185. A State census in 1855 gave the population at 935,090.*

14. There were employed in industrial pursuits in 1850, 123,243 free male persons over the age of 15 years. Of these 20,715 were engaged in commerce, trade, manufactures, mechanic arts, and mining; 83,362 in agriculture; 11,505 in labor not agricultural; 18 in the army; 282 in sea and river navigation; 2,815 in law, medicine and divinity; 3,942 in other pursuits requiring education; 416 in government civil service; 15 in domestic service, and 173 in unclassified occupations.

15. In 1850 Georgia contained 51,759 farms and plantations, covering 22,821,379 (improved 6,378,479, and unimproved 16,442,900) acres of land, and valued at $95,753,445. The value of implements and machinery in use on these was $5,894,150.

16. The amount of livestock in the State in 1840 and 1850 was as follows:

	equines,	neat cattle,	sheep,	swine,
1840	157,540	884,414	267,107	1,457,755
1850	208,716†	1,097,528‡	560,435	2,168,617

—the stock of 1850 having a total value of $25,728,416, and the value of animals slaughtered in the year preceding was $6,339,762. The products of animals consisted of—butter 4,640,559 pounds, cheese 46,976 pounds, and wool 990,019 pounds. In 1840 the wool crop amounted to only 371,303 pounds.

17. The cereal crops (bushels) of the two years were as follows:

	wheat,	rye,	oats,	corn,	barley,	buckwheat,
1840	1,801,830	60,693	1,610,030	20,905,122	12,979	141
1850	1,088,534	53,750	3,820,044	30,080,099	11,501	250

—and other food crops—potatoes (Irish 227,379, and sweet 6,986,428) 7,213,807 bushels, peas and beans 1,142,011 bushels, etc.

18. The products of the Southern staples (pounds) were as follows:

	cotton,	clean rice,	tobacco,	sugar,
1840	163,392,396	12,384,732	162,894	329,744
1850	199,636,400	rough 38,950,691	423,924	846,000

—and in 1850, molasses, 216,245 gallons.

19. And among the miscellaneous products of 1850 are named the following: hay, 23,449 tons; clover and grass-seed, 560 bushels; beeswax and honey, 732,514 pounds; flax, 5,387 pounds; silk cocoons, 813 pounds; wine, 796 gallons, etc.

20. The total value of agricultural products in 1840 was $29,612,436, and in 1850, $46,686,151.

* The State census of 1855 gives the population at 935,090, of which 542,567 were whites, 3,286 free colored persons, and 389,237 slaves. Number of families 99,695

† Namely, horses 151,331, and asses and mules 57,379.

‡ Namely, milch cows 334,223, working oxen 73,286, and other cattle 690,019.

21. Among the manufacturing establishments of Georgia in 1850 there were 35 cotton-mills, consuming 20,230 bales of cotton annually, and producing goods to the value of $2,135,044. The total number of manufacturing, mining, and mechanic establishments was 1,527, with an aggregate invested capital of $5,460,483, and employing 8,378 hands. The value of the raw material consumed in the year preceding was $3,404,917; the cost of labor was $1,712,304, and the value of the manufactured products $7,086,525. In 1810 the value of the products of the manufactures was $2,768,904, and in 1840 only $3,856,677.

RICE-MILL ON SAVANNAH RIVER.

22. The value of goods manufactured in families and not included in the above was—in 1840, $1,838,968, and in 1850, $1,467,630.

23. The value of exports to foreign countries in the years ending 30th June, 1850 and 1855 was $7,551,943 and $7,543,519, and of imports $636,964 and $273,716. The shipping employed in this trade in 1850 amounted to 129,580 tons, viz., cleared 72,563 tons, and entered 54,017 tons; and in 1855 to 154,391 tons, viz., cleared 104,368 tons, and entered 50,023 tons. The shipping owned in the State in 1850 amounted to 21,690 (registered 10,437, and steam 6,478) tons, and in 1855 to 29,505 (registered 17,990, and steam 6,113) tons; and the amount of shipping built in the two years amounted to 684 and 194 tons respectively.

24. The comparatively small foreign trade of Georgia is counterbalanced by the activity of its coasting trade. By the coast route its commercial products are carried to Northern ports, and by the same route nearly the whole of its foreign imports are received. In this trade several lines of steamers are engaged, and there are others which, trading with Florida, tranship their freights at Savannah. The interior trade is carried on by an extensive system of railroads, and by the rivers which are navigated by steamers.

25. The principal railroads are the Georgia, the Central, the Macon and Western, the Western and Atlantic, and the East Tennessee and Georgia, which form lines from Savannah and Charleston to Tennessee; the Atlanta and Lagrange, and the Southwestern and Muscogee, which connect with the above at Macon and Atlanta, and form junctions with the Alabama lines at West Point and Columbus; the Savannah, Albany and Gulf, and the Brunswick and Florida, which, in conjunction with the Atlantic and Gulf Railroad, will connect Savannah and Brunswick with the Gulf ports, etc., etc. These, with their branches and connections, penetrate every part of the State, and form the general courses of its commerce; and other lines are now in rapid progress between Savannah and Charleston and Savannah and St. Mary's, which will extend the great north and south coast line to the Florida border, and there connect with the great transit line of the isthmus. The total length of railroad completed and in operation in this State in 1855 was nearly 1,200 miles, or one mile to every 48.33 square miles of surface.

26. Georgia has but two canals: the Ogeechee Canal, 16 miles in length, which connects the navigation of the Ogeechee with Savannah, and the Brunswick Canal, 12 miles long, which connects the Alatamaha with Brunswick Harbor. Both of these, however, are of the greatest value to the commerce of their localities.

27. The government of Georgia is based on the constitution of 1798 and amendments thereto adopted in 1838. The right to vote is granted to every resident citizen 21 years of age, who has paid all taxes demanded for the year and resided in the county for the six months preceding. Votes are given *viva voce*. The general elections are held on the first Monday in October biennially.

28. The general assembly consists of a senate of 112 members, and a house of representatives of 150 members, elected for two years. All revenue bills must originate in the house, and the governor's veto to any bill passed by the two houses may be nullified by a subsequent two-thirds vote. The sessions are biennial, and commence on the first Monday in November.

29. The governor is elected for two years by popular vote. He must be 30 years of age, have been a citizen of the United States for 12 years and of the State 6 years, and be possessed of a freehold of 500 acres or other property worth $4,000. In case of vacancy the office is filled by the president of the senate, and he failing, by the speaker of the house of representatives. The chief administrative officers of the State are elected by joint ballot of the general assembly for two years.

30. The judiciary is exercised by a supreme court, circuit court, etc. The supreme court consists of three judges, who are elected for six years (one every two years) by the general assembly. This is the highest court of appeal. Judges of the circuit courts are elected for four years by the people, in the sixteen circuits into which the State is divided, one in each. These courts have exclusive criminal and concurrent civil jurisdiction. Ordinaries or judges of probate are elected in each county, and justices of the peace in districts, for four years. Savannah and Augusta have each a separate court of oyer and terminer.

31. The receipts into the treasury for the two years ending 30th September, 1855, amounted to $1,112,871, and the disbursements to $946,874. The chief sources of income are general tax, sales of land, etc. The public debt consists chiefly of bonds issued for the construction of the Western and Atlantic Railroad, and on the 20th October, 1855, amounted to $2,644,222, paying an annual interest of $158,653. The productive property held by the State (viz., the Western and Atlantic Railroad) is valued at $5,000,000. The value of taxable property in 1850 amounted to $335,116,225, and in 1855 to $528,927,963.

32. The public institutions supported in part or wholly by the State are the Lunatic Asylum at Midway, near Milledgeville, the Institution for the Deaf and Dumb and Blind in Murray County, and the State Prison at Milledgeville.

33. The number of children returned by the census of 1850 as having attended school in that year was 77,016, or one to every 6.8 of the free population. The actual condition of the schools on the 1st June of that year was as follows:

Classification.	Number.	Teachers.	Scholars.	Income
Primary and public schools	1,251	1,265	32,705	$182,231
Academies and private schools	219	318	9,059	43,299
Universities and colleges	13	84	1,585	105,430

—making a total of 1,483 schools, 1,667 teachers, and 43,299 scholars, and an annual income of $330,960. The total of free persons over 20 years of age unable to read and write was 41,667, of which number 41,200 were whites and 467 free colored persons, and 41,261 were Americans and 406 foreigners.

34. The chief collegiate and professional schools in the State, and statements of their condition in 1855, are exhibited in the following table:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
Franklin College	Athens	1785	10	160	20,000
Oglethorpe University	Milledgeville	1838	5	93	5,000
Emory College	Oxford	1838	5	115	2,000
Mercer University	Penfield	1838	7	87	6,000
Wesleyan Female College	Macon	1839	11	177	1,500
Theological (Bapt.) Seminary	Mercer University	1844	2	10	2,500
Med. College of Georgia	Augusta	1832	7	115	—

35. The most numerous of the religious denominations of Georgia are the Baptist and Methodists, which include seven eighths of the total population. The Presbyterian is the next most numerous, and claims a twelfth, and after these the Episcopal and Roman Catholic, which in this State are in comparatively small numbers; while the other denominations have scarcely a representative. The whole number of churches in 1850 was 1,862, with accommodation for 627,197 persons, and the value of church property amounted to $1,269,357.

36. Milledgeville, the capital of the State, is built on an elevated site at the head of navigation of the Oconee River, in latitude 33° 7′ 20″, and longitude 83° 19′ 45″—642 miles southwest from Washington. The city is laid out on a regular plan, the streets being at right angles, and the buildings are generally substantial and elegant. Washington Avenue, the main thoroughfare, is 120 feet wide, the other streets being 100 feet wide; and there are three public squares, each of which has its sides 450 feet long. The principal building is the State House, a handsome Gothic structure, occupying a lofty site near the center of the city. The governor's residence, the State Arsenal and Magazine and Penitentiary are also goodly structures, and there is a market-house and several neat churches, etc. Milledgeville stands in the center of a rich cotton district, and is a place of considerable business, which is accommodated by the Milledgeville and Eatonton Railroad, forming a junction with the Georgia Central Railroad at Gordon, 18 miles to the south. Population 2,216.

37. Savannah, on the river of the same name, on its right bank, and about 18 miles from the sea, is the principal city and the chief commercial port of the State. Latitude 32° 4′ 56″, and longitude 81° 8′ 18″. This city is generally regarded as one of the finest and healthiest on the south coast. It is about a mile long and about three fourths of a mile wide. Along the river are convenient wharves and warehouses. The principal public buildings are the Custom House, a fine edifice 110 feet long by 52 feet deep; a court-house and jail; the City Hall, Exchange, Arsenal, Barracks, Theater, Market House, etc.; several asylums and hospitals, and 15 churches, some of which are handsome structures. Of the private houses, most are constructed of wood, owing to which the city has been several times seriously damaged by fire.

38. As a commercial city, Savannah has ever occupied a prominent position in the South, and is especially eminent as a mart for cotton, rice, and lumber. The quantity of cotton exported in 1851-2 was 353,068 bales (228,614 coastwise and 124,454 direct to foreign countries); of rice 39,929 tierces, and of lumber 25,508,500 feet. The entire foreign commerce of the State centers at this port. The internal trade of Savannah is facilitated by the Central Railroad, which, with its branches and connections, drains a wide line of country, westward to the Mississippi and northwest to Nashville and Knoxville, in Tennessee. Other railroads are being built—north to Charleston and southwest toward Pensacola and Mobile. The city also maintains regular lines of steamships to and from the Florida Atlantic ports, and also between Savannah and the cities north, viz., Charleston, Philadelphia, New York, etc.

39. In 1810 Savannah contained 5,195 inhabitants; in 1820, 7,523; in 1830, 9,776; in 1840, 11,214; and in 1850, 16,060. A local census taken in 1852 gave the population at 18,301. Savannah was first settled in 1733 by some thirty families under General Oglethorpe.

40. The principal ports below Savannah are Darien, Brunswick, and St. Mary's. Darien is situated on the north bank of the Altamaha River, 12 miles from the bar at the entrance of the sound. This bar has 14 feet of water. The town is a place of considerable coastwise commerce and the natural port of the valley of the Alatamaha, the great branches of which are navigable—one of them, the Oconee, to Milledgeville, and the other, the Ocmulgee, to Macon. Population 550. The Florida steamboats from Savannah and Charleston call at this port. Brunswick is an important port on the north side of Turtle Creek, and has a spacious, safe, and, indeed, one of the best harbors of the Southern coast. Ships drawing not more than 13 feet of water can pass the bar at low tide. The town is 13½ miles above the bar, and 8 miles above the light-house on St. Simon's Island. The Brunswick Canal extends 12 miles to the Alatamaha, and connects the navigation of the two rivers, and a railroad, the

Brunswick and Florida, is now being built toward Pensacola and Mobile. This work when completed will raise Brunswick to a high rank among Southern commercial towns. Population about 2,000. St. Mary's, on the north bank of St. Mary's River, which here divides Georgia and Florida, is a thriving port a little more than 100 miles south-southwest from Savannah. It has a safe harbor, and vessels drawing 21 feet of water come up to its wharves. The town contains about 1,000 inhabitants. While Florida remained a Spanish possession, this place held a more important position in commerce than at the present day. The Florida steamers call here on both their up and down passages.

41. Augusta, on the left bank of the Savannah, is one of the most flourishing towns of the State, being the commercial center of a fertile cotton region. It is connected with Hamburg by bridges, and here also is the point of junction between the South Carolina and Georgia railroads. Population in 1840, 6,430, and in 1850, 11,753.

42. Columbus, at the head of navigation of the Chattahoochee, and immediately below the falls, is also a very important town. In the three miles above, the river falls 112 feet, and affords excellent water-power. The site of the town is 60 feet above the river, and covers 1,200 acres; it is regularly laid out in wide and handsome streets, crossing at right angles, and contains several large cotton factories and flouring mills. Its trade is chiefly in cotton, for which it is a first-rate depôt. This staple is exported by the Chattahoochee to Appalachicola, and also to Savannah by the Muscogee Railroad, extending from this city to Macon. On the opposite, or Alabama, side of the river is the town of Girard, with which Columbus is connected by a railroad bridge, for the accommodation of the Opelika Branch of the Montgomery and West Point Railroad and of the Mobile and Girard Railroad, which terminate here. Columbus is a new town: it was founded in 1828; in 1840 it had 3,114 and in 1850, 5,942 inhabitants.

43. Macon is situated on the right bank of the Ocmulgee, at the head of steamboat navigation. It is the point of union of the Central and the Macon and Western railroads, and of the Southwestern and Muscogee railroads. It is a rapidly increasing town, and has a large trade with the interior and sea-board. In 1850 it contained 5,720 inhabitants. A very large quantity of cotton is sent down the river, and also by railroad to the sea-board. The town contains several goodly public buildings, extensive stores, lumber-yards, commission houses, etc., and is the seat of the Wesleyan Female College. It has been proposed to make this the State capital, instead of Milledgeville.

44. Atlanta, at the junction of the Georgia, the Western and Atlantic, the Macon and Western, and the Atlanta and Lagrange railroads, is an important entrepôt of the internal commerce of the State, and, by these several lines and their connections, has direct intercourse with—Augusta, 171 miles; Charleston, 308 miles; Savannah, 292 miles; Montgomery, 175 miles; Chattanooga, 104 miles; Nashville, 291 miles; Knoxville, 263 miles; Memphis, 436 miles, etc. Population in 1850, 2,572.

45. Athens, on the right bank of the Oconee, 57 miles north Milledgeville, is chiefly noticeable as the seat of the University of Georgia. It is connected by railroad with the sea-board at Savannah, and has a considerable inland trade. Population 1,661.

46. Dahlonega, 112 miles north-northwest Milledgeville, is a small town of 1,277 inhabitants. It is the central depôt of the gold region of Georgia and the seat of a branch of the United States Mint, at which only gold is coined.

47. Georgia was the last settled of the old States; the charter under which the colony was founded was granted in 1732 by George II.—in honor of whom it received its name—to the trustees for the establishing the Colony of Georgia. The double purpose of making the settlement was to relieve the distresses of the poor at home, and to secure the frontiers of the Carolinas from the Indians and Spaniards. In 1733 General Oglethorpe, one of the trustees, conducted the first colonists to the Savannah, and several bodies of Germans and Highlanders were soon after brought over. The lands were held on a military tenure. The country was repeatedly traversed by the Spaniards from Florida, who considered the occupation of the English as an encroachment upon their domain. In 1752 the proprietary government was abolished, and Georgia became a royal colony. The original limits of the State included the territory now divided into the two thriving States of Alabama and Mississippi.

48. At the commencement of the Revolutionary War, Georgia was only in the infancy of her strength, and had just begun to enjoy peace and the advantages of a better system of government. The inhabitants knew the operation of the royal government only by its favorable contrast with that of the trustees. Notwithstanding, the people did not hesitate to take part with their Northern brethren. During the war that ensued, Georgia was overrun by the British troops, and the principal inhabitants were compelled to abandon their possessions and fly into the neighboring States. In proportion to their numbers, the exertions and losses of her citizens were as great as in any of the States.

49. After the war Georgia suffered on her frontiers from the incursions of the Creek Indians, whose hostility had been too often provoked by the whites. In 1790 a treaty was concluded with this nation, by which the boundaries of Georgia were established. In 1802 the Creeks ceded to the United States a large tract of country, which has since been ceded by the United States to Georgia, and forms the southwest corner of the State. Georgia possessed—as included within her limits—a claim to an immense body of Western land, of which in 1795 the legislature sold a large portion, said to have contained 22,000,000 acres, to a company, by which it was again sold to individuals. In the succeeding year the legislature declared the sale unconstitutional, and on the ground that it was obtained through bribery, they declared it to be void, and ordered all the records to be burned. In 1802 Georgia ceded to the United States all the lands west of the Chattahochee River, and of a certain line including the contested lands; and in 1814 Congress passed an act by which a compromise was made with the purchasers, who received a certain amount of public stock. The history of Georgia since this period records no territorial or government changes; but it is full of instruction, recording the gradual progress of a people in the arts, agriculture, manufactures, and commerce, from a small beginning to an elevation attained by few other members of the Confederation, in the escutcheon of which this State is one of the brightest stars.

STATE OF FLORIDA.

1. Florida is situated between latitudes 24° 30′ and 31° north, and longitudes 80° and 87° 45′ west; and is bounded on the north by Georgia and Alabama, on the east by the Atlantic Ocean, on the southwest and south by the Gulf of Mexico, and on the west by the Rio Perdido.

2. This State consists of a long narrow strip of territory extending from 30 to 50 miles south from Georgia and Alabama, and from the Atlantic to the Perdido about 340 miles, and of a long peninsula extending from the mainland southward through five degrees of latitude, between the Atlantic and the Gulf. The area is computed at 59,268 square miles, or 2.02 per cent. of the whole Union.

3. Florida has a coast-line of much greater length than any other State—on the Atlantic 472 miles and on the Gulf 674 miles; but if the bays and all irregularities be included 1,034 and 883 miles, and the islands off the coast have an additional shore-line of 1,440 and 679 miles. The total line is therefore 4,036 miles, or one mile to every 14.6 square miles of surface.

4. Notwithstanding this enormous stretch of coast the State is almost inaccessible on account of soundings, and has few good harbors. West of Cape San Blas the shores are bold, but east of that point it begins to shoal. From Appalachee Bay to Tampa Bay the whole coast sends off shallow banks; and from Wacasasa Bay to the Amaxura there are only six or seven feet of water at as many miles distance from the shore. To the south of Carlos Bay the shores are bolder. On the eastern side of the peninsula there is no harbor south of San Augustine, and scarcely an inlet breaks the coast from that point to Cape Florida.

5. Florida is the most southern of the United States. The southern portion of the peninsula, from about 28° north latitude, is an extensive marsh, which, during the rainy season, between June and October, effectually prevents an overland transit from one shore to the other. North of this tract to Georgia the surface is generally a dead level, but in some parts it is undulating, and even presents eminences worthy the designation of hills. West of the neck of the peninsula it is more uneven and rugged; but still the elevations are inconsiderable, and, where occurring, of very limited extent.

6. The great southern marsh contains numerous tracts of pine-barrens, prairies, and hummocks, and the more northerly part of the peninsula consists chiefly of pine-forests, interspersed with hummocks, prairies, and marshes. In the first section timber is the exception, and in the latter the distinguishing feature. The soils are generally sandy, except in the hummocks, in which it is clay mixed with sand. These hummocks are scattered throughout the country, and vary in extent from a few acres to thousands, but form in the aggregate only a small por-

SWAMP SCENE IN SOUTHERN FLORIDA.

tion of the whole area. They are covered with a fine growth of red, live, and water oak, dogwood, mahogany, and pine, and form, when cleared, excellent arable land.

7. The prairies or savannahs, as here called, are sometimes pretty extensive, stretching several miles in length and breadth, and forming natural pastures. The barrens are overgrown with pine-forests, with little underwood; and though the soil is generally indifferent, it is sometimes productive, and may be easily improved.

8. The swamps or morasses, the most conspicuous feature in the country, are formed either by the inundation of rivers which, overflowing their high-wooded banks, cover the lowlands in their rear with water, or they are produced by the drainage of the surrounding country. The latter or pine-barren swamps are overgrown with pine, cypress, and cypress knees; and the former or river swamps are covered with a heavy growth of timber trees.

9. The rivers of Florida are numerous, and afford great facilities to internal navigation. The St. John's rises in the great southern marsh, and reaches the ocean after a northerly course of 300 miles in latitude 30° 20′ north. For nearly 100 miles from its mouth it forms a wide sluggish sheet of water, more resembling a lagoon than a river, and it is navigable to Lake George, a little higher up, for vessels drawing eight feet of water. Indian River is a long lagoon, having much the same character, and communicates with the ocean by an outlet in latitude 27° 30′ north.

10. Charlotte and Amaxura are the principal rivers on the western shore, the whole of which, south of the Suwanee, contains only small streams. The Suwanee is formed by the Withlacoochee and Little St. John's from Georgia, and reaches the Gulf at Wacasasa Bay. The Ockloconee also rises in Georgia. The Appalachicola River, formed on the frontier of Florida by the junction of the Chattahoochee and Flint rivers, falls into the bay of the same name, after a navigable course of 80 miles. The Choctawatchee rises in Alabama and reaches the Gulf through Choctawatchee Bay; and the Escambia flows into Pensacola Bay.

11. The St. Mary's, forming the northeastern boundary, empties into the Atlantic, and affords, through a great portion of its length, a fine navigable channel.

12. South from the mainland a chain of small, rocky islands, named cayos or keys, extends to the westward, ending in a cluster of rocks and sand-banks called the Tortugas. South of the bank upon which these keys rise, and separated from them by a navigable channel, is a long narrow coral reef, known as the Florida Reef. The most important of the keys is Key West (a nautical corruption of "Cayo Hueso" or bone key), called also Thompson's Island. For a long period the haunt of smugglers and pirates, it is now a naval station of the first importance, and the seat of bands of wreckers, whose business it is to assist vessels in distress; and here a special court is established to adjust salvages. This key is about six miles in length by two in breadth, with a large, well-sheltered, and commodious harbor; and the extensive ponds thereon yield annually a large amount of salt. The Tortugas derive their name from the number of turtles found in the surrounding waters.

13. The whole of the peninsula is of diluvial formation. The substratum of the eastern part is clay, mixed with sand; but that of the western is a kind of rotten limestone, which in many places is undermined by subterranean streams, forming numerous cavities called "sinks." These sinks are inverted conical hollows, varying in size from a few yards to several acres, at the bottom of which running water often appears. The central district is the most productive, but even here a large portion is composed of poor pine-barrens; yet in the midst of these are found gentle eminences of fertile land, supporting a vigorous growth of oaks and hickories, while numerous rivulets of pure water flow through the country, or expand into beautiful lakes. Farther west the land is more generally poor. Thus it appears that a small portion only of the State can be said to be available for cultivation, yet the warmth and humidity of the climate compensate in a great measure for the stubborn nature of the soils, and give it a vegetation of great variety and luxuriance.

14. The climate of Florida has been spoken of, and justly, as one of the finest—and aside from the miasms from the swamps—as one of the most salubrious in the world. In the south the temperature scarcely changes the year round, and summer is only distinguished by the copiousness of its showers. No more delightful residence for invalids can be found than Key West, where the difference of the mean temperature of summer and winter is not more than 11° Fahr. The average mean temperature in the State is about 73°, and in no place does the difference between summer and winter exceed 25°. The average fall of rain in the year is 33 inches.

FLORIDA INDIANS.

15. The productions of Florida are chiefly those which require a tropical sun to mature them. It is not, however, merely in tropical products that Florida possesses advantages over every other State of the Union; it is now established beyond a doubt that the *Sea-island* or long staple cotton (the production of which was formerly confined to a few small islands off the coasts of South Carolina and Georgia) will grow luxuriantly even in the very center of the peninsula. A fine quality of this staple has also been produced on the Suwanee, and in the very center of Alachua, as well as on the eastern coast. This important fact is no doubt attributable to the almost insular position of the State.

16. The soils are also adapted to the successful cultivation of the coffee-plant, also cocoa, the sugar-cane, cottons generally, Cuba and other tobacco, rice, indigo, arrow-root, Sisal hemp, New Zealand flax, etc.; and the climate is suitable for the cochineal insect and the silk-worm. Corn, potatoes, turnips, and, in short, most of the vegetables known to the North or South find in one or other locality congenial soils.

17. The fruits produced are very numerous, and of the most delicate descriptions; oranges, lemons, limes, pine-apples, olives, grapes, etc., flourish luxuriantly. Much of the tropical fruit found in the markets of Northern cities is brought from this State. Beets, onions, egg-plants, carrots, lettuce, celery, and cauliflowers are produced with the most indifferent cultivation; and water-melons, cantelopes, pumpkins, cucumbers, and everything that grows upon vines, are in abundance and in great perfection.

18. The driest seasons are relieved by heavy dews, and the sun that would bake the earth in other States, and wither vegetation, is here so tempered by the pervading moisture as to force the development of vegetative life to the utmost, and envelop the earth in perennial verdure.

19. The grassy prairies of this country afford excellent pasturage, and have long been the feeding-grounds of the Southern grazier. Immense herds of cattle are constantly upon them, requiring little care from their owners, and no housing on account of the colds of winter; and in most parts of the State hogs thrive well and fatten without any other support than that which they derive from the abundant roots and masts of the forests; and there is certainly no part of the United States where game and fish are so abundant as in Florida. It was common, before the war, for a good hunter to kill seven or eight deer in a day, and multitudes of these animals were slaughtered merely for their skins. The country abounds also in various species of small game.

20. In 1850 Florida contained 87,445 inhabitants, being 1.48 to the square mile, or 0.38 per cent. of the total of the United States. This population consisting of 9,107 families inhabiting 9,022 dwellings, was distributed into the counties as follows:

Counties.	Population.	County Seats.
Alachua	2,524	Newnanville.
Benton	926	(*now* Hernando)
Calhoun	1,377	St. Joseph.
Brevard	(*new.*)	Susanna.
Columbia	4,808	Alligator.
Dade	159	Miami.
Duval	4,539	Jacksonville.
Escambia	4,351	Pensacola.
Franklin	1,561	Appalachicola.
Gadsden	8,784	Quincy.
Hamilton	2,511	Jasper.
Hernando	(*new*)	Bay Port.
Hillsboro'	2,377	Tampa.
Holmes	1,205	Cerro Gordo.
Jackson	6,639	Mariana.
Jefferson	7,718	Monticello.
Leon	11,442	Tallahassee.
Levy	465	Atsena Otie.
Liberty	(*new.*)	——?
Madison	5,490	Madison.
Marion	3,338	Ocala
Monroe	2,645	Key West.
Nassau	2,164	Fernandina.
Orange	466	Mellonville.
Putnam	687	Pilatka.
Santa Rosa	2,883	Milton.
St. John's	2,525	St. Augustine.
St. Lucia	139	(*now* Brevard.)
Sumter	(*new.*)	Lake Griffin.
Volusia	(*new.*)	Enterprise.
Wakulla	1,955	Newport.
Walton	1,817	Ucha Anna.
Washington	1,950	Holmes Valley.

—of the total population 47,203 (53.98 per cent.) were whites—25,705 males and 21,498 females, 932 free colored—418 males and 514 females, and 39,310 (44.96 per cent.) slaves—19,804 males and 19,506 females; and of the free population (48,135) 45,320, or 55.04 per cent. were Americans, of whom 20,563 were born in this State; 2,757 or 5.73 per cent. were foreigners, and 58 of origin not ascertained. In other States of the Union there were 4,734 natives of Florida. In 1830 Florida contained 34,730 inhabitants; in 1840, 54,477, and in 1850 (as above), 87,445. The population according to the State census of 1855 was 110,725.*

21. The number of free male persons over 15 years of age engaged in industrial pursuits in 1850 was 13,135. Of these 2,380 were engaged in commerce, trade, manufactures, mechanic arts, and mining; 5,977 in agriculture; 2,666 in labor not agricultural; 423 in the army; 708 in sea and river navigation; 357 in law, medicine, and divinity; 302 in other pursuits requiring education; 268 in government civil service; 12 in domestic service, and 42 in occupations not classified.

22. In 1850 Florida contained 4,304 farms and plantations, covering 1,595,289 (improved 349,049 and unimproved 1,246,240) acres of land, and these were valued at $6,328,109, and the implements and machinery in use thereon at $658,795.

23. The crops of 1840 and 1850 compare as follows:

	1840.	1850.		1840.	1850.		1840.	1850.
Wheat ..... bush.	412	1,027	Potatoes—Irish, bush.	264,617	7,828	Cane-sugar. lbs	275,317	2,750,000
Rye ..... "	305	1,152	" —sweet, "		757,226	Molasses ... gals.	—	352,893
Oats ..... "	13,829	66,586	Peas and beans, "	—	135,359	Cotton ..... lbs.	12,110,533	18,052,400
Indian corn "	898,974	1,996,809	Hay ..... tons	1,197	2,510	Rice ..... "	481,420	—
Barley ..... "	30	—	Beesw., honey. lbs.	—	18,971	Rough rice. "	—	1,075,090
Buckwheat. "	—	55	Beeswax ..... "	75	—	Tobacco ... "	75,274	998,614

—and the value of market-garden products was $8,721, and of orchard products $1,280.

24. The quantity of livestock upon the farms was as follows:

1840	equines,	12,043	neat cattle,	118,081	sheep,	7,198	swine,	92,680
1850	"	15,850*	"	261,085†	"	23,311	"	209,453

—and the stock of 1850 was valued at $2,880,058, and the value of animals slaughtered in the year preceding was $514,685. The products of animals were—butter 371,498 pounds, cheese 18,015 pounds, and wool 23,247 (in 1840, 7,285) pounds.

25. The total value of agricultural products in this State was in 1840 $1,817,718, and in 1850 $3,865,059.

26. In 1850 Florida contained 103 manufacturing and mechanic establishments, in which was invested capital to the amount of $54,706, and which gave employment to 991 hands. The value of raw material consumed in the year was $220,611, the cost of labor $199,452, and the total value of products $668,335. In 1840 the total value of goods manufactured was $587,167.

27. The value of goods manufactured in families was—in 1840 $20,205, and in 1850 $75,582.

28. The whole coast is productive of the finest fish, and oysters of exquisite flavor are found on the shores. Sheep-head, grouper, red-fish, mullet, green turtle, etc., abound on the eastern and western coasts; and the numerous lakes, rivers, and creeks of the interior teem with fresh-water fish, and the most delicious species of soft-shelled turtle, etc. On many parts of the coast sponges are found, and in this product the trade is constantly increasing.

29. The total exports from Florida to foreign countries for the years ending 30 June, 1850 and 1855, amounted to $2,623,624 and $1,403,594, and the imports to $95,907 and $45,998. The shipping engaged in this trade in 1850 amounted to 40,136 tons, viz., cleared 22,156, and entered 17,980 tons, and in 1855 to 103,333 tons, viz., cleared 49,773 and entered 53,560 tons. The shipping owned in the State in 1850 amounted to 11,272 (registered 1,221 and steam 2,185) tons, and in 1855 to 14,712 (registered 9,240 and steam 371) tons; and the shipping built amounted to 79 and 274 tons in the years respectively. The foreign trade centers principally at Key West, Pensacola, Appalachicola, and St. John's; St. Augustine and Fernandina on the Atlantic and St. Mark's on the Gulf have little foreign trade, but are

* The census of 1855 (which omits Duval County) gave the total population at 110,823, of which 60,493 were whites, 804 free colored persons, and 49,526 slaves. The same census returns 2,265,503 acres as occupied land.

† Namely, horses 10,848, and asses and mules 5,002.

‡ Namely, milch cows 72,876, working oxen 5,794, and other cattle 182,415.

actively engaged in coasting. A considerable portion of the material exported from Pensacola and Appalachicola is the produce of Alabama and Georgia.

30. Internal trade has hitherto had few advantages for its development. This defect, however, is now being remedied by the construction of several lines of railroad. The most important of these will traverse the whole length of the State from Jacksonville to Pensacola, 300 miles, and another will extend in a northeast and southwest direction across the peninsula between Fernandina and Cedar Keys, 140 miles. Otherwise a railroad is now being constructed from Pensacola to Montgomery, Ala., and another from Tallahassee into Georgia. The whole system will probably be completed by the year 1860. Already sections of each are finished and the cars running on them. The railroad between Fernandina and Cedar Keys must be regarded as a work of commercial necessity: it will form a part of a steam route from the Atlantic to the Gulf ports, and not only greatly shorten the distance, but avoid the necessity of rounding the dangerous point to the south.

31. The constitution of Florida secures the right of voting to every free white male citizen of the United States who has resided in the State two years and in the country six months next preceding an election, and whose name is on the registration list. The general election is held on the 1st Monday in October.

32. The general assembly consists of a senate of 19 members elected for four years (one half biennially), and a house of representatives of 40 members elected for two years. Senators must be 30 and representatives 21 years of age. The sessions are held biennially, commencing on the 4th Monday in November.

33. The governor is chosen for four years. He must be 30 years of age, have been a citizen of the United States for 10 years, and a resident of the State for five years next preceding election. In case of disability his office is exercised by the president of the senate or speaker of the house. The secretary of state is elected for four years, and the state treasurer and controller for two years, by the joint vote of the general assembly.

34. The judiciary is vested in a supreme court, circuit courts, and justices of the peace. The supreme court is composed of a chief and two associate judges, and holds four sessions annually, viz., one at Tallahassee, one at Tampa, one at Jacksonville, and one at Marianna. The jurisdiction of this court is entirely appellate. For circuit court purposes the State is divided into the western, middle, eastern, and southern circuits, each of which has a judge and solicitor. These courts have original jurisdiction in all matters civil as well as criminal. All judges are elected by the people.

35. The total receipts into the public treasury for the year ending 31st October, 1856, amounted to $94,022, and the expenditures to $76,430. The State debt at the same time amounted to $193,000. In 1850 the valuation of taxable property was $23,198,734, and in 1855, $49,461,461.

36. The total number of free persons having been in attendance at school in 1850 was returned at 4,812, or one to every 10.03 of the total free population. On the 1st June of that year the condition of the schools was as follows:

Schools.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	69	73	1,878	$22,386
Academies and private schools	34	49	1,251	3,129

—making a total of 103 schools, 122 teachers, and 3,129 scholars, and an annual income of $25,515. The number of free persons over 20 years of age who were unable to read and write was 4,129, of whom 3,858 were whites and 270 free colored persons, and 3,834 were Americans and 295 foreigners.

37. The Methodist and Baptist denominations are the most numerous in this State, together claiming three fourths of the whole population; next to these rank the Presbyterian, and then the Episcopal and Roman Catholic. In all the State there were 177 churches with accommodation for 44,960 persons, and the value of church property in 1850 was $165,400.

38. Tallahassee (latitude 30° 38′ north, and longitude 84° 36′ west) is the political capital of the State. Population, 1,391. Pensacola, Appalachicola, San Augustine, and Key West are its chief ports. Pensacola, on the bay so called, has a fine anchorage (latitude 30° 24′ north, and longitude 87° 10′ 12″ west), and enjoys a considerable coasting trade. Population, 2,164. It is the site of a naval station. Appalachicola, on a bluff at the west side of the mouth of the river of the same name, has a deep and safe harbor, and is the outlet of an extensive country. Population about 1,600.

39. San Augustine, the oldest town in the State (latitude 29° 48′ 30″ north, and longitude 81° 35′ west), is situate two miles back from the Atlantic, on an inlet in the rear of a small island. The inlet, about one-half mile wide, forms a capacious and secure harbor, and admits vessels of large burden. Population, 1,934. On account of its fine climate, this city is the resort of invalids in the winter season.

40. Jacksonville, on the St. John River, is a prosperous town of 1,045 inhabitants, and is the eastern terminus of the Florida, Atlanta and Gulf Railroad. Fernandina, a new town at the north end of Amelia Island, is the northern terminus of the Florida Railroad, the western terminus of which is at Cedar Keys on the Gulf.

41. Key West, on the islet so called (latitude 24° 32′ north, and longitude 81° 47′ 40″ west), is the key of the United States to the Florida Pass and Gulf of Mexico. The harbor is capacious, safe, and easy of access. Vessels drawing 22 feet water may enter, and it is the only port between Pensacola and Hampton Roads admitting such. The principal business of the place is "wrecking," but numbers are employed in fishing, sponging, salt making, and other similar occupations. Steamers to and from the Havana touch at Key West. Population, 2,367.

42. Florida was discovered in 1496, by Cabot, and was visited by Ponce de Leon in 1512. In 1562 we find the French and Spaniards contesting their respective rights to the soil. San Augustine was founded in 1564, and Pensacola in 1596. The Spanish settlements in the country were never of great extent, and with the exception of establishing a few military posts and missions, the settlers never ventured far from the coast.

43. It was ceded to Great Britain in 1763, and from this period its real prosperity commenced. The British held the country for twenty years, and in that short period greater improvement was effected than in the previous two hundred years of Spanish occupancy. On the retrocession, in 1783, most of the settlers left the country for the adjoining States, and for a period of nearly forty years to its cession to the United States in 1821, every interest of the colony languished or struggled along with difficulty.

44. Immigration now again set into the Territory, but the unsurveyed state of the lands, the uncertainty of titles, etc., militated against its rapid settlement, and the fierce and turbulent Indian race, which had made it a battle-ground for two hundred and fifty years, occupied the best lands, rendering it impossible to obtain them for cultivation. Yet in spite of these obstacles a considerable population planted themselves in the country. From 1835 to 1842 the Seminole war raged, and suspended what progress had been hitherto effected; but since the latter year the country has progressed with reasonable rapidity. Florida was admitted as a State of the Union on the 3d March, 1845.

STATE OF ALABAMA.

1. Alabama is situated between latitudes 30° 10′ and 35° north, and longitudes 84° 53′ and 88° 30′ west; and is bounded on the north by Tennessee, on the east by Georgia and Florida, on the south by Florida and the Gulf of Mexico, and on the west by Mississippi.

2. The general length of the State, north and south, is 278 miles, or including a strip of land projecting between Florida and Mississippi to the Gulf 336 miles, and the general breadth is 160 miles, the greatest breadth being about 200 miles. The area is computed at 50,722 square miles, or 1.73 per cent. of the total area of the United States.

3. The sea-coast of Alabama, extending from the Rio Perdido (which separates this State from Florida) to the eastern line of Mississippi, has a direct length of only 58 miles, but including its bays and irregularities of 247 miles. In this short line, however, is contained Mobile Bay, one of the largest and deepest indentations of the Gulf coast, and into this the principal rivers of the State empty themselves.

4. The northeastern part of Alabama, being traversed by several off-shoots of the Alleghanies, which terminate in this State, is decidedly mountainous, but presents nowhere any great elevations. South of this mountain region the surface has a general declivity toward the Gulf of Mexico, first descending gradually from mountain to high hills, and then sinking to a vast plain, scarcely broken except by gentle swells; and the more southern portion is a dead level, but little above the water-surface of the ocean.

5. The southern half of the State consists of extensive prairies and pine barrens, interspersed with alluvial river bottoms of great fertility; and the lands of the middle section and the north are generally covered with a good, if not a very rich and productive soil. In the valley of the Tennessee, which occupies so large an area in the northern part of the State, alluvion is the prevailing formation; and the rich bottom lands of this region are extensive, and form the best agricultural districts within the limits of the State. The valleys of the Alabama and other great rivers are equally fertile.

6. With the exception of the Tennessee, which takes a circular sweep through northern Alabama, but receives no considerable tributaries on its southern side, all the rivers flow toward the Gulf of Mexico. Nearly the whole surface, indeed, is drained into one single channel, the Mobile River, which, by several large arms, gathers up the waters of the whole southern slope, except those of a comparatively small tract in the southeast. The Chattahoochee, although a large river, receives only a few inconsiderable streams from this State; and the Choctawatchee, Conecuh, and Perdido are, in point of size, secondary rivers.

7. The Mobile, the great river of Alabama, is formed by the junction of two large rivers, the Alabama and Tombigbee, fifty miles above Mobile Bay. A few miles below its junction it gives out a large branch, called the Tensaw, which also receives an arm from the Alabama, and reaches Mobile Bay at Blakely.

8. The Tombigbee, or western branch of the Mobile, is formed by the confluence of two large streams, the Tombigbee proper from Mississippi, and the Black Warrior from north Alabama. It admits vessels drawing five or six feet water to St. Stephen's, 93 miles from the bay; and steamboats ascend the Black Warrior to Tuscaloosa, 285 miles, and the Tombigbee proper to Columbus in Mississippi, about 300 miles. The length of this river, by its tortuous channel, is about 450 miles, and it is boatable almost to its sources.

9. The Alabama, or eastern branch, is navigable for vessels of six feet draft to Claiborne, 60 miles above its junction with the Tombigbee; 150 miles farther to the mouth of the Cahawba it has four or five feet of water, and to the junction of the Coosa and Tallapoosa, of which it is formed, it has in the shallowest parts three feet of water. Steamboats ascend it to Montgomery, 300 miles by the course of the river, and even to Wetumpka, on the Coosa, several miles above. The Coosa and Tallapoosa both have their rise in Georgia. The navigation of all these rivers, however, is interrupted during the season of low water in the summer months.

10. Alabama has great mineral resources. The whole central region is underlaid with vast beds of iron ore, or occupied by coal measures of great thickness and extent. The coal found here is of a highly bituminous character, and well adapted to steamboats and factories, and being in juxtaposition with the iron ores, will greatly facilitate the progress of mining industry. The country in this region is also well wooded, fertile, and easily attained from all directions, and in the succession of events must indubitably become of great importance to the whole South.

11. Besides coal and iron, Alabama yields lead ore, manganese, several descriptions of ochres, limestone, and marbles; and in the northeastern section gold in considerable quantities has been collected. Lead ore or galena is found in the limestone formation, chiefly in Benton County; it is a pure sulphuret and granular, closely attached to the rock, and passes it in irregular bunches. The carbonate is also found, and in its neighborhood there are veins of calx-spar and sulphate of barytes. Manganese occurs also in the limestone region, and has been used in the manufacture of chloride of lime. The ochres occur chiefly near Bucksville, and the red ochre found here is sufficiently rich to be used as an ore of iron.

12. The marbles found in this State occur most plentifully on the Cahawba, and many of the beds afford specimens of great beauty; some are gray, with red veins, others are red and yellow, and specimens with greenish veins are not uncommon. There is also a buff-colored marble, filled with organic remains, and beds of white crystalline marble, clouded with red, occur. Black marble is also abundant. The compactness and thickness of these formations is such as to elicit a favorable opinion of their value, and cause them to be looked upon with great interest in connection with the industrial resources of the State.

13. The mineral resources of Alabama, however, have never been thoroughly examined; but there can be little doubt, accepting the present knowledge of its mineral deposits as an index, that the researches now being instituted will result in further and more valuable disclosures of a vast wealth of mineral within its borders, and be the means of placing the State in the first rank of mineral-producing districts.

14. The soil, climate, and vegetation vary with the position and elevation of its several parts. In the north, where mountain is the prevailing feature, the soil is but moderately fertile, but in the intervales there is much that can not be excelled. The climate is here moderate and vegetation hardy: it is the region of the cereals, and a fine grazing country. The central parts of the State, less elevated and undulating, are well watered, and in the river bottoms extremely rich and productive. The valley of the Alabama is one of the most fertile regions of the Union. In the south the climate is very warm, and the soils are rich, but with great exceptions. The sugar-cane has been found to succeed well in the extreme southern strip between Florida and Mississippi, and indigo was formerly raised in considerable quantities; rice also grows well in the alluvial lands near the Gulf; but cotton, which thrives throughout the State, is the great agricultural staple, and in the production of this staple Alabama exceeds every other State.

15. In 1850 Alabama contained 771,623 inhabitants, being 15.21 to the square mile, or 3.32 per cent. of the total population of the Union. The distribution of the population into the counties was as follows:

NORTHERN ALABAMA.

Counties.	Population.	County Seats.	Counties.	Population.	County Seats.	Counties.	Population.	County Seats.
Benton	17,163	Jacksonville.	Hancock	1,542	Hancock C. H.	Madison	26,427	Huntsville.
Blount	7,367	Blountsville.	Jackson	14,088	Bellefonte.	Marion	7,883	Pikeville.
Cherokee	13,884	Centre.	Jefferson	8,989	Elyton.	Marshall	8,846	Warrenton.
De Kalb	8,245	Lebanon.	Lauderdale	17,172	Florence.	Morgan	10,125	Somerville.
Fayette	9,681	Fayette.	Lawrence	15,258	Moulton.	St. Clair	6,829	Ashville.
Franklin	19,610	Russellville.	Limestone	16,483	Athens.	Walker	5,124	Jasper.

SOUTHERN ALABAMA.

Autauga	15,023	Kingston.	Covington	3,645	Andalusia.	Pickens	21,512	Carrollton.
Baldwin	4,414	Blakely.	Dale	6,382	Newton.	Pike	15,920	Troy.
Barbour	23,632	Clayton.	Dallas	29,727	Cahawba.	Randolph	11,581	Wedowee.
Bibb	9,969	Centreville.	Greene	31,441	Eutaw.	Russell	19,548	Crawford.
Butler	10,886	Greenville.	Henry	9,019	Abbeville.	Shelby	9,536	Columbiana.
Chambers	23,960	Chambers.	Lowndes	21,915	Haynesville.	Sumter	22,250	Livingston.
Choctaw	8,389	Butler.	Macon	26,898	Tuskegee.	Talladega	18,624	Talladega.
Clarke	9,786	Clarkesville.	Marengo	27,831	Linden.	Tallapoosa	15,584	Dadeville.
Coffee	5,940	Wellborn.	Mobile	27,600	Mobile.	Tuscaloosa	18,056	Tuscaloosa.
Conecuh	9,322	Sparta.	Monroe	12,013	Claiborne.	Washington	2,713	O. Washington.
Coosa	14,543	Rockford.	Montgomery	29,711	MONTGOMERY.	Wilcox	17,352	Camden.
			Perry	22,285	Marion.			

—and this population was contained in 73,786 families inhabiting 73,070 dwellings.

16. Of the total population 426,514 (55.27 per cent.) were whites—219,483 males and 207,031 females, 2,265 free colored—1,056 males and 1,209 females, and 342,844 slaves—171,804 males and 171,040 females. Of the free population 420,490 (98.07 per cent.) were Americans, of whom 237,542 were born in Alabama; 6,638 (1.55 per cent.) were foreigners, and 1,109 were of unascertained origin. The number of Alabamans in other States was 83,388. In 1820 Alabama contained 127,901 inhabitants; in 1830, 309,527; in 1840, 590,756, and in 1850 (as above), 771,623. In 1855 a State census gave the population at 841,704, viz., 464,456 whites, 2,466 free colored, and 374,782 slaves.

17. Of 100,467 free male persons over 15 years of age engaged in industrial pursuits in 1850 the classification was as follows: 16,630 in commerce, trade, manufactures, mining, etc.; 68,635 in agriculture; 7,683 in labor not agricultural; 807 in sea and river navigation; 2,610 in law, medicine, and divinity; 3,638 in other pursuits requiring education; 323 in government civil service; 43 in domestic service, and 97 in other occupations.

18. The number of farms and plantations in Alabama in 1850 was 41,964, covering 12,137,681 (improved 4,435,614 and unimproved 7,702,067) acres, or two fifths of the whole surface of the State. The cash value of these is stated to have been $64,323,224, and the value of implements and machinery thereon $5,125,663.

19. The quantity of livestock in the State in the years 1840 and 1850 respectively was as follows:

1840	horses, mules, etc.,	143,147	neat cattle,	668,018	sheep,	163,243	swine,	1,423,873
1850	" "	187,896	"	728,015	"	371,880	"	1,904,540

—and the value of the stock in 1850 was $21,690,112, and in the year animals to the value of $4,823,485 had been slaughtered. In 1850 the number of mules and asses was 59,895, and the neat cattle comprised 227,791 milch cows, and 66,961 working oxen. In the same year 4,008,811 pounds of butter, and 31,412 pounds of cheese were made; and the wool produced in 1840 amounted to 220,353, and in 1850 to 657,118 pounds.

20. The grain crops (bushels) in 1840 and 1850 were comparatively as follows:

1840	wheat,	838,052	rye,	51,008	oats,	1,406,353	Indian corn,	20,947,004	barley,	7,692	buckwheat, 58
1850	"	294,044	"	17,261	"	2,965,596	"	28,754,048	"	3,958	" 348

—making a total of cereals in 1840 of 23,250,167 bushels, and in 1850 of 32,035,355 bushels. The potato crop in 1840 was 1,708,356, and in 1850 (including Irish 246,001) 5,721,205 bushels; that of peas and beans in 1850 amounted to 892,701 bushels, and that of hay in 1840 to 12,718, and in 1850 to 32,685 tons.

21. The Southern staple crops (pounds) were as follows:

1840	cotton,	117,138,823	sugar,	10,143	rice (clean),	149,019	tobacco,	273,302
1850	"	225,771,600	"	87,643	" (rough),	2,312,252	"	164,990

—and in 1850 molasses 83,428 gallons.

22. And among the miscellaneous products of 1850 are noted—beeswax and honey, 897,021 pounds; flax, 3,921 pounds; hemp, 10,000 pounds; wine, 220 gallons, etc. The value of the products of market-gardens in 1850 was $84,821, and of orchards $15,408.

PICKING COTTON.

23. The total value of agricultural products in 1840 was $23,833,470, and in 1850, $44,223,955.

24. The capital invested in manufactures, mining, and mechanic arts in 1850 amounted in the aggregate to $3,450,606. The number of separate establishments was 1,026 employing 4,938 hands, and which in the year preceding had consumed raw material to the value of $2,224,960, and paid wages to the amount of $1,106,112. The value of the goods produced was $4,528,878. Among the establishments were 12 cotton mills which used 5,208 bales of cotton, and produced manufactures to the value of $382,260; 12 iron works which produced to the value of $201,126, etc. In 1840 the total value of the manufactures of Alabama was $3,319,752.

25. The value of goods manufactured in families was in 1840 $1,656,119, and in 1850, $1,934,120.

26. Mobile is the only port of Alabama engaged in direct foreign commerce. For the years ending 30th June, 1850 and 1855, the value of exports was $10,544,858 and $14,270,565, and of imports $865,362 and $619,964. In the same years there cleared 112,985 and 145,615 tons of shipping, and entered 96,020 and 69,832 tons. The whole of the exports were of domestic origin. The shipping owned in the State amounted in 1850 to (registered 7,403 and steam 12,028) 24,157, and in 1855 to (registered 12,322 and steam 20,515) 36,274 tons; and the shipping built in the two years to 113 and 729 tons.

27. The movement of the commerce and navigation of Alabama in the 10 years ending with 1854–55 has been as follows:

Years.	Value of Exports.	Value of Imports.	Tonnage Cleared.	Tonnage Entered.	Shipping owned. Registered.	Shipping owned. Steam.	Shipping owned. Total.	Tonnage Built.
1846	$5,260,317	$259,607	—	—	—	—	—	—
1847	9,054,580	390,161	—	—	—	—	—	—
1848	11,927,749	419,396	—	—	—	—	—	—
1849	12,823,725	657,147	148,116	87,071	7,085	13,325	25,067	106
1850	10,544,853	865,362	112,985	96,020	7,403	12,028	24,157	113
1851	18,528,824	413,446	121,265	55,684	8,579	13,568	27,327	354
1852	17,385,704	588,382	163,195	87,289	7,412	16,225	28,533	93
1853	16,786,913	809,562	143,685	79,822	8,171	16,781	28,040	—
1854	13,911,612	587,782	118,498	86,321	11,605	18,110	33,599	1,999
1855	14,270,565	619,964	145,615	69,832	12,322	20,515	86,274	729

28. The navigable Alabama and its branches demark the extent of the commercial field of Mobile. In the north the interior trade depends on the towns of the Tennessee and of the East and West Railroad which here crosses the State; while the east and southeast trade with those of the Chattahoochee River which has its outlet at Appalachicola. Mobile is also the commercial depôt of a large section of eastern Mississippi, which is traversed by the Tombigbee River and the Mobile and Ohio Railroad. The chief trading towns in the center of the State are Selma and Montgomery, both connected by railroad and river with large sections, and from which there is continuous connection by railroad entirely across the State, and from the latter a railroad is being built to Pensacola. Among other important works now in progress, and which will greatly facilitate domestic trade, is the northeast and southwest line, which will traverse the State from Chattanooga in Tennessee to Meridian in Mississippi, and when completed will form a section of a continuous line from Richmond and Petersburg in Virginia to the Mississippi at Vicksburg and New Orleans. Thus Alabama with its rivers and the great lines of railroad already completed, and with those to be com-

pleted at an early day, will be amply provided with means of communication and transit, and in realizing the advantages these will confer on its industry, will be amply repaid for the great cost its public works have entailed on its inhabitants.

29. Referring to the commercial returns (27), a great disproportion between the exports and imports is apparent. It is also obvious that the value of exports is not commensurate with the value of the commercial products of the State. These anomalies are explained by the coasting trade which is immense, and by which the great bulk of exportable articles is carried to the Atlantic ports, and nearly all the imports of foreign origin are brought from the same ports into this State. A large interchange is also effected by the railroads, which extending east from Alabama terminate at the sea-board.

30. In 1851 Alabama had only two banks and in 1856 four banks, with capital amounting to $1,800,580 and $2,297,800 in the years respectively. The liabilities of these institutions in the two years were as follows—circulation, $3,568,235 and $3,467,242; deposits, $1,474,963 and $2,837,556; due to other banks, $196,911 and $481,289; and other liabilities, $660,732 and $10,000. The assets were as follows—loans and discounts, $4,670,458 and $5,117,427; stocks, $70,361 and $713,026; real estate, $125,697 and $80,648; due by other banks, $960,334 and $1,421,445; notes of other banks, $63,865 and $561,482; other investments (in 1851), $81,000; and specie, $1,998,820 and $1,274,944.

31. The government of Alabama is based on the constitution of 1819 and subsequent amendments. It secures the right of voting to every white male adult citizen of the United States, who has resided in the State one year preceding an election. The general election is held on the 1st Monday in August.

32. The general assembly consists of a senate of 33 members elected for four years, one half biennially, and a house of representatives of 100 members elected for two years. Sessions are held every second (odd) year, commencing on the 2d Monday of November.

33. The governor of the State is elected for two years. In case of death or disability the president of the senate succeeds to the office. The chief administrative officers are chosen by the general assembly in joint ballot.

34. The judiciary consists of a supreme court, courts of chancery, circuit courts, etc. The supreme court judges and chancellors are elected for six years by the joint legislature; all other judges by the people, and for the same official term. The supreme court consists of a chief and two other justices, the attorney-general, a reporter, and a clerk, and has appellate jurisdiction only. Its sessions are held at the capital in January and June. For chancery purposes the State is divided into three divisions and 39 districts, in each of which one session of the court is held annually. There are 10 circuits, each having a judge and solicitor. Circuit courts have original jurisdiction in all criminal and in all civil cases involving $50 and upward. When less than $50 their jurisdiction is only appellate from the decisions of justices of the peace. Two sessions (spring and fall) are held in each county annually. In the county of Mobile criminal jurisdiction is exercised by a special city court which holds three sessions a year. Each of the counties has a judge of probate, who is also clerk of the circuit court.

35. The chief source of revenue is the general tax. For the years ending 30th September, 1850 and 1855, the receipts amounted to $499,670 and $715,236, and the expenditures in the same years to $499,670 and $342,859. At the end of the fiscal year, 1855, there was a balance in the treasury amounting to $1,192,653.

36. The public debt consists of two descriptions—foreign and domestic. The foreign debt in 1850 amounted to $4,053,666, on which the annual interest was $206,503, and in 1855 to $4,497,666, being nearly $230,000 interest. The domestic debt in the same years amounted to $2,340,300 and $1,390,467. The domestic debt is due to the common school, educational, and other funds belonging to the State.

37. The principal institutions supported by the State are the Penitentiary at Wetumpka, the Insane Hospital at Tuscaloosa, the Asylum for the Blind at Mobile, etc.

38. The whole number of children attending school in the years 1849–50 was 62,846, or one in every 6.82 of the total free population. The condition of the schools on the 1st June, 1850, was as follows:

Classification.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	1,152	1,195	28,380	$315,602
Academies and private schools	166	380	8,290	37,237
Universities and colleges	5	55	567	41,255

—making a total of 1,323 schools, 1,630 teachers, and 37,237 scholars; and an annual income amounting to $414,094. The number of white and free colored persons over 20 years of age unable to read and write was 33,992, of whom 33,853 were Americans and 139 foreigners, and 33,757 were white and 235 free colored persons.

39. The statistics of the principal collegiate and professional schools in the State in 1855, were as follows:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
University of Alabama	Tuscaloosa	1830	10	128	10,000
Wesleyan College	Florence	1830	6	104	2,600
Spring Hill College	Spring Hill	1830	20	86	7,500
Howard College	Marion	1841	6	80	2,400
Masonic University (female)	Selma	1847	7	33	2,000
Howard Theol. (Bapt.) Institution	Marion	1843	1	13	1,000

—there is also a Roman Catholic Seminary at Spring Hill, and the University has a law school.

40. The Baptist and Methodist denominations are more numerous than any other, and together include four fifths of the population, and the Episcopal denomination includes a full sixth of the whole. Thus little is left for other denominations, and among these only the Roman Catholics number above 5,000 communicants. The total number of churches in 1850 was 1,373, with accommodation for 439,605 persons, and the value of church property was estimated at $1,131,616.

41. Montgomery, the State capital, is situated on the left bank of the Alabama River, at the head of navigation, and 340 miles above Mobile. Latitude 32° 21′, and longitude 86° 26′. The city is built on a high bluff, and contains the Capitol and other State buildings. The vicinity is one of the most productive cotton regions of the State. Few cities are so amply provided with means of communication by river and railroad. These facilities of communication have made it one of the most flourishing cities of the Southwest. At the present day it is absolutely the second city of the State in population and wealth, and its progress has been rapid. In 1817 its foundations were laid; in 1840 it had 2,170, and in 1850, 4,935 inhabitants. In 1854 a local census gave the population at 6,695.

42. Mobile, the chief commercial city, is situated on the west bank of Mobile River, immediately above its entrance into Mobile Bay. Latitude 30° 41′ 48″, and longitude 87° 59′ 4″. The site is very little elevated above the water, but sufficiently so for all purposes of convenient drainage. The soil is dry and sandy. Immediately opposite the city, on the east, is a large low island, covered with high grass and rushes, and known as "the marsh;" above, on the north, is a large swamp, extending along the river, and back of the city the dry, sandy pine hills commence, affording delightful and healthy retreats from the heat, sickness, and annoyances of the city during the summer season; and here have sprung up the pleasant villages of Toulminville, Spring Hill, Cottage Hill, Summerville, and Fulton. South from the city the shores of the bay are dotted for many miles with elegant residences, and these spots have been usually exempt from epidemic diseases.

43. The city itself is not compactly built, except in the portions occupied by the commercial and business houses. The streets generally are wide, and run mostly north and south, and east and west; and of late years these have been abundantly planted with shade trees. The climate is warm and relaxing, and diseases, engendered of the swamps and heat, are prevalent during summer and autumn. The spring season, however, is delightful, and, moreover, the sanitary condition of the city has been greatly improved by the filling in of the swamps and an approved system of drainage. Water is supplied to the city through pipes, which convey it from a stream some miles distant.

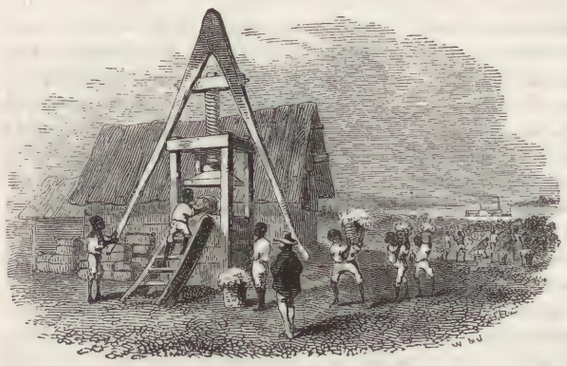
44. The public buildings of Mobile are numerous, and some of them large and substantial edifices. The principal are the county court-house, several United States offices, the municipal court-house, the city hall, a jail, etc., also a splendid Roman Catholic cathedral, numerous churches of the various religious bodies, hospitals, schools, markets, a theater and circus, several first-class hotels, etc. The hospitals—the United States Marine and City—are large and commodious buildings, each capable of accommodating from 250 to 300 patients; and there are other charitable institutions worthy of notice, among which stand pre-eminent the Catholic and Protestant Orphan asylums, the Benevolent Society, and the Samaritan Society. There are also asylums for the blind and the deaf and dumb. The city has three cemeteries.

45. The port of Mobile is the only sea-port of the State open to foreign commerce, and from this point is shipped the great bulk of the cotton of eastern Mississippi and western Alabama. This is brought from the interior by river and railroad. The total quantity exported for the year ending 30th August, 1852, was 575,104 bales, or more than a sixth of the whole produce of the Union. Of this amount 307,513 bales were sent to England, 95,917 bales to France, and 27,048 to other foreign states, and 144,626 were sent coastwise to domestic ports. Staves, lumber, and naval stores are also shipped in large quantities.

46. As a commercial mart of the Gulf, Mobile is second only to New Orleans in its facilities and available position. Immense rivers connect it with an extensive and highly productive interior, and a fine bay gives it access to the sea. Mobile Bay sets up from the Gulf, and is 30 miles long and on an average 12 miles broad. It communicates with the Gulf by two straits, one on each side of Dauphin Island. The strait on the west side will not admit of vessels of more than five feet draft; but that on the east side, between the island and Mobile Point, has 18 feet water, the channel passing within a few yards of the point. There is a bar across the bay at its upper end, which has only eleven feet water. The entrance to the harbor is defended by Fort Morgan, situated on a long, low, sandy point at the mouth of the bay opposite Dauphin Island. The local trade of Mobile is very extensive and valuable, and its coasting trade extends to all the Gulf ports and those of the Atlantic as far north as Boston. It has also a large trade with the interior. Steamboats ply regularly to and from New Orleans, *via* the lakes, and up both branches of the Mobile River, and also to Havana, New York, etc. The system of railroads now in course of construction and partly completed will connect the port with the great interior, and also with the Atlantic sea-board and Northern lake-ports.

47. Mobile was originally a Spanish settlement, and up to a later period a portion of Spanish Louisiana. It was surrendered to the Americans in 1813. In 1814 it was chartered as a town, and in 1819 as a city. In 1814 the total valuation of property in the town was only $350,950; in 1819, $764,510; in 1824, $1,107,500; in 1829, $2,719,148; in 1834, $6,756,025; in 1839, $7,480,315; in 1844, $8,098,877; in 1849, $12,629,700, and in 1850, $12,985,790. The population of the city was, in 1830, 3,194; in 1840, 12,672, and in 1850, 20,515. The present (1855) population is estimated at 25,000.

48. The other important towns in Alabama, with their population in 1850, are noted in alphabetical order as follows: Athens, 25 miles west-by-north Huntsville, is a thriving place of 991 inhabitants; Blakely, on the Tensaw River, at its entrance into Mobile Bay, about 12 miles east-by-north Mobile City, is a thriving town, and has a harbor accessible to steamboats; Cahawba is a thriving town on the Alabama, 220 miles above Mobile. It is a cotton mart of some importance, and the seat of a United States land office; Claiborne, also on the Alabama, 200 miles from Montgomery, is a noted river-port, and stands at the head of sloop navigation; Decatur, on the Tennessee, is a town of 606 inhabitants. The Memphis and Charleston Railroad passes through it, 60 miles from Stevenson and 187 miles from Memphis. It is also the southern terminus of the Central Southern Railroad from Nashville, and railroads are projected southward to Columbus, Miss., and to Selma, Ala., and another eastward to Rome, Ga. It is a place of considerable trade; Eufaula, on the Chattahoochee, is a handsome town, finely situated on a bluff 200 feet above the river. It is the center of an active and increasing trade, and upward of 20,000 bales of cotton are annually shipped hence down the river. Railroads are projected to connect Eufaula with Brunswick, on the sea-board, *via* Albany, and also northward with Columbus; Florence, on the Tennessee, at the foot of Muscle Shoals, and nearly opposite Tuscumbia, is a flourishing town of 1,170 inhabitants. In the vicinity there are several large cotton factories. The river is navigable for steamboats to this place, 300 miles from its mouth, and a large shipping business is done. A bridge over the river connects it with the Memphis and Charleston Railroad, 144 miles from Memphis, and a railroad is projected which, when completed, will connect Florence with Nashville; Girard, on the Chattahoochee, opposite Columbus, Ga., is a town of about 1,200 inhabitants, and is a cotton mart of great importance. It is the eastern terminus of the Mobile and Girard Railroad, and also of the Columbus Branch of the Montgomery and



West Point Railroad. A bridge over the river connects the railroads of Alabama and Georgia; Gunter's Landing or Guntersville is a town on the Tennessee 35 miles southeast Huntsville. It has long been celebrated as a crossing-place and trading point, and is the projected point of junction of the Winchester and Alabama Railroad and of the Alabama and Tennessee Rivers Railroad, both now (1855) in process of construction; Huntsville is an important trading town on the line of the Memphis and Charleston Railroad, 60 miles from Stevenson and 211 from Memphis. It contains a very handsome court-house, a land office, six churches, and numerous warehouses, stores, etc. In 1850 it contained 2,863 inhabitants; Jacksonville is situated on a beautiful eminence in Tallasahatchee valley, 125 miles north-by-east Montgomery. In 1850 it had 716 inhabitants. It is on the Alabama and Tennessee Rivers Railroad, and one of the most flourishing towns on that line. A railroad is also projected here to Dalton, Ga., in the direction of Knoxville and Virginia; Marion, capital of Perry County, is a flourishing town, 80 miles west-north-west Montgomery. Population 1,544. It is the seat of Howard College; Selma, on the Alabama, is one of the principal trading towns of the interior. It is situated 70 miles below Montgomery, and on the line of the Alabama and Mississippi Railroad. It is also the southern terminus of the Alabama and Tennessee Rivers Railroad. The vicinity is a rich farming country and very populous, and the commerce of the town is commensurately large. Steamboats ply regularly to Montgomery and Mobile. Population 1,728; Stevenson is a new town on the Nashville and Chattanooga Railroad, 38 miles from Chattanooga, and is the point of junction of the Memphis and Charleston Railroad, 287 miles from Memphis; Talladega is a flourishing town of 1,320 inhabitants, 96 miles north-by-east Montgomery. The Alabama and Tennessee Rivers Railroad passes through it; Tuscaloosa is a thriving town on the Black Warrior, at the head of steam navigation, 125 miles northwest Montgomery. Latitude 33° 12′, and longitude 87° 42′. It was formerly the State capital, and is still one of the principal towns of the State, having an active trade, etc. The University of Alabama, founded in 1831, is seated here, and also the State Lunatic Asylum. It has manufactures of cotton and iron. The projected Northeast and Southwest Railroad, extending from Chattanooga, Tenn., to Meridian, Miss., will pass through this town. Population 2,961. Large quantities of cotton are annually shipped to Mobile; Tuscumbia, in the valley of the Tennessee, and about a mile south from that river, is an old and active trading town, to which steamboats ascend in high stages of the water. The Memphis and Charleston Railroad passes near the town, 144 miles from Memphis, and 127 miles from Stevenson. Population about 2,500; Tuskegee, in the valley of the Tallapoosa, is a flourishing village, 40 miles east-by-north Montgomery. Population 1,563; West Point, on the Chattahoochee, 40 miles above Columbus, and partly in Georgia, is an active business place, and the point of junction of the Montgomery and West Point and the Atlanta and Lagrange railroads; Wetumpka is situated at the head of steamboat navigation of the Coosa River, 15 miles north Montgomery. It is one of the principal cotton ports of the State, and the seat of the State Penitentiary. Population 3,016.

TUSCALOOSA OBSERVATORY.

49. Alabama was originally included within the territorial limits of Georgia, except the portion south of the 31st parallel, which belonged to Spanish Florida. In 1798 the Mississippi Territory was erected, which included the present States of Mississippi and Alabama, the lands of which had been previously ceded to the United States. In 1811 the country between the rivers Pearl and Perdido were taken possession of by the United States forces, and in 1813 formally attached to the Territory. In 1817 the western portion was erected into the State of Mississippi, and the eastern into the Territory of Alabama, which latter became a State in 1820. Before 1810 Alabama contained very few civilized inhabitants; but since its separate organization its increase has been rapid, and its general prosperity onward and sustained. At the present time it ranks in the Union the twelfth in population.

STATE OF MISSISSIPPI.

1. Mississippi is situated between latitudes 30° 10′ and 35° north, and longitudes 88° 12′ and 91° 41′ west, and is bounded on the north by Tennessee, on the east by Alabama, on the south by the Gulf of Mexico and Louisiana, and on the west by Pearl River and the River Mississippi, which separate it from Louisiana and Arkansas.

2. The greatest length of the State north and south is 336 miles, and the breadth varies from 116 miles in the north to 189 miles on the 31st parallel. Within these limits the area is computed at 47,156* square miles.

* According to the United States Census, 1850. Dr. Harper, in his Report on the Geology and Agriculture of the State (1857), gives the area at 45,463 square miles. In his report, however, the lineal measurements are incorrect, and hence little reliance can be placed on the deduction as to surface.

The Gulf coast has a length of only 88 miles, or, including its bays and irregularities, a line of 247 miles.

3. Every portion of the State is well watered; clear running streams penetrate it in every direction, and its rivers are numerous and wide-spreading. The Tennessee River laves the northeastern corner, and the Tombigbee, which rises in this section, has been navigated by steamboats to Aberdeen. The Mississippi washes the western border for a distance, by the circuitous course of its channel, of 530 miles, but in a straight line of not half that distance. From Memphis, just above the northern frontier of Mississippi, to Vicksburg, a distance of 450 miles, the uplands or river hills are separated from the river by inundated bottoms of greater or less width, and afford no site suitable for a port. Below Vicksburg the only eligible port is Natchez, 100 miles south, and below this point there is no bank of much magnitude above the reach of high water until we come to Baton Rouge, in Louisiana, and the only port between these places is Bayou Sara.

4. The Mississippi, however, receives several considerable streams from the most valuable parts of the State: the Yazoo is formed by the junction of the Yallobusha and Tallahatchee, which rise in the northern part of the State, near the head-waters of the Tombigbee, and flows into the Mississippi 12 miles above Vicksburg, after a course of 200 miles, 150 of which are navigable for steamboats. Big Black River is next in point of size, and enters the Mississippi immediately above Grand Gulf by a mouth 40 yards wide. Its length is 200 miles, and it is navigated by steamboats for 50 miles. The Bayou Pierre and the Homochitto are its other principal tributaries from this State; the latter enters it 43 miles below Natchez.

5. The other rivers of Mississippi have a southerly course to the Gulf of Mexico and the lagoons connected with it. The Amité has but a small part of its course in this State. The Pearl River rises near the center of the State, and flows through a fertile and populous region into the Rigolets, or outlet of Lake Pontchartrain. Below 31° north latitude it divides Mississippi from Louisiana, and has been navigated by steamboats to Jackson. The Pascagoula waters the southeastern section. It is formed by the confluence of the Chickasawha and Leaf rivers, and empties into the sound of the same name. It is navigable for 50 miles for vessels of six feet draft, and for boats 100 miles farther, but the bay at its mouth has only four feet of water.

6. The coast which extends along the Gulf of Mexico has no harbors except those of Mississippi City and Shieldsboro'. These, however, do not admit large vessels. A chain of low sand islands, six or seven miles from the shore, inclose several bays or sounds, the largest of which are Pascagoula Sound and Lake Borgne. Ship and Cat islands are eligible stations for ocean steamships.

7. The upper portion of the State, known as the Chickasaw Cession, has a rolling surface and an open champaign appearance, and is beautifully wooded with oak, hickory, etc., devoid of undergrowth. The uplands produce very abundantly, but the substratum of the country being sandy, they are soon ruined by the heavy rains. The valley lands are much more durable, the soil being heavier and darker, and are highly productive; but they are liable to be, and frequently are, submerged, acres at a time, under billows of sand washed from the uplands. Cotton has hitherto been the staple product. Memphis is the chief outlet of all this region.

8. Another section of north Mississippi is the prairie or Tombigbee country, covering the northeast part of the State, and extending far down on the Alabama line. This country is uniformly level, with scarcely a tree, covered by rank grass, dotted sometimes with pools and marshes, and intersected by dull, sluggish branches. The soil is a dark, heavy loam, coal black, and of surpassing strength and fertility. The mold is different from that of Lower Louisiana in this, that it is more of an original and less of a depository character, and also in being thick and highly adhesive, instead of light and ashy as the former. It is also corrosive, and deeply impregnated with lime. This section forms a beautiful and healthy range of counties finely watered, and produces cotton and the lighter grains.

9. A large portion of the State is known as East Mississippi, which really includes the southeast and part of the southern sections. Though one of the oldest, it is one of the thinnest settled parts of the State. The character of the land is mixed—some poor and some very rich, or broken hills and fertile valleys. Cotton is produced, but to no great extent; corn and small grain abundantly, and sometimes rice. It is also famous for its cattle. Indeed, the region possesses many of the pleasant characteristics of a pastoral country. The natural market of this section is the port of Mobile, and some of it seeks that of New Orleans by way of the Pearl River.

10. The portion of the State bordering on the Gulf shore, with its bathing, fish, and oysters, and pleasant summer retreats, is well known to the denizens of New Orleans, and is becoming to the South what Newport and Cape May are to the North. Back from the seacoast is generally a sandy, broken tract, covered by quantities of fine pine, which is now being worked off the land for timber and naval stores. The southwest and country above it is the oldest settled portion of the State; the soil is rich and the population wealthy.

11. Commencing some fifty miles below the mouth of the Yazoo River, inclining to the interior for about 100 miles in a line gently circling northward up through the center, then diverging to the northwest to a point below Memphis, is to be found as noble a sweep of country as any in the world. It is washed by the Mississippi from Memphis to Vicksburg, and is intersected by the Yazoo, its head-waters, and tributaries, throughout its greatest extent. The facilities for market are unequaled. The Yazoo River, running through nearly its whole extent, is an excellent stream, affording steam navigation as high as the southwest corner of Marshall County. The soil is of a most productive character, being, as it is called, "swamp land." It possesses all the strength of the prairie lands, without their adhesive and corrosive nature. This region has but recently come into cultivation, it having hitherto been considered damp and unhealthy; but this assumption experience has much modified. The great drawback of these lands, however, as before mentioned, is their liability to overflow from freshets in the Mississippi River.

12. In 1850 Mississippi contained 626,526 inhabitants, being 12.86 to the square mile, or 2.61 per cent. of the whole population of the Union. This population was distributed into the several counties as follows:

MISSISSIPPI, LOUISIANA & ARKANSAS.

—and the whole was contained in 52,107 families, and occupied 51,681 dwellings.

13. Of the total population 295,718 (48.76 per cent.) were whites—156,287 males and 139,431 females, free colored 930—474 males and 456 females, and 309,878 slaves—154,674 males and 154,626 females; and of the free population 291,114 (98.1 per cent.) were Americans, of which number 140,885 were born in this State; 4,958 were foreigners, and 576 of unascertained origin. In other States of the Union there were 31,588 natives of Mississippi.

14. Of 75,082 free male persons over 15 years of age that were employed in industrial pursuits in 1850 the numbers were thus classified: 12,053 in commerce, trade, manufactures, mechanic arts, and mining; 50,284 in agriculture; 6,067 in labor not agricultural; 292 in sea and river navigation; 2,329 in law, medicine, and divinity; 3,380 in other pursuits requiring education; 377 in government civil service; 69 in domestic service, and 231 in unspecified occupations.

15. Mississippi in 1850 contained 33,960 farms and plantations, covering 10,490,419 (improved 3,444,358 and unimproved 7,046,061) acres, or about one third the total area of the State. The value of these was estimated at $54,738,634, and the value of implements and machinery thereon was $5,762,927.

16. The livestock in the State in 1840 and 1850 amounted to the following enumerations:

1840	horses, mules, etc.,	109,227	neat cattle,	623,197	sheep,	128,367	swine,	1,001,209
1850	"	"	170,007	"	733,970	"	304,929	"	1,582,734

—and the value of the stock of 1850 was $19,403,662; and the value of animals slaughtered in the year was $3,636,582. In 1850 there were in the State 54,547 asses and mules, and among the neat cattle 214,231 milch cows and 83,485 working oxen. In the same year the products of the dairy consisted of 4,346,234 pounds of butter, and 21,191 pounds of cheese; and the whole crop in 1840 and 1850 amounted to 175,196 and 559,619 pounds respectively.

17. The grain crops in the two years amounted in bushels to the following quantities:

1840	wheat,	196,626	rye,	11,444	oats,	668 624	Indian corn,	13,161,237	barley,	1,654	buckwheat,	61
1850	"	137,990	"	9,606	"	1,503,288	"	22,446,552	"	228	"	1,121

—or a total in 1840 of 14,039,646 bushels, and in 1850 of 24,098,785 bushels. The potato crop of 1840 was 1,630,100, and in 1850 (including 261,428 Irish), 5,003,277 bushels; that of peas and beans in 1850 was 1,072,757, and that of hay in 1840 was 171, and in 1850, 12,504 tons.

18. The staple Southern crops (pounds) in the two years consisted of—

1840	cotton,	193,401,577	sugar,	77	rice (clear),	777,195	tobacco,	83,471
1850	"	193,716,800	"	8,000	" (rough)	2,719,856	"	49,960

—and in 1850 molasses 18,318 gallons.

19. Among the miscellaneous products of 1850 are also noted—beeswax and honey, 397,460 pounds; flax, 665 pounds; hemp, 14 tons, and wine, 407 gallons. The value of market-garden products was $46,250, and of orchard products, $50,405.

20. The total value of agricultural products in 1840 was $26,297,666, and in 1850, $36,802,141.

21. In 1850 the number of establishments engaged in manufactures, mechanic arts, and mining was 877, which in the aggregate employed a capital of $1,833,420, and gave employment to 3,173 hands. The value of raw material consumed in the year was $1,290,271, and the cost of labor $775,128. The products of the year were valued at $2,972,038. None of the establishments are on a large scale. In 1840 the value of manufactured products was $2,879,425.

22. The manufactures produced in families, and not included in the above, were valued—in 1840 at $682,945, and in 1850 at $1,164,020.

23. Mississippi has little or no direct foreign commerce. In some years a small amount of imports is noted in the official returns—in 1855 to the value of $1,661. Otherwise its connection with foreign countries is through New Orleans and Mobile. Pearl River and Vicksburg are ports of entry. The shipping owned at these ports in 1850 amounted to 1,828 (steam 675) tons, and in 1855 to 2,475 (steam 588) tons. The shipping built in the State in 1850 amounted to (*nil*) tons, and in 1855 to 369 tons.

24. The coasting and river trade is very extensive, and employs a large tonnage. The coasting trade is chiefly directed to New Orleans and Mobile, while that of the Mississippi and its tributaries belongs altogether to the first-named port. Through these two ports the whole foreign business of the State is transacted. Internal trade is facilitated by several important railroads, two of which terminate respectively at New Orleans and Mobile, and extend north through the length of the State to connections on the north frontier. From Vicksburg a railroad extends east and through Alabama, etc., to the Atlantic sea-board, and there are other lines which have their termini on the Mississippi, at Memphis and St. Francisville. When all these lines are completed (they are not as yet), the commerce of the Gulf and that of the Northern lakes and Upper Mississippi, and that between the Lower Mississippi and the Atlantic, will be connected, and Mississippi thus become one of the great States, through which their interchanges will be transmitted; and, at the same time, the State itself will reap the benefits of a development which otherwise might be indefinitely postponed.

25. Mississippi has only one bank, the capital of which in 1851 amounted to $118,460, and in 1856 to $240,165. The assets in the years respectively consisted of—loans and discounts, $112,275 and $488,411; due by other banks, $302,641 and $81,152; other assets, $8,400 and $25,247, and specie, $—— and $7,744. The liabilities were as follows: circulation, $161,390 and $324,080; deposits, $4,500 and $35,606, and other liabilities (1851), $142,390.

26. The government is based on the constitution of 1817 and the amendments thereof. The right to vote is secured to every adult free white male person, a citizen of the United States, resident in the State for one year, and in the town or county for four months next preceding an election. General elections are held on the 1st Monday and Tuesday in November.

27. The legislature is composed of a senate of 32 members, chosen for four years, one half biennially, and a house of representatives of 92 members, elected for two years. The legislature meets at Jackson on the 1st January every second year. The governer is chosen for two years. He must have been a citizen of the United States for twenty years, and a resident of the State for five years.

28. The judiciary is exercised by a high court of errors and appeals, circuit courts, and probate courts. The superior and vice-chancery courts have been abolished. The high court has appellate jurisdiction only, and holds two terms annually at the capital, and one at Oxford. This court consists of three judges, the attorney-general, and a reporter. The circuit courts have original jurisdiction in all civil cases in which the sum in controversy exceeds $50, and has exclusive criminal jurisdiction. For the purposes of this court the State is divided into ten districts, each of which elects a judge and attorney for four years, and a term is held in each county twice a year. Probate courts, with a judge and clerk, are held monthly in the several counties. The probate clerk is also register of deeds. All judicial officers are elected by the people.

29. The revenue of the State is derived chiefly from taxation. In the years ending 30th April, 1850 and 1855, the total income amounted to $379,402 and $572,656, and the expenditures for the same years was $284,999 and $313,248. The absolute debt of the State amounts to $2,271,707, and the contingent debt to $5,000,000, or a total of $7,271,707. The debt of this State has been repudiated. The valuation of taxable property in 1850 was $208,422,167, and in 1855, $251,525,006.

30. The institutions supported in whole or partly by the public treasury are the State University at Oxford, the State Prison at Jackson, and asylums for the blind, the deaf and dumb, and the insane, at Jackson.

31. The total number of persons attending school in the year 1849–50 was 48,803, or one in every 6.06 of the white or in every 12.4 of the total inhabitants. Free colored persons are not admitted to the schools. The condition of the schools on 1st June, 1850, was as follows:

Classes of Schools.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	782	826	18,746	$254,159
Academies and private schools	171	297	6,628	26,236
Universities and colleges	11	45	862	42,400

—making a total of 964 schools, 1,168 teachers, and 26,236 scholars, and an annual income of $322,795. The number of persons over 20 years of age who could not read and write was 13,528, of whom 13,447 were Americans and 81 foreigners, and 13,405 white and 123 free colored persons.

32. The principal collegiate and professional schools in the State in 1855 were as follows:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
Oakland College	Claiborne Co.	1830	5	73	6,700
University of Mississippi	Oxford	1844	12	229	4,200
Mississippi College	Clinton	1851	5	27	1,270
Madison College	Sharon	1852	5	58	1,000

33. The most numerous of the religious denominations in this State are the Methodist and Baptist, which included more than three fourths of the population, and the Presbyterian, which counts among its adherents one sixth of the whole. The Episcopal and Roman Catholic denominations are comparatively small in numbers, neither of them having 5,000 members. The total number of churches of all denominations in 1850 was 1,016, with accommodations for 294,104 persons, and the total value of church property was $755,542.

34. Jackson, the seat of government, is situated on the right bank of Pearl River, and is the point of junction of four railroads coming in from the cardinal points, and which, when completed, will extend from the extremities of the Union in all these directions. It may thus be considered as eminently a commercial place and as an emporium of vast importance. At the present day it is one of the great cotton markets of the State. The principal public buildings are the State House, the State Lunatic Asylum, the State Penitentiary, etc. In 1850 it contained 1,881, and has now (1855) probably 3,000 inhabitants.

35. Vicksburg is a city and port of entry on the Mississippi, 408 miles above New Orleans, and 46 miles west Jackson, with which it is connected by the Southern Railroad. The site is elevated but uneven, and the city somewhat irregular in its plan, the business part being along the river and the residences on the bluff above. Vicksburg is the most commercial town between New Orleans and Memphis, and exports from 100,000 to 120,000 bales of cotton annually. Steamboats ply regularly to and from New Orleans, and both up and down steamboats stop at this port. A line of railroad, called the Vicksburg, Shreveport and Texas Railroad, extends west from Vicksburg, and forms a portion of the great Southern Pacific Railroad. Population (1840) 3,104, (1850) 3,678, and (1855) about 5,000.

STEAMBOAT WOODING.

36. Natchez, the largest city of the State, is situated on the Mississippi, 107 miles below Vicksburg. Latitude 31° 34′, and longitude 91° 24′ 42″. It is built on a bluff which rises

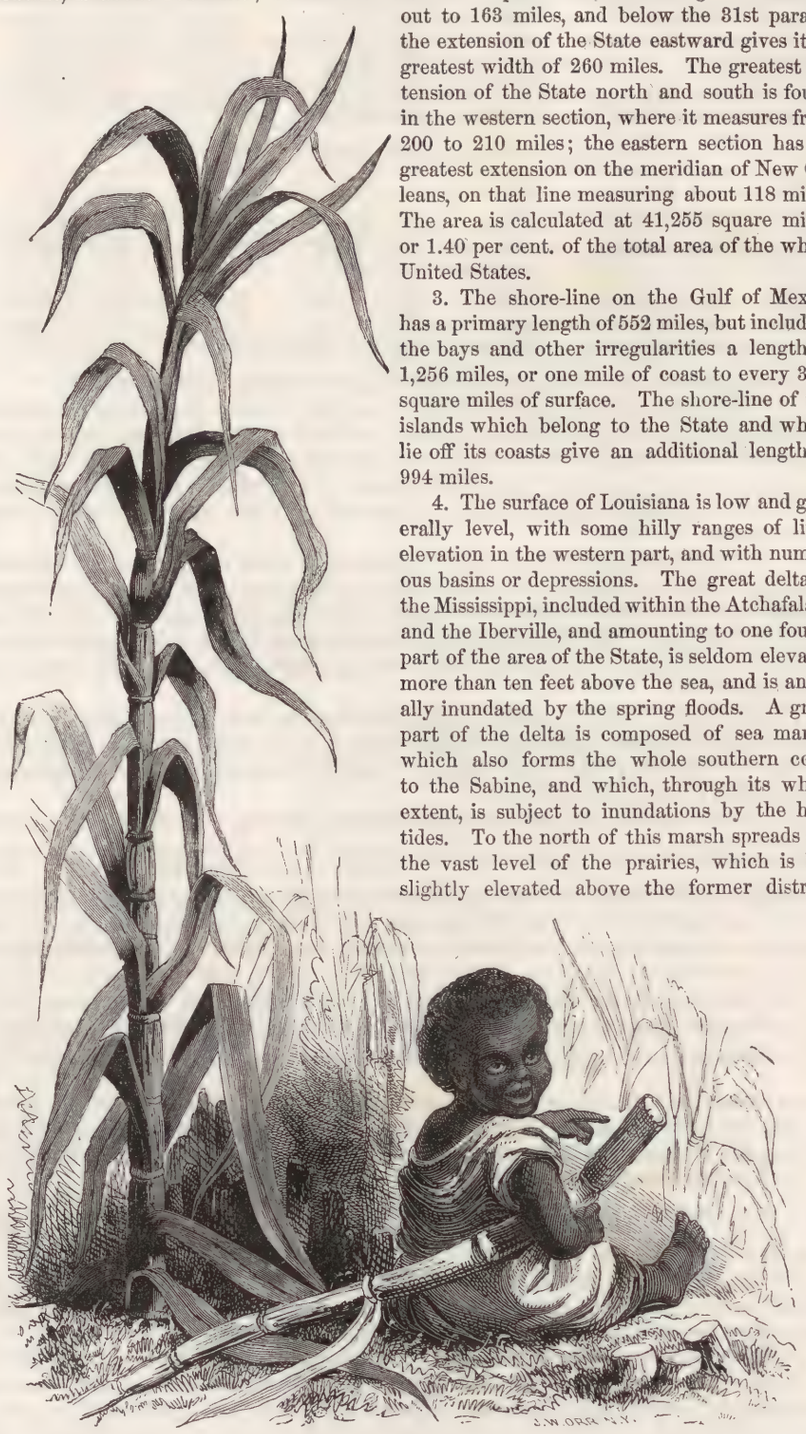
about 200 feet above the river, and overlooks on the one side the low cypress swamps of Louisiana, and on the other the undulating prairies of Mississippi. Natchez is the center of an extensive trade in cotton, and a heavy shipping business is transacted in the lower part of the town, called Natchez-under-the-hill. Population in 1850, 4,434, and in 1855, by local census, 8,098.

37. Intermediate between Natchez and Vicksburg is the port called Grand Gulf, two miles below the mouth of Black River. The Mississippi, by a remarkable bend, here forms what is termed the "Grand Gulf." The town enjoys a considerable trade in cotton, and supplies a wide neighborhood with merchandise, etc. Population (1850) 613, now (1855) about 800. Port Gibson, on Bayou Pierre, 28 miles from its mouth and 8 miles southeast Grand Gulf, is surrounded by a fine planting country, and is a place of considerable business. The cotton raised in the vicinity is sent down the bayou in keel boats or to Grand Gulf by railroad. Population (1850) 1,137.

38. Along the Gulf coast are the towns of Biloxi, Mississippi City, Pascagoula, Pass Christian, Pearlington, and Shieldsboro'. These towns have each more or less commerce, and serve as outlets for the extreme southern section of the State. The steamboats plying between New Orleans and Mobile call at many of them; and in the summer season the citizens of both these cities find in them cool and healthy retreats from the heat and sickness so prevalent at home.

39. The other more important places in the State are: Aberdeen, the largest and most flourishing town of the Tombigbee, and about 400 miles above Mobile. The adjacent country is highly fertile, and more than 30,000 bales of cotton are annually sent down the river from this port. Brandon, a town on the Southern Railroad, and 14 miles east Jackson. It has a large trade in cotton; Canton, a thriving town 24 miles north Jackson. It is the northern terminus of the New Orleans, Jackson, and Great Northern Railroad, and the southern terminus of the Central Railroad from Tennessee; Columbus, 28 miles below Aberdeen, on the Tombigbee River. The river is navigable at all seasons to this town, and a regular steam navigation is maintained to and from Mobile. The town is surrounded by a fertile neighborhood, and has an active cotton trade. It is connected with the Mobile and Ohio Railroad by a branch line, and a railroad is projected northeast to Decatur, Ala., a town on the Memphis and Charleston Railroad. Population (1850) 2,611; Cotton-Gin Port, a village 15 miles above Aberdeen on the Tombigbee. It is a place of considerable trade, and ships its cotton to Mobile by steamboat; Fulton, at the head of navigation of the Tombigbee River. Population (1850) 275. Small steamers ascend to this port during high water only; Grenada, a thriving village on the Yallobusha River, 112 miles north from Jackson. It is at the head of steamboat navigation, and has an active trade. The Mississippi and Tennessee Railroad from Memphis, 97 miles, here forms a junction with the Mississippi Central Railroad; Holly Springs, the largest and most flourishing town of north Mississippi. It is situated on the Central Railroad, 25 miles below the Memphis junction. Population (1855) about 3,500; Macon, a thriving village on the Mobile and Ohio Railroad, 197 miles from Mobile. To this point the railroad was completed in 1856; Marion, an important town on the same road, 139 miles from Mobile. At or near this place the line will be crossed by the Southern Railroad and connected with the Northeast and Southwest Railroad of Alabama. There is another town of the same name on the Yazoo, about 90 miles north Jackson, from which large quantities of cotton are shipped; Oxford, a flourishing town on the Central Railroad, 30 miles south of Holly Springs. It is noted for the salubrity of its climate, and as the seat of the University of Mississippi. Population about 1,200; Raymond, 24 miles from Jackson by the Southern Railroad, the center of a cotton region tributary to Vicksburg; and Woodville, a thriving town in the southwest, and connected with Bayou Sara, on the Mississippi, by the West Feliciana Railroad, 26 miles long. The country surrounding it is highly fertile, and produces large crops of cotton.

40. De Soto, the first European that visited this State, traversed it in 1542. At that time it was inhabited by numerous savage tribes, the Choctaws, Chickasaws, Natchez, etc. La Salle, descending the rivers from the Illinois country, visited the section bordering on the Mississippi in 1681; and in 1698 the first attempts at settlements were made by Iberville. His colony arrived at Ship Island in 1700, and after exploring the country built a fort at Biloxi, on the mainland. Other settlements were made on the Mississippi River at New Orleans, Natchez, etc. Fort Rosalie, on the present site of Natchez, was surprised and captured by the Indians in 1729, and for many years after great distress was caused by the hostility of all the indigenous tribes.



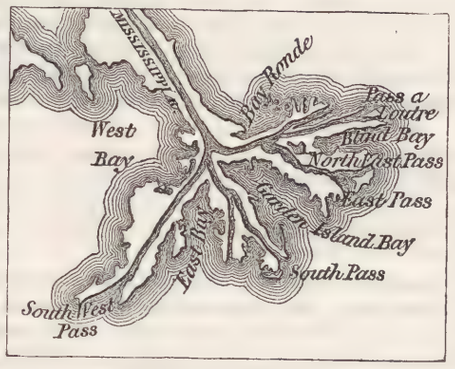
41. The war between England and France, which forms so conspicuous a page in the history of the eighteenth century, ended in 1763, France relinquishing to England all her possessions east of the Mississippi. By the treaty of 1783 the country north of the 31st parallel was included in the United States, and Florida reverted to Spain. By its charter, granted in 1732, Georgia extended westward to the Mississippi, and hence, though at that period Mississippi was *de facto* a French colony, yet on its coming into English possession it of course fell to the lot of Georgia. These extensive territories were subsequently ceded by that State to the United States, and in 1798 were erected into a territorial government, which included also the present State of Alabama.

42. In 1811 that portion of the country south of 31°, and west of Perdido River—having been wrested from Spain—was attached to this Territory and Louisiana as now partitioned. On the 1st March, 1817, an act of Congress was passed dividing the Territory, the eastern portion to form the Territory of Alabama, and on the 10th December of the same year Mississippi was admitted into the Union as a State.

STATE OF LOUISIANA.

1. Louisiana is situated between latitudes 28° 55′ and 33° north, and longitudes 88° 40′ and 94° west; and is bounded on the north by Arkansas and Mississippi, on the east by the Mississippi and Pearl rivers which divide it from the State of Mississippi, on the south by the Gulf of Mexico, and on the west by the Sabine River and Texas.

2. The width of the State east and west on the 31st parallel, between the Mississippi and the Sabine, is about 102 miles; but in the north on the parallel of Vicksburg it is widened out to 163 miles, and below the 31st parallel the extension of the State eastward gives it its greatest width of 260 miles. The greatest extension of the State north and south is found in the western section, where it measures from 200 to 210 miles; the eastern section has its greatest extension on the meridian of New Orleans, on that line measuring about 118 miles. The area is calculated at 41,255 square miles, or 1.40 per cent. of the total area of the whole United States.



3. The shore-line on the Gulf of Mexico has a primary length of 552 miles, but including the bays and other irregularities a length of 1,256 miles, or one mile of coast to every 32.9 square miles of surface. The shore-line of the islands which belong to the State and which lie off its coasts give an additional length of 994 miles.

4. The surface of Louisiana is low and generally level, with some hilly ranges of little elevation in the western part, and with numerous basins or depressions. The great delta of the Mississippi, included within the Atchafalaya and the Iberville, and amounting to one fourth part of the area of the State, is seldom elevated more than ten feet above the sea, and is annually inundated by the spring floods. A great part of the delta is composed of sea marsh, which also forms the whole southern coast to the Sabine, and which, through its whole extent, is subject to inundations by the high tides. To the north of this marsh spreads out the vast level of the prairies, which is but slightly elevated above the former district.

The western margin of the Mississippi is also a low country, intersected by numerous small rivers, and liable to inundation. To the west and north of these is an extensive region comprising one half of the State, considerably broken, but nowhere exceeding 200 feet in elevation. It consists mostly of pine barrens covered with a vast forest of pitch pine, interspersed with oaks, elms, cypress, honey-locust, etc. The tract east of the Mississippi and north of the Iberville and the connected lakes closely resembles that last described in its surface and forest growths. It is, in fact, a part of the same upland plain whose margin on the western side is separated from the river-bed by the low inundated lands, but on the east comes up to the channel of the river, in many places forming those prominent bluffs on which stand Baton Rouge, St. Francisville, Fort Adams, Natchez, and Vicksburg.

5. The State presents but a limited geological field. It is divided into the leading grades or divisions of tertiary, diluvial, and alluvial. The tertiary, occupying about two fifths of the State, lies north of a waving line, commencing on the Sabine near the mouth of the Neches, crossing Red River 20 miles north of Alexandria, and the Ouachita 10 miles north of Harrisonburg. Its beds contain coal (aluminous brown coal), salt, iron, ochre, gypsum, and marls. The coal is inferior to that of Pittsburg, and could not compete with it in the market, but is developing for use in those portions of the State where the better coal would not bear the expense of transportation. It abounds in Sabine, Natchitoches, Caddo, and De Soto, and all the parishes thence east to the Ouachita. Salt springs are common in Natchitoches and Rapides, and have been wrought in earlier times. A saline bed, it is thought, underlies the tertiary series generally. Iron is found in great quantities in all the tertiary parishes, and is well worth the attention of those who would develop the State's resources. Ochre, gypsum, and marls, too, are found—the first in the native form, and the others co-extensive with the tertiary beds. The gypsum is very fine, equal to any known to commerce, and the marls very rich in the regions where they will be most needed.

6. The Mississippi, after having formed the boundary of the State for about 450 miles, enters its limits 350 miles from the sea, by the course of the river channel. Throughout this distance of 800 miles, its western bank is low, and flooded in high stages of the water. At the point where it enters the State, it throws off its first outlet, the Atchafalaya, and here may be said to commence the delta of the river. The Atchafalaya receives the waters of the Mississippi only in flood, and the navigation is obstructed by collections of timber, often covered with mud and weeds, which choke up its channel. The Teche and Courtableau are its principal tributaries. The Bayou Plaquemines, the next considerable outlet of the Mississippi, discharges the waters of that river into the Atchafalaya during the floods, and is the channel of trade between the country on the Atchafalaya and New Orleans. Lower down is the La Fourche outlet, which has high banks along its upper course, and admits vessels of four or five feet draft nearly to its head. On the left bank, the Bayou Manchac, a little below Baton Rouge or the last highland passed in descending the Mississippi, is the first and principal outlet: after receiving the River Amité from Mississippi, it takes the name of Iberville River.

MOUTHS OF THE MISSISSIPPI.

7. The Red River is the most important, and, indeed, with the exception of two or three navigable streams on the eastern side above Baton Rouge, the only tributary of the Mississippi within this State; for the surrounding country being lower than the river banks, its waters can not gain access to the bed. The Red River rises in the Rocky Mountains, and flowing eastwardly along the north border of Texas and into Arkansas, turns to the south, and passes into Louisiana. Soon after entering this State, its bed is choked up by an immense accumulation of fallen timber, called the "Raft," and the water is dispersed into numerous channels, and spread over wide expanses. Below Natchitoches the river divides into several arms, which again unite above Alexandria, and its waters reach the Mississippi just above the first outlet, after a course of 2,000 miles, of which 1,500 miles is open to steam navigation. The Black River, its principal tributary, is formed by the junction of the Tensaw, Ouachita, Catahoula or Little River, all considerable streams, and navigable by steamboats; but most of the country along their courses is overflowed. The Bayou du Bon Dieu is also a large and navigable river, which enters it above the Black. There are numerous lakes in this section of the State, formed chiefly by the overflowings of the rivers, which fill the low basins back of their banks.

8. In the south are the Vermillion, Mermenteau, and Calcasieu, which, rising in a tract of pine hills to the south of the Red River, and flowing through the great pastoral plains of the west, reach the low marshy strip to the Mexican Gulf, and spread into shallow lagoons. The Sabine, which partakes of the character of the last described rivers, is, however, a considerable stream, rising farther to the north in Texas, and is a navigable river beyond the Louisiana boundary, but its mouth is obstructed by a bar.

9. From the northeastern pine region, the Pearl, Tangipahoa, Chefuncta, and Iberville, large navigable rivers, flow into the lakes and passes which separate that region from the fluviatile district. The Iberville, formed by the junction of the Amité from the north and the Manchac from the west, enters the head of Lake Maurepas, which is from 10 to 12 feet deep, and connected with Lake Pontchartrain by the Pass Manchac. Lake Pontchartrain is about 40 miles long and 24 miles wide, with an average depth of 10 fathoms, but is shallow near the shores. Vessels drawing eight feet of water can, however, go up to Madisonville and to the mouth of Bayou St. John, in the rear of New Orleans: and not more than that draft can be carried through the passes or channels called the Rigolets and Chef Menteur, through which it communicates with Lake Borgne. This last is, properly speaking, no lake, but the termination of Pascagoula Sound; it approaches to within fifteen miles of New Orleans, and boats can go up the bayoux that empty into it to within a short distance of the city.

10. Louisiana is remarkably destitute of good harbors. There is, however, a good roadstead on the west side of Chandeleur Islands, called the Road of Naso, in which the heavy vessels of the English fleet lay during the expedition against New Orleans. Numerous sheets of water, improperly called lakes, lie along the coast. Of Lake Borgne mention has already been made. Barataria, Vermillion, Côte Blanche, Atchafalaya, and Simballier bays are shallow tide basins. In the interior, lakes L'Allemands and Chetimaches are large bodies of water.

11. Although Louisiana extends more than a degree farther south than any other portion of the Union, except the peninsula of Florida, its winters are longer and more severe than in the corresponding latitudes on the Atlantic borders. Thus New Orleans has the winters of Charleston, which is nearly two degrees farther north. The climate is favorable to the peach and fig tree, but the apple can not be cultivated to advantage, and the cherry is wholly unproductive.

12. The agricultural staples are cotton and sugar; rice, maize or Indian corn, and tobacco are also cultivated, but have been neglected for the first-named articles; and indigo, which was formerly a staple, has been abandoned. The prairie lands of the west afford valuable pastures. In the northwestern part of the State, between the Mississippi and Pearl rivers, much lumber is prepared for exportation, and also tar, pitch, and turpentine. The cotton plant is cultivated chiefly on the Red River and in the northeastern parts of the State. Sugar is planted as far north as the head of the delta, and it has been raised with success in the parish of Rapides.

13. In 1850 Louisiana contained 517,712 inhabitants, distributed into 54,112 families, and occupying 49,101 dwellings. This population gives 12.55 inhabitants to every square mile of surface, and is equal to 2.23 per cent. of the total population of the Union. The population of the parishes or counties was as follows:

Counties.	Population.	County Seats.	Counties.	Population.	County Seats.	Counties.	Population.	County Seats.
Ascension	10,752	Donaldsonvill'	Feliciana, W.	13,245	St. Francisvil'	Sabine	4,515	Many.

Feliciana, East	13,598	Clinton.	Rapides	16,561	Alexandria.			

—of the total population 255,491 (49.35 per cent.) were white persons—141,243 males and 114,248 females; 17,462 (3.37 per cent.) free colored persons—7,479 males and 9,983 females, and 244,809 (47.28 per cent.) slaves—125,874 males and 118,935 females; and of the free population 205,921 were Americans, of which number 145,474 were born in this State; 66,413 were foreigners, and 619 of unascertained origin. In other States of the Union there were 14,779 natives of Louisiana.

14. The population of Louisiana amounted in 1810 to 76,556; in 1820 to 153,407; in 1830 to 215,739; in 1840 to 352,411, and in 1850 (as above) to 517,762. In 1855 the total was reported at 587,774, of which 301,764 were whites, 23,843 free colored, and 263,167 slaves.

15. The census of 1850 returns 77,168 free male persons over 15 years of age as employed in industrial occupations. Of this number 32,879 were engaged in commerce, trade, manufactures, mechanic arts, and mining; 18,639 in agriculture; 15,264 in labor not agricultural; 45 in the army; 4,263 in sea and river navigation; 1,827 in law, medicine, and divinity; 2,444 in other pursuits requiring education; 811 in government civil service; 508 in domestic service, and 488 in occupations not specified.

SOUTHERN PLANTATION.

16. Louisiana is eminently an agricultural State, the chief employment of its planters being the production of cotton and sugar. Manufactures other than those dependent on the preparation of these agricultural staples are carried on only in New Orleans, and the commerce for which the State has the credit is confined almost entirely to the same city, which is not only the commercial metropolis of Louisiana, but also the commercial depôt of the whole lower portion of the Mississippi valley.

17. Louisiana in 1850 contained 13,422 farms and plantations, in which were inclosed 4,989,043 (improved 1,590,025 and unimproved 3,399,018) acres of land, or about a fifth of the whole area of the State. The value of these was estimated at $75,814,398, and the value of implements and machinery thereon at $11,576,938.*

18. The quantity of livestock in the State in 1840 and 1850 comparatively is enumerated in the following table:

	horses, asses, etc.,	neat cattle,	sheep,	swine,
1840	99,888	381,248	98,072	323,220
1850	184,363	575,342	110,333	597,301

—in all valued in 1850 at $11,152,275; and the value of animals slaughtered in the year had been $1,458,990. The number of asses and mules in the State in 1850 was 44,849, and among the neat cattle of that year were included 105,576 milch cows and 54,968 working oxen. The products of the dairy in 1850 consisted of 683,069 pounds of butter and 1,957 pounds of cheese; and the wheat crop in 1840 amounted to 49,283 and in 1850 to 109,897 pounds.

19. The grain crop for the two years amounted to the following number of bushels:

	wheat,	rye,	oats,	Indian corn,	barley,	buckwheat,
1840	60	1,812	107,353	5,952,912	(*nil*)	(*nil*)
1850	417	475	89,637	10,266,373	(*nil*)	3

—making in 1840 a total of 6,061,137 bushels, and in 1850 a total of $10,356,905 bushels. The potato crop in 1840 amounted to 834,341, and in 1850 to 1,524,085 (including Irish 95,632) bushels; that of peas and beans amounted in 1850 to 161,732 bushels; and that of hay amounted in 1840 to 24,651, and in 1850 to 25,752 tons.

20. The Southern staple crop (pounds) produced in Louisiana in 1840 and 1850 amounted to the annexed notation of quantities:

	cotton,	sugar,	rice (clear),	tobacco,
1840	152,555,363	119,947,720	3,604,534	119,824
1850	71,494,800	226,001,255	(rough), 5,425,349	26,878

—and in 1850, molasses, 10,931,177 gallons.

21. And among the miscellaneous products of 1850 the following are noted: beeswax

* In 1855 the land cultivated in cane amounted to 248,195 acres, which produced 233,466 hogsheads of sugar and 1,285,888 barrels of molasses; cultivated in cotton to 616,788 acres, which produced 368,077 bales; cultivated in corn to 643,391 acres, which produced 10,717,080 bushels; and cultivated in rice to 3,177, which produced 31,449 barrels.

and honey, 96,701 pounds; wine, 15 gallons, etc. The value of the products of market gardens was $148,329, and of orchard products, $22,359.

22. The total value of agricultural products in 1840 amounted to $17,976,017, and in 1850 to $15,210,299.

23. In 1850 Louisiana contained 1,017 establishments for manufactures, mining, and the mechanic arts, and employed in these industries a collective capital of $5,318,074. The raw material consumed in the year was valued at $2,958,988, and the number of hands was 6,437, the cost of whose labor amounted to $2,086,212. The total value of the goods produced was $7,320,948. The value of goods produced in families was $139,232.

24. New Orleans is the chief port of Louisiana engaged in the foreign trade. In the years ending 30th June, 1850 and 1855, the total value of exports from the State, consisting chiefly of cotton, tobacco, provisions, breadstuffs, etc., amounted to $38,105,350 and $55,367,962, and in the same years the imports were valued at $10,760,499 and $12,900,821. The shipping cleared amounted in the years respectively to 369,937 and 604,402 tons, and the shipping entered to 350,853 and 445,302 tons. In 1850 the shipping owned in the State amounted to (registered 83,668 and steam 151,614) 250,089 tons, and in 1855 to (registered 114,398 and steam 71,544) 204,149 tons; and the shipping built in 1850 to 1,592 tons, and in 1855 to 872 tons.

25. The progress of the commerce of Louisiana for the ten years ending with 1854–5 has been as follows:

Years.	Value of Exports.	Value of Imports.	Shipping (tons). Cleared.	Shipping (tons). Entered.	Tonnage owned in State. Registered.	Tonnage owned in State. Steam.	Tonnage owned in State. Total.	Tonnage Built.
1846	$31,275,704	$7,223,090	—	—	—	—	—	—
1847	41,051,633	9,222,969	—	—	—	—	—	—
1848	40,971,361	9,380,439	—	—	—	—	—	—
1849	37,611,667	10,050,697	487,690	425,449	81,898	146,413	241,497	1,755
1850	38,105,350	10,760,499	369,937	350,853	83,668	151,614	250,089	1,592
1851	54,413,953	12,528,460	421,566	328,932	86,625	157,191	253,285	2,327
1852	49,058,885	12,057,724	544,482	424,281	81,501	171,502	268,171	1,284
1853	68,292,658	13,630,686	630,820	512,812	84,099	55,414	156,274	1,346
1854	60,931,852	14,422,154	603,755	499,227	103,996	66,093	187,074	1,508
1855	55,367,962	12,900,821	604,402	445,302	114,398	71,544	204,149	872

26. But to comprehend the magnitude of the commerce of this State, or rather of New Orleans, its vast trade with the interior, and its equally vast coasting trade, must be summed up. In 1855 there was received from the interior merchandise to the value of $117,106,823, viz., cotton 1,284,768 bales, valued at $51,390,720; sugar 346,653 hogsheads, $18,025,020; tobacco 53,348 hogsheads, $7,215,195; flour 673,111 barrels, $5,553,166; pork 276,393 barrels, $4,980,557; lard 144,036 barrels and 98,326 kegs, $4,092,530; molasses 23,000,000 gallons, $4,255,000; bacon (in various packages), $4,993,154; corn 1,110,446 sacks, $2,402,440; whisky 108,854 barrels, $1,306,248; and among other principal articles lead, wheat, bagging, beef, hemp, bale rope, butter, hay, hides, coal, potatoes, staves, tallow, feathers, oats, etc., etc.; and of these were exported coastwise, cotton, 1,270,264 bales; tobacco, 64,100 hogsheads; sugar, 129,487 hogsheads and 10,466 barrels; molasses, 266 hogsheads and 257,444 barrels; flour, 345,743 barrels; pork, 168,311 barrels; bacon, 43,312 hogsheads; lard, 791,635 kegs; beef, 32,963 barrels; lead, 53,326 pigs; whisky, 41,700 barrels, corn, 520,937 sacks, etc. The return trade coastwise and into the interior is also very extensive, a large portion of the interior receiving in this way its groceries, clothing, and other necessities. These statistics in connection with the record of the foreign trade show New Orleans to be a first-class port, and one of the greatest depôts of commerce in the world.

27. In works of internal improvement, Louisiana is still deficient. The people have too long depended on their magnificent water system for the facilities of trade. Railroads however have been constructed in several directions—toward the north and northwest from New Orleans, and it has also several local railroads. A line is also being built from Vicksburg across the State into Texas where it will connect with the Southern Pacific Railroad, and another line is projected farther south, to connect on the frontier with a road from Houston, so as to furnish a direct line between New Orleans and that city. Louisiana has likewise several canals, which unite the navigation of its different waters.

28. In December, 1850, there were twenty-five and in 1855 nineteen banks in Louisiana, with an aggregate capital at the two periods amounting to $12,370,390 and $19,027,728. Their liabilities for circulation amounted to $5,059,229 and $7,222,614; for deposits to $8,464,389 and $14,147,470; for dues to other banks to $1,384,232 and $1,687,532, and for other accounts (1855) to $2,301,747. The assets in the years respectively consisted of—loans and discounts, $19,309,108 and $27,500,348; real estate, $2,255,169 and $2,341,335; other investments, $3,242,149 and $4,824,812; due by other banks, $2,225,896 and $6,099,850, and specie, $5,716,001 and $8,191,625.

29. The government is based on the constitution of 1845, which superseded that of 1812. The right to vote is granted to every free white male 21 years of age, who for two years has been a citizen of the United States, and a resident of the State for two years, and of the parish for one year. The general election is held on the first Monday in November.

30. The legislature consists of a senate of 32 members, elected for four years, one half biennially, and a house of representatives of not less than 70 nor more than 100 (now 88) members, elected for two years. Senators must be 27 and representatives 21 years of age, and be otherwise qualified as to citizenship and residence. Sessions are annual, and commence on the second Monday in January, but are not to continue longer than 60 days.

31. The governor and lieutenant-governor are elected by a plurality of votes, and for four years; must be 35 years of age, citizens of the United States, and have resided in the State for 15 years. The governor is ineligible for re-election for the succeeding term. The secretary of state is elected by the people for four years, and the state treasurer for two years.

32. The judiciary is exercised by a supreme court and 19 district courts. The judges of the supreme court are elected for ten years—the chief-justice by the people at large, and four associates by the people in districts. This court sits at New Orleans from the first Monday in November to the end of June, and has chiefly appellate jurisdiction. Judges of district courts are elected by the people of their several districts, as are also attorneys, clerks, etc. The attorney-general is elected by the people at large.

33. The finances of the State are in a very flourishing condition. The receipts into the treasury for the year ending 31st December, 1855, amounted to $1,577,096, and with a balance (743,398) remaining from last year, the total resources were $2,320,494. The disbursements for the same year amounted to $1,683,098. The sources of income are direct taxes, sales of public lands, and licenses of trades and professions. The principal expenditures are on account of public debt, government schools, charities, etc. The State debt in 1855 amounted to $12,459,349, of which $3,839,222 was called the State debt proper, $8,421,888 the bank debt, and $198,240 the municipal debt. Nearly a million and a half of State bonds have been issued to railroad companies, in addition to the sum above given. The valuation of taxable property in the State in 1850 was $220,165,172, and in 1855, $299,996,176.

34. The principal institutions supported in part or wholly by the State are the Louisiana Penitentiary at Baton Rouge, the Deaf and Dumb and Blind Asylum also at the capital, the Insane Asylum at Jackson, and the Charity Hospital at New Orleans.

35. The number of scholars registered as attending school in 1850 was 34,057, or one to every 8.01 of the whole free population. The condition of the schools on the 1st June of the same year was as follows:

Classification.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	664	822	25,046	$349,679
Academies and private schools	143	354	5,328	193,077
Universities and colleges	6	41	629	85,750

—making a total of 813 schools, 1,217 teachers, and 31,003 scholars, and an annual income of $628,506. The number of free persons over 20 years of age who could not read and write was 24,610, of which number 18,339 were Americans and 6,271 foreigners, and 21,221 were white and 3,389 free colored persons. In 1855 the average attendance at public schools was estimated at 36,000. The school fund in the same year amounted to $461,269, and the seminary fund to $151,269, which are invested with the State and form part of the debt proper. The yearly sum of $250,000, raised by a mill-tax on property, and a poll-tax of $1 on each white male, is appropriated to the support of free schools.

36. The collegiate and professional schools of the State are as follows:

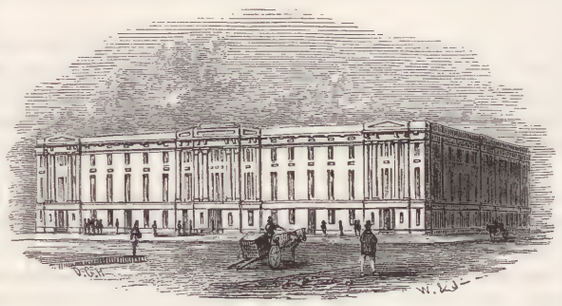
Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
St. Charles College	Coteau Grand	1838	26	85	6,000
Baton Rouge College	Baton Rouge	1838	4	—	3,000
Centenary College	Jackson	1839	7	—	5,500
Franklin College	Opelousas	1839	4	—	2,000
University of Louisiana	New Orleans	1849	7	112	10,000
College of St. Peter and St. Paul	Baton Rouge	1850	6	47	4,000
Law Depart. Univer. of Louisiana	New Orleans	1849	3	57	1,000
Med. Depart. " "	New Orleans	1836	8	222	—

37. The Roman Catholic and Methodist are the most numerous among the religious denominations, each claiming about one third the whole population, and next in point of numbers the Baptist, Presbyterian, and Episcopal denominations. The total number of churches in the State in 1850 was 306, with accommodation for 109,615 persons, and the total value of church property was estimated at $1,782,470.

38. Baton Rouge, capital of the State, is built on the east bank of the Mississippi, 140 miles above New Orleans. Latitude 30° 28′, and longitude 85° 11′. It occupies the first bluff which occurs in the lower river, which is elevated some 25 or 30 feet above the highest flood-mark. It is eminently a healthy locality, and commands a fine view of the surrounding country. The city contains an elegant State House, a college, an arsenal and barracks belonging to the United States, and the State Prison. The seat of government was located here in 1847. The Baton Rouge, Gros-Tête and Opelousas Railroad, when completed, will open to it a wide commercial field, and by its connection with the New Orleans, Opelousas and Great Western Railroad, make it one of the Mississippi termini of the Southern Pacific Railroad. Regular steamboat communication is maintained with New Orleans and other river ports. Population (1850) 3,905.

39. New Orleans, the great entrepôt not only of the trade of Louisiana, but also of the whole Mississippi valley, is built on a low site between the Mississippi River and Lake Pontchartrain, 100 miles from the Gulf of Mexico, and 1,952 miles below the Falls of St. Anthony. Latitude (City Hall) 29° 57′ 30″, and longitude 90° 07′.

40. The city is built around a bend of the river, and on this account has been familiarly called the "Crescent City." The site inclines gently from the Mississippi toward the marshes in the rear, and is somewhat below the usual spring freshets, to protect it from which levees have been built, extending 160 miles above and more than 40 miles below it. This embankment now forms a delightful promenade, and in front of the city a splendid quay, on which immense warehouses have been built.



VICINITY OF NEW ORLEANS.

41. The city proper, as laid out by the French, is 1,320 yards long and 700 yards wide, in the form of a parallelogram. Above and below and in the rear of this are what were originally faubourgs or suburbs, but which are now within the municipal limits, as is now also Lafayette, immediately above the old city. In 1852 the whole, extending about 7 miles along the river and back from 4 to 5 miles, to Lake Pontchartrain, was consolidated.

42. The streets are generally wide, and intersect at right angles; the principal is Canal Street, 100 feet wide, and extending throughout its entire length, and having a grass-plat, 25 feet wide, in its middle. Most of the buildings are of brick, and are usually low, except in the business portion, where many of them are five and six stories high. The suburban residences are many of them, particularly in Lafayette, beautifully planned and ornamented with garden plots and shrubberies. In different parts of the city are several public squares, among which may be named Jackson Square, formerly Place d'Armes, occupying the river front of the old town or First District, a beautiful retreat, ornamented by shell walks, statuettes, shrubberies, etc., and Lafayette Square, in the Second District, finely laid out and adorned with shade trees. Congo Square, in the rear of the city, is also a handsome inclosure.

43. The public buildings of note are the Custom House, the largest edifice in the Union, built of Quincy granite; the Branch Mint, the Municipal Hall, the Odd-Fellows Hall, and the Merchants' Exchange, which latter contains also the City Post Office. Many of the churches

are large and costly structures. The church of St. Louis is a splendid edifice. In all, the city contains about 40 church edifices, of which 12 belong to the Roman Catholics, 7 to the Episcopalians, 6 to the Presbyterians, 3 to the Jews, and the remainder to various Protestant sects. There are also about 40 schools in the city, which have an average attendance of from 16,000 to 18,000 scholars. The public moneys appropriated to school purposes amount to more than $200,000 a year. Besides the public schools and academies, New Orleans has several collegiate and literary institutions, at the head of which is the University.

CUSTOM HOUSE.

44. The press of New Orleans is highly distinguished, and consists of about 10 daily newspapers and about the same number issued weekly and at other periods. Several are published in the French and one or two in the Spanish languages. De Bow's Review, issued monthly, is one of the most valued commercial publications in the Union, and represents the Southern interest generally. The benevolent institutions of the city are extensive, well supported, and liberally conducted. The Charity Hospital is undoubtedly the first medical and surgical institution in America. It is a magnificent structure, inclosed in beautiful grounds, and capable of accommodating at one time a thousand patients, and about 20,000 are annually received. This institution is the refuge alike of the citizen and stranger, and is attended chiefly by those exemplary women—the Sisters of Charity—whose deeds reflect so great an honor on the Catholic Church.

45. New Orleans is also distinguished for its hotels and places of public amusement. The St. Charles, the Orleans, and American theaters will accommodate an aggregate of 4,500 persons. Among the hotels the principal are the St. Charles, Exchange, City Exchange, Verandah, etc. The city is supplied with water from the Mississippi, which is raised by machinery into a reservoir, and thence distributed through iron pipes.

46. New Orleans as a commercial city ranks next to New York and Boston in the scale of importance. It is the great outlet of the products of the valley in which it is situated, and gathers tribute from all the ports from St. Paul, nearly 2,000 miles north, from the headwaters of the Ohio, Missouri, Arkansas, and Red rivers, and from the great lakes. More than 20,000 miles of navigation are tributary to it; and the forest, the mine, and the field are constantly laying their wealth into its lap. Among the great staples landed here are the cotton, sugar, and tobacco of the South, and the lead, corn, and provisions of the North. These are duly exported to foreign countries and to the ports of the Atlantic. The amount of this commerce is so vast as to be almost beyond calculation. The receipts from the interior since the years 1847–8 were:

1847–48	$79,779,151	1849–50	$96,817,873	1851–52	$108,051,708	1853–54	$115,336,798
1848–49	81,989,692	1850–51	106,924,083	1852–53	134,233,735	1854 55	117,106,823

—and besides this the amounts of receipt by Lake Pontchartrain and the new canal are large. The exports to foreign countries in 1850 amounted to $38,105,350, and in 1855 to $55,367,962; and the imports in the same years to $10,760,499 and $12,900,821 respectively. The increase between the two periods corresponds nearly to the increase of the population and wealth of the great valley, and establishes the fact that, in the face of the railroad competition of the North Atlantic States, New Orleans still retains its pre-eminence as a great and permanent port.

47. The manufactures of New Orleans are not extensive, but of late years their development has not been slow. It already possesses, either within its own limits or in its suburbs, furnaces, machine-shops, distilleries, sugar-refineries, lumber-yards, sawmills, tobacco factories, etc., many of which are large, and besides these there are all the handicrafts.

48. The retail trade of the city is extravagantly provided for. Its stores and sales-rooms are magnificent and their patronage beyond precedent. The dress, habits, and customs of the inhabitants require this lavish exhibition of merchandise, and they willingly support it at an immense cost to individual revenue. An immense trade is also supported by the crowds which in the winter season flock to the city from the country, including wealthy planters and their families, and Northern people in search of a fair climate and a refuge from the inclemency of their colder homes. At this season the city is resplendent with fashion and luxury. In the summer and fall New Orleans is subject to visitations of the yellow fever, frequently in the form of an epidemic, but there are years of intermission, when few or no cases are reported.

49. Perhaps no city of the Union is so diversived in its population. The sunny isles of the Antilles, Mexico, Central America, France and Spain and the other states of Europe, and the sister States northward, have each representatives among its inhabitants. The colored races, however, preponderate, and, slave and free, make up at least one half of the whole. Of the white races, Americans, French, and Spanish constitute the larger portion, and in these classes are found what may be denominated the aristocracy. The Irish are also very numerous, but the English and Scotch are relatively few in number, and are chiefly connected with the foreign commerce as merchants or factors. This admixture of races is embarrassing; but this circumstance has also its advantages. It elicits much that is cosmopolitan. But the vices and virtues of such a community stand out in relief, and Sunday bull-baiting, gaming, and balls contrast harshly with the exercises appropriate to that day of rest.

50. Compared with the great Northern cities, New Orleans has done little toward providing for its commerce due facilities. Many great works, however, have been undertaken which, when completed, will give it excellent trade routes to the interior; among them the most conspicuous are the New Orleans, Jackson and Great Northern and the New Orleans, Opelousas and Great Western railroads; the first, with its connections, will open to it a way to the great cities of the lakes, the Ohio, etc., and the latter will give it access to Texas and the Pacific. Both these works are partially in use. Otherwise New Orleans has several local railroads, which connect it with Lake Pontchartrain, etc., and the same connection is also made through the new canal.

51. Opposite to New Orleans, and connecting with it by a ferry, is the town of Algiers, the principal workshop of the city. Here are several extensive ship-yards, and numerous artisans engaged in building and repairing vessels. At Macdonough, above and adjoining it, is the United States Marine Hospital, a splendid building, used for the purpose its name designates. Belleville lies below and also adjoins Algiers, and has many fine residences. Many of the seats in the suburbs of the city are surrounded with spacious gardens, splendidly ornamented with orange, lemon, magnolia, and other trees.

52. The history of New Orleans in its early epochs is that of the whole French settlements in Lower Louisiana. The city was founded in 1717, and named after the Duc d'Orleans, then regent of France, but the site was abandoned soon after, and not settled again until 1722. Soon after this it began to prosper, and constant accessions were made to the population by the arrival of immigrants.

53. By the treaty of 1763, New Orleans, with all Louisiana west of the Mississippi, was transferred to Spain by treaty. The population now numbered 3,190. The transfer greatly provoked the French inhabitants, and some opposition was made, but in the end the Spanish laws were gradually introduced, and, by a beneficent administration, the city so flourished under the new government, that the population in 1785 had increased to 4,980—a great movement in those days. In 1792 the city was divided into four wards, and its police greatly improved, and two years later the first newspaper was published.

54. The country was prosperous at the commencement of the French Revolution; but in 1801, Spain having fallen into the power of France, it was retroceded to that nation, and in 1803 was sold to the United States by the French. The population was now over 8,000. In 1804 New Orleans was made a port of entry, and in 1805 was incorporated. Early in 1812 the first steamboat arrived from the Ohio! The war of 1812–15 now broke out, and the British made a descent on the city, and on the 8th of January, 1815, the greatest battle of the war was fought—the result is known to every schoolboy.

55. The modern progress of the city now commenced; the settlement of the valley of the Mississippi, and the consequent trade with the only port of its outlet increased rapidly and proportionally. The increase is still going on, and will raise New Orleans to the first rank among commercial cities. It is now the great depôt of the export trade of the valley; and when its railroad to the North is completed, much of the import trade, now having its course from the northern Atlantic coast, will certainly make New Orleans its entrepôt. The difficult up-navigation of the river, even by steamboats, has hitherto been the great drawback.

56. Population in 1810, 17,242; in 1820, 27,178; in 1830, 49,826; in 1840, 102,193; and in 1850, 119,461. The population of Lafayette in 1840 was 3,207, and in 1850, 14,190.

57. The other most important places within the State are—Alexandria, on the Red River, 150 miles from its junction with the Mississippi, and the shipping port of a fine cotton region, with 672 inhabitants; Barataria, 1,176; Bayou Sara, on the Mississippi, opposite Point Coupée, 532; Carrollton, above New Orleans, 1,470; Franklin, on the Bayou Teché, 891; Gretna, adjoining Algiers, 717; Harrisonburg, on the Ouachita River, 326; Homer, the capital of Claiborne County, 418; Minden, in the same county, 533; Monroe, on the Ouachita, 435; Natchitoches, on the Red River, a place of considerable trade, 1,261; New Iberia, on the Bayou Teché, 306; St. Francisville, on the Bayou Sara, a mile from the Mississippi, and the terminus of the West Feliciana Railroad, 405; St. Martinsville, on the Bayou Teché, 652; Shreveport, on the Red River, about 30 miles below the "great raft," a place of great trade, 1,728; and Thibodeauxville, on the Bayou la Fourche, 1,242. In this connection may also be mentioned the following—Madisonville, near the north shore of Lake Pontchartrain; Opelousas, on the west of Bayou Teché; Donaldsonville, at the head of Bayou la Fourche, and formerly the capital; Plaquemines, at the head of the bayou so called, etc.

58. The State of Louisiana embraces the southern part of the extensive Louisiana territory which was purchased by the United States from France, in 1803, for 60,000,000 francs. The earliest settlements within the present State were, that of Iberville, begun in 1699, and that of New Orleans, begun in 1717. By treaty of 1762 with Spain, and of 1763 with Great Britain, France ceded to these powers all of her American territories. In 1800 Spain reconveyed her portion of these provinces to France. The United States received them in 1803, and established therefrom two territories, of which the "Territory of Orleans" comprised the present State of Louisiana. On February 11th, 1811, Congress passed an act enabling the inhabitants of the Territory to form a constitution and State government; and upon compliance therewith Louisiana was admitted into the Union, April 8th, 1812.

STATE OF ARKANSAS.

1. Arkansas is situated between latitudes 33° and 36° 30′ north, and longitudes 89° 40′ and 94° 42′ west; and is bounded on the north by Missouri, on the east by the St. Francis and Mississippi rivers—which divide it from Missouri, Tennessee, and Mississippi, on the south by Louisiana, and on the west by Texas and the Indian Territory.

2. The width of the State, east and west, varies from 148 miles on the south line to 240 miles on the 36th parallel. The general extent, north and south, is 242 miles. The area is computed at 52,198 square miles, or 1.78 per cent. of the total surface of the Union.

3. The surface of Arkansas presents great variations in its physical configuration. Along the Mississippi, which demarks its eastern boundary, and for thirty to a hundred miles inland, the country is low and widely interspersed with lakes and swamps, and with inconsiderable

exceptions is annually overflowed by the floods of the Mississippi, Arkansas, and St. Francis. Farther west the surface rises, and toward the center of the State becomes moderately hilly, and still farther west rises into the Ozark Mountains, and beyond these the country spreads out into elevated and gradually rising plains, which terminate only with the Rocky Mountains.

4. Of the highlands that have been called the Ozark or Masserne Mountains, our knowledge is very imperfect. They consist of several low ridges, irregular in their direction, and seldom rising to an elevation of more than 1,500 or 2,000 feet They appear to be composed chiefly of secondary rocks, limestones, clay slates, and sandstones, traversed in many places by dykes of greenstone, granite, and sienite. Those portions of this region which have been examined are found to be rich in minerals, of which iron and lead, copper and zinc, exist in great profusion. Coal and salt also abound; and there are valuable thermal and sulphurous springs. The hot springs of the Washita are remarkable for their high temperature, but are not powerfully impregnated with any mineral substances; they burst forth in great numbers and volume in a small valley lying between two lofty ridges of sandstone, and vary in temperature from 105° to 151°. There are said to be more than seventy of these springs, several rising from the bed of a small stream which flows through the valley, and others issuing from the bounding ridges, at various heights. The Washita oilstones or novaculites, so much esteemed, are found in this region.

5. The Mississippi bathes the eastern front of Arkansas for more than 350 miles by its windings, but affords no sites suitable for large towns in the present condition of the country. The Arkansas, one of the largest tributaries of the Mississippi (but having no large tributaries of its own within this State), traverses the whole breadth of the country through its center, by a very tortuous course of about 1,500 miles, and is navigable during the greater part of the year far above its western limits. The Red River flows through the southwestern corner, which is thus rendered accessible to steamboats. All the other rivers, some of which are of great magnitude, empty themselves into these three, affording navigable facilities to almost every quarter of the State.

6. The St. Francis is a large and full river, rising in the eastern highlands of Missouri. Its channel, however, is much obstructed by numerous rafts or jams of fallen trees, and above and below the northern boundary its waters are dispersed in such a manner as to render the navigation intricate and difficult. The "Spread," as it is called by the inhabitants, extends for the space of about 50 miles, with a width in some parts of 20 miles, and is attributed to the earthquake of 1811, at which time a large tract of country sunk considerably below its former level, and the waters of the rivers were dissipated in numerous lakes and branches.

7. The White River has its sources in the northwestern part of the State, and passes into Missouri, whence it soon returns, reaching the Mississippi in a general southeasterly course. Its length is not less than 600 miles; and although at present it is choked up in many places by accumulations of drift-wood, steamboats ascend it as far as Batesville, 260 miles, and on the removal of these obstructions will be able to ascend it 200 miles farther. The White River receives several large tributaries from Missouri, of which the Big Black, a navigable stream, is the principal; the Caché and Little Red River have their courses wholly within this State.

8. The Washita, a noble river running through a fertile and beautiful region, drains nearly the whole southern part of the State; rising near the western border, it flows nearly parallel with the White River and the Arkansas, first east and then southeast, and is navigable upward of 350 miles from its mouth. The Little Missouri, the Saline, the Bayou Bartholomew, the Bayou Bœuff, and the Bayou Maçon are its principal tributaries.

9. The climate of Arkansas is temperate, but subject to sudden and frequent variations; and the whole country is exposed to the effect of the cold north winds which render the central portions of the United States so cheerless in the winter season. The same winds traverse southward to the equator, and are known in the Gulf of Mexico as the "northers," the terror of seamen navigating that sea. Yet in the spring, summer, and fall the weather is highly propitious to agriculture, and here cotton, Indian corn, and, in fact, all the great staples of the country find the climate highly congenial. The soils vary, from the most sterile to the most fertile, and on the margins of all the rivers the productiveness is unbounded. On most of these the soil is a rich alluvion deposited from the washings of the flood, deep and wide, covering millions of acres. Back from the rivers the soil becomes more and more sterile, and in many parts it is unfit for culture, either from scarcity of water or from metallic impregnation. The principal growths are pines, cypresses, sycamores, and oaks, according to the formation, and on the prairies, which are extensive, is that rank grass for which this description of land is so famous. On the whole, Arkansas has many advantages for agriculture, and it has many disadvantages; but where the latter exist, they are fully compensated for by the abundance of its minerals.

10. In 1850 Arkansas contained 209,897 inhabitants, distributed into 28,416 families and occupying 28,252 dwellings. This population gives 4.02 inhabitants to every square mile, or 0.91 per cent. of the whole population of the Union. The population of the counties was as follows:

Counties.	Population.	County Seats.	Counties.	Population.	County Seats.	Counties.	Population.	County Seats.
Arkansas	3,245	Arkansas Post.	Hot Springs	3,213	Rockport.	Pike	1,861	Murfreesboro'.
Ashley	2,058	Hamburg.	Independence	3,086	Batesville.	Poinsett	2,308	Bolivar.
Benton	3,710	Bentonville.	Izard	5,884	Mt. Olive.	Polk	1,263	Dallas.
Bradley	3,829	Warren.	Jackson	5,227	Elizabeth.	Pope	4,710	Dover.
Carroll	4,614	Carrollton.	Jefferson	5,220	Pine Bluff.	Prairie	2,097	Brownville.
Chicot	5,115	Columbia.	Johnson	5,274	Clarksville.	Pulaski	5,657	Little Rock.
Clark	4,070	Arkadelphia.	Lafayette	4,823	Lewisville.	Randolph	3,275	Pocahontas.
Conway	3,583	Springfield.	Lawrence	2,308	Smithville.	St. Francis	4,479	MountVernon.
Crawford	7,960	Van Buren.	Madison	2,368	Huntsville.	Saline	3,908	Benton.
Crittenden	2,648	Marion.	Marion	2,049	Yellville.	Scott	3,083	Waldron.
Dallas	6,877	Princeton.	Mississippi	1,958	Oceola.	Searcy	1,979	Lebanon.
Desha	2,911	Napoleon.	Monroe	1,758	Lawrenceville.	Sevier	4,240	Paraclifta.
Drew	3,276	Monticello.	Montgomery	1,958	Mount Ida.	Union	10,298	El Dorado.
Franklin	3,972	Ozark.	Newton	1,758	Jasper.	Van Buren	2,864	Clinton.
Fulton	1,819	Salem.	Ouachita	9,591	Camden.	Washington	9,970	Fayetteville.
Greene	2,593	Gainesville.	Perry	978	Perryville.	White	2,619	Searcy.
Hempstead	7,672	Washington.	Phillips	6,935	Helena.	Yell	3,841	Danville.

—of the total population 162,189 (77.27 per cent.) were white persons—85,874 males and 76,315 females, 608 (0.29 per cent.) free colored persons—314 males and 294 females, and 47,100 (22.44 per cent.) slaves—23,658 males and 23,442 females; and of the free population 160,345 (98.49 per cent.) were Americans (of which 63,206 were born in this State), 1,628 were foreigners, and 824 were of unknown origin. In other States of the Union 10,916 natives of Arkansas were resident. The population of Arkansas in 1820 amounted to 14,273; in 1830, to 30,388; in 1840, to 97,574; and in 1850 (as above), to 209,897. In 1854 a State census returned 253,117 inhabitants, of whom 199,224 were whites, 614 free colored persons, and 60,279 slaves.

11. The employments of 40,785 free male persons over 15 years of age in 1850 were as follows: in commerce, trade, manufactures, mechanic arts, and mining, 4,296; in agriculture, 28,942; in labor not agricultural, 5,684; in the army, 33; in river navigation, 106; in law, medicine, and divinity, 911; in other pursuits requiring education, 676; in government civil service, 110; and in other pursuits not specified, 27.

12. Thus agriculture employs three fourths of the population of the State. Manufactures are insignificant, nor has mining as yet become an element in its industrial economy. Every kind of industry, indeed, is still in its first period excepting agriculture which furnishes to commerce one of its chief materials in its cotton. The rapid advance of this State in population and wealth, however, augurs well for its future, and with natural resources equal to the most prosperous regions of the Union, time and force alone are required for Arkansas to assert its true position among its confederates.

13. In 1850 Arkansas contained 17,758 farms and plantations covering 2,598,214 (improved 781,530* and unimproved 1,816,684) acres, or about an eighth of the whole surface; and their value was estimated at $15,265,245. The value of implements and machinery in use was $1,601,298.

14. The livestock of Arkansas in 1840 and 1850 amounted in the years severally to the following numbers:

1840	horses, asses, etc.,	51,472	neat cattle,	188,786	sheep,	42,151	swine,	393,058
1850	" "	71,756	"	292,710	"	91,256	"	886,727

—the stock of 1850 being valued at $6,647,969; and the value of animals slaughtered in the year was $1,163,313. Animal products in 1850—butter 1,854,239 pounds, and cheese 30,088 pounds; and wool in 1840 and 1850 respectively 64,943 and 182,595 pounds.

15. The grain crops (in bushels) were as follows:

1840	wheat,	105,878	rye,	6,219	oats,	189,553	Indian corn,	4,846,682	barley,	760	buckwheat,	88
1850	"	199,689	"	8,047	"	656,183	"	8,893,989	"	177	"	175

—being a total in 1840 of 5,149,130, and in 1850 of 9,758,160 bushels. The potato crop in 1840 amounted to 293,608, and in 1850 to 981,981, of which 193,832 were Irish and 788,149 sweet potatoes. The crop of peas and beans in 1850 was 285,738 bushels, and of hay 3,976 tons.

16. The Southern crops (pounds) grown in this State were as follows:

1840	cotton,	6,028,642	rice (clear),	5,454	tobacco,	148,439
1850	"	25,137,600	" (rough),	63,179	"	218,936

—and among the miscellaneous farm products in 1850 are noted—beeswax and honey 192,338 pounds, flax 12,291 pounds, hemp 30 tons, wine 35 gallons. The value of market-garden products was $17,150, and of orchard products $40,141.

17. The total value of agricultural products raised in this State in 1840 was $4,973,655, and in 1850, $9,676,577.

18. Arkansas ranks lowest among the States in relation to manufactures and the mechanic arts. In 1850 it contained only 272 establishments, and the total capital invested in this branch of industry was only $324,065. Raw material consumed in the year $268,564, hands employed 903, cost of labor $169,356. The manufactures produced were valued at only $607,436. The value of goods manufactured in families was $638,217.

19. Arkansas has no direct foreign commerce. Its commercial staples are taken to New Orleans by steamboat and other river craft, and its imports are received through the same means. Internal trade is limited for want of roads, but along the navigable rivers great activity prevails throughout the year. The railroad is scarcely known within the borders of the State, a few miles of the Memphis and Little Rock Railroad being the only one as yet (1857) completed. This road, however, when opened through will give to Arkansas a new route to the east, which will have a great influence on its progress, and which in connection with the Fulton and Little Rock Railroad will furnish an outlet to the Indian Territory, with which Arkansas has already an extensive trade.

20. The constitution forbids the establishment of any banking institution within this State. None are at present in operation, and the old State banks have for some years been in liquidation.

21. The government is based on the constitution of the 4th January, 1836, and subsequent amendments thereto. By this instrument the right of voting is granted to every free white male citizen of the United States, and who has been a citizen of Arkansas for the preceding six months. General election is held on the 1st Monday of August every second (*even*) year.

22. The legislature consists of a senate of 25 members elected for four years, one half biennially, and a house of representatives of 75 members elected for two years. Sessions are biennial, and commence on the 1st Monday of November.

23. The governor is elected for four years. He must be a native-born citizen of the United States, and have resided four years in this State. The secretary of state, auditor, and treasurer are chosen by a joint vote of both houses of the legislature. The term of office of the present governor ends in November, 1860, and of the administrative officers in 1858.

24. The judiciary is exercised by a supreme court, six circuit courts, county courts, etc. The supreme court consists of a chief and two associate justices (elected by a joint vote of the legislature for eight years), the attorney-general, and a clerk and reporter. It has appellate jurisdiction only except in particular cases indicated by the constitution. Sessions are held at Little Rock in January and July. Pulaski County, in which is the seat of government, has a court of chancery. Judges of circuit and prosecuting attorneys are elected by the people, the former for four and the latter for two years; and hold two terms annually in their respective circuits. Their jurisdiction is original in all criminal and civil cases where not specially otherwise provided. Judges of inferior courts, justices of the peace, etc., are elected by the people for four years.

* In 1854 the quantity of land in cultivation was 875,180 acres, of which 256,666 acres were in cotton and 600,513 in grain, and the products of 1853 amounted to—cotton 160,779 bales, and Indian corn 11,586,969, wheat 332,585, and oats 1,040,206 bushels.

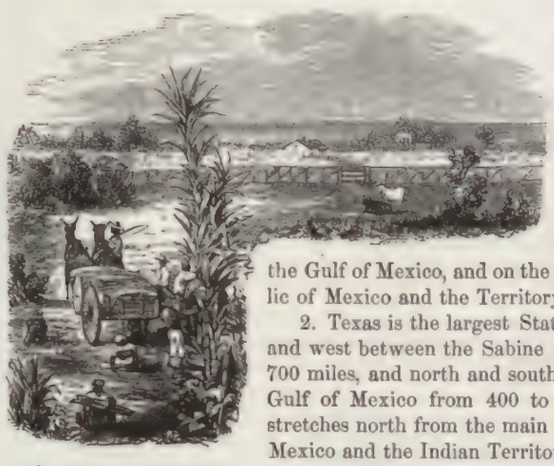
25. The finances of the State are made up for a period of two years. For the terms ending 30th September, 1850 and 1856, the receipts amounted to $89,988 and $332,287, and the total resources (including balances from next preceding terms) to $102,670 and $391,059. The total disbursements for the two periods amounted to $58,616 and $213,832. The revenue is derived chiefly from taxes. The outstanding absolute debt of the State (contracted on account of the old banks) amounted on the 1st November, 1855, to $1,506,017, and the contingent debt to $1,813,579. The government owns about 8,000,000 acres of swamp lands. Taxable property within the State in 1850 was valued at $34,995,885, and in 1855 to $65,479,734. Among the property taxed in 1855 were 122 saw-mills, 86 tanneries, and 26 distilleries. The penitentiary at Little Rock is the only public institution supported by the State.

26. In 1850 there were enumerated as having attended school in that year 23,361 scholars, being at the rate of one to every 6.9 of the free population. On the 1st of June, 1850, the statistics of the various educational institutions in the State were as follows:

Institutions.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	353	355	8,493	$43,763
Academies and private schools	90	126	2,407	27,937
Universities and colleges	3	14	150	3,100

—making a total of 446 schools, 495 teachers, and 11,050 scholars; and an annual income of $74,800. The number of free persons over 20 years of age who could not read and write was 16,935, of which 16,908 were Americans and 27 foreigners, and 16,819 white and 116 free colored persons.

27. The most numerous of the religious denominations in Arkansas are the Methodist, Baptist, and Presbyterian. If the total population be divided into twelve parts, five of these would belong to the Methodist, four to the Baptist, and two to the Presbyterian. The remaining one twelfth is divided among the Roman Catholic, Episcopal, and the minor denominations under a variety of names. The whole number of churches in 1850 was 362, with accommodation for 60,226 persons, and the value of church property in the same year was $89,315, or about $1 50 for each sitting provided.



28. Little Rock, the seat of government, is situated on the right bank of the Arkansas, 300 miles from its mouth. Latitude 34° 40′ north, and longitude 83° 12′ west. The city, which stands on a high rocky bluff, the nearest rock to the mouth of the river, was founded in 1820. It is regularly laid out, and contains, besides the State and court houses, a United States arsenal, the State penitentiary, six or seven churches, etc., etc. Steamboat communication is established with the principal river towns, and a considerable trade is carried on both above and below. Population 2,167.

29. Arkansas Post, about 50 miles up the river, was settled by the French in 1685, and is the oldest town within the State. Population 584. Van Buren and Fort Smith, both on the Arkansas and near the western boundary, are thriving trading towns—the former with 964, and the latter with 1,382 inhabitants.

30. The population of several county towns is returned in the census of 1850 as follows: Warren, 679; Carrollton, 923; Arkadelphia, 248; Marion, 696; Princeton, 1,163; Napoleon, 239; Washington, 469; Batesville, 848; Pine Bluff, 460; Clarksville, 398; Huntsville, 255; Camden, 894; Helena, 614; Bolivar, 648; Waldron, 90; Paraclifta, 144; El Dorado, 1,925; and Fayetteville, 598. There are also other flourishing towns, chiefly on the lines of the great rivers.

31. Arkansas was a part of French Louisiana purchased by the United States, April 30th, 1803; and subsequently it formed a portion of the "Territory of Louisiana," and of "Missouri Territory" until 1819, when it was erected into a separate territory under its present name, derived from the great river which flows through it. Having adopted its constitution, Arkansas was admitted into the Union by act of Congress, June 15th, 1836. For the last ten or twelve years its progress has been rapid, and in the mean time its population has nearly duplicated.

STATE OF TEXAS.

1. Texas, formerly an independent republic, and at a still earlier date a province of Mexico, is situated between latitudes 25° 50′ and 36° 30′ north, and longitudes 93° 30′ and 106° 45′ west; and is bounded on the north by New Mexico and the Indian Territory, on the east by Arkansas and Louisiana, on the south by the Gulf of Mexico, and on the southwest and west by the Republic of Mexico and the Territory of New Mexico.

2. Texas is the largest State of the Union. It extends east and west between the Sabine and the Rio Grande from 500 to 700 miles, and north and south between the Red River and the Gulf of Mexico from 400 to 600 miles; a large section also stretches north from the main body of the State between New Mexico and the Indian Territory, extending from 34° to 36° 30′ north, with a width of three degrees. The area of the whole is computed at 237,504 square miles,* or 8.09 per cent. of the whole surface of the United States—an extent of territory nearly equal to that of the Austrian Empire and more than three times that of the six New England States. The coast-line has a length of 392 miles, but including its bays and other irregularities a length of 940 miles, or one mile of coast to every 253 square miles of surface. The islands by which it is beset have an additional shore-line of 390 miles.

* The State commissioner of land office estimates the area at 274,356 square miles, or 175,594,350 acres, of which in 1855 only 102,158,359 acres remained in the State's possession.

3. Texas may be divided into three physical districts or regions, each of which in many respects is entirely different from the others. These are the level, the undulating, and the hilly and mountain regions, or the lower, middle, and upper districts. The level region occupies the entire coast, extending from 30 to 60 miles into the interior. The undulating succeeds this, and embraces the whole of the interior and north, and reaches westward to the mountain tract. The mountains and table-lands are generally some 200 miles distant from the level regions, and cover the greater portion of northwestern Texas, on the confines of New Mexico. Of these little is as yet ascertained, but they are represented as rivaling the table lands of Anahuac, and to be rich in soil, well-watered, and abounding in the precious metals. The hills are first found between the Brazos and Colorado, but here they present but a low, broken appearance. Westward of the latter river, and north of the sources of the Nueces and San Antonio, the country is traversed in various directions by outliers of the great chain of the Rocky Mountains, none of which, however, attain any great elevation. In the second division are the high rolling verdant prairies, the narrow wooded bottoms, the beautiful islands of timber, the quick-running streams, and the healthful clime. Here the soil, but little broken, is not inferior to that of the alluvial country below, and the products are more varied. In this region the planter may raise cotton and tobacco, every kind of grain, and stock to any extent, and with very little labor. The alluvial lands of the several rivers which make into the Gulf are from three to 20 miles in width, and are heavily timbered, and on many of the rivers are cane-brakes of immense extent. These bottoms, and the alluvial forming the lower section of the State, are the proper fields for the cultivation of rice, sugar, and other Southern staples.

4. No part of the extensive coast of the Gulf of Mexico presents a greater number of harbors, bays, and inlets than that of Texas. The interior is intersected by numerous magnificent and navigable streams. Red River may be considered in part as belonging to Texas, and furnishes to the northeast section an outlet to the Mississippi, and the great mart of the southwest. The chief rivers, those which are more or less navigable for steamboats, are—the Sabine and Neches, the Trinity, the Brazos, the Colorado, the Guadalupe, the San Antonio, and the Rio Grande—the Sabine forming the boundary toward Louisiana and the Rio Grande that toward Mexico. Besides these there are others of less magnitude, though navigable to a considerable extent—the Angelina, San Jacinto, Buffalo Bayou, Oyster and Chocolate bayous, San Bernardo, Caney, Navidad, Lavaca, and Nueces. All these discharge their waters into the Gulf of Mexico, either directly or through large bays and estuaries. There are no lakes of any importance to be found in the country. A few small ones near the sources of the Guadalupe, and on some of the tributaries of the Red River and the Trinity, are all that are worthy of the name, and they are inconsiderable. To a country so well watered, intersected by rivers so numerous, and offering such valuable facilities for canal communication, they would be useless. Indeed, its vast water-courses might be united in one great navigable chain, which would render transportation from any section to a commercial emporium at any point on the coast a matter of the utmost ease, and not expensive.

5. Texas abounds in minerals. The silver mine of San Saba is among the richest in the world, and in Spanish times afforded a large revenue. Gold has been found on the Atoyac and other streams, and silver also on the Bedais. Iron ore pervades the greater portion of the country. Lead, copper, alum, etc., are found in several parts; and bituminous coal on the Trinity and Brazos. Salt is exceedingly abundant. The undulating country furnishes limestone, and in the level districts there are immense deposits of oyster shells. Agate, chalcedony, jasper, and some singular petrifactions are found near the mountains. Quarries of red and white sandstone or freestone abound throughout the country, and at Austin there is a quarry of white stone similar to that of the Paris basin, and of which the Louvre is built. The same kind of stone is found on the Trinity and in the vicinity of San Antonio de Bexar. Mineral springs—salt, sulphur, chalybeate, etc.—are numerous, and many of them of great value.

6. Though varying with location from tropical to temperate, the climate is remarkably pleasant and salubrious. The average notation of the thermometer in the summer season is 80° Fahr. During winter, ice is seldom seen except in the northwestern part of the State. Periodical winds, from the north in winter and from the south in summer, pass over the country, purifying the atmosphere and contributing much to the salubrity. The climate, indeed, is modified by so many favoring circumstances as to possess all the genial influences of Louisiana, while it escapes its attendant evils.

7. Texas in her forests has an infinite variety of timber suitable for building and ornamental purposes. Her forests of live-oak and cedar are unrivaled. The whole coast, nearly, including all the bayous and river bottoms, from the Sabine to the Nueces, is one entire belt of timber. The eastern section, probably, embraces more woodland than any other. It is heavily timbered with pine, oak, ash, walnut, hickory, pecan, mulberry, cedar, cypress, and other forest trees which extend to the Red River, occasionally variegated with beautiful prairies of greater or less extent. The soil is admirably adapted to grasses and other agricultural staples.

8. Among the productions that may be regarded as naturally adapted to the soil, and which now forms a chief and important article of commerce, cotton stands pre-eminent. This is the great staple of Texas. The sugar-cane grows luxuriantly throughout the whole level region, and tobacco throughout the State. The indigenous indigo of Texas is also an important staple, and of very superior quality. Breadstuffs of every description are produced easily and abundantly in every district, while flax and hemp are prospectively valuable crops. The fruits of the north and of the tropics flourish alike in this State. The fig is common, the peach unrivaled, the nectarine, quince, and grape luxuriant, and these, side by side, grow in the same sun and soil with the plum, apple, and pawpaw. The orange, lemon, and lime, the pine-apple and olive, ripen together. Berries are in great variety; the mulberry, dewberry, whortleberry, and gooseberry grow wild and in great profusion; and nuts—pecan, walnut, hickory, etc.—are very abundant. Garden vegetables of every description are cultivated with success.

9. In 1850 Texas contained 212,592 inhabitants, constituting 28,377 families, and occupying 27,988 dwellings. This population gave the State 0.89 inhabitants to the square mile, and

was 0.92 per cent. of the total population of the United States. The population of the counties was as follows:

Counties.	Population.	County Seats.
Anderson	2,884	Palestine.
Angelina	1,165	Marion.
Austin	3,841	San Felipe.
Bastrop	3,099	Bastrop.
Bexar	6,052	San Antonio.
Bowie	2,912	Boston.
Brazoria	4,841	Brazoria.
Brazos	614	Booneville.
Burleson	1,713	Caldwell.
Caldwell	1,329	Lockhart.
Calhoun	1,110	Port Lavaca.
Cameron, Starr, Webb	8,541	Brownsville, Rio Grande, Webb C. H.
Cass	4,991	Jefferson.
Cherokee	6,673	Rusk.
Collin	1,950	M'Kinney.
Colorado	2,257	Columbus.
Comal	1,723	New Braunfels.
Cook	220	Cook C. H.
Dallas	2,743	Dallas.
Denton	641	Alton.
De Witt	1,716	Cuero.
Ellis	989	Waxahachi.
Fannin	3,788	Bonham.
Fayette	3,756	La Grange.
Fort Bend	2,533	Richmond.
Galveston	4,529	Galveston.
Gillespie	1,240	Fredericksburg
Goliad	648	Goliad.
Gonzales	1,492	Gonzales.
Grayson	2,008	Sherman.
Grimes	4,008	Anderson
Guadalupe	1,511	Seguin.
Harris	4,668	Houston.
Harrison	11,822	Marshall.
Hays	387	San Marcos.
Henderson	1,237	Athens.
Hopkins	2,623	Tarrant.
Houston	2,721	Crockett.
Hunt	1,520	Greenville.
Jackson	996	Texana.
Jasper	1,767	Jasper.
Jefferson	1,836	Beaumont.
Kaufman	1,047	Kaufman.
Lamar	3,978	Paris.
Lavaca	1,571	Petersburg.
Leon	1,946	Leona.
Liberty	2,522	Liberty.
Limestone	2,608	Springfield.
Matagorda	2,124	Matagorda.
Medina	909	Castroville.

—of the total population 154,034 (72.45 per cent.) were whites—84,869 males and 69,165 females; 397 (0.16 per cent.) free colored persons—211 males and 186 females, and 58,161 (27.36 per cent.) slaves—28,700 males and 29,466 females.

10. Of the total free population in 1850 the American born amounted to 137,053 (88.69 per cent.) of which 49,160 were natives of this State; the foreigners numbered 16,774, and there were 604 whose origin had not been ascertained. The number of natives of Texas resident in other States of the Union was 2,481.

11. The population of Texas in 1855 was estimated at 482,837, showing that the number of inhabitants had more than duplicated in the five years then ending. This rapid increase is due alike to foreign and domestic immigration. The foreigners settling in this State—chiefly in the west—are principally Germans, who come here in strong colonies under influential patronage and settle on the best lands. Their settlements are among the best cultivated and most flourishing in the State.

12. In 1850 there were in the State 42,856 free male persons over 15 years of age whose occupations were ascertained. Of these 7,327 were employed in commerce, trade, manufactures, mechanic arts, and mining; 25,299 in agriculture; 6,194 in labor not agricultural; 584 in the army; 321 in sea and river navigation; 1,368 in law, medicine, and divinity; 996 in other pursuits requiring education; 677 in government civil service, and 90 in unclassified occupations.

13. Thus the preponderant employment of the people is agriculture. In manufactures little progress has been effected. Commerce, however, is considerable, as in all new countries without manufactures, and which produce, as Texas does, such valuable staples as cotton and sugar. The industry of this State, however, is still in a very undeveloped condition, and its vast resources as yet but partially touched.

14. Texas in 1850 contained 12,198 farms and plantations, covering 11,496,339 (improved 643,976 and unimproved 10,852,363) acres, or about one eighth of the whole area. The value of these was $16,550,008, and the value of implements and machinery thereon $2,151,704.

FARM IN TEXAS.

15. The livestock of Texas in 1850 consisted of—horses 76,760, and asses and mules 12,463; 217,811 milch cows, 51,285 working oxen, and 661,018 other cattle; 100,530 sheep, and 692,022 swine—in all valued at $10,412,927. The value of animals slaughtered during the year had been $667,486. The products of the dairy consisted of 2,344,900 pounds of butter and 95,299 pounds of cheese, and the wool crop amounted to 131,917 pounds.

16. The cereals were produced in the following quantities: wheat, 41,729; rye, 3,108; oats, 199,917; Indian corn, 6,028,876; barley, 4,776, and buckwheat, 59—in all 6,277,565 bushels. The potato crop amounted to (including Irish 94,645) 1,426,803 bushels; that of peas and beans to 179,350 bushels, and that of hay to 8,354 tons.

17. Of the Southern staples, Texas produced 7,351,000 pounds of sugar; 441,918 gallons of molasses; 23,228,800 pounds of cotton; 88,203 pounds of rough rice, and 66,897 pounds of tobacco.

18. Among the miscellaneous products of the farm are also noted 380,825 pounds of beeswax and honey, 1,048 pounds of flax, and 99 gallons of wine. The value of market-garden products in 1850 was $12,354, and of orchard products $12,505. The total value of agricultural products for the census year was $9,065,181.

TEXAS LOG CABIN.

19. Texas in 1850 had 309 manufacturing and mechanic establishments, employing a collective capital of $539,290 and 1,066 hands, the cost of whose labor was $322,368. The value of raw material consumed was $394,642, and the products of the year amounted to $1,165,538. The value of goods produced in families was $266,984.

20. The direct foreign trade of Texas is comparatively insignificant. In 1850 the total value of merchandise exported from its own ports to foreign countries amounted to only $24,958, and in 1855 to $916,961. The imports of the same years were valued at $25,650 and $262,568. For the same two years the shipping cleared amounted to 3,608 and 10,964 tons, and entered to 3,671 and 8,553 tons; the shipping owned in the State to (registered 416 and steam 979) 3,897 and (registered 2,256 and steam 2,479) 8,801 tons, and the shipping built to 105 and 323 tons.

21. The great bulk of the commercial products are sent coastwise to New Orleans and the Atlantic ports, and the imports are returned by the same routes. Thus the coasting trade is far more valuable than the direct foreign trade. In this several steamers are employed, and a large sailing tonnage. The principal route to New Orleans is from Galveston by steamer to Brashear, on the Atchafalaya, and thence by New Orleans, Opelousas and Great Western Railroad. Other lines connecting at Galveston call at all the ports westward to the Rio Grande. Regular sailing packets ply between Galveston and New York, etc.

22. The internal trade of Texas is carried on by means of its rivers and the railroads so far as constructed. Steamers navigate all the great rivers, communicating with Galveston and other ports of the sea-board. The railroads of the State have their principal center at Houston, and diverge thence in every direction; but as yet the length of line completed is not above 200 miles. Galveston is the great center of both foreign and domestic trade.

23. The government of Texas is based on the constitution of 1845. By this instrument the right of voting is secured to every white male citizen 21 years of age, and who has resided in the State twelve and in the district six months next preceding an election. The general election is held on the first Monday in August.

24. The legislature is composed of a senate of 21 members, elected for four years, one half every second year, and a house of representatives of 66 members, elected for two years. Every voter is eligible as a representative. Senators must be 30 years of age. The legislative sessions are biennial, commencing on the first Monday in December. The sixth biennial session was held in 1855.

25. The governor and lieutenant-governor are elected for two years. They must have the qualifications of senators, and the lieutenant-governor is *ex-officio* president of the senate. The principal administrative officers are the secretary of state, attorney-general, state treasurer, controller, auditor, commissioner of claims, etc.

26. The judiciary is exercised by the supreme court, district courts, county courts, and justices of the peace. All judges are elected by the people for six years. The supreme court consists of a chief-justice and two associates, with a clerk and reporter, and holds annual sessions at Austin (October), Galveston (January), and Tyler (April). This court has appellate jurisdiction only. The State is divided into 18 districts, and the district court judges hold two sessions in each county annually. This court has original jurisdiction in all criminal cases, and in all suits, both in law and equity, in which the value in suit is $100. In criminal cases, if the punishment be not specifically determined by law, the jury determine it; in equity cases either party may demand a jury. There is also in each county a county court sitting once a month as a court of ordinary, and once in three months for the transaction of county business. Justices of the peace, with jurisdiction to the amount of $100, are elected in precincts for two years.

27. Texas is entirely free from debt, and on 31st October, 1854, had resources on hand amounting to $1,741,063, and received during the year then commencing, for back dues and interest, the sum of $123,243, making the total resources of the treasury for 1855, $1,864,306. The total disbursements for the year ending 31st October, 1855, amounted to $249,558, leaving a balance on hand amounting to $1,614,748. Since 1851 the expenses of the State have been paid from the general fund, consisting of United States 5 per cent. bonds, which were obtained in the settlement of the northwestern boundary. The State taxes in the meanwhile (with the exception of one tenth thereof, which is appropriated to the school fund) have been paid over to the counties in which they were assessed, for the erection of county buildings and other county expenses. In 1854 these amounted to $246,521, and in 1855 to $273,823. The valuation of taxable property in 1850 was $52,740,473, and in 1855, $149,521,451. The public domain, over and above all claims under the late Republic and the State, amounts to 102,158,359 acres.

28. The principal institutions founded and supported by the State are—the State University, for which 221,400 acres of land have been set apart; the Lunatic Asylum, for the erection of which $50,000 were granted, and for its support $10,000 a year, also 100,000 acres of land; asylums for the deaf and dumb and the blind, to each of which 100,000 acres

SCALE OF STATUTE MILES.

0 10 20 40 60 80 100

50 Geographical or 57.63 Statute Miles, to one inch.

Entered according to Act of Congress in the Year 1858 by J.H. Colton & Co. in the Clerks Office of the District Court of the United States, for the Southern District of New York.

were granted and $5,000 a year; the State Orphan Asylum, to which 100,000 acres were granted, and the State Prison at Huntsville, etc.

29. The number of children in the State in 1850 attending school was 19,389, or one in every 7.9 of the population. On the 1st June of the same year the condition of educational institutions was as follows:

Institutions.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	349	360	7,946	$44,088
Academies and private schools	97	137	3,389	39,384
Universities and colleges	2	7	165	1,000

—making a total of schools 448, of teachers 504, and of scholars 11,500, and an annual income of $84,472. The total number of free persons above 20 years of age unable to read and write was 10,583, of which 8,095 were Americans and 2,488 foreigners; and 10,525 white and 58 free colored persons.

30. In 1855 the number of scholars between 6 and 18 years of age was returned at 66,150. For the support of free schools the State has a permanent fund of $2,128,666, which is invested in United States 5 per cent. bonds, and this fund is annually increased by the addition of one tenth of the annual revenue derived from taxation. Besides this fund, the income of which is distributed to the counties, each county has four leagues or 17,712 acres of land set apart for the support of schools.

31. In 1850 Texas contained 328 churches of all denominations, with accommodation for 64,155 persons, and the value of church property was $206,930. The most numerous denominations were the Methodist, which counted more than one half the population, and the Baptist, Presbyterian, and Roman Catholic, which together counted a full third of the whole. The remaining sixth of the population belonged to the Episcopal and several minor denominations. The change in the relative denominational aspect of the State, however, must have materially varied in the next subsequent five years, in consequence of the vast influx of a foreign population.

32. Austin City, the capital of the State, is situate on the north bank of the Colorado, about 200 miles from the Gulf of Mexico. Latitude 30° 17′ north, and longitude 97° 48′ west. The river is navigable to this point during high water for steamboats. The State House is a new and handsome edifice. The city is a place of considerable business, and in the progress of events must become a leading center of trade. A railroad is being built from Houston to this place.

33. Galveston is the principal sea-port and largest city of the State. It is situate at the east end of the island at the mouth of the bay, both of the same name, and has the best harbor on the coast. Nearly all the foreign business of the State is transacted here, and regular lines of steamers communicate with New Orleans, about 450 miles to the east. A railroad is in operation to Houston. Houston is situate on Buffalo Bayou, about 40 miles from Galveston Bay, at the head of steamboat navigation. It is the shipping port for a fine agricultural region, in which cotton and sugar are largely produced. Railroads diverge hence in all directions. Harrisburg, lower down the bayou, is also a thriving town.

34. San Antonio, an ancient Spanish town on the river of the same name, is noted for its wealth and refinement. The town is also famous on account of the massacre of the Texan patriots at the Alamo, on the 6th March, 1836. It is an active business place, and has of late years become the depôt of a large and flourishing agricultural region. The San Antonio and Mexican Gulf Railroad connects it with the sea-board.

35. The other principal towns in Texas are—Bonham, Castroville, Comal, Corpus Christi, Crockett, Eagle Pass, Fredericksburg, Hortontown, Indianola, Lavaca, Marshall, M'Kinney, Nacogdoches, New Braunfels (a German settlement), Palestine, Richmond, Rusk, Victoria, etc.

36. The first European settlers in Texas were the French at Matagorda, but these were expelled by the Spaniards in 1690. Texas was a territory of the Mexican Republic until March, 1836, when it declared itself independent, which was conceded by Santa Anna after the battle of San Jacinto, 21st April, 1836, but this concession was not ratified by the senate. The first congress under the constitution held its first session at Houston, October 1st, 1836. The joint resolutions of the United States Congress admitting Texas into the Union were signed by the President of the United States on March 1st, 1845, and ratified by the Congress of Texas on the 4th July following. The State constitution was adopted at Austin City, August 27th, and ratified by the people October 13th, 1845. The first State legislature convened at Austin, February 16th, 1846, and annexation was consummated and the first governor of the State installed February 19th of the same year. The act of annexation led to the war with Mexico. Texas may hereafter be divided into five States.

STATE OF TENNESSEE.

TENNESSEE is situated between latitudes 35° and 36° 35′ north, and longitudes 81° 37′ and 90° 28′ west; and is bounded on the north by Kentucky and Virginia, on the east by the Alleghany Mountains and North Carolina, on the south by Georgia, Alabama, and Mississippi, and on the west by the Mississippi River, which separates this State from Arkansas and Missouri.

2. The greatest length of this State is on its northern frontier, where it measures about 420 miles, and its general width is from 100 to 110 miles. The area is estimated at 45,600 square miles, and hence Tennessee occupies 1.55 per cent. of the whole territory of the Union.

3. Tennessee is, perhaps, more diversified in the character of its surface than any other of the central States. In the east, mountain prevails, and in this section the country is traversed in a north and south direction by several ridges of the Apalachian chain, and in its topography presents much picturesque and beautiful scenery. The middle portion of the State is less bold in outline, and the surface imperceptibly declines by gradations from a region overspread with hills and swells of ever-changing and varying elevation and character, to a rolling country of excellent fertility, and watered by innumerable streams, affluents of its great rivers, the Cumberland and Tennessee. Between the Tennessee and the Mississippi, in the west, the surface is nearly level, the general evenness being interrupted only by the courses of the low watersheds dividing the tributaries of the two rivers, or by alternations of woodland and prairie. In all the country, however, there are few portions so hilly and broken as to interfere with its agricultural capacities; the hills are clothed with wood to their summits, and the soil is everywhere sufficiently fertile for profitable cultivation or yields nourishing grasses for pasturage to the hill-tops. The east abounds in minerals of the most valuable description, and the spurs of the mountains disclose in the various rocks useful building materials.

4. The Kittatinny range, under the local names of Stone, Bald, Iron, Smoky, and Unika mountains, forms the dividing line between Tennessee and North Carolina, while the prolongation of the Alleghany chain, of Chestnut Ridge, and of Laurel Ridge traverse the State north and south. The latter, which here takes the name of Cumberland Mountains, spreads out in this State to a breadth of about fifty miles, filling that section of the country which lies between the Tennessee and Cumberland rivers, before they take a westerly course, with long, irregular ridges, of no great elevation. Perhaps none of their summits exceed 2,000 feet in height, but the chains are continuous, interrupted only at great intervals by gaps or passes. In some places they are rocky and rugged, while in others, and generally, they swell gently from their elevated bases and embosom numerous delightful and fertile valleys. The valleys of the great streams—the Tennessee and Cumberland—differ little from the alluvions of other large rivers of the central region of the Union. In the small valleys are many fine plantations, so lonely that they seem lost among the mountains.

5. Noble rivers, open to navigation, and fine, pure streams, furnishing ample power for economical purposes, are distinguishing features of Tennessee. The Mississippi washes the western border for 160 miles, and its banks within the State afford some of the most commercial sites to be found in its long course.

6. The Cumberland has its sources and mouth in Kentucky, but runs for about 250 miles in Tennessee, through which is its most southern bend; it enters the State in longitude 85° 40′, and leaves it in 88° 12′, and within 12 miles to the east of the Tennessee River. To the city of Nashville, the capital of the State, navigation is easy and convenient.

7. The Tennessee also rises beyond the limits of the State. The Clinch and Holston have their sources in the Alleghany Ridge of Virginia, but the Watauga, a tributary of the Holston, the Nolichucky, and Big Pigeon, branches of the French Broad River, the Little Tennessee, and the Hiwassee, all rise in the Blue Ridge. The Little Tennessee is often considered as the main river, but it is much inferior to the Holston, with which it unites, and the confluence of the Holston and Clinch forms the Tennessee. Most of these rivers are navigable by boats, and they receive numerous valuable mill streams. The junction is effected at Kingston, whence the course of the Tennessee is south and southwest, until it enters Alabama, through which State to the Mississippi State line its course is west, and thence its course is north, through Tennessee and Kentucky, to the Ohio. After re-entering Tennessee, it flows 200 miles within its limits, and is navigable throughout that distance for steamboats. The Elk and Duck are its only considerable tributaries; rising in the same district, on the western slope of the Cumberland Mountains, they reach their common recipient at a distance of 200 miles from each other, and are both navigable for a considerable distance.

8. The Sequatchee is a smaller stream, flowing through a rich and beautiful valley in the Cumberland Mountains. Caney Fork and Stones River, the principal tributaries of the Cumberland, are navigable streams; the former rises within the mountains and the latter on their western slope. Western Tennessee is almost entirely drained by affluents of the Mississippi.

9. The mineral resources of Tennessee consist of valuable deposits of iron, copper, lead, etc., of which the ores are exceedingly rich. These are principally located in the eastern and middle sections of the State. Copper is of recent discovery, and promises to become a rich acquisition to the known mineral resources of the country. Iron is extensively reduced along the borders of the Cumberland River. The lead mines, although of easy excess, have only been partially worked. Gold is also found in the State. The gold region extends into the northeastern part of Tennessee, but the metal has not been collected in large quantities.

10. Coal of excellent quality has been mined in the mountains, but being less accessible than the coal fields of Ohio, operations have not been extensive. Formerly this coal was more extensively mined, and carried from Crab Orchard Mountain, near Emory's River, down the Tennessee to New Orleans. The supposed coal of Williamson, Davidson, and Maury counties, according to Prof. Troost, is aluminous slate.

11. The State contains quarries of excellent marble and other calcareous formations; gypsum is also abundant; nitrous earths are found in the limestone caverns, and there is a variety of other useful minerals throughout the country. East of the Tennessee, salt is abundant, and in the eastern section there are numerous sulphur and other mineral springs. Many of the caverns are of great extent; some have been explored for a distance of ten miles, and contain spacious apartments, and are traversed by considerable streams.

12. The climate of Tennessee is mild and genial, being free alike from the scorching heats of the south, and the chilling blasts of the north. Cattle may graze on the plains throughout the winter. Its salubrity is unquestionable; the low valleys, where the waters are stagnant, and the alluvions of the great rivers, being exceptions. The soil of east Tennessee, principally calcareous, is eminently fertile. In the west the soils vary; and the strata descend from the mountains in the following order: first, loamy soil or mixtures of clay and sand; next, yellow clay; next, a mixture of red sand and red clay; and lastly, white sand. In the southern parts are immense beds of oyster shells, on high table-land, at a distance from any stream. Nearly all the forest trees of the central country are found in this State. Juniper, cedar, and red savin cover the mountains. The pine forests of the eastern section are valuable for their tar, turpentine, etc. The sugar-maple is very abundant. Fruit in all its varieties is raised in great perfection in every part. The agricultural productions are similar to those of the Ohio valley generally, with the addition of cotton, which is grown chiefly in the south and west. The east is mainly engaged in cattle rearing, and exports largely to the south. Tobacco and hemp are also staples of Tennessee, and in quality are excellent.

13. With all these natural advantages and resources, however, the material wealth of the State has not progressed as might have been expected from the increase of its population. In proportion to capitation, indeed, the production of many staples has decreased, and in some cases there has been an absolute decrease. Such are the deductions predicated on a comparison of the official returns of 1840 and 1850 respectively. In cotton and hemp alone has there been any great increase.

14. In 1850 Tennessee contained 1,002,717 inhabitants, being 21.99 to the square mile or 4.32 per cent. of the total population of the United States. This population was included in 130,004 families, and inhabited 129,419 dwellings; and was distributed as follows:

—of the total population 756,836 (75.47 per cent.) are white persons—382,235 males and 374,601 females; 6,422 (0.64 per cent.) are free colored persons—3,117 males and 3,305 females, and 239,459 (23.8 per cent.) are slaves—118,780 males and 120,679 females; and the free population of 1850 was composed of 755,655 (99.01 per cent.) Americans, of which number 585,084 were born in this State, 5,740 were of foreign birth, and 1,863 were of origin not ascertained. The number of natives of Tennessee residing in other States was 241,606.

15. In 1790 Tennessee had 35,791 inhabitants; in 1800, 105,602; in 1810, 261,727; in 1820, 422,813; in 1830, 681,904; in 1840, 829,210, and in 1850 1,002,717. In 1855 the population was estimated at 1,107,583.

16. Of 168,240 free male persons, white and colored, over 15 years of age employed in industrial pursuits in 1850, the numbers employed in the several branches were as follows—23,432 in commerce, trade, manufactures, mechanic arts, and mining; 118,979 in agriculture; 17,559 in labor not agricultural; 258 in sea and river navigation; 3,363 in law, medicine, and divinity; 3,589 in other pursuits requiring education; 705 in government civil service; 10 in domestic service, and 345 in unclassified pursuits.

17. Tennessee is eminently an agricultural State; but it has also valuable manufactures, and mining is carried on to some considerable extent. Its internal trade is large, and its position in relation to the great lines of travel secures it all the benefits of an extensive transit trade between the sea-board and the neighboring States.

18. Mining operations are chiefly carried on in the neighborhood of the Cumberland River, and in some other parts of eastern and middle Tennessee. This is one of the great industrial interests of the State, and whether looking to iron, lead, or copper, is being rapidly developed. Coal is also claiming general attention.

19. In 1850 Tennessee contained 72,735 farms and plantations, which occupied 18,984,022 (improved 5,175,173 and unimproved 13,808,849) acres of land, valued at $97,851,212, and the value of implements and machinery thereon was $5,360,210. Thus about two thirds of the whole area were in private hands, and a little more than one sixth under cultivation.

20. The quantity of livestock in the State at the census periods of 1840 and 1850 was comparatively as follows:

1840	horses, mules, etc.,	341,409	neat cattle,	822,851	sheep,	741,593	swine,	2,926,607
1850	"	"	345,989	"	750,762	"	811,591	"	3,104,800

—and the whole in 1850 was valued at $29,978,016. The value of animals slaughtered in 1849–50 had been $6,401,765; and the products of animals in that year—butter 8,139,585, cheese 177,681, and wool 1,364,378 (in 1840, 1,060,332) pounds. The number of asses and mules in the State in 1850 was 75,303; of milch cows 250,456, and of working oxen 86,255, all included in the table above.

21. The cereal crops (bushels) of 1840 and 1850 compare as follows:

1840	wheat,	4,569,692	rye,	304,320	oats,	7,035,678	Indian corn,	44,986,188	barley,	4,809	buckwheat,	17,118
1850	"	1,619,386	"	89,137	"	7,703,086	"	52,276,223	"	2,737	"	19,427

—being in the aggregate in 1840, 56,917,805, and in 1850, 61,709,996 bushels. The potato crop in the same years amounted to 1,904,370 and 3,845,560 (Irish 1,067,844 and sweet 2,777,716) bushels. The crop of peas and beans in 1850 amounted to 369,321 bushels; the hay crop in 1840 to 31,233, and in 1850 to 74,091 tons; and in 1850 the crop of clover and grass-seed to 14,214 bushels.

22. The staple crops grown in this State in 1840 and 1850 were as follows:

1840	hemp and flax,	3,344 tons	cotton,	27,701,277 lbs	rice (clear),	7,977 lbs	tobacco,	29,550,432 lbs.
1850	"	"	779	"	"	77,812,800	"	" (rough),	258,554	"	"	20,148,932	"

—and in the latter year there were produced 3 hogsheads of cane sugar.

23. Among the miscellaneous products of 1849–50 are enumerated: hops 1,032 pounds, beeswax and honey 1,036,572 pounds, flax-seed 18,904 bushels, maple sugar 158,557 pounds, silk cocoons 1,923 pounds, etc. The value of market-garden products was $97,183, and of orchard products $52,894.

24. The total value of agricultural products in 1840 was $27,917,692—1850, $50,394,447.

25. In 1850 Tennessee contained 2,861 manufacturing, mining, and mechanic establishments, in which was employed an aggregate capital amounting to $6,975,279. The value of the raw material consumed in the preceding year had been $4,900,952, and the average number of hands employed 12,032, of which 878 were females. The cost of labor amounted to $2,277,228, and the value of the products of the year was $8,570,920. Among the establishments were 33 cotton-mills, with capital amounting to $669,600; 23 pig-iron works, with capital $1,021,400; 16 cast-iron works, with capital $139,500; 42 wrought-iron works, with capital $755,050; 30 distilleries, with capital $25,025, etc. In 1810 the total value of manufactures in Tennessee (including goods manufactured in families) was $2,747,701, in 1840, $8,517,394, and in 1850, $12,880,476.

26. Tennessee has no direct foreign commerce, but makes its imports and exports at New Orleans, Savannah, Charleston, and the Northern ports. The internal and transit trade—carried through its rivers, railroads, and other channels—however, is extensive. Memphis, Nashville, and Knoxville are the principal trading places. The exports are cotton, wool, hemp, flax, and cattle. The shipping owned in the State in 1850 was 3,776 and in 1855, 8,403 tons.

27. The system of railroads in Tennessee is as yet but partially completed, but great progress has been made, and several extensive lines have been projected. From Nashville and Knoxville, the principal centers, lines diverge in every direction—north toward Henderson, Louisville, Cincinnati, and Maysville; east toward Richmond, Wilmington, Savannah, and Charleston; south toward Mobile and New Orleans; and west toward the Mississippi, at Memphis, etc. The great line from Mobile to Cairo also passes through this State, and the Memphis and Charleston Railroad has its western terminus, and part of its course north of the Mississippi State line. Tennessee has no canals, but several of its rivers have been improved and rendered navigable.

28. The government of Tennessee is based on the constitution of 1796 as amended in 1834. The right to vote is granted to every free male white citizen 21 years of age, and who has resided in the county six months next before an election. The general election is held every second year on the 1st Thursday in August.

29. The legislature consists of a senate of 25 members, and a house of representatives of 75 members, all elected for two years. All voters who have resided in the State three years and in the county or district one year are eligible for election, but senators must be 30 years of age. The sessions are biennial, commencing on the 1st Monday of October.

30. The governor is chosen for two years. He must be 30 years of age, and have been a citizen of the State for seven years preceding election. In case of vacancy the speaker of the senate succeeds to the office, and he failing, the speaker of the house. The principal administrative officers are the secretary of state, the state treasurer, the controller, and attorney-general.

31. The judiciary is vested in the supreme court, courts of chancery, and circuit courts. The supreme court is constituted of three judges, one for each of the grand divisions of the State. For chancery purposes the State is divided into six divisions, each with a chancellor; and for circuit court purposes into 14 circuits, each with a separate judge. Davidson, the metropolitan county, has a special criminal court, and the city of Memphis a special common law and chancery court, and a criminal court. All judges are elected by the people of their several precincts for the term of eight years.

32. The revenue of the State is derived chiefly from taxes on property, poll tax, special taxes and licenses, net profits of State banks, etc. The total revenue for the two years ending 15th October, 1855, amounted to $1,035,715, or including a balance from former years to $1,242,147, and the expenditures to $1,154,307, of which $400,783 were paid for interest on State bonds. The value of taxable property in 1850 was $159,558,183, and in 1855, $219,011,048.

33. The absolute liabilities of the State on the 1st October, 1855, were $3,992,857, on which at 5 and 5½ per cent. accrue annually $215,327 interest. Of this liability, $2,051,857 were internal improvement bonds, $1,250,000 bank bonds, and $691,000 Capitol bonds. The State has likewise loaned its bonds to the amount of $4,752,000.

34. The principal institutions supported wholly or in part by the State are—the Hospital for the Insane at Nashville, the School for the Deaf and Dumb at Knoxville, and the Tennessee Penitentiary at Nashville.

35. The number of children attending school in 1850 was 146,200, or one to every 5.2 of the total free population. On the 1st June of the same year the school returns presented the following statistics:

Classification.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	2,680	2,819	104,117	$198,518
Academies and private schools	264	404	9,928	155,902
Universities and colleges	18	83	1,705	65,307

—making a total of 2,962 schools, 3,306 teachers, and 115,750 scholars, and an annual income of $419,727. In 1856 the number of scholars was estimated at 291,407. The number of free persons over 20 years of age unable to read and write was 78,619, of whom 78,114 were Americans, and 505 foreigners, and 77,522 were white and 1,097 free colored persons. The State school fund amounts to $584,000.

36. The principal collegiate institutions with their statistics for 1855 are as follows:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
Tusculum College	Greeneville	1843	2	36	2,000
Washington College	Washington Co.	1795	3	22	2,000
University of Nashville	Nashville	1806	7	101	10,500
Franklin College	Near Nashville	1844	6	106	3,700
East Tennessee University	Knoxville	1806	5	45	5,000
Cumberland University	Lebanon	1844	12	120	5,000
Jackson College	Columbia.	1833	4	90	4,500
Union College	Murfreesboro'	1848	6	133	2,200
Southwest Theol. (Presb.) Sem.	Maryville	1821	2	24	6,000
Theol. School, Cumb. University	Lebanon	1854	2	15	1,000
Law Depart., Cumb. University	Lebanon	1847	3	95	500
" " Univ. of Nashville	Nashville	—	—	—	—
Med. Depart., Univ. of Nashville	Nashville	1850	8	318	—
" " E. Tenn. Univer.	Knoxville	1855	8	—	—

37. The most numerous religious denominations are the Methodist, Baptist, and Presbyterian, which severally include two fifths, a third, and a fourth of the total population. Next

numerically may be named the Christian, Free Church, Episcopal, Union, Lutheran, and others, none of which approach the three prominent denominations. The Roman Catholics have scarcely a representation. Tennessee, in 1850, had 2,014 churches, with accommodation for 625,595 persons; and the value of church property was estimated at $1,216,101.

38. The principal cities of the State are Nashville, Memphis, and Knoxville, the population of which at successive periods has been as follows:

Cities.	1800.	1810.	1820.	1830.	1840.	1850.	1855.
Nashville	345	—	—	5,566	6,929	10,165	16,000
Memphis	—	—	—	—	—	8,851	12 687
Knoxville	518	—	—	—	—	2,076	5,000

—and the following are villages with 500 inhabitants and upward in 1850—in East Tennessee: Chattanooga 1,000, Cleveland 800, Greeneville 600; in Middle Tennessee: Clarkesville 2,000, Columbia 2,977, Dover 530, Edgefield 1,611, Franklin 894, Lebanon 1,554, Murfreesboro' 1,917, Pulaski 1,137, Shelbyville 1,615, South Nashville 1,353; and in West Tennessee: Bolivar 626, Brownsville 971, Dresden 633, Jackson 1,673, La Grange 700, Lexington 700, Paris 1,200, Savannah 800, Somerville 1,200, Trenton 732.

39. Nashville, capital of the State, is situated on the left bank of Cumberland River, 460 feet above the sea, and 184 miles from its confluence with the Ohio. Latitude (*University*) 36° 9′ 33″, and longitude 86° 49′ 3″. It is the most wealthy and populous city of the State, and distinguished alike for the enterprise of its people and its polished society. Many of its private residences are palatial, and its public buildings magnificent. The Capitol, which is built on an eminence 180 feet above the river, is one of the noblest structures in the Union, and cost $1,000,000. It is built entirely of freestone and iron, and roofed with copper. The other principal buildings are the State Lunatic Asylum and State Penitentiary. The University of Nashville, to which is attached a medical school, was founded in 1806, and is one of the most flourishing institutions of the West. The city has also several efficient high schools and female seminaries, and contains about 20 churches of the various denominations.

STATE-HOUSE, NASHVILLE.

40. As a commercial town, Nashville ranks among the great interior marts; and the river, during high water, is thronged with steamers and river boats from all parts. The shipping of the port in 1850 amounted to 3,776 tons, and in 1855 to 6,269 tons, all in steamboats. The trade of the city, however, has been largely promoted by making it the center of a vast system of railroads which come in from every direction, and extend to the great lakes and the Gulf, to the Atlantic sea-board and the whole West. The construction of these works has already given a vast impulse to the prosperity of the city, and when completed will rapidly advance its material interests. Nashville is also the seat of various and valuable manufactures. South Nashville may be regarded as a suburb of Nashville.

41. About 13 miles northeast of Nashville is the "Hermitage," the homestead of the late Andrew Jackson, the renowned general and president. In this secluded abode the last days of that great patriot were passed; and here, on the 8th of June, 1845, he died, at the advanced age of 79 years.

42. Memphis the great western port of Tennessee, is beautifully situated on the fourth Chickasaw bluff, just below the mouth of Wolf River, 414 miles below St. Louis and 798 miles above New Orleans. The site was formerly occupied by Fort Assumption. The bluff on which it stands is 30 feet above the highest floods, and its base is washed by the river for a distance of three miles, while a bed of sandstone, the only known stratum of rock below the Ohio, juts into the stream and forms a convenient landing. From the mouth of the Ohio to Vicksburg, 632 miles, it is the only site for a commercial mart on either side of the Mississippi. The appearance of the town from the river is remarkably fine. An esplanade several feet wide extends along the bluff in front, and is bordered by large blocks of warehouses. The signs of improvement and commercial activity, indeed, are everywhere visible, and in the past 15 years the population has quadrupled. It contains seven or eight churches, a medical college and other schools, etc., and the federal government has recently established a naval depôt here. The river is deep enough to float the largest ship of war from this point to New Orleans, and the building of steamboats has been commenced. Manufactures of cotton, ropes, bagging, and ironware are also carried on. The quantity of cotton shipped from this port is now upward of 200,000 bales a year. Steamboats ply to all the river ports; and its railroads are constantly increasing their traffic as they are extended into the interior. The railroads centering here are the Memphis and St. Louis and the Memphis and Little Rock from the west, and the Memphis and Charleston, the Memphis and Ohio, and the Mississippi and Tennessee—all of which are more or less completed. The line east, toward Charleston, was opened through early in 1857. Tonnage of the port (1855) 2,133 tons, all steam.

NAVY-YARD, MEMPHIS.

43. The other larger towns and villages of the State are—in *West Tennessee:* Bolivar, on the Hatchie, 168 miles southwest Nashville, and at the crossing of the Mississippi Central and Tennessee Railroad. The river is navigable hence to the Mississippi for small steamers two thirds of the year, and an active and increasing trade is carried on; Brownsville, on the Memphis and Ohio Railroad, 57 miles northeast Memphis, and a few miles from the Hatchie River, is the center of an active trade and the seat of a female college. It is surrounded by a rich cotton and corn country; Dresden is a flourishing town on the Nashville and Northwestern Railroad, 125 miles west Nashville; Jackson, on Forked Deer River, where it is crossed by the Mobile and Ohio and the Mississippi Central and Tennessee railroads; La Grange is a town on the Memphis and Charleston Railroad, 49 miles east Memphis; Lexington, on Beech River, an affluent of the Tennessee, 120 miles west-southwest Nashville, is an active trading town; Paris is a trading town 110 miles west Nashville, and is the point of junction of the Memphis and Ohio and the Memphis, Clarkesville and Louisville railroads; Perryville is a small cotton port on the Tennessee, 30 miles east Jackson; Savannah, on the east bank of Tennessee River, 120 miles southwest Nashville, is an active shipping port; Somerville is situated in a populous and fertile region on the Loosahatchie, by railroad 52 miles northeast Memphis, and is a place of large trade; Totten Wells is the point of junction of the Mobile and Ohio and the Nashville and Northwestern railroads; Trenton, on Forked Deer River, and on the line of the Mobile and Ohio Railroad, is a place of considerable commerce, and has several manufacturing establishments.

44. In *Middle Tennessee:* Clarksville, on the Cumberland at the mouth of Red River, and 56 miles northwest Nashville, is a prominent trading town, and is also on the line of the Louisville, Clarksville and Memphis Railroad; Columbia is a beautiful and thriving town on the left bank of Duck River, 45 miles by the Tennessee and Alabama Railroad south-by-west Nashville. It is the seat of Jackson College, founded in 1833, and two female seminaries. The town has a large trade, and will also be the northern terminus of the Southern Central Railroad to Decatur, Ala. The Tennessee and Alabama Railroad, already completed between Nashville and this town, will be extended to the Alabama line, and there connect with the New Orleans, Jackson and Great Northern Railroad from New Orleans. Columbia was the residence of James K. Polk, late President of the United States; Dover is a river-port on the Cumberland, 75 miles west-by-north Nashville; Edgefield is a pleasant village on the Cumberland River opposite Nashville. It is the southern terminus of the Edgefield and Kentucky Railroad, and is connected with the capital by a handsome suspension bridge; Franklin, on Harpeth River, an affluent of the Cumberland, and 19 miles south Nashville by the Tennessee and Alabama Railroad, has cotton and iron factories; Lebanon is situated 30 miles east the capital, and is distinguished for its manufactures. It is also the seat of the Cumberland University, with a law school established in 1847, and a divinity school in 1854; McMinnville is a small town at the terminus of the McMinnville and Manchester Railroad, 105 miles by railroad from Nashville, and is also the southern terminus of the Southwestern Railroad from Danville, Ky.; Manchester, on the same railroad, 23 miles southwest from McMinnville and 12 miles from the Tullahoma junction with the Nashville and Chattanooga Railroad, is situated at the forks of Duck River, which affords excellent water-power. There are some ancient stone walls here, which are attributed to times anterior to the coming of the white man; Mount Pleasant is a thriving town on the Tennessee and Alabama Railroad, 55 miles south Nashville; Murfreesboro', on the Nashville and Chattanooga Railroad, 32 miles southeast Nashville, is situated in a beautiful plain surrounded by a fertile and healthy country. Union College, located here, is a Baptist institution, and there is also in the town a flourishing female academy. Murfreesboro' was capital of Tennessee from 1817 to 1827, in which latter year the State House was burned down; Pulaski is situated on a branch of Elk River, 78 miles south Nashville, and is an active business place; Shelbyville, on Duck River, is a flourishing town reached from Nashville by a branch of the Nashville and Chattanooga Railroad; Winchester is a flourishing town on the Winchester and Alabama Railroad, two miles south of its junction with the Nashville and Chattanooga Railroad, and 85 miles southeast Nashville.

45. In *East Tennessee:* Chattanooga is a new and thriving town on Tennessee River, 151 miles southeast Nashville by the Nashville and Chattanooga Railroad. Here also comes in the Western and Atlantic Railroad from Georgia, and the Memphis and Charleston Railroad line; and it will be the eventual northern terminus of the Northeast and Southwest Alabama Railroad. A railroad is also in progress from Cleveland on the East Tennessee and Georgia Railroad. The surrounding country is abundantly supplied with coal and iron ore, and is eminently fertile. These favoring circumstances have built up a considerable town, and one that is constantly adding to its importance by the development of the country; Cleveland is an active business place on the East Tennessee and Georgia Railroad, 83 miles from Knoxville and 30 east of Chattanooga, to which latter a railroad is now being constructed; Greeneville is a flourishing town on the East Tennessee and Virginia Railroad, 68 miles east-northeast Knoxville. Near this town is Tusculum College; Jonesboro', on the same railroad, is also a thriving town, situated in a highly productive and beautiful valley; Knoxville is the chief city of East Tennessee, and was formerly the seat of the State government. Latitude 5° 59′, and longitude 83° 54′. It is beautifully situated on the right bank of the Holston, which is here navigable for steamboats all the year round, and in winter and spring they ascend to Kingsport. It is the seat of the State Asylum for the Deaf and Dumb and of the East Tennessee University. Knoxville is the chief trading town of this section of the State, and the center of a vast system of railroads which come in from all directions. It has also valuable manufactures and the largest glass-works in the southwest. With these advantages it is rapidly increasing in prosperity. The town was founded in 1794, and was the State capital from that year to 1817; Maryville, 18 miles south-by-west Knoxville, is the seat of the Southwestern Theological Seminary, founded in 1821.

46. Tennessee was originally included within the limits of North Carolina, from which colony the first inhabitants came. These immigrations occurred principally in the years 1754, 1765, and 1770. When the constitution of North Carolina was framed in 1776, Tennessee (then the District of Washington) sent deputies to the constitutional convention. In 1785 the separation of Tennessee from the parent State was attempted, though not accomplished; but in 1789 North Carolina proposed to cede the territory to the United States on certain conditions, which Congress accepted, and by its act of May 25th, 1790, constituted it "The Territory of the United States South of the Ohio." In 1794 Tennessee was erected

into a separate Territory; and in 1796 Congress passed an act enabling the people to form a State constitution, which was adopted, and having been approved by Congress June 1st, 1796, Tennessee was then admitted into the Union.

47. It is now proposed to erect, under the title of Frankland, a new State from the western sections of Tennessee and Kentucky and the northern portion of Mississippi. The reasons for such a proceeding are stated to be the incompatibility of the interests of the different sections as now organized, and the desire of the slave-holding States to have their number and their power in the federal senate increased.

STATE OF KENTUCKY.

1. KENTUCKY is situated between latitudes 36° 30′ and 39° 6′ north, and longitudes 82° 2′ and 89° 40′ west; and is bounded on the north by the Ohio River (separating this State from Illinois, Indiana, and Ohio), on the east by Big Sandy River and the Cumberland Mountains (which divide Kentucky from Virginia), on the north by Tennessee, and on the west by the Mississippi River which separates it from the State of Missouri.

2. The greatest length of Kentucky east and west is about 368 miles, and the greatest width, north and south, which occurs on the meridian of North Bend in Ohio is 172 miles. On account of the eccentricity of the outline of this State, however, its breadth varies exceedingly, being in the west not more than 30 miles, and its length aiso varies as much as 100 miles from a maximum. The area is estimated at 37,680 square miles, or 1.28 per cent. of the whole surface of the United States.

3. The general surface may be described as level or moderately uneven. The levels, however, are not absolute plains, but are interspersed with small risings and declivities, which make a scene of varying interest. In the southeast the Cumberland Mountains, which form the boundary toward Virginia, differ from this character; but even here no great elevations are attained; yet they give to the country overspread by them a rugged and mountainous appearance, and their numerous spurs or offshoots, projecting quite into the middle of the State, render the surface of the whole eastern division somewhat broken and hilly. Farther westward the country becomes undulating, abounding in bold features, although the hills are much less abrupt than in the east, and gradually sink down with more rounded forms and gentle acclivities, until merged into the almost level plains of the Cumberland, Tennessee, and Mississippi rivers. Along the Ohio, and extending from 10 to 20 miles in different places from it, are the Ohio Hills, parallel with that beautiful stream. These hills are often high, generally gracefully rounded and conical, with narrow vales and bottoms around their bases, and give to the country through which they extend a rough appearance; they are covered with lofty forests, and have often a good soil on their sides and summits; and the alluvial bottoms between them and the Ohio, and along the streams which flow into that river, are of the richest description.

4. Nature has been most bountiful to this State in its noble rivers and useful streams. Besides the exterior waters, the Ohio, Mississippi, etc., several important water-courses traverse the interior, and, with the single exception of the Upper Cumberland, these flow in a uniform direction, from southeast to northwest; and while the Ohio is the recipient of all the large rivers of the State, the Mississippi only receives a few inconsiderable streams.

5. The Sandy, Licking, Kentucky, and Cumberland rise in the same region in the mountains of the southeast. The Kentucky is a rapid stream, running, like the other rivers of the State, in a deep channel, with a rocky bed, and generally perpendicular banks; it flows through a rich and highly cultivated country, and in high stages of the water is navigable for steamboats to Frankfort, 60 miles, and for flatboats about 100 miles farther. The Licking, which also flows through a rich region, enters the Ohio opposite Cincinnati, and affords boat navigation for about 80 miles. Salt River rises in the center of the State; it has a great volume of water in proportion to the length of its course, and is navigable for boats 100 miles. It receives from the south a large tributary, called the Rolling Fork. Green River, likewise, rises in the center of the State, and takes a westerly course, until, having received the Big Barren from the south, it turns to the northwest. It has a gentle current, with great depth of water. Steamboats go up to Bowling Green, on the Big Barren, 180 miles, and flatboats ascend to near its head.

6. The Cumberland has its sources and its mouth in Kentucky, but the greater part of its course is in Tennessee. Rising in the western declivity of the Cumberland Mountains, it passes into the latter, and returning north, enters the Ohio in the former State. Its course is about 600 miles long, and steamboats go up to Nashville, Tenn., 120 miles, and in times of flood even to Burkesville, in Kentucky. The Tennessee being separated from the Cumberland by the mountains of the same name, has no portion of its head waters in Kentucky, but it enters the State about 70 miles above its mouth, and admits steamboats to Florence, in Alabama, a distance of about 300 miles. The navigation of several of these rivers has been improved by locks, etc., and in some the obstructions have been overcome by canals and littoral railroads.

7. In the geology of Kentucky the blue limestone occupies a conspicuous place; it forms the surface rock in a large part of the State, and furnishes a valuable material for building purposes. Among the cliffs of the Kentucky is found an excellent marble, capable of a fine polish. The cliff limestone is the base of the Ohio Falls at Louisville; the slate or shale is very common, bituminous, and supports combustion, and contains iron pyrites and ores, giving rise to mineral springs. The sand or freestone extends from Danville to Louisville, etc. The cavernous limestone, as its name imports, gives rise to many caves, the most famous of which is the Mammoth Cave, in Edmondson County. The limestone region, indeed, abounds in caverns, sinks, and subterranean water-courses. Several of the caves are of extraordinary dimensions, but the Mammoth Cave is the largest yet discovered. The conglomerate or pudding-stone consists of quartz pebbles, rounded and united with fine sand by a kind of natural cement; it underlies the coal formation. The coal beds of Kentucky are continuous of those of the

ENTRANCE TO THE MAMMOTH CAVE.

Ohio and Illinois, and cover an area of 10,000 or 12,000 square miles. Iron is equally abundant in the State. Small quantities of lead have also been traced in Kentucky, and silver ore near the Cumberland Falls. Salt springs abound in the sandstone formation, and saltpeter-earth and gypsum are fouud in the caves. Mineral springs are numerous, embracing sulphur, saline, chalybeate, etc.

8. The most productive soil of Kentucky is that of the blue limestone formation; and in the neighborhood of Lexington, and toward the Ohio, the country based on that rock is said to be the garden of the State. The line demarking this region passes from the Ohio round the heads of Kentucky and Licking rivers, Dick's Creek, and down Green River to the Ohio; and in this great compass of about 100 miles square is found one of the most fertile and extraordinary countries on which the sun has ever shone. In a state of nature it was covered with a dense forest of majestic trees and a close undergrowth of gigantic reeds. In the southern part, however, on the head waters of Green River and its tributaries, is an extensive tract, thinly wooded, and covered in summer with high grass, growing amid scattered and stunted oaks. Struck with the contrast, the early settlers gave these lands the name of "barrens," but as a general thing this appellative is by no means appropriate. There are, indeed, portions of the barrens too sterile and rugged to admit of cultivation; but the soil is generally productive, although not of the first quality, and is well suited for grazing. There are also tracts in the mountain regions and portions of land on the Ohio hills too much broken for general agriculture; but, as a whole, Kentucky has as great a portion of the best soils as any other State, and from the splendor of its climate has many advantages possessed by few other regions.

9. The country in general is well timbered. Perhaps among its forest growths none is more valuable than the sugar-tree, which grows in all parts, and furnishes the settler with an indispensable staple; and the honey-locust, so curiously surrounded by large thorny spikes, bears long pods, having a sweet flavor, and from which domestic beer is made. The coffee-tree grows large, and also bears a pod in which is inclosed coffee. The paw-paw is likewise abundant, and also the cane on which cattle feed and grow fat. There are many cane-brakes so thick and tall that it is difficult to pass through them. Where no cane grows there is abundance of wild rye, clover, and buffalo grass, covering vast tracts, and affording excellent pasture; and the fields are covered with wild flowers and herbage, which in summer give to the landscape an extraordinary beauty.

10. In 1850 Kentucky contained 982,405 inhabitants, being 26.07 to the square mile, or 4.24 per cent. of the total population of the Union. This was included in 132,920 families, and occupied 130,769 dwellings. Its distribution into the counties was as follows:

Counties.	Population.	County Seats.
Adair	9,898	Columbia.
Allen	8,742	Scottville.
Anderson	6,260	Lawrenceburg.
Ballard	5,496	Blandville.
Barren	20,240	Glasgow.
Bath	12,115	Owingsville.
Boone	11,185	Burlington.
Bourbon	14,466	Paris.
Boyle	9,116	Danville.
Bracken	8,903	Augusta.
Breathitt	3,785	Jackson.
Breckenridge	10,593	Hardinsburg.
Bullitt	6,774	Shepherdsville.
Butler	5,755	Morgantown.
Caldwell	13,048	Princeton.
Calloway	8,096	Murray.
Campbell	13,127	Alexandria.
Carroll	5,526	Carrollton.
Carter	6,241	Grayson.
Casey	6,556	Liberty.
Christian	19,580	Hopkinsville.
Clark	12,683	Winchester.
Clay	5,421	Manchester.
Clinton	4,889	Albany.
Crittenden	6,351	Marion.
Cumberland	7,005	Burkesville.
Daviess	12,362	Owensboro'.
Edmondson	4,088	Brownsville.
Estill	5,985	Irvine.
Fayette	22,735	Lexington.

Pulaski	14,195	Somerset.
Rock Castle	4,697	Mount Vernon.
Russell	5,349	Jamestown.
Scott	14,946	Georgetown.
Shelby	17,095	Shelbyville.
Simpson	7,733	Franklin.
Spencer	6,842	Taylorsville.
Taylor	7,250	Campbellsville.
Todd	12,268	Elkton.
Trigg	10,129	Cadiz.
Trimble	5,963	Bedford.
Union	9,072	Morganfield.
Warren	15,123	Bowling Green
Washington	12,194	Springfield.
Wayne	8,692	Monticello.
Whitley	7,447	Williamsburg.
Woodford	12,423	Versailles.

—of the total population 761,413 (77.5 per cent.) were white persons—392,804 males and

368,609 females, 10,011 (1.02 per cent.) were free colored persons—4,863 males and 5,148 females, and 210,981 (21.48 per cent.) were slaves—105,063 males and 105,918 females; and of the free population, white and colored, 740,881 (96.04 per cent.) were American born, of which number 601,764 were natives of this State, 29,189 were foreigners, and 1,354 were of origin not ascertained. The number of Kentuckians in other States of the Union was 257,643.

11. Kentucky in 1790 contained 73,077 inhabitants; in 1800 it had 220,955; in 1810, 406,511; in 1820, 564,317; in 1830, 687,917; in 1840, 779,828, and in 1850 (as above), 982,405. The population in 1855 was estimated at 1,113,678.

12. Of 191,075 free male persons over 15 years of age industrially occupied in this State in 1850, the numbers engaged in the several great branches were as follows: 36,598 in commerce, trade, manufactures, mechanic arts, and mining; 115,017 in agriculture; 28,413 in labor not agricultural; 204 in the army; 1,027 in sea and river navigation; 3,811 in law, medicine, and divinity; 4,420 in other pursuits requiring education; 902 in government civil service, and 471 in unclassified employments.

13. Agriculture and cattle grazing are conspicuous industrial pursuits in Kentucky. The State, however, has also important manufactures, a busy mining industry, and a great and increasing commerce. Its geographical position is eminently advantageous for a rapid development of its resources.

14. Kentucky in 1850 contained 74,777 farms and plantations, in which were inclosed 16,949,748 (improved 5,968,270 and unimproved 10,981,478) acres of land, or about two thirds of the whole surface of the State. The cash value of these was $75,814,398, and the cash value of implements and machinery thereon $11,576,938. Thus the average value of farms, etc., was $6,511.

15. The quantity of livestock in the State as returned in 1840 and 1850, was as follows:

	horses, mules, etc.,		neat cattle,		sheep,		swine,
1840	395,859	"	787,093	"	1,008,240	"	2,310,533
1850	381,291	"	752,512	"	1,102,091	"	2,891,163

—and the value of the whole in 1850 was $29,661,436; and the value of animals slaughtered in the preceding year was $6,462,598. In the same year the number of asses and mules was 65,609; of milch cows 247,475, and of working oxen 62,274, all included in the above table. The products of animals in 1850 consisted of butter 9,947,523, of cheese 213,954, and of wool 2,297,433 pounds. In 1840 the wool crop amounted to 1,786,847 pounds.

16. The grain crops of 1840 and 1850 compare as follows:

	wheat,		rye,		oats,		Indian corn,		barley,		buckwheat,
1840	4,803,152	..	1,321,373	..	7,155,974	..	39,847,120	..	17,491	....	8,168
1850	2,142,822	..	415,073	..	8,201,311	..	58,672,591	..	95,343	....	16,097

—making a total in 1840 of 53,153,279, and in 1850 of 69,542,237 bushels. The potato crop in 1840 amounted to 1,055,085, and in 1850 to 2,490,666 (Irish 1,492,487 and sweet 998,179) bushels; the hay crop in the two years to 88,306 and 113,747 tons, and the crops of peas and beans in 1850 to 202,574 bushels.

17. The Southern staple products of the State were comparatively as follows:

	hemp and flax		cotton		rice		tobacco
1840	9,992 tons	.....	691,456 lbs.	.....	16,376 lbs.	.....	53,436,909 lbs.
1850	hemp 1,050 and flax 17,787 = 18,837	"	"	303,200 "	"	5,688 "	" 55,501,196 "

—and also in 1850, cane sugar 10,000 pounds.

18. Other agricultural products according to the returns of 1850 were—hops 4,309 pounds, clover seed 3,230 pounds, other grass seed 21,481 pounds, beeswax and honey 1,158,019 pounds, flax seed 75,801 pounds, maple sugar 437,405 pounds, molasses 30,079 gallons, silk cocoons 1,281 pounds, wine 8,093 gallons, etc. The value of market-garden products was $303,120, and of orchard products $106,230.

19. The total value of agricultural products of this State in 1840 amounted to $26,233,968, and in 1850 to $52,477,680.

20. Manufactures, mining, and the mechanic arts in 1850 were conducted in 3,609 several establishments, employing an aggregate capital of $12,350,734 and 24,385 (male 22,445 and female 1,940) persons. The cost of raw material, etc., consumed in the year was $12,170,225, and the cost of labor $4,764,096; value of the products of the year $24,588,483. Among the manufacturing establishments are enumerated—8 cotton mills, with a capital of $239,000; 25 woolen mills, $249,820; 21 works for pig-iron, $924,700; 20 works for iron castings, $502,200; 4 works for wrought-iron, $176,000; 81 distilleries and breweries, $201,335; 12 salt works, $121,450; 275 tanneries, $763,455, etc. The progress of manufactures in Kentucky is illustrated by the value of the products at decennial periods: in 1810 this was $5,307,380; in 1840, $13,221,958; and in 1850, $27,089,019—in each instance including the value of home-made goods.

21. Kentucky has no direct foreign commerce, but trades seaward through the ports of the Gulf of Mexico and the Atlantic. Its domestic commerce by river and railroad, however, is very extensive, and of late years has been largely increased. The chief commercial places are Catlettsburg, Maysville, Covington, Louisville, Henderson, Smithland, Paducah, etc., on the Ohio River, and Columbus on the Mississippi. From most of these places railroads (some completed and some only in progress or projected) extend into the interior and across the State into Tennessee, and all are engaged in external navigation. In the interior there are a great number of commercial towns, found chiefly on the navigable rivers and the railroads. Of these, Lexington is perhaps the most important, and may be considered as the commercial and railroad center of the State. The exports of Kentucky consist chiefly of hemp and flax, tobacco, cotton, horses, cattle, bagging, rope, etc.

22. The shipping owned in this State in 1850 amounted to 14,820 tons, and in 1855 to 22,680 tons, all of which was navigated by steam. The number of vessels (steamers) built in 1850 was thirty-four, of an aggregate burden of 6,461 tons: in 1855 twenty-seven, 9,401 tons.

23. The internal improvements of Kentucky are numerous, and embrace river improvements, canals, railroads, bridges, turnpikes, etc. In all the great rivers important improvements have been made. The principal of these are the works on the Kentucky, Green, Licking, and Big Sandy rivers; and the Portland and Louisville Canal, which overcomes the falls of the Ohio. The latter is one of the most important works in the Union, but still inadequate for the trade which seeks its facilities, and it is now proposed to open a similar canal on the Indiana side of the river. The principal railroads are those diverging from the towns on the Ohio toward Knoxville, Nashville, and the south; and the great roads from Mobile and New Orleans cross the western part of the State terminating at Columbus, a point opposite to Cairo, Ill., and Paducah. At the end of 1857 the total length of completed railroad in the State was about 300 miles. The geographical position of the State, however, is such as to invite a rapid development of the railroad within its borders, and many years can not elapse before the material interests of the people will demand an extension of works of this description. The commonwealth has hitherto left to individual effort the construction of these works.

24. Kentucky in 1850 had twenty-six banks and branches, with an aggregate capital of $7,536,927; and in 1855 thirty-three such institutions, with $10,454,572. The liabilities of these banks in the two years were respectively, for circulation, $7,643,075 and $12,634,533; deposits, $2,322,657 and $3,608,757; due to other banks, $1,256,589 and $2,555,953; and miscellaneous, $100,807 and $532,000. At the same periods the assets consisted of loans and discounts, $12,536,305 and $21,132,519; stocks, $694,962 and $678,389; real estate, $419,070 and $488,504; other investments, $440,127 and $535,730; due by other banks, $2,451,155 and 3,731,463; notes of other banks, $550,879 and $965,878; and specie, $2,794,351 and $4,611,766.

25. The constitution of 1850 is the basis of the government. It grants the right of voting to every free white male citizen 21 years of age, and who has resided in the State two years, in the county one year, and in the precinct 60 days next preceding an election. All votes are *viva voce;* and the general election is held on the 1st Monday of August.

26. The legislature consists of a senate of 38 members elected for four years, one half biennially, and a house of representatives of 100 members, chosen in single districts for two years. Senators must be 30 and representatives 24 years of age, and citizens of the United States, and residents of the State. The sessions commence on the 1st Monday in December every second year, and continue not longer than 60 days unless a prolongation is agreed upon by two thirds of each house.

27. The governor is chosen for four years. He must be 35 years of age, a citizen of the United States, and a resident of six years' standing. The lieutenant-governor is *ex officio* president of the senate, and in case of vacancy succeeds the governor. The secretary of state is appointed by the governor; but the treasurer is elected by the people for two years, and other administrative officers for four years.

28. The judiciary consists of the court of appeals, circuit courts (13 in number), and county courts. Louisville has a separate chancery court. All judges, justices of the peace, and officers of courts are elected by the people; judges of the court of appeals from districts for eight years, one every second year, and of the four the one having the shortest time to serve is chief-justice; judges of circuit for six years, and justices of the peace for four years. The officers of courts are elected for the same term as is the presiding judge of their court.

29. Revenue is derived principally from direct taxation, specific taxes, and polls. The ordinary receipts for the year ending 10th October, 1851, amounted to $738,245, and 1855 to $995,427; and the expenditures to $733,653 and $739,696. At the end of the financial year, 1855, the treasury had a surplus of $255,731. The State debt at the last-named period amounted to $5,993,576, for the payment of the principal and interest of which a sinking fund is in operation, which in 1855 received $662,494, and disbursed $519,015. In 1850 the total value of taxable property in the State was $317,082,604, and in 1855, $407,326,443. The rate of taxation in 1855 was 17 cents on every $100.

30. The principal institutions supported wholly or in part by the State are the Lunatic Asylum at Lexington and the Western Lunatic Asylum at Hopkinsville, the Deaf and Dumb Asylum at Danville, the School for the Blind at Louisville, the State Penitentiary, and a Normal School at Lexington. To the latter each representative district can send one pupil.

31. The number of children reported as in attendance at schools in 1850 was 131,205, being at the rate of one to every 6.1 of the total free population. On the 1st June of the same year the school returns presented the following statistics:

Classification.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	2,234	2,306	71,429	$211,852
Academies and private schools	330	600	12,712	252,617
Universities and colleges	15	100	1,773	131,461

—making a total of 2,579 schools, 3,006 teachers, and 85,914 scholars, and an annual income of $595,530. The number of free persons over 20 years of age unable to read and write in 1850 was 69,706, of which 67,359 were Americans and 2,347 foreigners, and 66,687 were white and 3,019 free colored persons. In 1855 the number of children reported was 215,002, and the average attendance at the public schools 113,763. The school fund amounted to $1,443,164.

32. The principal collegiate and professional schools in the State in 1855 were as follows:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
Transylvania University	Lexington	1798	8	25	15,000
St. Joseph's College	Bardstown	1819	20	169	5,500
Centre College	Danville	1823	5	180	6,000
Augusta College	Augusta	1825	4	—	3,000
Bacon College	Harrodsburg	1836	4	—	1,000
Shelby College	Shelbyville	1837	6	44	600
Georgetown College	Georgetown	1840	7	83	7,000
Western Military Institute	Drennon Springs	1847	9	141	2,000
St. Aloysius' College	Louisville	1849	6	—	1,000
Paducah College	Paducah	1852	7	19	—

33. The most numerous of the religious denominations in Kentucky are the Baptist,

Methodist, and Presbyterian, which include respectively a third, a fourth, and a sixth of the total population. Next in numbers are the Christian and Roman Catholic denominations; and after these the Free, Union, and Episcopal, etc. The total number of churches in the State in 1850 was 1,845, with accommodation for 671,053 persons; and the value of church property was estimated at $2,252,448.

34. Frankfort is the seat of government. It is built on high ground on the right bank of Kentucky River, 62 miles from its mouth, in latitude 38° 14′, and longitude 84° 40′—551 miles west-by-south Washington. The site is an elevated plain between the river, here between 60 and 100 yards wide, and flowing through a deep channel of limestone rock, and the bluff, which rises a short distance behind the town. Frankfort is regularly laid out and generally well built. The State House, a handsome edifice of Kentucky marble, stands on an eminence nearly midway between the river and bluff. It is 86 feet long by 54 feet deep, with a portico supported on six Ionic columns. The governor's house is a plain brick edifice. The other public buildings are the State Penitentiary, Court House, and Jail, and five churches. Water is supplied to the town from an excellent spring, from which it is conveyed in iron pipes. The manufactures of the town are considerable, and its trade active and progressive, being facilitated by railroads leading directly to Louisville and Lexington and indirectly to Covington and Danville, and will ultimately be connected with the east and southeast by the Lexington and Big Sandy Railroad. The river navigation is also complete, and has been extended by locks and dams above the town to the junction of its constituents. Population (1810) 1,099, (1820) 1,679, (1830) 1,680, (1840) 1,917, (1850) 3,308, and in 1855 about 5,000. A chain suspension bridge connects the town with the flourishing village of South Frankfort, a suburb on the opposite bank of the river.

35. Louisville is the chief commercial and manufacturing city of Kentucky, and the third in importance on the Ohio River. Latitude 38° 3′, and longitude 85° 30′. It is situated at the mouth of Bear Grass Creek and at the head of the Falls of the Ohio, 637 miles below Pittsburg and 376 miles above the mouth of the Ohio. The city occupies a plain sloping to the river, is regularly laid out and well built, consisting of ten broad streets (from 60 to 120 feet wide, parallel to the river) and thirty others, uniformly 60 feet wide, intersecting them at right angles. The streets are generally paved and lighted with gas and adorned with shade trees. Along the river are spacious wharves. Several of the public buildings have considerable architectural pretensions—the principal of these are the University, with law and medical departments; the State School for the Blind, the General Hospital, two orphan asylums, the Marine Hospital, the City Hall, Court House, and many of the churches and school-houses. Louisville has also several literary and scientific institutions.

36. The manufactures of Louisville are very extensive, and embrace a great variety of products. It has several founderies and machine shops, at which a vast amount of machinery, etc., is annually turned out, several large steam bagging factories and ropewalks, cotton and woolen factories, tobacco factories, flouring mills, distilleries, breweries, agricultural implement factories, and others, small and large, which in the aggregate constitute a vast industry. Its hog-packing establishments may also be noted; and also its large manufactories of furniture, soap and candles, white-lead, glass, pottery, etc. Its trade is immense, and embraces a wide and productive circuit. Its wharves are at all times thronged by steamboats and other

RAFT ON THE OHIO RIVER.

river craft, carrying to and fro a merchandise inferior only in amount to that moved at Cincinnati and Pittsburg. The value of its commerce is scarcely less than $80,000,000 annually, and the amount is constantly increasing. Its exports consist chiefly of tobacco, bagging, rope and cordage, spirits, pork, flax and hemp, livestock, machinery for steamboats and railroads, factories, mills, and farms (manufactured in the city), and a great amount of groceries and assorted merchandise; and its imports comprise every article and product needed in its interior commercial range. Steam packets carrying the mails and passengers come and go several times a day from, and destined to, all the commercial cities of the river lines. Its commerce is also greatly facilitated by means of its railroads, which, completed or in progress, give it access in every direction to the sources of supply and the fields of demand. Its local and retail trade is also immense, chiefly as regards groceries, dry goods, boots and shoes, drugs, etc.

37. Louisville was laid out as early as 1773, but no settlement was made for the subsequent five years, nor until after the expulsion of the British from their posts on the Wabash. It was named Louisville by the Virginia legislature, in honor of Louis XVI. of France, in commemoration of his alliance with the great Republic of the West, then just rising from its probationary condition of colonial dependence. The first block-house was built in 1778, but this was subsequently removed to make way for Fort Nelson, erected in 1782. In 1780 the town was established by an act of the legislature of Virginia. At this period it contained only 30 inhabitants, and in 1800 its population scarcely numbered 600 souls. In 1810 it contained 1,357 inhabitants; in 1820, 4,052; in 1830, 10,352; in 1840, 21,210; and in 1850, 43,194; a census in 1852 gave it 51,726. Three miles below Louisville is the town of Portland, which is connected with the metropolis by a railroad worked by horse-power. Portland is at the foot of the falls as Louisville is at the head; and the falls, which have a descent of 22 feet in 2½ miles, are overcome by the Portland Canal.

38. Lexington is the most important inland town of the State, distant 29 miles by railroad east Frankfort, and on the line of railroad from Louisville to Virginia. It is built on Town Fork of the Elkhorn. Latitude 38° 6′, and longitude 84° 18′. The town is the center of a vast trade and the seat of valuable manufactures, the most important of which are bagging, ropes, machinery, carriages, iron and brass works, silverware, etc. It was founded in 1776, and was formerly the State capital. Transylvania University and the State Lunatic Asylum are located here. Population (1850) 9,180, now (1855) about 12,000. About a mile and a half from this town is Ashland, the homestead of the late Henry Clay; Maysville, on the Ohio, 62 miles above Cincinnati, is a handsome city, backed by bold and verdant highlands, and is compactly built. In business importance it ranks fourth among the towns of Kentucky, and is the most extensive hemp market in the United States. Among its various manufactures the most important are those of cotton goods, bagging, rope, iron, carriages, and agricultural implements. A railroad is under construction to Lexington, which will connect it with the South and West. Population (1850) 4,256, now (1855) 6,500.

39. Covington is a busy commercial mart on the Ohio, just below the mouth of Licking River and opposite Cincinnati. On the right bank of the Licking is the city of Newport. These cities are but suburbs of Cincinnati, and correspond to it in plan, and are connected therewith by ferries. Here are extensive pork-packing establishments and manufactures of iron, machinery, hemp, tobacco, etc. Covington has also a large trade, which is facilitated by the Kentucky Central Railroad, and the city will become the outlet of several other railroads now under construction. The Western Baptist Theological Institution is located here. In 1850 Covington contained 9,408, and Newport in 1850, 5,985.

40. Danville is situated in a rich, fertile, and populous section of the State, 35 miles southwest Lexington, and is important as a business center, to which several great lines of railroad are now under construction. It is the seat of the State Asylum for the Deaf and Dumb. Previous to 1792 it was the capital of Kentucky. Population (1850) 2,650.

41. Paris is a town of 2,500 inhabitants, on the Maysville and Lexington Railroad, at the point where it is joined by the Kentucky Central Railroad. It is a place of active trade, and contains several mills, etc. Harrodsburg is eligibly situated a few miles north of Danville and about a mile from Salt River. It is said to be the oldest town in Kentucky, having been settled in 1775. It is an important market for cattle, horses, etc., and has a large general trade. A railroad is in progress which will connect it with Louisville. The Harrodsburg Springs are among the most celebrated in the State. Population (1850) 1,481.

42. Henderson, on the Ohio, 10 miles below Evansville, is the port of export for a fine country, and has large manufactures of tobacco, etc. It is about being connected with Nashville by railroad. Population (1850) 1,775; (1855) about 1,600; Paducah, on the Ohio, immediately below the mouth of the Tennessee, is a place of active business, and ships large quantities of tobacco, pork, horses, etc. It has a fine range of warehouses along the river. It will be the terminus of a branch of the Mobile and Ohio Railroad. Population (1850) 2,428. It is the seat of a college; Smithfield is a river-port on the Ohio, immediately below the mouth of Cumberland River. Population 882.

43. Hickman, on the Mississippi, a few miles above the Kentucky State line, and 30 miles below the mouth of the Ohio, has an active shipping business, and will be the terminus of the Nashville and Northwestern Railroad, now under construction. Population (1850) 401; Hopkinsville has a population of about 3,500, and is the seat of the Western Lunatic Asylum. It is one of the most flourishing towns of Kentucky. Columbus is a new town on the Mississippi, and one of the termini of the Mobile and Ohio Railroad.

44. Kentucky originally formed a part of the Territory of Virginia. About the year 1747 the Cumberland River was visited and named by a party from that colony, and in the succeeding years Kentucky became famous as a hunting-ground. The first permanent settlements were made near Lexington in 1775, when Harrodsburg and Boonesboro' were founded, and about the same time the colony of Transylvania was organized. In 1776 the present territory of Kentucky was constituted a county of Virginia. In 1785 a convention petitioned the Virginia legislature for the separate organization of Kentucky, which was assented to, but the separation was not consummated until 1790, when Kentucky became a separate Territory. On the 1st of June, 1792, it was admitted into the Union as a State.

STATE OF OHIO.

1. Ohio is situated between latitudes 38° 24′ and 42° north, and longitudes 80° 34′ and 84° 42′ west; and is bounded on the north by Michigan and Lake Erie, on the east by Pennsylvania and Virginia, on the south by Kentucky, and on the west by Indiana. The Ohio River separates this State from Virginia and Kentucky. The average length of Ohio, north and south, is about 220 miles, and the average breadth about 200 miles. In shape it is an irregular square, and very compact; and altogether contains 39,964 square miles, or 1.36 per cent. of the whole territory of the United States.

2. Though the surface is much and delightfully varied, it nowhere presents any considerable elevations above the general level; but the country is a lofty table-land, which in its middle zone is about 1,000, and on the northern and southern borders from 600 to 800 feet above the sea-

level. A slightly elevated ridge of highlands divides the waters flowing north into Lake Erie from those flowing south into the Ohio. From this there is rather a rapid descent to the level. The general slope toward the Ohio is interrupted by a subordinate ridge, which crosses the State in the latitude of Zanesville and Columbus, between which and the river the surface is very much diversified by hills and valleys. The central belt consists of extensive flat tracts, with numerous broad swells rising from the plains, and swamps and morasses occasionally occur. The northern or Erie slope also contains extensive morasses. The extent of swamp lands in the State, however, is only about one twentieth part of the whole. Nine tenths of the surface are susceptible of cultivation, and nearly three fourths of the soil are eminently productive. Even the hills are cultivated to their summits. The river bottoms are very extensive, and exuberantly fertile. In the center and northwest, prairies or native meadows are numerous and wide, but the greater part of the country was originally covered with magnificent forests, and even at the present day timber is abundant.

3. The Ohio River, on the south, and Lake Erie, on the north, are the recipients of all the rivers of this State. The Ohio runs along the southern shore for nearly 500 miles, and the principal rivers falling into it are the Muskingum, the Hockhocking, the Scioto, the Miami, etc. The Muskingum, which enters it at Marietta, rises in the northern watershed, near the head waters of the Cuyahoga, and drains a beautiful and fertile district. It is navigable for steamers to Zanesville, 75 miles, and nearly to its sources, 120 miles, for small boats. Sandy River and Wells' Creek from the east, and Walhonding and Licking rivers from the west, are its principal tributaries. The Hockhocking rises on the southern ridge, and reaches the Ohio at Hocking Port, after a course of 80 miles through a hilly and picturesque country, abounding in yellow pine. It is a deep and narrow stream, and boats ascend it to Athens. The Scioto is a fine navigable river, entering the Ohio at Portsmouth. It flows through a wide and fertile valley, and in the upper part of its course is environed by rich and beautiful prairies. Boats have ascended it to near its source, and passed by a portage of four miles into the Sandusky and Lake Erie. Many thriving towns are located on its banks. The Little Miami has its rise in the southern ridge, and although too much broken by falls to be useful as a navigable channel, it is a fine mill-stream—it enters the Ohio about 12 miles above Cincinnati. The head waters of the Miami or Big Miami approach very near to those of the Scioto, the Auglaize, and the St. Mary's; its current is rapid, but it is navigable for 70 or 80 miles; and at Dayton and other points it furnishes immense water-power. It is 200 yards wide at its mouth, and enters the Ohio in the southwest corner of the State, after a course of 100 miles.

4. Among the northern rivers are the Maumee, Sandusky, Cuyahoga, etc. The Maumee or Miami of the Lakes, which has its source in Indiana, is the most important of these; it is formed by the union of the St. Joseph's, St. Mary's, and Auglaize rivers. In the spring and fall it is boatable to Fort Wayne, and for steamboats to Perrysburg, 18 miles from its mouth, and at all times furnishes large water-power. It enters Lake Erie through Maumee Bay. The Sandusky is a rapid stream, but navigable to Fremont City. It enters the lake through Sandusky Bay, an immense bay, destined to become a scene of a mighty commerce. The Cuyahoga rises near Lake Erie, but taking a southwesterly course, it approaches the head of the Muskingum, and thence flows northward into the lake at Cleveland. It is more than 60 miles long, and has numerous falls, and along its banks several manufacturing towns have sprung up. Besides these, there are other important streams flowing into the lake, as Portage, navigable for 12 miles from Port Clinton; Huron, navigable to Milan, 14 miles; Vermillion, Black, Rocky, etc., all of which are navigable to a greater or less extent, and which at their mouths furnish harbors.

5. Iron, coal, and lime, the most useful of minerals, abound in all the eastern parts of the State, and are deposited in beds of vast thickness. Salt springs are also numerous in this region. The coal of Ohio is bituminous, and lies very accessible. The principal points of coal mining are at Talmadge, Pomeroy, Nelsonville, and some points in Stark and Coshocton counties. Extending through the counties of Lawrence, Gallia, Jackson, Meigs, Vinton, Athens, and Hocking is a belt of iron ore, averaging some twelve miles in width, and extending a distance of one hundred miles or more in length. Coal of the very best quality, from three to twenty and even thirty feet in thickness, also underlies these counties, together with others, sufficient to last for ages as a material of fuel for manufacturing in their midst, as well as for supplying the market demand beyond the mineral region. The salines are immensely valuable, although not in the same proportion as the coal-fields and iron deposits. There are salt wells on Yellow Creek, above Steubenville; on Wells' Creek; on the Muskingum, from the Coshocton to near its mouth; on the Hockhocking; on Leading Creek, and in numerous other localities. The salt rock is reached generally at from 600 to 800 feet from the surface, and the brine in many cases yields ten per centum of salt. Marble and freestone, well adapted for building purposes, and gypsum also occur; and there are in various places mineral springs.

6. The soils are almost everywhere suitable for agricultural purposes. The river bottoms are exceedingly fertile, while the rich level plain of the interior is scarcely of inferior productiveness. The eastern and southeastern parts are hilly, but hardly any portion of the surface is so broken as to be unfit for tillage. The marshy tracts in the north have an excellent soil, and may be easily drained. On the whole, indeed, Ohio may be regarded as one of the most fertile countries of the world.

7. On account of the general elevation of the surface, the average temperature is several degrees lower than in the Atlantic States on the same parallel. The winters are occasionally severe, and the summer is subject to tornadoes, but the autumn is always temperate, serene, and pleasant. Along the valley of the Ohio the weather is more equable and mild than in the interior. Little snow falls in this section of the State. Near the marshy spots and stagnant waters fevers and agues prevail, especially among new settlers, but, as a general fact, few States can boast of so healthy a climate.

8. The forests produce black walnut, various species of oaks, hickory, sugar-maple, and several other sorts of maple, beech, birch, poplar, ash, sycamore, pawpaw, buckeye, cherry, dogwood, elm, hornbeam, etc. With the exception of a few cypress-trees, this State produces scarcely any evergreens. Many sorts of medicinal roots are found here, as ginseng, valerian, columbo, snake-root, blood-root, etc.

9. Wild animals, formerly abundant in this State, are now seldom seen. The wolf, bear, and others are occasionally found in the unsettled parts, but may be said to be extinct as common animals. Deer, raccoons, and various small game are abundant; and birds of various descriptions, as geese, ducks, snipes, pheasants, grouse, still afford sport and sustenance to the settler. Fish of almost every description abound in the waters.

10. Aboriginal works in this State, as in most others in the great West, still remain as objects of antiquarian research. In the neighborhood of Circleville are the earth-works from which that city takes its name, and works of like character are found in various other localities. Near Marietta is a mound 31 feet high, inclosed by an elliptical wall with a periphery of about 1,300 or 1,400 feet. Fort Ancient, in Warren County, and Clarke's Works, in Ross County, are also instances of this kind. These works are attributable to races which preceded the advent of the Indians found in the country by the first explorers.

11. In 1850 Ohio contained 1,980,329 inhabitants distributed into 348,514 families, occupying 336,098 dwellings. This was equivalent to 49.55 inhabitants to the square mile, and 8.54 per cent. of the population of the Union. The counties were as follows:

Counties.	Population.	County Seats.
Adams	18,883	West Union.
Allen	12,109	Lima.
Ashland	23,813	Ashland.
Ashtabula	28,767	Jefferson.
Athens	18,215	Athens.
Auglaize	11,388	Wapakonetta.
Belmont	34,600	St. Clairsville.
Brown	27,332	Georgetown.
Butler	30,782	Hamilton.
Carroll	17,685	Carrollton.
Champaign	19,782	Urbana.
Clarke	22,178	Springfield.
Clermont	30,455	Batavia.
Clinton	18,828	Wilmington.
Columbiana	33,621	New Lisbon.
Coshocton	25,674	Coshocton.
Crawford	18,177	Bucyrus.
Cuyahoga	48,099	Cleveland.
Darke	20,276	Greenville.
Defiance	6,966	Defiance.
Delaware	21,817	Delaware.
Erie	18,568	Sandusky City.
Fairfield	30,264	Lancaster.
Fayette	12,726	Washington.
Franklin	42,909	Columbus.
Fulton	7,781	Ai.
Gallia	17,063	Gallipolis.
Geauga	17,827	Chardon.
Green	21,946	Xenia.
Guernsey	30,488	Cambridge.
Hamilton	156,844	Cincinnati.
Hancock	16,751	Findlay.
Hardin	8,251	Kenton.
Harrison	20,157	Cadiz.
Henry	3,484	Napoleon.
Highland	25,781	Hillsboro'.
Hocking	14,119	Logan.
Holmes	20,452	Millersburg.
Huron	26,203	Norwalk.
Jackson	12,719	Jackson C. H.
Jefferson	29,133	Steubenville.
Knox	28,872	Mount Vernon.
Lake	14,654	Painesville.
Lawrence	15,246	Burlington.
Licking	38,846	Newark.
Logan	19,162	Bellefontaine.
Lorain	26,086	Elyria.
Lucas	12,368	Maumee City.
Madison	10,015	London.
Mahoning	23,785	Canfield.
Marion	12,618	Marion.
Medina	24,441	Medina C. H.
Meigs	17,971	Pomeroy.
Mercer	7,712	Celina.
Miami	24,999	Troy.
Monroe	28,351	Woodsfield.
Montgomery	38,218	Dayton.
Morgan	28,585	M'Connellsville.
Morrow	20,280	Mount Gilead.
Muskingum	45,049	Zanesville.
Ottawa	3,308	Port Clinton.
Paulding	1,766	Charloe.
Perry	20,775	Somerset.
Pickaway	21,006	Circleville.
Pike	10,953	Piketon.
Portage	24,419	Ravenna.
Preble	21,736	Eaton.
Putnam	7,221	Kalida.
Richland	30,879	Mansfield.
Ross	32,074	Chillicothe.
Sandusky	14,305	Frémont.
Scioto	18,428	Portsmouth.
Seneca	27,104	Tiffin.
Shelby	13,958	Sidney.
Stark	39,878	Canton.
Summit	27,485	Akron.
Trumbull	30,490	Warren.
Tuscarawas	31,761	N. Philadelphia.
Union	12,204	Marysville.
Van Wert	4,793	Van Wert.
Vinton	9,353	M'Arthurstown.
Warren	25,560	Lebanon.
Washington	29,540	Marietta.
Wayne	32,981	Wooster.
Williams	8,018	Bryan.
Wood	9,157	Perrysburg.
Wyandott	11,194	Up. Sandusky.

—of the total population, 1,955,050 (98.72 per cent.) were white persons—1,004,117 males and 950,933 females, and 25,279 (1.28 per cent.) were free persons of color—12,691 males and 12,588 females; and of the whole 1,757,556 (88.75 per cent.) were American born, of which number 1,219,432 were born in this State, 218,512 (11.03 per cent.) were of foreign birth, and 4,261 of origin not ascertained. At the same time 295,453 natives of Ohio were resident in other States of the Union.

12. The population of this State in 1800 was 45,365; in 1810, 230,760; in 1820, 581,434; in 1830, 937,903; in 1840, 1,519,467; and in 1850 (as above), 1,980,329. In 1855 the population was estimated at 2,311,829.

13. The employments of 530,792 males over 15 years of age were returned in 1850 as follows: engaged in commerce, trade, manufactures, mechanic arts, and mining, 142,687; in agriculture, 270,362; in labor not agricultural, 92,766; in sea and river navigation, 4,109; in law, medicine, and divinity, 9,001; in other pursuits requiring education, 8,263; in government civil service, 1,218; in domestic service, 1,167; and in miscellaneous pursuits, 1,219 persons.

14. Ohio ranks next to New York as an agricultural State, and next to New York, Pennsylvania, and Massachusetts as a manufacturing State; and in no other State are these two great interests so nearly proportioned in regard to the value of their productions. Mining for coal is also a large and valuable interest, and already its mines furnish nearly the entire wants of the State besides large quantities for export. In commerce and the means of internal communication Ohio stands pre-eminent, and it occupies the first place among the States of the interior.

15. In 1850 Ohio contained 143,807 farms including 17,997,493 (improved 9,851,493 and unimproved 8,146,000) acres of land, valued at $358,758,603; and the value of implements and machinery thereon was $12,750,585.

16. The quantity of livestock in the State according to the censuses of 1840 and 1850 was as follows:

1840	horses, mules, etc.,	430,527	neat cattle,	1,217,874	sheep,	2,028,401	swine, 2,097,746
1850	" "	466,820	"	1,358,947	"	3,942,929	" 1,964,770

—the whole in 1850 valued at $44,121,741; and the value of animals slaughtered in 1849-50 was $7,439,243. The number of mules and asses in 1850 was 3,423, of milch cows 544,499, and of working oxen 65,381, all included in the above aggregates of horses and neat cattle. Of animal products the following are noted in the census of 1850—butter 34,449,379 pounds, cheese 20,819,542 pounds; and wool 10,196,371 pounds. In 1840 the production of wool amounted to only 3,685,315 pounds.

17. The food crops (bushels) in 1840 and 1850 were comparatively as follows:

1840	wheat,	16,571,661	rye,	814,205	oats,	14,393,103	Indian corn,	33,668,147	barley, 212,440	buckwheat, 633,189
1850	"	14,487,351	"	425,918	"	13,472,742	"	59,078,695	" 354,358	" 638,060

—making a total of grain in 1840 amounting to 66,322,692, and in 1850 to 88,457,124 bushels. The potato crop in 1840 was 5,805,021, and in 1850 (including "sweet" 187,991), 5,245,760 bushels, and the crop of peas and beans in 1850 was 60,168 bushels. Hay (1840) 1,022,037 and (1850) 1,443,142 tons.

18. Other agricultural products in 1850 were as follows—hops 63,731 pounds, clover-seed 103,197, and other grass-seed 37,310 bushels, beeswax and honey 804,275 pounds, flax-seed 188,880 bushels, flax 446,932 pounds, hemp 150 tons, maple-sugar 4,588,209 pounds, molasses 197,308 gallons, tobacco 10,454,449 pounds, silk cocoons 1,552 pounds, wine 48,207 (in 1840, 11,524) gallons, etc. One fifth of all the wine produced in the United States is the yield of the Ohio vineyards, chiefly in the vicinity of Cincinnati. Value of market-garden products $214,004, and of orchard products $695,921.

19. In 1850 Ohio contained 10,622 establishments engaged in manufactures, mining, and the mechanic arts. The aggregate capital invested in these industries amounted to $29,019,538, and 51,489 persons were employed therein at an annual cost of $13,467,660. The cost of the

raw material consumed in the year was $34,677,937, and the value of the manufactures produced was $62,647,254.

20. The following exhibits the statistics of the chief branches of manufactures:

Branches.	Number of Establishments.	Capital Invested.	Hands Employed.	Value of Products.
Cotton	8	$297,000	401	$394,700
Wool	130	870,220	1,201	1,111,027
Iron—Pig	35	1,503,000	2,415	1,255,850
" —Castings	183	2,063,650	2,758	3,069,350
" —Wrought	6	164,800	276	127,849
Distilleries and breweries	58	1,262,974	1,033	3,451,003
Tanneries	706	1,340,289	1,826	1,964,591
Salt works	32	188,750	167	132,293
All others	9,464	21,328,755	41,412	51,140,591

—and the following exhibits the value of manufactures produced in Ohio at stated periods:

Census Years.	Cotton Goods.	Woolen Goods.	Iron, Pig and Cast.	Wrought Iron.	Spirits and Beers.	Home-made Goods.	All other Manufactures.	Total Value.
1810	$887,053	$132,920	$109,090	$74,123	$585,892	$ —	$501,152	$2,290,230
1820	51,315	689,292	413,350	491,707	479,511	—	3,165,252	5,290,427
1830	(No census of manufactures returned.)							
1840	139,378	685,757	1,665,301	485,290	1,922,354	1,853,987	24,706,384	31,458,401
1850	394,700	1,111,027	4,325,200	127,849	3,451,003	1,712,196	53,237,475	64,359,450

—the home manufactures in the first two periods are included in the cotton and woolen goods returns.

21. The direct foreign commerce of Ohio is very limited, and is confined to an intercourse with Canada. In 1850 the exports were valued at $217,632, and in 1855 at $847,143, and the imports in those years at $582,504 and $600,656. The shipping employed in this trade in 1850 amounted to 73,678 tons, of which 33,807 cleared and 39,871 entered, and in 1855 to 125,925 tons, viz., 57,410 cleared and 68,575 entered. The shipping owned in the State in 1850 amounted to (including steamers 28,653) 62,462 tons, and in 1855 (steam 44,148), 91,607 tons. In the latter year Cleveland had (steam 15,012) 51,078, Sandusky (steam 307) 8,052, Toledo (steam 115) 3,763, and Cincinnati (all steam) 28,713 tons. The shipping built in 1850 amounted to 5,214 tons, and in 1855 to 17,751 tons.

22. The domestic and transit commerce of the State by lake, river, and canal, and by railroad, is immeasurably more extensive than the foreign commerce. The canals of Ohio are magnificent works, uniting the lakes at Cleveland and Toledo with the Ohio valley at Portsmouth and Cincinnati, and extending into Pennsylvania on the one hand and into Indiana on the other hand. The railroad system embraces nearly 3,000 miles of railroad, crossing and recrossing the State and connecting the principal towns within its own limits, and forming with the systems of the adjoining States parts of the great lines extending from the sea-board to and beyond the Mississippi, and from the lake shores to those of the Gulf of Mexico.

23. In November, 1850, Ohio contained fifty-seven banks and branch banks, and in 1855 sixty-six such institutions, with aggregate capital amounting to $8,718,366 and $7,166,581. The liabilities of these banks in the years respectively consisted of—circulation $1,059,700 and $8,074,132, deposits $5,310,555 and $5,450,566, due to other banks $1,305,839 and $949,727, and other liabilities $343,856 and $411,652. The assets comprised—loans and discounts $17,059,593 and $13,578,339, stocks $2,200,891 and $2,466,247, real estate $451,593 and $298,222, other investments $460,692 and $1,006,525, due by other banks $3,373,272 and $2,751,312, notes of other banks $1,195,655 and $905,555, specie funds $93,460 and $158,310, and specie $2,750,537 and $1,690,105.

24. The constitution of Ohio bears date 10th March, 1851. This instrument secures the right of voting to every white male citizen of the United States, 21 years of age and who has resided in the State one year. General election is held on the 2d Tuesday of October annually. All votes are by ballot.

25. The general assembly consists of a senate of 35 members, and a house of representatives of 100 members, all of which are elected in districts for two years, and each must have resided in his own district for the year next before election. The legislative sessions are held every second year, commencing on the 1st Monday in January.

26. The governor is chosen for two years. The lieutenant-governor, the secretary of state, the state treasurer, and attorney-general are elected for the same term, and the state auditor for four years.

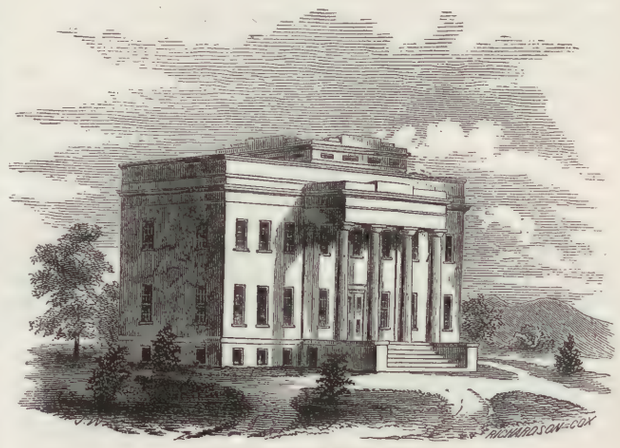
27. The judiciary is vested in a supreme court with five judges, courts of common pleas, district courts, probate courts, etc. Judges of the supreme and common pleas courts are elected in districts for five years, and judges of all inferior courts and justices of the peace for three years. Cincinnati and Dayton have each a separate superior court.

28. The revenue of the State is derived chiefly from direct taxes, canal tolls, land sales, etc. The expenditures are principally on account of school, the State debt, State institutions, and public works. The expenses of the government proper in 1855 amounted to only $148,015. The total resources of the treasury (including $584,681 surplus from previous year) for the year ending 15th November, 1855, amounted to $4,215,854, and the expenditures for the same year to $3,512,484. The State debt on the 1st January, 1856, amounted to $16,273,427, the annual interest on which was $956,893. The total value of taxable property in 1850 was $439,876,340, and in 1855, $860,877,354. The total tax levied, including State, county, township, school, etc., taxes, amounted in the latter year to $8,954,512, of which sum $2,754,807 were State taxes.

29. The principal institutions supported wholly or in part by the State are the Ohio Lunatic Asylum, the Deaf and Dumb Asylum, the Institution for the Blind, and the Ohio Penitentiary, all located at or near Columbus.

30. The number of children returned in 1850 as attending school was 514,809, or 26 per cent. of the total population. On the 1st June of the same year the schools presented the following statistics:

Classification.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	11,661	12,886	484,153	$743,074
Academies and private schools	206	474	15,052	149,392
Universities and colleges	26	180	3,621	125,792



—making a total of 11,893 schools, 13,540 teachers, and 502,826 scholars, and an annual income of $1,019,258. The number of persons over 20 years of age who could not read and write was 66,020, of which number 56,958 were natives and 9,062 foreigners, and 61,030 white and 4,990 colored persons.

31. In 1855 the number of common schools was 12,012, with 21,176 teachers and 669,024 scholars; of high schools 91, with 196 teachers and 3,974 scholars; of colored schools 88, with 4,110 scholars, and of German and English schools 88, with 1,729 scholars. The whole cost of these schools in the year was $2,631,818.

32. The principal collegiate and professional institutions of the State, with a statement of their condition in 1855, are named in the following table:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
Ohio University	Athens	1804	5	41	5,000
Miami University	Oxford	1824	8	119	6,800
Franklin College	New Athens	1824	4	85	2,200
Western Reserve College	Hudson	1826	7	27	8,500
Kenyon College	Gambier	1826	9	83	10,500

Starling Medical College	Columbus	1847	8	124	—
Eclectic Medical Institute	Cincinnati	1845	8	81	—

33. The most numerous religious denominations in Ohio are the Methodist, representing a third of the total population, the Presbyterian a fifth, and the Baptist an eighth. Next in numerical order come the Lutheran, Roman Catholic, Moravian, Congregational, Friends, Christian, Episcopal, German Reformed, and Universalist; and after them, but at a great numerical distance, the Union, Tunker, Free, Mennonite, Dutch Reformed, Jewish, Swedenborgian, Unitarian, etc. The whole number of churches in the State in 1850 was 3,936, with accommodation for 1,457,291 persons; and the value of church property was $5,793,099.

OBSERVATORY AT CINCINNATI.

34. Columbus is the State capital, and Cincinnati the commercial metropolis and largest town, not only of Ohio, but also of the whole central valley. Otherwise the State has many important and wealthy cities and towns, as Cleveland, Sandusky, and Toledo on the lake; Columbus, Dayton, Springfield, Zanesville, Newark, etc., in the interior; and Steubenville, Portsmouth, Marietta, etc., on the Ohio River.

35. Columbus, the seat of government, is situated on the left bank of Scioto River, 90 miles above its confluence with the Ohio; and in latitude 39° 57′, and longitude 83° 3′. In 1812 the vicinity was a wilderness. The State House was built in 1814, and the legislature first met here in 1816. The site on which the city is built rises gradually from the river, and is laid out in wide and commodious streets, intersecting at right angles. In the center of the city is a public square of 10 acres, in which Broad Street, 120 feet wide, and High Street, 100 feet, cross each other. All the other streets are 88 feet wide, and the alleys 33 feet. The old State House, a plain brick building, occupying one corner of the square, was entirely consumed by fire in 1852. The new Capitol is one of the most magnificent buildings of the kind in the Union. It is 304 feet long and 184 feet wide, covering an area of 55,936 square feet. The basement is 16 feet above the common surface; the height of the blocking course is 62 feet, and to the top of the rotunda 157 feet. The other remarkable buildings are the Ohio Penitentiary, a spacious and elegant structure on the river, northwest of the State House, and the asylums for the blind, the deaf and dumb, and the insane; the Starling Medical College, etc. Many of the churches and school-houses are also fine buildings, and generally the business and private houses are neat, substantial, and often elegant. Columbus is surrounded by a rich and populous country, and is an active business place, with extensive manufactures. The avenues of travel and commerce connecting the city with other parts of the State and Union are the National Road, a branch of the Ohio Canal, and several rail and other roads. Population (1820) about 1,400, (1830) 2,455, (1840) 6,048, and (1850) 17,882.

STATE-HOUSE, COLUMBUS.

36. Cincinnati, the commercial metropolis of the Ohio Valley, is situated on the right bank of that river, opposite the mouth of Licking River, and distant from Pittsburg 497, and

from Cairo 516 miles. Latitude 39° 5′ 54″, and longitude 84° 27′. It covers an area of 4,127 acres, and is the largest inland city in America, and in population is only exceeded by New York, Philadelphia, and Baltimore. In 1795 it had scarcely 500 inhabitants, and since that year it has increased quintennially as follows:

1800	750	1815	6,070	1830	24,831	1845	74,699
1805	960	1820	9,602	1835	29,400	1850	115,436
1810	2,540	1825	13,778	1840	46,338	1853	153,643

The constituents of this population in 1853 were in the following proportions: Americans 57, Germans 26, Irish and other British 15, French and Italians 1, and other foreigners 1 per centum. Immediately adjacent are the cities of Covington and Newport, and the villages of Brooklyn, Jamestown, and Ludlow, in Kentucky; and on the Ohio side, Pendleton, Fulton, Walnut Hills, Clinton, Clifton, Fairmont, and Storrs, containing an aggregate population in the suburbs of 60,000 more.

37. Pioneers still living, more than sixty years since, with arms in their hands, disputed with the aborigines the title to the ground upon which now dwells this population of nearly a quarter of a million. It was first settled on the 26th December, 1788, by a party of men sent out under Matthias Denman and Robert Patterson, to improve a portion of the purchase made by the Hon. John Cleves Symmes. This purchase embraced a tract of 311,682 acres, lying between the Great and Little Miami rivers, and extending along the Ohio River a distance of 37 miles.

38. This party landed opposite the mouth of Licking River, and laid out a village called Losantiville, a name shortly afterward abandoned for that of Cincinnati. In February, 1789, another party, under Judge Symmes himself, landed at North Bend, and there laid out what was intended to be a large city, to which they gave the name of Symmes. The village of Cleves now occupies a portion of the site of the intended city. Soldiers were now sent out to protect the settlers at the Bend; but Fort Washington having been established, they were removed to Cincinnati subsequently, and the rivalry of the two places succumbed in favor of Cincinnati as the chief seat of business. In 1790 General Harrison marched hence against the Indians, and in the next year General St. Clair started for the same place on his ill-fated expedition. In 1792 the first church was erected on what is now corner of Main and Fourth streets, and occupied by the First Presbyterian Church. In 1793 the first paper, called the "Sentinel of the Northwest Territory," north of the Ohio River was established at Cincinnati by William Maxwell. On the 11th January, 1794, a line of two keel-boats, with bullet-proof covers and port-holes, and provided with cannon and small-arms, was established between Cincinnati and Pittsburg, each making a trip once in four weeks.

39. During this period the town progressed but slowly, while idleness, drinking, and gambling prevailed in the army, and was to some extent participated in by the citizens. The population at various periods is shown above. From 1800 to 1810 it progressed pretty rapidly, and considerable trade was carried on with New Orleans in keel-boats, which returned laden with foreign goods. The passage to New Orleans then occupied about 25 days, and the return 65 days. In 1819 the city was incorporated, since which period its progress in population and material wealth has been uninterrupted and rapid in an astonishing degree, considering the difficulties it had to contend with before the establishment of steam navigation on the rivers and railroads throughout the country.

40. The position of Cincinnati is admirable. It is in the center of a beautiful valley, surrounded by hills. It occupies the whole of the first and second planes above the Ohio River, and extends a mile over the third, or still higher elevations of Mount Adams, Mount Auburn, Mount Washington, etc. The first of these planes or tables, called the bottom, is at an elevation of 50 feet above low-water mark; the second, called the hill, about 60 feet higher, and is densely built upon, and more populous than the other two; it is elevated 541 feet above tide-water and 23 feet below the level of Lake Erie. Above this table are the hills of Mount

CITY OF CINCINNATI.

Auburn, etc., 200 feet higher. To an eye placed on these highest elevations, the city appears to occupy the center and base of an immense basin, the view being in every direction terminated by swelling hills. The grade of these planes or terraces has for years been changing to conform to the general improvement of the city, and now affords the regular and facile ascent and descent required by heavy draughts, as well as to permit the safe drainage of water from the upper tables of the city. Many of the streets are ornamented with elegant edifices and beautiful shade trees.

41. The city is regularly laid out in streets and alleys, crossing each other at right angles. The streets running east and west are denominated Water, Front, Columbia, Pearl, Third, Fourth, etc., while those running north and south are named Broadway, Sycamore, Main, Walnut, Western Row, etc. Main Street extends from the steamboat landing, on the river, northwardly to the northern bounds of the second plane. The streets are generally paved, and the foot-paths bricked. In 1853 the city contained 19,904 houses, 91 churches, 3 colleges, 5 medical schools, a law school, a female college, several female seminaries, 6 classical schools, a large number of finely-built public schools, the Mechanics' Institute, 6 chartered and 14 private banks, and 17 insurance companies, etc.; a great number of public halls, the county and city courts; the new Court House, a massive and elegant edifice, covering an area of 41,209 feet; a mercantile exchange, and numerous libraries; and literary, philosophical, and charitable institutions, an observatory, four theaters, a museum, gas-works, water-works, custom-house, etc. In fact, it has all the appliances necessary for the physical, intellectual, and moral enjoyment of a large population; and in its manufactures, commerce, and general wealth is pre-eminent among the cities of the world.

42. The manufactures of Cincinnati embrace almost every department of industrial employment. It would be impossible to enumerate them in the compass allowed to this article; but there are some industries that so distinguish the city that their enumeration is necessary. It has 6 distilleries, 140 bakeries, 12 bell and brass founderies, 82 blacksmith shops, 10 boiler yards, 15 book-binderies, 374 boot and shoe factories, 31 breweries, 60 brick-yards, 208 mason yards, 121 butchers' shops, 284 carpenter and builder shops, 24 carriage factories, 63 coopers' shops, 42 copper-plate printing establishments, 13 beef and tongue-curing establishments, 4 cutleries, 32 daguerreotype establishments, 16 domestic liquor manufactories, 15 dye-houses, 19 edge-tool factories, 14 engraving establishments, 14 feed and flour mills, 44 founderies and engine-shops, 136 furniture factories, 10 gilding establishments, 2 glass-works, 6 gunsmith shops, 40 hat factories, 14 ice-packing establishments, 5 iron rolling-mills, 3 iron safe factories, 5 iron railing factories, 10 lever lock factories, 4 lithographic establishments, 7 looking-glass factories, 22 machinist shops, 5 marble works, 6 mathematical and optical instrument factories, 10 upholsteries, 60 millineries, 7 morocco leather factories, 6 musical instrument factories, 1 castor-oil factory, 24 oil, lard, and stearine factories, 3 linseed-oil mills, 72 paint and glazing shops, 9 paper mills, 14 patent medicine factories, 7 plane factories, 1 planing machine factory, 6 platform scale factories, 6 plow factories, 16 plumbing shops, 14 potteries, 33 pork, beef, and ham-curing factories (employing 2,450 hands, and producing annually $5,760,000), 12 publishing houses, 40 saddleries, 25 sash, blind, etc., factories, 22 sausage factories, 15 saw-mills, 2 saw factories, 5 sheeting, etc., factories, 15 shirt and stock factories, 38 soap and candle factories, 7 steamboat building yards, 3 stereotype founderies, 23 stonecutting yards, 36 stone mason yards, 157 tailor establishments, 30 tanneries, 62 tobacco, cigar, and snuff factories, 30 turners' shops, 2 type founderies, 26 vinegar factories, 42 wagon factories, 40 wine manufactories, 5 wire-working establishments, 4 locomotive manufactories, etc. There are 180 several industries pursued, and the total number of all manufacturing and industrial establishments in the city was about 3,400. The total number of hands employed about 32,850, and the annual value of products $55,000,000.

43. There are few cities of the Union so well furnished with facilities of locomotion. It has one of the finest rivers in the world fronting it. Its river commerce is commensurate with the immense internal trade centering at this point, and with the daily increasing manufacturing industry of the city. It is carried on chiefly in steamboats plying hence to Pittsburg, St. Louis, New Orleans, and intermediate places. Its steamers also penetrate all the great navigable rivers of the West—tributaries of the great Father of Waters—an inland navigation of 45,000 miles, unsurpassed by any other internal navigation of the globe. The steamboat arrivals for the year ending August 31, 1853, numbered 4,058: of these, 619 were from Pittsburg, 233 from St. Louis, 254 from New Orleans, and 2,952 from other ports; and the departures were 4,146, namely, for Pittsburg 567, for St. Louis 288, for New Orleans 250, other ports 3,041. Two hundred and ninety-eight different boats arrived during the year, with an aggregate tonnage of 76,647 tons custom-house measurement. The actual tonnage of the entire number of arrivals was 1,390,541 tons.

STEAMBOAT LANDING.

44. The Miami Canal, commencing at Cincinnati, extends up the valley of the Great Miami, passes the summit at St. Mary's, thence down the Maumee valley, and terminates at Toledo, on Lake Erie. Connecting with this, at Junction, is the Wabash Canal, making an aggregate canal navigation through the valleys of the Miami, Maumee, and Wabash of 600 miles. The amount of freight transmitted on these canals from these great and productive valleys is immense, especially their heavy products. The Whitewater Canal connects the city with the eastern and central parts of Indiana, and is an important avenue of trade.

45. The table-land between the Ohio River and Lake Erie is the grand highway over which must pass the railroads from the Mississippi valley to the Atlantic cities. Most of these connect with Cincinnati, making it a principal center of the system. These works are gradually and almost imperceptibly extending the commercial enterprise of this vigorous and growing city to the remotest plains and valleys of the interior. Twenty-six railroads will bring to this mart of commerce the trade of great portions of the States of Ohio, Kentucky, Indiana, Illinois, etc., and bring within her grasp the products of more than 300,000 square miles of territory unsurpassed for productiveness. Railroad connections are now complete with New York and the principal cities of the sea-board, *via* Cleveland, and also, *via* Sandusky City, with Philadelphia, with Chicago, and every lake port from thence to Niagara, with

Albany, Indianapolis, and soon will be with Baltimore, St. Louis, Lexington, Charleston, Savannah, Mobile, and New Orleans. A second railroad is being built to Xenia, although a portion of the present railway has a double track; and a second road is also being constructed to Dayton, which passes out of the city through a tunnel 10,000 feet long, part of the way at a depth of 160 feet. Railroads are being constructed in all these directions, and when completed will built up Cincinnati, and make it a competitor for the wealth of commerce second to no other city of the world. It has already had the foretaste of its future, and is now stretching out its arms to gather in the vast, illimitable wealth with which nature has surrounded it. It has also telegraphs, giving it instantaneous communication with every large city from Maine to Florida, and from the Atlantic to beyond the Mississippi.

46. The commerce of the city has increased with unprecedented rapidity. From a supply of goods furnished by the two keel-boats and a few pack-horses, a little more than half a century since, its imports have increased for the year last named to $51,230,641, and its exports for the same period, $36,266,108.

47. In the immediate vicinity the culture of the grape is carried on to a greater extent than in any other place in the Union. In the center of a large extent of lower silurian formation, the fertile loamy and argillaceous soil on the slopes of the higher table-lands are admirably adapted to vineyards. They form a most delightful portion of the scenery on the graceful declivities of the hills. The mean annual temperature is 54.6°; of winter, 34.5°; spring, 54.6°; summer, 73.9°; autumn, 54.8°. Annual mean quantity of rain 48.33 inches, snow 19.70 inches, showing an exceedingly favorable climate for the vine. Although the culture of the vine is in its infancy here, the vintage of 1853 is estimated at 500,000 gallons, which, when bottled, will be worth $2,000,000. The wines produced are chiefly the still and sparkling Catawba, and are said to be equal to the wines of France in flavor and body.

48. Adjoining the city on the east is the large village of Fulton, and on the north the beautiful village of Walnut Hills, which is mostly occupied as country seats by persons doing business in Cincinnati. Walnut Hills is the seat of Lane Seminary, a theological institution owned by the New School Presbyterians. Four miles northwest of the city are two fine cemeteries—"Spring Grove Cemetery," containing about 220 acres, and the "Wesleyan Cemetery," containing about 40 acres.

49. Cleveland, on the shore of Lake Erie, at the mouth of Cuyahoga River, is, next to Cincinnati, the most commercial city of the State, and, with the exception of Buffalo, of the Erie coast. It has great natural facilities for trade, and is connected with the interior by the Ohio Canal and several railroads. Its harbor is good, and has been improved by piers extending into the lake. Its progress in manufactures has also been rapid, and they are now large and valuable. Steamboats are constantly plying to and from the principal lake ports. Cleveland is the seat of the Western College of Homeopathy, founded in 1850, and of the Medical Department of the Western Reserve College, founded in 1844. Population (1850) 17,034, and (1855) 41,196.

50. Chillicothe, on the Scioto and on the Ohio Canal, 45 miles from Portsmouth, at the mouth of the river, is situated on a beautiful plain, inclosed by verdant and cultivated hills. The town is regularly planned, the streets wide and lighted with gas, and bordered by handsome buildings. It is the center of trade for a fine farming region, and is steadily advancing in importance. The Marietta and Cincinnati Railroad passes through it, on the one side giving it access to immeasurable coal-fields, and on the other with the great mart of commerce. Within its own limits it has immense water-power. It was the State capital until 1810, and the old State House is now used for county purposes. Population (1850) 7,100. Circleville, also on the Scioto, 20 miles above Chillicothe, occupies the site of an old circular fortification, and is surrounded by a highly fertile country. The town has various mills and factories, and a large trade which is facilitated by the Cincinnati, Wilmington and Zanesville Railroad and the Ohio Canal, both of which pass through the town. Population (1850) 3,411.

51. Dayton, at the confluence of Mad River with the Miami, and on the Miami Canal, is the fourth city of the State in population and importance. It is the center of six railroads and nine macadamized roads, which connect it with all parts and create for it an immense commerce. The city is laid out in wide streets and contains many elegant buildings, its courthouse, of white marble, being perhaps the finest in the West. It has about 20 churches and numerous academies and schools. The streets and stores are lighted with gas. Its manufactures, chiefly worked by water-power furnished by a hydraulic canal, are extensive, consisting of railroad machinery, cars, paper, and hollow-ware, cotton and woolen goods, oil, flour, etc. In the vicinity are limestone quarries, which furnish building material for Cincinnati and other cities. Population (1830) 2,954, (1840) 6,067, (1850) 10,977, and (1853) 16,562.

52. Hamilton, on the Miami River and Canal, and the Cincinnati, Hamilton and Dayton Railroad, 25 miles north Cincinnati, is a prosperous manufacturing and trading town, with extensive flour, paper, iron, and other works. On the opposite side of the river is the pleasant village of Rossville. Population (1850) 3,210.

53. Newark is situated at the confluence of the forks of Licking River and on the Ohio Canal, 37 miles east Columbus. It is one of the most flourishing towns of the State, and is rapidly progressing in business and manufactures. The Central Ohio Railroad passes through it, and is here intersected by the Sandusky, Mansfield and Newark Railroad, and also the railroad being built from Portsmouth. In the vicinity are sandstone quarries and mines of cannel coal. Population (1850) 3,654.

54. Portsmouth, on the Ohio, immediately above the mouth of the Scioto, is the south terminus of the Ohio Canal and of the Scioto and Hocking Valleys Railroad, 92 miles south Columbus. It is a place of large business, and has regular steamboat communication with Cincinnati and other river ports. Iron ore, coal, and building-stone are abundant in the vicinity, and the town has considerable manufactures. Population (1850) 4,011.

55. Sandusky is eligibly situated on Sandusky Bay, three miles from Lake Erie and 60 miles west Cleveland, in latitude 41° 27′, and longitude 82° 45′. The bay, which is 20 miles long and from 5 to 6 miles wide, forms a capacious and easily approached harbor, with an average depth of 12 feet. The city stands on ground gradually rising from the shore and commands a beautiful view of the water, enlivened during the navigation season by vessels of all kinds going and coming with their rich freights. It is one of the great commercial ports of the lake, and the entrepôt of a vast and constantly increasing trade, with railroads diverging from it east and west and south. The total of imports in 1852 was $40,896,085, and of exports $18,789,814, and these amounts are annually increasing. Population (1850) 5,087.

56. Springfield, on the Mad River, where it is crossed by the National Road, is a beautiful town, and surrounded by a populous and highly cultivated country. Railroads radiate from it in five directions, and also six macadamized roads, which make it a great trade center. In the city and vicinity there are large industrial establishments, manufacturing cotton, wool, paper, ironware, machinery, etc., and extensive flouring mills, which are driven by water-power, abundantly supplied by Mad River and Lagonda Creek, which here joins it. It is the seat of Wittenberg College, founded by the Christian denomination in 1845. Population 5,108. Tecumseh, the famous Indian warrior, was born about five miles west of Springfield.

57. Steubenville is a flourishing town on the Ohio, 24 miles above Wheeling and 42 miles west Pittsburg. It is the center of an extensive trade and the seat of flourishing manufactures. In the vicinity are inexhaustible coal-fields. This important town has now diverging from it railroads east and west, and north and south, and an extensive steamboat connection. Population (1850) 6,140.

58. Toledo, on the Maumee, four miles from its mouth, is one of the most flourishing entrepôts of the commerce of the lakes. Latitude 41° 39′ 30″, and longitude 83° 32′—distant by railroad from Cleveland 109 miles, from Detroit 67 miles, from Chicago 243 miles, from St. Louis 460 miles, and from Cincinnati 187 miles. It has also steamboat connection with the principal lake ports; and is the northern terminus of the Miami and Wabash and Erie canals, by which it drains immense and fertile regions extending south to Cincinnati and west and southwest to Evansville on the Ohio. The total value of its imports in 1852 was $37,565,029, and of its exports $19,738,923. Toledo extends along the river for more than a mile, and consisted originally of two settlements, called Port Lawrence and Vistula, and still distinguished as the upper and lower landing. It was incorporated in 1836; in 1840 it contained 1,322 inhabitants; in 1850, 3,829, and in 1853, 6,412.

59. Zanesville is an important town on the Muskingum, 30 miles from its mouth and opposite the confluence of the Licking. The Cincinnati, Wilmington and Zanesville and the Cleveland, Zanesville and Cincinnati railroads here connect and are crossed by the Central Ohio Railroad, 59 miles east Columbus. Latitude 39° 57′, and longitude 80° 57′. It is situated on the left bank of the river, which is navigable and flows through a rich and populous valley. The streets are regular and wide and lighted with gas. Its natural advantages for a large trade are multiform, and have been so liberally improved that it has become one of the greatest interior towns of the State. Steamboats ascend the river from the Ohio. It has also eminent manufacturing capabilities from its immense water-power and its coal beds. Its manufactures are ironware, machinery, paper, glass, woolen goods, flour, etc. The river is here crossed by a fine iron bridge, 538 feet long, over which passes the Central Ohio Railroad. Bridges also connect it with its suburbs, South Zanesville, West Zanesville, Putnam, etc. In 1810 it was made the seat of government and remained so until the removal to Columbus, in 1812. Population (1850) 7,929, and with its suburbs about 10,000.

60. Ohio has besides these a large number of other important towns. The principal of these with their population in 1850 are noted in the following table:

Akron	3,266	Elyria	1,482	Marietta	3,175	Pomeroy	1,638
Ashtabula	821	Findlay	1,256	Marion	1,311	Putnam	1,383
Athens	898	Fremont	1,464	Maumee	1,465	Sidney	1,302
Bellefontaine	1,222	Gallipolis	1,686	Mt. Vernon	3,711	Somerset	1,240
Cadiz	1,144	Hillsboro'	1,392	New Philadelphia	1,418	Tiffin	2,718
Canton	2,603	Lancaster	3,453	Norwalk	1,437	Troy	1,956
Delaware	2,074	Lebanon	2,088	Oxford	1,716	Urbana	2,020
Dresden	1,448	McConnellsville	1,643	Perrysburg	1,199	Wilmington	1,298
Eaton	1,346	Mansfield	3,175	Piqua	3,277	Xenia	3,024

61. The French from Canada were the first visitors to the valley of the Ohio, but within the limits of this State established no settlements. The first permanent European settlement was made in 1788 at Marietta. In July, 1787, Congress established the "Territory Northwest of the Ohio." In 1799 this territory was divided, and the country now composing the State of Ohio was formed into a separate government. On the 30th April, 1802, Congress passed a law enabling the people to frame a constitution and State government, and on the 29th November, 1802, Ohio was admitted into the Union.

STATE OF INDIANA.

1. Indiana is situated between latitudes 37° 51′ and 41° 46′ north, and longitudes 84° 49′ and 88° 02′ west; and is bounded on the north by the Lake and State of Michigan, on the east by Ohio, on the south by Kentucky and the Ohio River, and on the west by the Wabash River and Illinois. It has an extreme length, north and south, of 276 miles, and a width of about 140 miles. The area is 33,809 square miles or 1.15 per cent. of the total surface of the United States.

2. The general features of Indiana are those which pertain to all countries where mountain, in the strict sense of the word, is wanting, for, if we except the river-hills and the accumulations of sand on the southern shore of Lake Michigan, no portion of the country has any

continuous or definite culmination, and all of mountain that really appears are a few isolated "knobs," which serve only to diversify the scenery. Nearly two thirds of the State are level, or at most undulating, and a most singular feature of the country is the absence of any water-shed or dividing ridge, such as almost every geographical region presents, from which the waters flow in different directions; still, however, the country has continuous slopes of great extent, and the difference of elevation of the highest land and the Ohio River at the falls is nearly 600 feet, and a considerable difference is observed (about 70 feet) between the levels of the Ohio, at the falls, and at the mouth of the Wabash, the latter being the lowest.

3. The river-hills, of which previous mention has been made, extend at various distances from, and parallel to, the courses of the Ohio and other streams, and inclose what are termed the bottom lands, which are chiefly rich alluvions, and thickly set with forests. These hills, along the Ohio River, are generally as high as the highest levels of the interior, often of a rugged and broken aspect, and where torn through by the tributaries of the Ohio, present much imposing scenery. Behind these a table-land spreads out and forms what may with propriety be termed the interior of the country, and now every feature is changed. Instead of the bottoms, with their mighty forests, the most varied landscape appears—here are extensive growths of oak, ash, and other trees, and there vast prairies, and in other parts the surface is undulating and occasionally rises into hills from 100 to 300 feet high. There is such a marked difference, however, between the several parts of the country, that no general description could embrace its topography.

4. The Ohio valley, including that of the Whitewater, contains some 5,500 square miles; this is a limestone region, and was originally clothed with heavy forests. The hills are abrupt and broken, and the numerous tributaries of the Ohio break through them in every direction. Many of these streams in dry weather show only the marks where the torrents have disappeared almost as soon as the storms that occasioned them. Of this division of the State, about two thirds are good farming lands, and the residue either too hilly or the soil too poor for profitable cultivation. The poorest part is at the flats, at the heads of the streams.

5. The White River valley extends from the Wabash centrally through the State to the Ohio line, and covers about 9,000 square miles of surface. It is almost uniformly level and heavily timbered, except in the western parts, where there are some prairies and barrens, and ranges of low, rugged hills. The whole valley is destitute of rock, and the soils are of the richest kind, with little that is unprofitable. Most of the streams are clear and never-failing, and water-power abundant.

6. The Wabash valley is the largest division, and embraces an area of upward of 12,000 square miles. It interlocks with the valley of the White River, and the eastern portion resembles it. It is equally fertile, but more broken. The middle part of the valley has abundant water-power. From the river-hills of the Ohio to the Wabash the surface is an inclined plane, and it is not a little curious to find streams, the head waters of which are near the borders of the Ohio valley, traversing to the Wabash, a river so much farther distant from their sources.

7. The north part of the State, watered by the St. Joseph's and the Kankakee, is much similar in its general character to the Wabash country, but is perhaps more swampy, and near Lake Michigan the country has extensive sand-hills, which are covered only with stunted and shriveled pines and burr-oaks.

8. Indiana has many fine rivers, but few of them are eligible for navigation. The Ohio, the final recipient of the principal water-courses, borders the State on the south from the Miami to the Wabash, a distance by the river's course of 380 miles. Laughery, Indian Kentucky, Silver, Indian Blue, Anderson, Big Pigeon, Little Pigeon, etc., are its principal tributaries between these points, yet none of them are of large capacity. The Whitewater joins the Miami six miles above its entrance into the Ohio.

9. The Wabash, which rises in Ohio, runs a devious course of about 600 miles, and is navigable for about half its length. Its principal affluents are—from the north and east, the Salamonie, Mississinewa, Wild Cat, Sugar or Rock, Raccoon, White, and Patoka rivers; and from the west and north, Little Wabash, and Embarras rivers, in Illinois, the Vermillion in both States, and in Indiana altogether, Tippecanoe, Eel, and Little rivers. White River, the most important of these, empties into the Wabash, 100 miles above its mouth; the West Fork, its longest branch, rises near the Ohio line, and runs in a southwest direction, receiving in its course Eel River, Fall Creek, etc.; and the East Fork, the principal feeders of which are Salt Creek, the Muscatatuck, Sand Creek, Clifty, Flat Rock, and Sugar creeks, rises in Ripley County, and has a western course to its union with the West Fork—the two forming White River proper, about 50 miles above its entrance into the Wabash.

10. The St. Joseph's and St. Mary's form the Maumee River, which passes to Ohio and Lake Erie. Another St. Joseph's and its tributaries, the Elkhart, etc., pass into Lake Michigan. The Kankakee, the principal branch of the Illinois, runs sluggishly through the northwestern counties for 100 miles, and in its course receives Yellow River, a stream about 50 miles long. Extensive marshes everywhere bound its course. Deep and Calumet rivers lie near and south of Lake Michigan, and in some places are only separated from it by banks of sand. The Iroquois or Pickamink rises south of the Kankakee, and runs nearly parallel to it for 50 miles, and joins it in Illinois.

11. Besides Lake Michigan on the northern border, there are numerous other, but small, lakes in different parts of the State, principally to the north of Wabash River. Several of them have no outlets; they are generally clear, however, and have sandy shores and bottoms. They seldom exceed a few acres in extent, though some, at the head of the Tippecanoe River and Turkey Creek, and near La Porte, cover several hundred acres—the largest, Beaver Lake, has a surface of 10,000 acres. All abound in fish, and have rich and pleasing scenery.

12. Three geological formations exist in Indiana: a bituminous coal formation, occupying that portion of the State west of the second principal meridian; a limestone formation, prevailing in the counties east of that meridian; and a diluvium, consisting of deposits of clay, sand, gravel, and boulders, overlying and in many places covering up the two other formations to a greater or less depth, particularly in the northern districts. Iron, lead, antimony, manganese, zinc, cobalt, bismuth, and arsenic are the principal metals found in the State, and silver, in the form of a sulphuret, has been discovered in the west; building stone and slate of every variety are abundant, and clays useful in the arts are extensively distributed. The coal beds in the west are very valuable and numerous; salt springs are found on the eastern edge of the coal formation. The fertility of the soil is universally admitted.

13. The forests of Indiana contain all the trees natural to the soil and climate of the whole central region of the United States. Oaks and beech-trees, however, preponderate, and probably count two thirds of the whole. Next in order are the sugar-tree, hickory, ash, walnut, poplar, elm, sycamore, cherry, hackberry, maple, etc. Of the smaller trees and undergrowths, the principal are dogwood, papaw, spear, plum, and thorn, and the persimmon and crab-apple. Many of the forests trees attain magnificent dimensions; and in most parts oak and beech mast is found in such quantities as to contribute largely to feeding and fattening hogs.

14. In 1850 Indiana contained 988,416 inhabitants, comprised in 171,563 families, and occupying 170,178 dwellings. This is equivalent to 29.24 inhabitants to the square mile, or 4.26 per cent. of the total population of the Union. Its distribution into the counties was as follows:

Counties.	Population.	County Seats.
Adams	5,797	Decatur.
Allen	16,919	Fort Wayne.
Bartholomew	12,428	Columbus.
Benton	1,144	Oxford.
Blackford	2,360	Hartford.
Boone	11,631	Lebanon.
Brown	4,846	Nashville.
Carroll	11,015	Delphi.
Cass	11,021	Logansport.
Clark	15,828	Charlestown.
Clay	7,944	Bowling Green.
Clinton	11,869	Frankfort.
Crawford	6,524	Levenworth.
Daviess	10,352	Washington.
Dearborne	20,166	Lawrenceburg.
Decatur	15,107	Greensburg.
De Kalb	8,251	Auburn
Delaware	10,843	Muncietown.
Dubois	6,321	Jasper.
Elkhart	12,690	Goshen.
Fayette	10,217	Connersville.
Floyd	14,875	New Albany.
Fountain	13,253	Covington.
Franklin	17,968	Brookville.
Fulton	5,982	Rochester.
Gibson	10,771	Princeton.
Grant	11,092	Marion.
Greene	12,313	Bloomfield.
Hamilton	12,684	Noblesville.
Hancock	9,698	Greenfield.
Harrison	15,286	Corydon.
Hendricks	14,083	Danville.
Henry	17,605	New Castle.
Howard	6,657	Kokomo.
Huntington	7,850	Huntington.
Jackson	11,047	Brownstown.
Jasper	3,540	Rensselaer.
Jay	7,047	Portland.
Jefferson	23,916	Madison.
Jennings	12,096	Vernon.
Johnson	12,101	Franklin.
Knox	11,084	Vincennes.
Kosciusko	19,243	Warsaw.
La Grange	8,387	La Grange.
Lake	3,991	Crown Point.
La Porte	12,145	La Porte.
Lawrence	12,097	Bedford.
Madison	12,375	Anderson.
Marion	24,103	INDIANAPOLIS.
Marshall	5,348	Plymouth.
Martin	5,941	Dover Hill.
Miami	11,304	Peru.
Monroe	11,286	Bloomington.
Montgomery	18,084	Crawfordsville.
Morgan	14,576	Martinsville.
Noble	7,946	Albion.
Ohio	5,308	Rising Sun.
Orange	10,809	Paoli.
Owen	12,106	Spencer.
Parke	14,968	Rockville.
Perry	7,268	Rome.
Pike	7,720	Petersburg.
Porter	5,234	Valparaiso.
Posey	12,549	Mount Vernon.
Pulaski	2,595	Winnimac.
Putnam	18,615	Green Castle.
Randolph	14,725	Winchester.
Ripley	14,820	Versailles.
Rush	16,445	Rushville.
Scott	5,885	Lexington.
Shelby	15,502	Shelbyville.
Spencer	8,616	Rockport.
Stark	557	Knox.
Steuben	6,104	Angola.
St. Joseph's	10,954	South Bend.
Sullivan	10,141	Sullivan.
Switzerland	12,932	Vevay.
Tippecanoe	19,377	La Fayette.
Tipton	3,532	Tipton.
Union	6,944	Liberty
Vanderburgh	11,414	Evansville.
Vermillion	8,661	Newport.
Vigo	15,289	Terre Haute.
Wabash	12,138	Wabash.
Warren	7,387	Williamsport.
Warrick	8,811	Booneville.
Washington	17,040	Salem.
Wayne	25,320	Centreville.
Wells	6,152	Bluffton.
White	4,761	Monticello.
Whitley	5,190	Columbia.

—of the total population, 977,154 (98.86 per cent.) were white persons—506,178 males and 470,976 females, and 11,262 (1.14 per cent.) were free colored persons—5,715 males and 5,547 females; and of the whole 931,392 (94.42 per cent.) were Americans, of which number 541,079 were born in the State; 54,426 (5.51 per cent.) were foreigners, and 2,598 were of unknown origin.

15. The total population of Indiana in 1800 was 4,875; in 1810, 24,520; in 1820, 147,178; in 1830, 343,031; in 1840, 685,866; and in 1850 (as above) 988,416. In 1855 the population was estimated at 1,198,733.

16. The occupations of 248,696 males over 15 years of age in 1850 were as follows: 45,318 in commerce, trade, manufactures, mechanic arts, and mining; 163,229 in agriculture; 29,854 in labor not agricultural; 1,725 in sea and river navigation; 4,229 in law, medicine, and divinity; 3,031 in other occupations requiring education; 677 in government civil service; 184 in domestic service, and 449 in pursuits not specified.

17. The number of farms in Indiana in 1850 was 93,896, and these inclosed 12,893,422 (improved 5,046,543 and unimproved 7,746,879) acres of land. The whole were valued at $136,385,173, and the value of implements and machinery thereon was $6,704,444.

18. The quantity of livestock* in the State in 1840 and 1850 was and consisted of—

1840	horses, mules, etc.,	211,036	neat cattle,	619,980	sheep,	675,982	swine,	1,623,608
1850	" "	320,898	"	714,666	"	1,122,493	"	2,263,770

—and in 1850 the stock was valued at $22,478,555, and the value of animals slaughtered in 1849–50 was $6,567,935. The products of animals consisted of—butter 12,881,535, cheese 624,564, and wool 2,610,287 pounds. In 1850 the mules and asses numbered 6,599, the milch cows 284,554, and the working oxen 40,221, all included in the above aggregates.

19. The grain crops (bushels)† of 1840 and 1850 comparatively were as follows:

1840	wheat,	4,049,375	rye,	129,621	oats,	5,981,605	Indian corn,	28,155,887	barley,	28,015	buckwheat,	49,019
1850	"	6,214,458	"	78,792	"	5,655,014	"	52,964,363	"	45,483	"	149,740

—making a total in 1840 of 38,393,522 and in 1850 of 65,087,973 bushels.

20. And among other agricultural products returned in the census of 1850 were the following: hay 403,230 tons, hops 92,796 pounds, clover-seed 18,320, and other grass-seed 11,951 bushels, peas and beans 35,773 bushels, beeswax and honey 935,329 pounds, flax-seed 36,888 bushels, flax 584,469 pounds, maple-sugar 2,921,192 pounds, molasses 180,325 gallons, ginned cotton 14 bales of 400 pounds, tobacco, 1,044,620 pounds, silk cocoons 387 pounds, and wine 14,055 gallons. The value of market-garden products in 1850 was $72,864, and of orchard products $324,940.

21. In 1850 Indiana had 4,288 establishments engaged in manufactures, mining, and the mechanic arts. These employed an aggregate capital of $7,941,602 and 14,342 hands; consumed in the year raw material to the value of $10,214,337, paid for labor $2,809,116, and produced goods to the value of $18,922,651. Among the principal establishments are noted two cotton mills with a capital of $43,000; 33 woolen mills with $171,545; 20 iron works with $171,900; 59 distilleries and breweries with $359,450, and 358 tanneries with $514,897. The principal seats of manufactures are Madison, New Albany, Cannelton, Indianapolis, etc. In 1810 the annual value of manufactured products (including goods made in families) was $264,890, in 1820, $397,814, in 1830 (no returns), in 1840, $9,379,586, and in 1850, $20,553,690. In 1840 the value of home-made manufactures produced was $1,289,802, and in 1850, $1,631,039.

22. Indiana has no direct foreign commerce; but it has a large domestic and transit trade.

* On the 1st June, 1855, as follows—horses, mules, and asses 304,028, value $13,657,874; neat cattle 798,419, value $7,578,200; sheep 882,797, value $937,370; and swine 2,668,572, value $5,514,098.

† Crops included in the assessments of 1855—viz., wheat 6,658,952, corn 34,811,902, rye 226,559, oats and barley 8,132,786, and potatoes 1,170,000 bushels; hay 422,280 tons; wool 1,396,544 pounds; garden products $259,273, and orchard products $435,122; home manufactures $2,373,674, etc. The quantity of land assessed for taxes was 19,599,936 acres.

Its principal exports are agricultural products. On Lake Michigan the only outlet is at Michigan City; on Lake Erie, Toledo and Sandusky, in Ohio. The chief shipping ports on the Ohio River are Lawrenceburg, Madison, Jeffersonville, New Albany, and Evansville, and beyond the State, Cincinnati. Railroads from each of these places stretch to the interior, and meet at Indianapolis, in the center of the State. Railroads also stretch east and west, and with their external connections form great through lines of commerce between the sea-board and the most western range to which railroads have been built. In the Wabash and Erie Canal, Indiana has one of the longest waterways in the world—it extends from Toledo to Evansville, 467 miles. The Whitewater Canal, in the southeast section of the State, has a length of 75 miles. The length of railroad in operation in 1855 was about 1,600 miles. The shipping owned in the State in 1855 amounted to 3,698 tons, all engaged in steam navigation.

23. The number of banks and branch banks in Indiana in November, 1850, was fourteen, with an aggregate capital of $2,082,950, and in 1855 forty-six, with $4,045,325. At the first period the only institutions of this kind were the State bank and its branches; at the latter periods the same and a number of others organized under the free banking law of the State. The assets of these at the two periods consisted of—loans and discounts $4,395,099 and $6,996,992, stocks (1855) $1,705,070, real estate $364,233 and $231,929, other investments $108,485 and $132,946, due by other banks $845,062 and $1,274,992, notes of other banks $224,842 and $598,262, specie funds (1855) $369,600, and specie $1,197,880 and $1,599,014; and the liabilities were—circulation $3,422,445 and $4,516,422, deposits $630,325 and $1,957,097, due to other banks $112,175 and $379,804, and other liabilities (1855) $161,175.

24. The government of Indiana is based on the constitution of 1851. By this instrument the right of voting is conferred on every white male citizen of the United States 21 years of age, and who has resided in the State six months next preceding an election. No negro or mulatto can vote. Elections by the people are by ballot, and those by the general assembly *viva voce*. General elections are held on the 2d Tuesday of October.

25. The general assembly consists of a senate of 50 members elected for four years, one half the number every second year, and of a house of representatives of 100 members elected for two years. Members of both houses must be citizens of the United States, and have resided in the State two years, and in the district from which elected one year. The legislative sessions are biennial, and commence on Thursday next after the first Monday of January, and no regular session can be prolonged beyond 60 days, and no special session beyond 40 days. Representation is apportioned according to a census of all white males over 21 years of age taken for such purpose every six years.

26. The governor is chosen by a plurality of votes for four years. He must be at least 30 years of age, and have resided in the State five years. His term commences on the second Monday of January. The lieutenant-governor, elected in the same way and for the same term, is *ex officio* president of the senate, and in case of disability or the death of the governor succeeds him in office. The secretary of state, the state auditor, and state treasurer are elected by the people for two years, and are required to reside at the capital during their term of office.

27. The judiciary consists of a supreme court, thirteen circuit courts, forty-four district or common pleas courts, etc. The supreme court consists of four justices chosen from districts by the people at large for six years. Circuit court judges are elected by the people of their respective circuits for six years, and judges of common pleas in districts for four years.

28. The officers elected by the people in each county are a clerk of the circuit court, auditor, recorder, treasurer, sheriff, coroner, and surveyor—the three first for four years and the others for two years. Justices of the peace are elected by the people of each township for four years.

29. The revenue is derived chiefly from general tax, sales of swamp lands, proceeds of the school fund, tolls on Wabash and Erie Canal, poll tax, etc. The total resources of the treasury in the year ending with October, 1850, amounted to $1,861,384, and 1855 to $2,168,315, and the expenditures for the two years to $1,513,534 and $1,700,091. The State debt amounted in 1855 to $7,338,473. In 1850 the value of taxable property in the State was $152,870,399, and in 1855, $280,648,554. The State tax for 1855 was $643,643, the county tax $969,242, the road tax $142,972, the school tax $369,842, the sinking fund tax $56,002, and the township tax $194,226—total tax on the grand list $2,830,606.

30. The principal institutions supported wholly or in part by the State are the Asylum for the Deaf and Dumb, the Institute for the Blind, and the Hospital for the Insane, at Indianapolis, and the State Prison at Jeffersonville, and many appropriations are made for the support of a State Board of Agriculture, and for the colonization of the free blacks.

31. The whole number of children returned as attending school in 1850 was 220,961 or one to every 4.49 of the total population. The condition of the schools on the 1st June of that year is given in the following table:

Classification.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	4,822	4,860	161,500	$316,955
Academies and private schools	131	283	6,185	63,520
Universities and colleges	11	61	1,069	43,350

—making a total of 4,964 schools; 5,154 teachers, and 168,754 scholars, and an annual income of $423,825. The number of persons over 20 years of age unable to read and write was 72,710, of which number 70,540 were white and 2,180 free colored persons, and 69,445 were natives and 3,265 foreigners. In 1855 the number of children attending the common schools was 161,536. The school fund in the year last named amounted to $2,559,308.

32. The chief collegiate and professional schools in the State in 1855 were the following:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
Indiana State University	Bloomington	1816	6	231	4,500
Hanover College	Hanover	1832	6	100	5,400
Wabash College	Crawfordsville	1834	7	43	6,800
Indiana Asbury University	Greencastle	1837	8	122	4,200
University of Notre Dame	South Bend	1842	14	—	—
Hartsville University	Hartsville	1850	8	—	—
Indiana Theol. Seminary	Hanover	1832	2	15	4,000
Theol. Depart. Hanover Col	Hanover	1853	—	—	—
Theol. Depart. Asbury Univer.	Greencastle	1852	2	29	2,500
Ecclesiastical (R. C.) Seminary	Vincennes	—	—	—	—
Theological (Presb.) Seminary	New Albany	—	—	19	—
Law Depart. Ind. State Univ.	Bloomington	—	2	18	—
Law Depart. Ind. Asbury Univ.	Greencastle	—	1	—	—
Indiana Medical College	La Porte	—	—	—	—
Ind. Central Med. College	Indianapolis	—	—	—	—

33. The most prominent religious denominations in the State are the Methodist, Baptist, and Presbyterian, which together include three fourths of the total population. The next most numerous of the denominations are the Christian and Friends; and then the Roman Catholic, Lutheran, and Moravian. The Episcopal scarcely includes one per cent. of the whole. The whole number of churches in the State in 1850 was 2,032 with accommodation for 709,655 persons, and the value of church property was estimated at $1,529,585.

34. Indianapolis, the seat of government, is situated on the west fork of White River, immediately below the mouth of Fall Creek, and near the geographical center of the State, in latitude 39° 55′, and longitude 86° 5′. It is the terminus of eight railroads, coming in from Dayton, 108 miles; Cincinnati, 110 miles; Madison, 87 miles; Jeffersonville, 108 miles; Terre Haute, 73 miles; Lafayette, 64 miles; Peru, 73 miles; and Union City, 84 miles; and these, with their connections, give it access to every town north of the Ohio, and to the utmost limits of railroad extension east and west. A railroad is also being constructed on an air-line to Decatur, Ill., 143 miles. By pre-eminence it is called the "Railroad City." The streets are at right angles with each other; Washington, through which the National Road passes, the principal street of the city, is 120 feet wide, and the others are from 80 to 90 feet. The State House, modeled after the Parthenon, is a handsome structure, 180 feet by 80 feet, with 10 Doric columns on each front, and cost $60,000. The Governor's House is near the center of the city, and is a fine four-fronted building, standing on a natural mound 60 feet high, and circumscribed by Circle Street, and from this also diverge four diagonal streets in the direction of the several corners of the city plot. The other public buildings are its spacious market-houses, its elegant and substantial churches, its fine hotels, bridges, depôts, etc. The city was founded in 1820 and in 1825 became the seat of government. In 1830 it contained only 1,085, and in 1840 only 2,692 inhabitants; in 1850 it had 8,094.

STATE-HOUSE, INDIANAPOLIS.

35. Attica, on the Wabash River and Canal, and on the Toledo, Wabash and Western Railroad, 19 miles from the Illinois line, is a thriving village of 1,500 inhabitants, and has a large trade in agricultural produce. A railroad is also about to be built to Terre Haute; Bedford is a handsome town on the New Albany and Salem Railroad, 81 miles northwest New Albany, and in 1850 had 962 inhabitants; Bloomington, on the same road, 96 miles from New Albany, is the seat of the Indiana State University, and in 1850 had 1,305 inhabitants; Brookville is a town of 1,177 inhabitants, situated at the confluence of the forks of Whitewater River, and is a place of considerable manufactures, and of a large trade facilitated by the Whitewater Canal; Cambridge City, on the Whitewater River and Canal, where they are crossed by the Indiana Central Railroad, is a place of active business, and in 1850 contained 1,217 inhabitants; Centerville is a thriving town on the Central Railroad, 62 miles east Indianapolis. It is the seat of a female college. Population 920; Columbus, on the east fork of White River, and on the Madison and Jeffersonville railroads, 42 miles south-by-east Indianapolis, had (1850) 1,008 inhabitants. A railroad has also been built from this town to Shelbyville, 23 miles; Corydon, on Indian Creek, 116 miles south Indianapolis, was formerly the State capital; Covington, on the Wabash River and Canal, 73 miles west-northwest Indianapolis, has a large trade in grain, and the vicinity abounds in coal and iron. Population (1850) 1,176; Crawfordsville is situated on Sugar Creek, and on the New Albany and Salem Railroad, 28 miles south Lafayette. It is surrounded by a fertile country, well timbered, and abounding in stone-coal. The town is well built and contains several excellent institutions, among which is Wabash College. Population 1,513.

36. Evansville, on the Ohio, 188 miles from its mouth, is a port of entry, and one of the principal commercial towns of the State. It is the southern terminus of the Evansville and Crawfordsville Railroad and of the Wabash and Erie Canal. Population (1850) 3,235; Lamasco, a village of 1,441 inhabitants, adjoins Evansville on the northwest. Both places have been largely advantaged by the completion of the works above named, and together contained in 1855 about 10,000 inhabitants.

37. Fort Wayne is an important city at the confluence of the St. Joseph's and St. Mary's branches of the Maumee, on the Wabash and Erie Canal and on the Toledo, Wabash and Western Railroad, here crossed by the Pittsburg, Fort Wayne and Chicago Railroad, 94 miles west-by-south Toledo. A large number of other railroads are in progress which will terminate here or intersect the town. Its facilities for commerce, indeed, are unrivaled for an inland town, and are rapidly raising it to the position of a first-rate city. The site was formerly occupied by an Indian village, and from 1794 by Fort Wayne, which continued to be a military post till 1819. In 1841 the Indians of this vicinity were removed beyond the Mississippi, and the trading post soon after became a flourishing entrepôt. In 1850 it contained 4,282 inhabitants, and in 1855 the population was estimated at 10,000.

38. Greencastle is a thriving town on the Terre Haute and Richmond Railroad, which is here crossed by the New Albany and Salem Railroad, 39 miles west Indianapolis. It is beautifully situated on a high plain in a rich farming country, and is the seat of the Indiana Asbury University, founded by the Methodists. This institution has also law and divinity schools. Population (1850) 1,382; Hagerstown is a thriving town at the head of Whitewater Canal, and a place of active trade. The Cincinnati and Chicago Railroad passes through it, 16 miles east of Richmond. Population (1850) 606; Jeffersonville is situated on the Ohio, nearly opposite Louisville, and above the falls. It is the seat of the State Prison. The Jeffersonville Railroad from Indianapolis terminates here. Population (1850) 2,122.

39. Lafayette is situated on the Wabash River and Canal, and on the Toledo, Wabash and Western Railroad, which is here joined by the Lafayette and Indianapolis Railroad, 64 miles

northwest Indianapolis. It is one of the largest towns on the canal, and the fourth or fifth in the State. In 1850 it had 6,129 inhabitants; La Porte, in the northwest, is a thriving town on the Northern Indiana Railroad, which is here joined by the Cincinnati, Peru and Chicago Railroad, 12 miles from Lake Michigan. It is a place of active trade, and is the seat of the Indiana Medical College; Lawrenceburg is a commercial town on the Ohio, 22 miles below Cincinnati. It is the south terminus of the Whitewater Canal and of the Indianapolis and Cincinnati Railroad. The Ohio and Mississippi Railroad also passes through it. These works have greatly benefited the town, which is rapidly increasing in wealth and importance. Population (1850) 2,651; Logansport is a flourishing town on the Wabash River and Canal, and on the Toledo, Wabash and Western Railroad, where it is crossed by the Cincinnati and Chicago Railroad, 39 miles east Lafayette. It is the trade center of a wide and fertile region, and has within itself several industrial establishments. West Logansport is separated from the town by Eel River, but is within its corporate limits.

40. Madison is the largest river town of Indiana, and is important as a trading port. It is situated about 90 miles below Cincinnati, and by railroad 86 miles southeast Indianapolis. It has large pork-packing houses, and also machine shops and other industrial establishments. The town is well built and the streets paved and lighted with gas. It was first settled in 1808. In 1840 it had 3,798, and in 1850, 8,012 inhabitants.

41. Michigan City is the only lake port of the State. It is the terminus of the New Albany and Salem Railroad, and the Michigan Central Railroad passes through it. It is little used as a port. In 1850 it contained 999 inhabitants, and in 1853, 2,353.

42. New Albany is situated on the Ohio two miles below the falls, and nearly opposite Portland. It is the southern terminus of the New Albany and Salem Railroad, which extends hence to Michigan City, 288 miles. Next to Madison it is the chief port of the State, and in 1850 had 8,181 inhabitants. The town is handsomely built, and has extensive manufactures of iron, brass, bagging, etc., and is also engaged in steamboat building.

43. Peru is a flourishing town on the Wabash River and Canal, and the northern terminus of the Peru and Indianapolis Railroad, which here connects with the Toledo, Wabash and Western Railroad, 74 miles north Indianapolis. It is a place of considerable trade, and in 1850 had 1,266 inhabitants. Richmond is a flourishing town on the east fork of Whitewater River, and on the Indiana Central Railroad, which is here crossed by the Cincinnati and Chicago Railroad, 68 miles east Indianapolis. It has manufactures of cotton, wool, paper, iron, flour, agricultural implements, etc., and is the center of a large trade. The vicinity is populous and highly cultivated. Population (1850) 1,443. Rushville is situated on Flatrock Creek, and is the terminus of a railroad from Shelbyville, 40 miles southeast Indianapolis. The Indianapolis and Cincinnati Junction Railroad will also pass through this town. Population (1850) 742. Salem is a considerable town on the New Albany and Salem Railroad, 35 miles northwest New Albany. It is pleasantly situated on rolling ground near the source of Blue River, and in the midst of a rich farming district. It has manufactures of woolens and flour, and a flourishing trade. Population (1850) 1,223; Shelbyville is situated on the Blue River, 26 miles southeast Indianapolis. Six railroads meet at this place—from Cincinnati, Columbus, Edinburg, Knightstown, Indianapolis, and Rushville, and create considerable business. Population (1850) 995.

44. Terre Haute is an important commercial town on the Wabash River and Canal, 73 miles west Indianapolis, with which it connects by the Terre Haute and Richmond Railroad. The Evansville and Crawfordsville, and the Terre Haute, Alton and St. Louis railroads also come in here, the latter forming a link in the great east and west central chain. It is a remarkably beautiful town, and the center of a vast and increasing trade, both by canal and railroad. Population (1850) 4,051.

45. Union City is an important railroad center on the Ohio line, 84 miles east-by-north Indianapolis. Seven railroads unite here and form connections in every direction. Those complete and in progress are the Indianapolis, Pittsburg and Cleveland; the Bellefontaine and Indiana; the Columbus, Piqua and Indiana; the Greenville and Miami; the Cincinnati, Union and Fort Wayne; the Marion and Mississinewa Valley, and the Fremont and Indiana.

46. Vincennes is a flourishing town on the Wabash River, and on the line of the Evansville and Crawfordsville Railroad, nearly equi-distant between Evansville and Terre Haute. East and west it is crossed by the Ohio and Mississippi Railroad, 192 miles west Cincinnati and 147 miles east St. Louis. The Wabash is also navigable to this point for steamboats. The facilities of movement have created a commercial center of vast importance, and converted a town, until lately known only as the most ancient in the State, into one of the most important entrepôts in the Valley States. Vincennes was settled in 1735 by the French from Canada. For several generations the colonists lived isolated from the world and in communion only with the savages that surrounded them. When the territorial government was organized it became the capital, and so continued until 1813. Many of the present inhabitants are of French descent. Population (1850) 2,070.

47. Among the other important towns may be mentioned—Dublin, 713; Knightstown, about 1,000; Liberty, 842; Newcastle, 666; Noblesville, 654; Newburg, 526; Princeton, 806; Paoli, 461; Pendleton, 389; Vernon, 690; Valparaiso, 522; Versailles, 412; Wabash, 1,300; Williamsport, about 500; Winchester, 532, etc. The population ascribed to these towns is referable to the census of 1850. Since that year many of them have added materially to their population, and partaken largely of the progressive movements of the State generally.

48. Indiana originally constituted a part of New France, and from 1683 to 1763, when the country was ceded to England, various trading posts had been established. Vincennes had become a flourishing town. On the 7th of May, 1800, Ohio having been erected into a separate territory, the remainder of the territory northwest of the Ohio River was named Indiana Territory, with a distinct organization. From this territory were subsequently formed, in 1805, the Michigan, and in 1809 the Illinois Territory. From 1788 to 1814 the settlements were much engaged in hostilities with the Indians. In 1815 the territorial legislature petitioned Congress for admission into the Union; and on the 19th of April, 1816, a bill passed Congress enabling the people to form a constitution and State government. A convention for this purpose was held in June, and Indiana was admitted into the Union by a resolution of Congress of the 11th December of the same year.

STATE OF MICHIGAN.

ARCH ROCKS, LAKE SUPERIOR.

1. MICHIGAN is situated between latitudes 41° 40′ and 47° 40′ north, and longitudes 82° 25′ and 90° 34′ west; and is bounded on the north by Lake Superior, on the east by St. Mary's River, Lake Huron, the St. Clair and Detroit straits and Lake Erie, on the south by the States of Ohio and Indiana, and on the west by Lake Michigan and the rivers Menomonee and Montreal.

2. This State consists of two peninsulas: the "southern," lying between lakes Michigan and Huron, is upward of 400 miles long, north and south, and from 100 to 300 miles wide; and the "northern," lying between lakes Superior and Michigan, is 316 miles long, east and west, and from 36 to 120 miles wide. The land surface of the whole State is 56,243 square miles, or 1.91 per cent of the total area of the United States.

3. The "northern peninsula" is much diversified by mountains, hills, valleys, and plains. The eastern portion, to the "pictured rocks," is undulating, rising gradually from the lakes to the interior, where it assumes the character of an elevated table-land. Westward the country becomes broken into hills, with intervening plains, until it is interrupted by the Porcupine Mountains, which form the dividing ridge separating the waters of Lake Superior from those of Lake Michigan. The highest peaks toward the western boundary are from 1,800 to 2,000 feet high. The ridge is often broken through by the larger streams, bordered by extensive valleys. The spurs of these mountains project in different directions, often exhibiting their denuded cliffs upon the northern shores. The greater portion of the peninsula, the sand plains excepted, is covered with immense forests, principally of white and yellow pine. Of the pine lands, there are millions of acres stretching between the Sault de Ste Marie and the Ontonagon and Montreal rivers. The country is abundantly supplied with water, and though none of the streams are large, yet they furnish immense power, and the means of internal navigation. The head branches of those flowing in different directions frequently interlock. The lake coast of this section of the State is estimated at between 700 and 800 miles in length, and that five sevenths of the entire peninsula may be reached by the common lake vessels. Thus the great mineral region of this important country is easily accessible to commerce.

4. The "southern peninsula" has generally a level or rolling surface, and in some parts is broken and hilly. The eastern portion, for a distance varying from 5 to 25 miles from the shore, is almost a dead level, but westward the land rises into an irregular ridge, in some parts attaining the height of 600 or 700 feet above the level. This ridge has much greater proximity to the eastern than to the western shore, and serves to separate the waters flowing into lakes on each side. The portion of the southern part of the State denominated hilly, branches off from the principal ridge in different directions through the adjoining country. The hills consist of an irregular assemblage of somewhat conical elevations, occasionally attaining the height of 150 to 200 feet, but ordinarily of not more than from 30 to 40 feet. The main portion of the table-land passing westward to Lake Michigan, with the exceptions noted, assumes a very gradual descent, exhibiting a gently undulating and very rarely broken surface. The ridge of land before spoken of again takes a rise near Au Sable River, and is seen from the lake to stretch on for many miles along and beyond the coast. It has been considered as the highest land of the State, and forms perhaps the most rugged part of the lower peninsula. Taking the great extent of this peninsula into consideration, however, it may, in a comparative point of view, be said to possess a great evenness of surface, with a sufficient declivity, nevertheless, to allow the waters to drain off in lively and healthy streams. The coasts, both toward lakes Michigan and Huron, are sometimes exhibited in high, steep, and rugged banks, and those of the former are frequently seen in bluffs and sand-hills, varying from 100 to 300 feet in height.

5. The rivers of Michigan are in general comparatively smaller, but more numerous, than is commonly observed in most other sections of the Union; a fact attributed not only to the uniformity of descent, but also to the more favorable structure of the interior to furnish them constant supplies. The Detroit, St. Clair, and St. Mary's are more properly called straits; they are tranquil, deep, copious, and expansive streams, uniting the great lakes, the waters of which they conduct toward the ocean.

6. The largest rivers of the southern peninsula are the Grand, the Maskegon, St. Joseph, and Kalamazoo, which flow into Lake Michigan; the Sheboygan and Thunder Bay rivers, that discharge into Lake Huron, and the Saginaw, which empties into the bay so called. The streams flowing eastward are small, owing to the position of the dividing ridge, which is considerably east of the middle of the peninsula. The largest are the Raisin, the Huron, the Clinton, and the Rouge.

7. The largest rivers of the northern peninsula are the Montreal, the Great Iron, the Ontonagon, the Huron, the St. John's, and the Chocolate, which put into Lake Superior, and the Menomonee and Manistee, which flow, the former into Green Bay, and the latter into Lake Michigan. There are several other considerable streams, though of a smaller grade, and these, with few exceptions, are lively, pure, and healthy, supplying mill power, and draining the fine agricultural lands through which they course. Many of these streams are well stocked with trout and other fish, and afford excellent sport to the angler.

8. Michigan is encompassed by five great lakes, four of which are the largest collections of fresh water on the globe. Of these immense mediterranean waters, Lake Superior is by

far the largest. It lies directly north of the upper peninsula. Lake Michigan is the second in size. It is a long, narrow lake, stretching between the lower peninsula and the States of Illinois and Wisconsin. Lake Huron is next in dimensions. The shape of this lake is very irregular; its principal indentations are Saginaw Bay, which extends down into the interior, and two others, one immediately north of the Manito Islands, and the other southeast of them. The latter, sometimes called Manito Bay, or Georgian Lake, is very large, estimated at one fourth the extent of Lake Huron. It empties through St. Clair Strait into Lake St. Clair, the smallest of the five lakes bordering on Michigan, and this again discharges itself through the Detroit into Lake Erie. More than 30 miles of this latter borders Michigan, and opens to the State a free navigation to the principal ports along its coasts.

SAULT STE MARIE AND CANAL.

9. Nor is this State merely surrounded by lakes, but the interior is interspersed with them from one border to the other. The country, indeed, is literally maculated with these collections of water, from an area of 1 to 1,000 acres, though as a general rule they do not perhaps average 500 acres in extent. They are usually very deep, with gravelly bottoms, waters transparent, and cool at all seasons. This latter fact is attributed to springs, which furnish them constant supplies. Water-fowl of various sorts inhabit their shores, and their depths are the domain of abundance of fish, which grow to an enormous size. It is usual to find some creek or rivulet originating in these, but many have no perceptible outlet, and yet are stored with fish.

10. With all its length of lake coast, Michigan can boast of but few good harbors, yet there are several that afford excellent shelter from the storms that frequently sweep over these great inland seas, and lash them into overwhelming billows.

11. The geological structure of Michigan is extremely various; the southern peninsula is exclusively secondary in its formation; while the northern peninsula, bordering on Lake Superior, is primitive, but the portions bordering on Lake Michigan and Green Bay are secondary. Primitive boulders are discoverable in every part of the State, and there are many evidences of the land having once formed the bottom of the lakes, the waters of which have receded.

12. The southern peninsula is much similar in its geology to the formation of western New York, its rocks consisting of horizontal strata of limestones, sandstones, and shales; the limestones being generally found in the beds of the rivers near the lakes, and the sandstones mostly in the interior. The soil covering these strata is either alluvial or diluvial, and has a depth varying from 1 foot to 150 feet. The upper sandstone occupies the central and more elevated portions of the peninsula. The stratum underlying the sandstone is a gray-colored limestone. Associated with this rock is found calcareous spar, strontian, barytes, gypsum, etc. Below the gray lime-rock, the graywacke or lower sandstone is supposed to exist. In all those localities where the superior stratum or carboniferous limestone formation exists, there are indications of the formation of bituminous coal. Marl is abundant, and the sand beds bordering the lakes yield a good sand for the manufacture of glass.

13. In the northern peninsula the great copper and iron region is found in the primitive formation. Here are the most stupendous deposits of those valuable metals hitherto discovered. The great copper deposits are principally confined to the Kewenaw peninsula. The extreme length of the beds is about 135 miles, with a width varying from one to six miles. The mineral, however, does not exist in every portion of this extent, for miles may intervene, and no trace be ascertained. In some of the river beds immense boulders of native copper are met with.

14. Salt springs are known to exist in different parts of the State. The saline district lies mostly north of a line drawn from Monroe to Grandville. Medicinal waters, chiefly chalybeate, and sulphur also occur in numerous localities, and are useful in cutaneons and chronic affections of the liver and spleen.

15. In 1850 Michigan contained 397,654 inhabitants, forming 72,611 families and occupying 71,616 dwellings. This gives the State a population of 7.07 to the square mile, and equal to 1.71 per cent. of the whole population of the United States. The population of the counties was as follows:

Counties.	Population.	County Seats.	Counties.	Population.	County Seats.	Counties.	Population.	County Seats.
Allegan	5,125	Allegan.	Jackson	19,431	Jackson.	Oakland	31,270	Pontiac.
Barry	5,072	Hastings.	Kalamazoo	13,179	Kalamazoo.	Oceana	300	——
Berrien	11,417	BerrienSpring	Kent	12,616	Gr. Rapids.	Ontonagon	889	Ontonagon.

—of the total, 395,071 (99.36 per cent.) were whites—208,465 males and 186,606 females, and 2,583 (0.64 per cent.) colored persons—1,431 males and 1,152 females; and 341,501 (85.9 per cent.) were Americans, of whom 140,648 were born in this State, 54,852 (13.79 per cent.) were foreigners, and 1,211 of unascertained origin. There were 12,409 natives of Michigan resident in other States.

16. The population in 1810 amounted to 4,762, in 1820 to 8,896, in 1830 to 31,639, in 1840 to 212,267, and in 1850 (as above) to 397,654. In 1855 there were in the State 509,374 inhabitants.

17. In 1850 there were 108,978 males over 15 years of age engaged in industrial pursuits. Of these 22,375 were engaged in commerce, trade, manufactures, the mechanic arts, and mining; 65,815 in agriculture; 15,662 in labor not agricultural; 143 in the army; 1,220 in navigation; 2,007 in law, medicine, and divinity; 1,092 in other pursuits requiring education; 337 in government civil service; 220 in domestic service, and 167 in occupations the nature of which is not specified.

18. The great interests of southern Michigan are agriculture and commerce. In northern Michigan copper and iron mining are the chief occupations. Manufactures have also attained a respectable footing, and the fisheries of the lakes attract considerable attention. The position of this State in regard to water communication and also in relation to its internal improvements afford it eminent advantages for a rapid development of its resources, which are not surpassed in richness and value by any other State of the Union.

19. The copper and iron mines of the north are extensively worked, chiefly by incorporated companies. Since the opening of the Sault Ste Marie Canal, this interest has flourished

COPPER HARBOR, LAKE SUPERIOR.

beyond all anticipation and is yearly increasing in productiveness. The statistics of copper mining in these regions in 1856 afford the following figures:

	Ontonagon Region.	Keweenaw Region.	Portage Lake Region.	Total
Companies operating	20	8	5	33
Engines worked	16	26	6	48
Horse-power of engines	501	651	52	1,204
Heads of stamps	140	162	139	441
Value of engines	—	—	—	$308,760
Copper—mass	1,668 tons	— tons	— tons	— tons.
" —barrel and stamp	1,099 "	— "	— "	— "
" —total	2,767 "	2,128 "	462 "	5,357 "
" —total = to ingots copper				3,600 "
" —total value at 25 cents per pound				$1,800,000

—and these results can only be considered as the first returns of this branch of industry, and a promise of the rich production of future years. The iron ore of this region is also attracting attention, and considerable quantities have already been exported.

20. The number of farms in Michigan in 1850 was 34,089, covering 4,383,890 (improved 1,929,110) acres of land or about one eighth of the whole surface. The value of these farms was $51,872,446, and the value of implements and machinery thereon was $2,891,371. Thus the average number of acres in each farm was 129, valued at $1,521, or with the implements, etc., $1,606.

21. The amount of livestock owned in the State in 1840 and 1850 is stated to have been as follows:

1840	horses, mules, etc.,	30,144	neat cattle,	187,190	sheep,	99,618	swine,	295,890
1850	" "	58,576	"	274,497	"	746,435	"	205,847

—and the stock of 1850 was valued at $8,008,734, and the value of animals slaughtered in the year preceding had been $1,328,327. Of the animals in 1850, 701 were mules and asses, 99,676 milch cows, and 55,350 working oxen. The products of animals in 1849–50 consisted of—butter 7,065,878, cheese 1,011,492, and wool 2,043,283 (in 1839–40, 153,375) pounds.

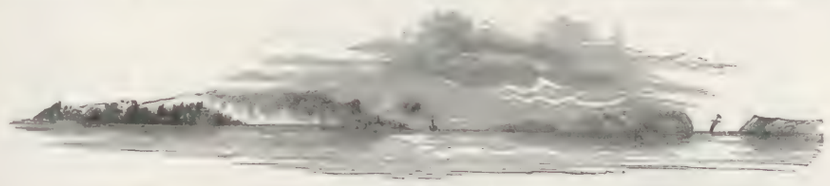
22. The grain crops (bushels) reported in the returns of 1840 and 1850 were as follows:

1840	wheat,	2,157,108	rye,	34,236	oats,	2,114,051	Indian corn,	2,277,089	barley,	127,802	buckwheat,	113,592
1850	"	4,925,889	"	105,871	"	2,866,056	"	5,641,420	"	75,249	"	472,917

—making a total in 1840 of 6,823,822, and in 1850 of 14,087,402 bushels. The potato crop

in 1840 was 2,109,205 and in 1850 (including sweet 1,177) 2,361,074, and the crop of peas and beans in 1850 amounted to 74,254 bushels.

23. The other agricultural products in 1849–50 consisted of—hay 404,934 tons, hops 10,663 pounds, clover seed 16,989, and other grass seed 9,285 bushels, beeswax and honey 359,232 pounds, flax seed 519 bushels, flax 7,152 pounds, maple sugar 2,439,794 pounds, molasses 19,823 gallons, tobacco 1,245 pounds, silk cocoons 108 pounds, and wine 1,654 gallons. The value of market-garden products was $14,738, and of orchard products $132,650.



24. The aggregate value of the agricultural products of the State was in 1840 $3,207,048, and in 1850 $17,329,385.

25. In 1850 there were in this State 1,963 establishments engaged in manufactures, mining, and the mechanic arts. In the prosecution of these branches of industry, a money capital of $6,534,250 was invested, and in the year ending 1st June, the raw material consumed was valued at $6,105,561; the average number of hands employed was 9,290, at a cost of $2,387,928; and the value of the year's production was $10,976,894. These establishments embraced 15 woolen manufactories, with capital amounting to $94,000; 64 iron works with $210,450; 29 distilleries and breweries with $126,625; 61 tanneries with $236,000, etc. Otherwise Michigan has about 260 flouring and 650 saw mills, with numerous asheries, potteries, machine-shops, etc. The value of home-made goods amounted to $340,947. The returns (including home-made goods) for 1810, valued the products of manufactures, etc., at $52,518; in 1820, at $100,460; in 1830 (no returns); in 1840, at $3,898,676, and in 1850, at $11,317,841.

26. The foreign commerce of Michigan is that carried on with Canada. For the year ending 30th June, 1850, the value of exports was $132,045, and 1855, $568,091; and the value of imports respectively, $144,102 and $281,379. The amount of shipping for the two years was—cleared 54,701 and 62,611 tons, and entered 56,963 and 70,491 tons. The shipping owned in the State in 1850 amounted to 38,144 (steam 18,015) tons, and in 1855 to 69,490 (steam 34,578) tons; and the shipping built amounted to 2,061 and 7,844 tons. The principal ports engaged in this trade are Mackinaw and Detroit. In the spring of 1858 a vessel sailed from the latter port direct for Liverpool *via* the Lakes, Welland Canal, and St. Lawrence.

27. The domestic and transit trade of the State is very extensive. A large share of the trade between the Upper Mississippi country and the sea-board passes over the railroads of the southern peninsula; and already most of the great centers of population communicate by railroad, and have easy access to the lake shores. The coasting trade is also large, and is carried on with great activity chiefly by steamers, which connect the ports of this State with the principal lake ports of the adjoining States. Steam navigation has even been extended to the Michigan ports of Lake Superior for the accommodation of the miners.

28. Three great lines of railroad cross the State east and west, viz., the Southern, the Central, and the Detroit and Milwaukee lines. The first two accommodate the Chicago trade, and the latter that of Milwaukee, with which it is connected by a steam ferry across the lake. A line is also being built from the western terminus of the Sarnia Branch of the Canada railroads to connect with the Milwaukee line. Otherwise there are several transverse roads, and others are projected which will extend from Ohio and Indiana north through Michigan to the new city of Mackinaw on the strait so called. In the northern peninsula there is a

STRAITS OF MACKINAW

railroad from Marquette to the iron mines 20 miles west, and this will be continued to a junction with the Ontonagon line projected from Ontonagon southward to Milwaukee and Chicago *via* Fond du Lac. There are now (1857) within the State between 600 and 700 miles of completed railroad, and twice that mileage is either under construction or projected. With the whole system completed, few other States will rival Michigan in its facilities for commerce.

29. At the close of the year 1850, Michigan had six banks with capital amounting to $764,022, and at the close of 1855 four banks with $730,438. The liabilities of these institutions at the two periods were as follows—circulation $897,364 and $573,840, deposits $416,147 and $1,366,958, due to other banks $42,589 and $53,425, and miscellaneous $138,930 and $128,216; and the assets consisted of—loans and discounts $1,319,305 and $1,988,087, stocks $420,521 and $517,945, real estate $221,626 and $124,486, other investments $65,083 and $21,347, due by other banks $404,691 and $402,520, notes of other banks $109,096 and $97,265, specie funds $195 and $6,433, and specie $125,722 and $152,080.

30. The constitution of Michigan was adopted in convention at Lansing on the 5th August, 1850. It grants the right to vote to every white male citizen, and to every civilized male Indian not a member of any tribe, but every elector must be 21 years of age and have resided in the State three months and in the district 10 days next preceding an election. The day of general election is the Tuesday after the first Monday in November.

31. The legislature consists of a senate of 32 members and a house of representatives of 66 members, all elected from districts for two years. Members of both houses must be citizens of the United States and qualified electors. The sessions commence on the first Wednesday in January and biennially.

32. The governor is elected for two years by the people at large. He must be 30 years of age, and must have been a citizen of the United States for five years and of the State for two years. The lieutenant-governor is elected for the same term, and must have the same qualifications. The administrative officers of the government are also elected for two years.

33. The judiciary consists of a supreme court, eight circuit courts, county probate courts, and justices' courts. Municipal courts of civil and criminal jurisdiction may also be established. All judges and justices are elected by the people.

34. The public revenue is derived chiefly from taxes on incorporated companies, sales of lands, the U. S. 5 per cent. on land sales, etc. For the years ending 30th November, 1850 and 1855, the receipts into the treasury amounted to $429,268 and $588,397, and the total resources (including remainders from former years) to $484,716 and $1,141,253. The expenditures for the years respectively amounted to $449,355 and $624,777. Nearly one half of the receipts and expenditures are on account of special funds administered by the State. In 1855 the receipts on these accounts were $246,470, and the expenditures $269,978. The balance left over belongs chiefly to the educational fund.

35. The State debt on the 30th November, 1855, amounted to $2,389,958, upon which the annual interest (6 per cent.) was $143,397. To meet this the State has ample resources in its swamp lands and other property. In 1850 the taxable property in the State was valued at $30,877,223, and in 1855 at $120,362,474.

36. The principal institutions supported wholly or in part by the State are the Asylum for the Insane at Flint, the Asylum for the Deaf and Dumb and the Blind at Kalamazoo, the State Prison at Jackson, and the House of Correction for Juvenile Offenders at Lansing. Annual appropriations are also made for the State Agricultural School, etc.

37. The census of 1850 returned 105,961 children as having attended school in the year preceding. This number is equivalent to one in every 3.75 of the total population. On the 1st June, 1850, the returns were as follows:

Classification.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	2,714	3,231	100,455	$167,806
Academies and private schools	37	71	1,619	24,947
Universities and colleges	3	22	808	14,000

—making a total of 2,754 schools, 3,324 teachers, and 102,382 scholars, and an annual income of $206,753. The number of persons over 20 years of age who could not read and write was 8,281, of which 5,272 were natives and 3,009 foreigners, and 7,912 were whites and 369 free colored persons.

38. In 1855 the number of children of school-age in the State was 173,117, of which 129,517 were attending school. The amount paid for teachers' wages was $237,827. The school fund amounted to $1,384,288, and the university fund to $452,423. There is a State Normal School at Ypsilanti, which went into operation in April, 1853.

39. The principal collegiate and professional schools in the State in 1855 were the following:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
University of Michigan	Ann Arbor	1837	13	285	8,400
St. Philip's College	Detroit	1839	4	30	3,200
Med. Depart. Univ. of Michigan	Ann Arbor	1850	7	167	Univ. Lib.

40. The most numerous of the religious denominations in Michigan in 1850 were the Methodist, Presbyterian, Baptist, and Roman Catholic, which in relation to the whole population included a fourth, a sixth, an eighth, and an eighth. Next in point of numbers were the Congregational (a twelfth) and the Episcopal (a sixteenth); and next, and in decreasing numbers, the Lutheran, Dutch Reformed, Friends, Universalist, Union, Christian, Free, Moravian, etc. The whole number of churches in the State in the year named was 399, with accommodations for 120,117 persons; and the value of church property was estimated at $723,600.

41. Lansing, the seat of government, is situated on Grand River, 150 miles from its mouth in Lake Michigan, and 112 miles west Detroit. Latitude 43° 43′, and longitude 84° 29′. Lansing was selected as the capital in 1847, at which period the site was a wilderness; it has since became an important center of trade and of a profitable industry facilitated by the abundant water-power in the vicinity. Plank roads have been built to Jackson, Marshall, and other towns, and a railroad is projected to Jackson, on the Michigan Central Railroad. The State House is a large and substantial edifice, built on an eminence 50 feet above the river. The other public buildings are a house of correction for juvenile offenders, opened in 1856, six or seven churches, several large hotels, etc. Population (1850) 1,229, and (1855) about 4,000. The neighborhood is also rapidly filling up with an industrious population.

42. Detroit, the commercial metropolis of Michigan, is situated on Detroit River, 20 miles above Lake Erie, and opposite Windsor, the western terminus of the Great Western Railroad of Canada. Latitude 42° 19′ 45″, and longitude 83° 2′ 30″. The river, here half a mile wide, forms an excellent harbor, and, by its position in regard to lake navigation, it has communication by water in every direction. Its commerce is large and ever increasing. In 1855 it exported domestic produce, coastwise and to Canada, valued at upward of $8,000,000. The railroads diverging from and connecting at this point also greatly facilitate its business, and, being links in the great chain through and from Canada westward, make it one of the first transit stations in the Union. These are the Michigan Central, connecting it directly with Chicago, and the Detroit and Milwaukee, connecting it with Milwaukee. Another railroad, the Detroit and Toledo, lately completed, gives it access to Toledo, and at Monroe, by a connection with the Michigan Southern Railroad, forms a second route to Chicago. The harbor is frozen over in winter, but during the season of navigation is alive with steamers and sail craft, which, either in connection with the railroads or independently, ply to and from all the lake ports.

43. The manufactures of the city are large and important, embracing machinery of all kinds for steamboats, locomotives, mills, etc., hollow-ware, agricultural implements, cabinet-ware, etc., and both steam and sail vessels are built. Tanning and brewing are also considerable interests, and a large amount of lumber is manufactured for the markets.

44. Detroit is a well built and regularly planned town, rectangular near the river, but beyond divided into triangular sections, the avenues of which converge to an open area called the Grand Circus. The city is adorned with several squares, and its main thoroughfares are from 120 to 200 feet wide, well paved and lighted with gas. The water supply is raised by machinery from the river to a reservoir 50 feet above the town, and is thence distributed. Among the public buildings of the city the principal are the old State House, a large edifice 90 by 60 feet, with a dome and steeple 140 feet high; the City Hall, a brick building 100 by 50 feet, and the building of the Michigan Bank. The railroad stations are also massive and very extensive buildings, and with their freight-houses cover large space. Detroit has about 30 churches, a museum, a theater, two orphan asylums, four banks, and numerous public schools. In the near vicinity is St. Philip's College, founded by the Catholics in 1839.

45. The site of Detroit appears to have been visited by the French as early as 1610: in

1670 a fort was built, and in 1701 the town founded. In 1759 the country fell into the hands of the English, and in 1783 it was transferred to the United States. In 1802 Detroit was incorporated; in 1805 it was destroyed by fire; in 1810 the act of incorporation was repealed; in 1812 the fort and town surrendered to the British, but in 1813 were returned to the United States, and in 1815 the city was re-incorporated. The population in 1810 was only 770; in 1820 it had increased to 1,442, and in 1830 to 2,222. From this its progress became more rapid, and in 1840 it contained 9,192 inhabitants, and in 1850, 21,019. In 1853 it had risen to 34,436, and in 1855 to 50,448.

OBSERVATORY OF UNIVERSITY OF MICHIGAN.

46. Michigan has also a large number of other important towns, which for convenience are arranged for description (as follows) in alphabetical order. Ann Arbor, on Huron River and the Michigan Central Railroad, 37 miles west Detroit, is one of the most important business towns in the State. It has also extensive manufactures and large flouring mills. The State University is located here. Population 4,868. Flint, on the river of the same name, is a thriving village, 60 miles northwest Detroit. It is the seat of the State Asylum for the Blind, and Deaf and Dumb. Population 3,304.

47. Grand Haven is situated on the south bank of Grand River, at its entrance into Lake Michigan. The river, which is here 350 yards wide, forms a spacious and eligible harbor, with a depth varying from 12 to 30 feet. It has a large shipping business, and is the western terminus of the railroads from Detroit and Huron, connecting at those places respectively with the railroads of Canada. Steam ferry-boats cross the lake to Milwaukee, Chicago, Racine, etc., and continue the great route west to and beyond the Mississippi. Population about 2,000; Grand Rapids is situated at the rapids of Grand River, 40 miles from its mouth, and on the Detroit and Milwaukee Railroad. It occupies a handsome site on the left bank of the river, and is one of the most flourishing cities of the States. Steamboats ply regularly between this place and Grand Haven, and carry on an active trade. A vast water-power is created by the rapids, and extensive manufactures are in operation. In the vicinity salt and gypsum are found, also limestone, and pine and other timber are abundant. Population 5,833.

48. Jackson, on Grand River, near its source, and on the Central Railroad, 75 miles west Detroit, is a considerable town of 6,510 inhabitants. It is the seat of the State Prison. The river here affords a great power, which is used in a varied manufacturing business. Jackson is also a place of considerable trade. A railroad has been constructed from Adrian to this town, and is in progress to Lansing, the capital, to which there is already a plank-road; Kalamazoo is the seat of the State Lunatic Asylum. It is built on the river of the same name, and on the Central Railroad, 143 miles west Detroit. Manufactures of various kinds have been commenced here, and its trade is extensive. The vicinity is well-timbered and highly productive. Population 5,791.

49. Mackinaw is a flourishing town on the island so called, in Lake Huron. Latitude 45° 54′, and longitude 84° 30′. It is pleasantly situated on a small bay on the east side, and has a deep and safe harbor. Fort Mackinaw stands on a rocky elevation, 150 feet above the lake, and commands the town. The trade of this place is large and increasing, and it has valuable fisheries. The Collingwood and Chicago steamers stop here, and it is also a stopping-place for other steamers between the ports of the lower and upper lakes. Population about 1,500.

50. Monroe is built on Raisin River, two miles from Lake Erie, with which it is connected by a ship canal. The Central Railroad also commences at the lake and runs west to the city, where it is intersected by the Detroit and Toledo Railroad, 40 miles south Detroit. Monroe is the principal market for the valley of the Raisin, and is the shipping port for the towns on the Central Road. Its exports are valued at more than $10,000,000 a year. A French settlement formerly occupied the site of this town, but the present town dates back scarcely 20 years. In 1850 it contained 3,650 inhabitants.

51. Pontiac is situated on Clinton River and on the Detroit and Milwaukee Railroad, 25 miles northwest Detroit. It is a place of active business and a principal wool market. It has also flourishing manufactures. Population 4,501.

52. Port Huron is eligibly situated on the St. Clair, at the mouth of Black River, and but two miles south from Lake Huron. On the opposite side of the river is the Canadian port Sarnia, the western terminus of the Grand Trunk and the Great Western railroads, which will connect with the Huron and Michigan Railroad from Port Huron to Grand Haven. The town has already an active trade, flourishing manufactures, and 3,886 inhabitants; Saginaw City, on the Saginaw, 25 miles from its mouth, is built on a commanding site on the left bank of the river, which is here navigable for vessels drawing 10 feet water. Population about 2,000. A railroad is about to be constructed between Lansing and Saginaw.

53. Ste Marie or Sault Ste Marie is situated at the rapids or sault of the St. Mary's River, 15 miles from the outlet of Lake Superior. The sault at this place has a descent of 22 feet, and is the natural bar between the upper and lower lakes. This has recently been overcome by a ship canal, and loaded vessels pass from one to the other lake without difficulty. The town is very pleasantly situated, and in summer is frequently visited by the northern tourist. Many of its inhabitants are engaged in the fisheries and the fur trade; but since the completion of the canal a large trade has sprung up with the Superior mining region.

54. Tecumseh is a beautiful town on the Raisin, 10 miles north of Adrian. The Jackson Branch of the Southern Railroad passes through it. Population 2,679; Ypsilanti is a flourishing town on the Huron River and Central Railroad, 30 miles west Detroit. It has considerable manufactures, and is the market for a fertile agricultural region. The State Normal School is located here. Population 3,051.

55. The principal places on Lake Superior are Marquette, Copper Harbor, Eagle Harbor, and Ontonagon. Marquette is a thriving settlement about 160 miles west of Ste Marie, and is the depôt of an extensive and rich iron region, to which a railroad 20 miles long has been opened. Copper Harbor is, as its name imports, the depôt for a copper region. It is situated on the northwest of Keweenaw peninsula. The mines in the vicinity are very productive and are largely worked. A few miles farther west and on the same peninsula is Eagle Harbor, also the outlet of rich mines and a place of considerable trade. About 80 miles farther west and at the mouth of Ontonagon River is the new town of the same name, to which a railroad is in progress from Fond du Lac in Wisconsin. Steamers from the lower lake ports call regularly at all these ports on their way to Superior City, and returning, carry back the produce of the mines. This trade is already very valuable, and yearly increasing.

EAGLE HARBOR.

56. The first settlements in Michigan were made by the French engaged in the fur trade, and Catholic missionaries were settled among the Indians at an early period. Detroit was first visited about 1610, but its foundation dates only from 1701. As early as 1632 Father Sægard had reached Lake Huron. About the middle of the seventeenth century trading ports were established at Sault de Ste Marie, Michilimackinac, and Green Bay. Michigan, in common with the whole Northwest Territory, was held by France until 1763, and then by England until the close of the Revolutionary War. The government of the United States did not take possession of the country until 1796. In 1805 Michigan was constituted a Territory, and on the 1st July of that year the government was organized at Detroit by Gen. William Hull, its first governor. In 1812 Detroit was taken by the British under Gen. Brock, but was recovered in 1813 by the Americans under Gen. Harrison. Michigan was admitted into the Union by an act of Congress, approved 26th January, 1837.

57. A proposition has long been entertained, both in this State and in Wisconsin, to have their northern sections divided off and erected into a separate State under the name of "Superior." Such a State would include the whole of the great mineral regions of the middle north, and as these constitute a separate geographical region, the interests of which are peculiar, the consummation of the project would be advantageous.

STATE OF ILLINOIS.

1. Illinois is situated between latitudes 37° and 42° 30′ north, and longitudes 87° 47′ and 91° 28′ west; and is bounded on the north by Wisconsin, on the northeast by Lake Michigan, on the east by Indiana and the Wabash River, on the south by the Ohio River and Kentucky, and on the west by the Mississippi which flows between this State and the States of Iowa and Missouri.

2. The extreme length of Illinois on the meridian of Cairo is 378 miles, and the greatest breadth which occurs on the parallel of Danville is about 212 miles. The outline of the State measures about 1,160 miles, the whole of which except 305 miles is formed by navigable waters; and its superficial extent is estimated at 54,405 square miles, or 1.89 per cent. of the whole area of the Union.

3. As a physical section, Illinois occupies the lower part of that inclined plane of which Lake Michigan and both its shores are the higher sections, and which is extended into and embraces the much greater part of Indiana. Down this plane, in a very nearly southwestern direction, flow the Wabash, the Kaskaskia, the Illinois, the Rock, and the Wisconsin rivers. The lowest section of the plane is also the extreme southern angle of Illinois, about 340 feet above tide-water in the Gulf of Mexico. The extreme elevation of the country may be stated at 800 feet above tide-water, and the mean height at 550 feet. Next to Louisiana and Delaware, it is the most level State in the Union. A small tract in the south is hilly, and the northern portion also is somewhat broken. There are likewise considerable elevations along the Illinois River, and the bluffs of the Mississippi in some places might pass almost for mountains. But by far the greater portion of the surface is distributed in vast prairies or in barrens, which are gently rolling, like the waves of the sea after a storm.

4. Illinois possesses immense advantages for internal navigation. Its northeastern corner for fifty miles is washed by the waters of Lake Michigan, which open a communication with the whole lake country of the north. The Mississippi River forms its western border, and

VICINITY OF CHICAGO

Entered according to Act of Congress in the Year 1858 by J.H. Colton & Co. in the Clerks Office of the District Court of the United States for the Southern District of New York

the Ohio and Wabash rivers demark its southern and eastern limits, together furnishing a natural water highway of unexampled extent.

5. The rivers which have their courses within the limits of the State are Rock, Illinois, Kaskaskia, and Big Muddy, affluents of the Mississippi; the Embarras and Little Wabash, tributaries of the Wabash; and the Saline and Cash rivers, which empty into the Ohio. The Illinois is much the largest of these: it is formed by the union of the Kankakee and Des Plaines, and in its course of 500 miles toward the Mississippi receives Fox and Spoon rivers, Crooked Creek, and several other streams from the north, and the Vermillion, Mackinaw, Sangamon, and others from the south. The current of the Illinois is in general gentle, with a wide, deep bed, in some places opening into broad and lake-like expanses. Rock River rises in Winconsin, and has a course of 300 miles; it is navigable for some distance, but in its upper course is impeded by several rapids. The Kaskaskia rises in the eastern part of the State, and pursues a direction nearly parallel to that of the Illinois and Rock rivers, and after a course of 300 miles reaches the Mississippi in latitude 38° north. The Big Muddy is also a considerable stream. The rivers flowing to the Ohio and Wabash are generally of less volume than the smaller class of rivers flowing toward the Mississippi; but several are navigable, and all contribute much to the wealth of the country by the abundance of water-power they supply for mechanical purposes.

6. The northern portion of Illinois is inexhaustibly rich in minerals, while coal, secondary limestone, and sandstone are found in almost every part. Iron ore is also widely distributed, The minerals most common to the northwestern section are lead and copper. The lead diggings extend over a vast tract, and into the adjoining States, and are doubtlessly the most productive of any hitherto known. Silver is frequently found in combination with the lead ores. The coal of Illinois is bituminous, and is spread over a large extent of country; it is found in the ravines and bluffs of the Mississippi, and large veins were struck in excavating the canal below Ottawa. Building stones of almost every description are quarried. Sulphur

FARMING SCENE IN ILLINOIS.

and chalybeate springs exist in several parts of the State, and there are salt springs in Gallatin, Jackson, Vermillion, and other counties. Immense boulders of granite are strewn upon the surface in many parts of the State.

7. The soils of Illinois, though of such various character, are mostly fertile and productive. In the bottoms, or alluvial borders of the rivers, the soil is chiefly formed from the deposits of the waters during floods. In some cases the mold so formed is twenty-five feet and upward in depth, and of inexhaustible fertility. One sixth of the alluvial land, however, is unfit for present cultivation, although it is productive in timber. A tract called the "American Bottom," extending along the Mississippi for ninety miles and about five miles in average width, is of this formation. About the French towns it has been cultivated, and produced Indian corn every year, without manuring, for a century and a half. The prairie lands, although not so productive, are yet not inferior for many agricultural purposes, and are preferred, where wood is to be had, on account of their superior salubrity. The barrens or oak-openings have frequently a thin soil. In the north there are tracts somewhat stony, yet in every other part the plow may pass over millions of acres without meeting so much as a pebble to impede its course.

8. Illinois possesses great variety in its climate, and the level surface that characterizes it exposes it alike to sun and storm. The winters are everywhere severe, and the summers hot and prolonged. The climate is also subject to sudden changes, especially from November to May, and below the parallel of 40° the summer heat is extremely enervating. The prevailing winds are the southwest, which blow for three fourths of the year; the north and northwesterly prevail in the winter months. On the whole, however, the climate is favorable to out-door occupations, the proportion of clear and cloudy days being as 245 of the former to 120 of the latter. Vegetation commences with April, and the first killing frost occurs from the 1st to the 15th September. The general salubrity of Illinois is well attested, and few suffer from endemic diseases, except those who are imprudent, or who settle near swamps or other sources of miasms.

9. In general Illinois is well supplied with timber, and were it equally distributed through the State there would be no part wanting. The kinds of timber most abundant are oaks of various species, black and white walnut, ash of several kinds, elm, sugar-maple, honey-locust, hackberry, linden, hickory, cotton-wood, pecan, mulberry, buckeye, sycamore, wild cherry, box-elder, sassafras, and persimmon. In the southern and eastern parts of the State yellow poplar and beech are the peculiar growths, and near the Ohio are clumps of yellow pine and cedar. The undergrowths are red-bud, pawpaw, sumac, plum, crab-apple, grape-vines, dogwood, spice-bush, green-brier, hazel, etc. The alluvial soil of the rivers produces cotton-wood and sycamore timber of amazing size. Many valuable medicinal plants are found in every part of the State.

10. In 1850 Illinois contained 851,470 inhabitants, comprised in 149,153 families, and occupying 146,544 dwellings. This population is equivalent to a density of 15.37 to the square mile, and 3.07 per cent. of the total of the Union. Its distribution into the counties was as follows:

Counties.	Population.	County Seats.
Adams	26,508	Quincy.
Alexander	2,484	Thebes.
Bond	6,144	Greenville.
Boone	7,624	Belvidere.

Winnebago	11,773	Rockford.
Woodford	4,415	Metamora.

—and of the total population, 846,034 (99.36 per cent.) were white persons—445,544 males and 400,409 females, and 5,436 (0.64 per cent.) free colored persons—2,777 males and 2,659 females; and 736,931 (86.5 per cent.) were Americans, of which number 343,618 were born in this State, 110,593 (12.9 per cent.) were foreigners, and 3,946 of origin not ascertained. The number of natives of Illinois residing in other States was 45,889.

11. In 1810 Illinois contained 12,282 inhabitants; in 1820 the population had increased to 55,211; in 1830 to 157,445; in 1840 to 466,183; and in 1850 to 851,470. A State census taken in 1855 made the population in that year 1,242,917.*

12. The occupations of 215,359 males over 15 years of age were returned in the census of 1850 as follows: occupied in commerce, trade, manufactures, mining, and the mechanic arts, 36,232; in agriculture, 141,099; in labor not agricultural, 29,778; in navigation, 1,644; in law, medicine, and divinity, 3,307; in other pursuits requiring education, 2,071; in government civil service, 701; in domestic service, 376; and in other pursuits not specified, 151.

13. It will thus be seen that agriculture is the predominant interest in this State. It has, however, considerable manufactures, and is actively engaged in mining. Its commerce is also very large, and has been greatly extended by the completion of numerous railroads and a canal which connects the waters of Lake Michigan with the navigable Illinois. To these works, indeed, must be attributed the rapid filling up of the State with a hardy population, and the equally rapid development of its resources.

14. Mining until lately was carried on solely in the lead regions of the northwest, and from this region the annual product, though varying in different years, has averaged about 4,000,000 pounds of pig lead. The largest quantity sent to market in any one year was in 1845, when it was 54,494,360 pounds. Since the discovery of the gold mines in California the production has greatly diminished, and in 1855 was only 30,125,556 pounds. The mineral next in importance is coal, which is largely worked on the Mississippi, opposite, and above, and below St. Louis, and on the Illinois at La Salle and other places. At Duquoin, 36 miles below Centralia, in southern Illinois, immense quantities are raised for the supply of steamers at Cairo. The veins are very rich, and yield a good coal, which is beyond value in a country many localities of which are so destitute of wood. The demand for the railroads and river steamers is constant. Salt is also produced in the south.

15. In 1850 Illinois contained 76,208 farms, which inclosed 12,037,412 (improved 5,039,545) acres of land, or a little more than one third of the total area. The cash value of these lands was $96,133,290, and the value of implements and machinery thereon was $6,405,561. Thus the average size of farms was 158 acres, valued at $1,261, or including implements, etc, $1,345.

16. The livestock upon the farms in 1840 and 1850 amounted to the following enumeration:

	horses, mules, etc.,	neat cattle,	sheep,	swine,
1840	199,235	626,274	395,672	1,095,254
1850	" " 278,226	" 912,036	" 894,043	" 1,915,907

—included among the horses, etc., (in 1850) were 10,573 asses and mules, and among the cattle 294,671 milch cows and 76,156 working oxen. The total value of the stock of 1850 was $24,209,258, and the value of animals slaughtered in the year preceding was $4,972,286. The products of animals in the same year comprised—butter 12,526,543, cheese 1,278,225, and wool 2,150,113 pounds. The wool crop of 1840 amounted to only 650,007 pounds.

17. The grain crops (bushels) for 1840 and 1850 were as follows:

	wheat,	rye,	oats,	Indian corn,	barley,	buckwheat,
1840	3,335,398	88,197	4,988,008	22,634,211	82,251	57,884
1850	" 9,414,575	" 83,364	" 10,087,241	" 57,646,984	" 110,795	" 184,504

—making a total in 1840 of 31,186,717, and in 1850 of 77,527,463 bushels; and the crop of potatoes in 1840 was 2,025,520 bushels, and in 1850 (including sweet potatoes, 157,433), 2,672,294 bushels.

18. Other agricultural products noted in the census of 1850 were—hay, 601,952 tons; hops, 3,551 pounds; clover-seed, 3,427; and other grass-seed, 14,380 bushels; beeswax and honey, 869,444 pounds; flax-seed, 10,787 bushels; flax, 160,063 pounds; maple-sugar, 248,904 pounds; molasses, 8,354 gallons; tobacco, 841,394 pounds; silk cocoons, 47 pounds; and wine, 2,997 gallons. The value of market-garden products was $127,494, and of orchard products $446,049.

19. In 1840 the total value of agricultural products was $11,577,281, and in 1850 it was $57,404,116.

20. The number of establishments engaged in manufactures, mining, and the mechanic

* Another return says 1,306,576.

arts in 1850 was 3,164, and in these was invested an aggregate capital of $6,385,387. The number of hands employed averaged 12,065—11,632 males and 433 females, and the cost of their labor in the year was $3,286,249. The value of raw material consumed was $8,915,173, and the value of the products was $17,236,073.

21. The value of manufactured products (including home-made goods) at decennial periods has been as follows: in 1810, $117,853; in 1820, $100,983; in 1830 (no returns); in 1840, $8,021,582; and in 1850, $19,071,075.

22. Illinois has but a small direct foreign trade. In the year ending 30th June, 1850, the exports amounted to only $17,669, and 1855 to $547,053; and the imports for the same years were valued respectively at $15,705 and $54,509. The clearances in 1850 amounted to 2,041, and in 1855 to 34,380 tons; and the entrances in the two years to 7,338 and 30,280 tons. The shipping owned in 1850 amounted to 21,242, and in 1855 to 53,796 tons; and the shipping built in the State in these years amounted to 1,691 and 1,903 tons.

23. The domestic trade of Illinois is very extensive and incomparably superior to its foreign trade, and is carried on over as fine and complete a system of railroads as any State could require. With little exception, these have been built within the past ten years, and already (1857) their aggregate length is more than 2,500 miles. The principal lines are—the Central, extending through the length of the State from Cairo to Chicago and Dubuque, and having a length of 704 miles; the Galena and Chicago Railroad, and its southern line, extending across the northern section of the State from Chicago to Dubuque and Fulton, and connecting directly with the Iowa railroads and by branches with the Wisconsin railroads; the Chicago and Rock Island, the Chicago, Burlington and Quincy, and the Chicago, Alton and St. Louis railroads, extending from Chicago severally to Rock Island, Quincy, and St. Louis; and four great transverse lines from Vincennes and Terre Haute to St. Louis, from Danville to Hannibal, and from Logansport to Burlington. These, with others of minor importance, constitute a system unsurpassed for the accommodation of a vast commerce; and besides these, numerous railroads from the East, rounding the head of Lake Michigan, have their termini at Chicago. As a central railroad point, indeed, Chicago has no equal; it has direct railroad communication with the whole country, and in every direction. It is also connected with the navigable Illinois and the whole Mississippi valley by the Illinois and Michigan Canal, a channel 100 miles in length, and which admits of the passage of the largest lake vessels.

24. Until the passage of the free banking law, in 1853, Illinois had only one recognized institution, the State Bank. In January, 1856, there were in the State 36 banks and branch banks, with capital amounting to $3,840,946, and liabilities as follows: circulation, $3,420,985; deposits, $1,267,234, and other, $241,903. The assets in the same years comprised—loans and discounts, $337,675; stocks, $3,777,676; real estate, $79,940; other investments, $1,108,148; due by other banks, $2,354,571; notes of other banks, $517,066; specie funds, $37,165, and specie, 759,474.

25. The first constitution of Illinois bears date 26th August, 1818. The constitution on which the government is now based was adopted in convention 31st August, 1847. It gives the right of voting to every white male citizen 21 years of age who has resided in the State one year. The general elections are held on the Tuesday after the first Monday in November.

26. The general assembly consists of 25 members, elected for four years, one half every second year, and a house of representatives of 75 members, elected for two years. Members of both houses must be citizens of the United States; senators 30 years of age, and residents of five years' standing, and representatives 25 years of age, and residents of three years' standing. Representation is by districts, based on white population. The legislature meets at Springfield on the second Monday of January, biennially (odd years).

27. The governor is elected for four years. He must be 35 years of age, a citizen of the United States, and a resident of ten years' standing. The lieutenant-governor is elected on the same basis. The principal administrative officers are the secretary of state, State auditor, State treasurer, etc. The governor's veto is nullified by the votes of a majority of both houses.

28. The judiciary consists of a supreme court, circuit courts, county courts, etc. For supreme court purposes the State is divided into three grand divisions, which have their seats at Mount Vernon, Springfield, and Ottawa, and each division elects one judge for nine years. The jurisdiction of this court is chiefly appellate, and one session is held in each division annually. There are 17 judicial circuits, each of which elects a judge for six years; and county judges are elected for four years. Cook County, in which Chicago is situated, has a special common pleas court, and the city of Chicago a recorder's court. These courts have concurrent jurisdiction with the circuit courts and common pleas in all civil cases, and in all criminal cases except murder and treason. The business of the county courts is chiefly probate.

29. The revenue of the State is derived chiefly from taxes. For the two years ending 30th November, 1850, the receipts into the treasury amounted to $402,179 (from taxes $394,103, and other sources $8,076), and for the two years ending 30th November, 1854, to $408,529. The total resources for the latter period (including sums on hand) amounted to $554,902. The total expenditures for the two periods were respectively $326,126 (ordinary expenses of government $137,196) and $525,877 (ordinary $255,195). On the 31st December, 1854, the State debt amounted to $13,994,615; at the end of 1849 it was $16,627,509. It is expected that the whole will be extinguished by 1866. The value of taxable property in the State in 1850 was $114,782,645, and in 1855, $333,287,474. In 1858 the valuation was assessed at $407,477,367. The assessed valuation of Cook County in the latter year was $45,680,333.

30. The principal institutions supported wholly or in part by the State were the State Hospital for the Insane and the Institution for the Deaf and Dumb at Jacksonville, and the State Prison at Alton.

31. The number of children attending school in 1850 was 182,292, or one in every 4.67 of the total population. The condition of the schools and number of scholars in attendance on the 1st June of that year was as follows:

Classification.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	4,052	4,248	125,725	$349,712
Academies and private schools	83	160	4,244	40,488
Universities and colleges	6	35	442	13,300

—making a total of 4,141 schools, 4,443 teachers, and 130,411 scholars, and a total income of $403,500. The number of persons over 20 years of age unable to read and write was 41,283, of whom 35,336 were Americans and 5,947 foreigners, and 40,054 were white and 1,229 colored persons.

32. In 1855 there were in the State 5,684 public schools, taught by 3,672 males and 2,699 females. The number of white children under 21 years of age was 696,340 (about half the population), of whom 323,393 attended school. The school fund in this year (State, county, and town) amounted to $2,953,594, which yielded interest amounting to $196,281. Illinois has also a State college and seminary fund which amounts to $152,421.

33. The principal collegiate and professional schools in the State in 1855 are named below:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
Illinois College	Jacksonville	1829	7	70	4,000
Shurtleff College	Upper Alton	1835	6	40	2,000
McKendree College	Lebanon	1835	10	79	7,500
Knox College	Galesburg	1837	7	56	3,600
University of St. Mary	Chicago	1844	12	—	6,000
Illinois State University	Springfield	1851	8	119	1,000
Universalist Centenary College	Salesbury	1855	—	—	—
Alton Theol. (Bapt.) Seminary	Upper Alton	1835	—	—	—
St. Mary's (R. C.) Theol. Sem.	Chicago	1844	—	—	—
Rush Medical College	Chicago	1842	6	79	—

34. The most numerous religious denominations in Illinois are the Methodist, Baptist, and Presbyterian, which together include three fourths of the whole population, and individually about a third, a fourth, and a fifth of the whole. Next in numerical order are the Christian and the Roman Catholic; and after these the Lutheran, Congregational, and Episcopal, etc. The whole number of churches in the State in 1850 was 1,223, with accommodation for 486,576 persons; and the value of church property was estimated at $1,482,185.

35. Springfield, the capital, is situated in the valley of the Sangamon, and about three miles south of the river, and nearly in the geographical center of the State. Latitude 39° 48′, and longitude 89° 33′. The city is laid out rectangularly, with wide streets and a public square in the center, on the latter of which is the State House and public buildings. The government located here in 1840, since which year its prosperity has been onward, until it has become an important commercial center. At this point the Great Western is crossed by the Chicago, Alton and St. Louis Railroad, which together give it access to the markets in every direction. The country around is a fine prairie and thickly settled, and abounds with bituminous coal. Population (1840) 2,579, and (1850) 4,533.

36. Chicago, the great commercial metropolis, is built on both sides of the Chicago River, and along the southwestern shore of Lake Michigan. Latitude 41° 52′ 20″, and longitude 87° 35′. The main body of the river sets back about a mile into the city, and then divides into two branches, both of which have a nearly uniform depth of 12 to 15 feet, all making a commodious and almost unlimited harbor. The city borders on a wide, rich, and beautiful prairie, handsomely diversified by groves and strips of timber, and interspersed with gardens and elegant villas. The bar at the entrance to the river has been much reduced, and piers have been extended into the lake to prevent accumulations. The depth, indeed, is now sufficient for the largest lake vessels and steamers.

37. In 1830 Chicago was a mere trading post, and in 1840 it had only 4,470 inhabitants. Since the last-named year, however, its population has increased rapidly, and as follows: in 1843, 7,580; 1845, 12,088; 1846, 14,169; 1847, 16,859; 1848, 20,085; 1849, 23,047; 1850, 28,269; 1851, 32,712; 1852, 38,733; 1853, 60,652; 1854, 65,872, and 1855, 83,509. In 1839 the assessed valuation of real and personal property in the city amounted to $236,842, in 1850 to $8,562,717, and in 1855 to $24,392,239.

COURT-HOUSE, CHICAGO.

38. Fronting on the lake, the city has direct shipping connection with all the ports of the Northern States and Canada; and by means of its extensive land lines its commerce reaches to the Atlantic and to and beyond the banks of the Mississippi and southward to the Gulf of Mexico. Chicago also reaches its immediate back country by numerous plank-roads; and the Illinois and Michigan Canal connects its waters with the Illinois and Mississippi rivers, fur-

nishing a water-line from the great lakes to the Gulf, and the vast rivers which, rising in the Rocky Mountains and the Alleghanies, reach the Mississippi at various and distant points.

39. The result of all the energy and enterprise expended on these works has been a success far exceeding the anticipations of the most sanguine of their projectors. Chicago has experienced an impetus which will carry it forward to the highest eminence as a commercial center, and the whole State has developed its resources to a measure beyond precedent. Every industry has been quickened, and population and capital have sought a center which promises at no far distant day to outcount the highest estimate of probability.

40. The city is laid out in rectangular streets and avenues. The northern section of the city and the lake shore are occupied by handsome residences; while the great business of the city is transacted south of the main river and along the banks of the south branch, which are lined with docks and large warehouses. Many of the streets are paved and lighted with gas. The most remarkable public buildings are the new Court House, the Merchants' Exchange, the Marine Hospital, the Rush Medical College, the new Custom House (which contains also the United States courts and Post Office), etc.; and many of the churches are massive and elegant structures. Schools are numerous, and Chicago has a very extensive and influential public press and several excellent literary and scientific institutions.

41. But the true distinction of this city is found in its vast commercial accommodations—in its wharves, warehouses, depôts, hotels, etc., which are on a most magnificent scale, and indicate the immense value of its trade. Railroads traverse its streets, and, interlacing one with the other make a very network of iron, and cars, freighted with rich merchandise and travelers, are constantly moving in and out, from and to every point of the compass. Meanwhile the harbor is crowded with steamers, propellers, and other lake and canal craft. Indeed, the commerce, of which these are the carriers, is immense, and in 1855 was valued as a whole, imports and exports, at more than 200 million dollars, or one third of the aggregate of the commerce of the Northern lakes. In the same year the coastward exports of domestic products and manufactures alone were valued at $33,985,165. As a grain market, Chicago is the first in the world, and as to its lumber trade, it exceeds every other port in the West.

42. The trade of Chicago with foreign ports is also respectable. In 1854–5 there were cleared 59 vessels (34,380 tons), and there were entered 52 vessels (30,280 tons). In 1856 a vessel was dispatched from Chicago to Liverpool, and after passing the lakes, canals, and St. Lawrence, arrived there after a rapid and successful passage. This experiment was made to test the practicability of a direct European commerce. The shipping owned at this port in 1855 amounted to 50,972 tons, of which 3,207 tons represented the steam marine. In the same year there were built here 12 vessels, measuring 1,742 tons.

43. The advance of Chicago in manufactures has been equally rapid as in commerce. The following returns prove this:

	1854.	1855.	1856.
Capital invested	$4,220,000	$6,295,000	$7,759,400
Hands employed	5,000	8,740	10,563
Manufactures produced	$7,870,000	$11,031,491	$15,515,063

The number of establishments (1856) propelled by steam was 137; the quantity of cast-iron consumed was 18,402 tons; of wrought-iron 11,196 tons; of coal 38,516 tons, and wood 3,000 cords.

44. This city, now one of the first commercial places in the world, was thus spoken of by Latrobe, an intelligent traveler, who visited Chicago in 1833: "This little mushroom town is situated on the verge of a level tract of country, for the greater part consisting of open prairie lands, at a point where a small river, whose sources interlock—in the wet season—with those of the Illinois River, enters Lake Michigan. It, however, forms no harbor; and vessels must anchor in the open lake, which spreads to the horizon on the north and east in a sheet of uniform extent." What a contrast between the Chicago of 1833 and the Chicago of the present day; and the writer of a quarter of a century ago, how little he expected his "little mushroom town" to expand into one of the first cities of the country! Had a prophet then told him that such would be the future of the embryo city, his prognostication would have been received as the emanation of a crazy brain; but who now doubts that this city will, in less than 10 years from the present day, contain 500,000 souls!

45. Alton is a port of entry on the Mississippi, 23 miles above St. Louis and three miles above the mouth of the Missouri. It is a rapidly growing town, and with its favorable position for trade and excellent landing, promises to become a very important place. It is connected with Chicago and Terre Haute by railroad, and also with Illinoistown, opposite to and a suburb of St. Louis; and steamboats ply regularly to and from all important river towns. Alton is a well-built town, with wide streets and ample squares, and contains the State Prison and other public buildings. Upper Alton is the seat of Shurtleff College and a Baptist theological seminary. In the vicinity are limestone and stone-coal. Population (1850) 3,585, and (1855) about 8,000. Belleville is a town 16 miles southeast Illinoistown, with which it is connected by railroad. It has flourishing manufactures and an active trade in agricultural products and coal, which abound in this section. Population (1855) about 6,000.

46. Cairo, at the extreme southern point of the State, where the Ohio joins the Mississippi, and the terminus of the Illinois Central Railroad, is a very important city and port, and may be considered as the geographical center of the commerce of the Mississippi and its affluents. From this place also diverge the Mobile and Ohio and the Cairo and Fulton railroads. Its site, however, is low, and naturally subject to inundation; but by extensive levees has been vastly improved and probably protected from the annual floods. Within a short period past many large warehouses and other commercial facilities have been erected, and already an extensive business has been inaugurated. Regular steamers ply to and from all the ports of the Ohio, Illinois, Missouri, etc. About two miles higher up the Ohio another site, called Mound City, to which a branch of the Illinois Central Railroad extends, has been settled, and will compete with Cairo for the commerce which must eventually be concentrated in this vicinity. Centralia is a new town on the Central Railroad, 110 miles north Cairo, and the point from which the Chicago Branch diverges.

47. Dunleith is a new and thriving town on the Mississippi, opposite Dubuque, and at the terminus of the Central and the Galena and Chicago Union railroads. It has extensive warehouses, depôts, etc., and will soon be connected with Dubuque by a bridge. Freeport is a busy town on the Pecatonica, and the terminus of the Galena and Chicago Union Railroad, which here joins the Central Railroad, 121 miles west Chicago. The Racine and Mississippi Railroad also passes through this place. These roads give it access to all the great markets. Population (1850) 1,436, and (1855) about 4,500. Fulton, on the Mississippi, 136 miles west Chicago, is the river terminus of the Chicago, Fulton and Iowa Railroad. It is a thriving town and has an active trade. On the opposite side of the river is Clinton, the eastern terminus of the Chicago, Iowa and Nebraska Railroad.

48. Galena is situated on Fevre River, six miles from its confluence with the Mississippi, and 171 miles by railroad west Chicago. It is the chief town of the lead region, and a place of great commercial importance, being an entrepôt between Minnesota and Chicago. Regular

GALENA.

lines of steamboats ply to and from St. Paul, Dubuque, etc., and it has also railroad connection north and south by the Central Railroad, which passes through it. It is the seat of Knox College. Population (1850) 2,745, and (1855) about 8,000.

49. Illinoistown is situated on the Mississippi, opposite St. Louis, and is the terminus of all the eastern railroads approaching St. Louis, of which city it is, in fact, a suburb. Coal is very abundant in the vicinity, and largely mined. Population about 3,000.

50. Jacksonville is situated on the Great Western Railroad, 33 miles west Springfield. It is an active trading town, and the seat of Illinois College and of the State institutions for the blind and the deaf and dumb. Railroads are projected hence to Alton, Peoria, etc. Population (1850) 2,745, and (1855) about 5,000. Joliet is a thriving town on Des Plaines River and Illinois and Michigan Canal. It is also an important station on the Chicago and Rock Island and the Chicago, Alton and St. Louis railroads, and is connected directly with the East by the Joliet and Northern Indiana Railroad. Population (1850) 2,659, and (1855) about 6,000.

51. Kaskaskia is built on the river of the same name, two miles back from the Mississippi. It is the oldest town in Illinois, and, perhaps, the oldest in the States north of the Ohio, having been settled by the French in 1673. It was the first capital of the State, and so remained until the removal to Vandalia, in 1818.

52. La Salle is situated at the outlet of the Illinois and Michigan Canal, 100 miles southwest Chicago. The Chicago and Rock Island and the Central Railroad intersect at this town. It has a large trade, estimated at $4,000,000 annually, and great facilities for manufactures. In the vicinity are extensive beds of bituminous coal. Population (1853) 3,201.

53. Naples, on the Illinois, and the present terminus of the Great Western Railroad, 55 miles west Springfield, is a place of considerable trade and a principal shipping port on the river. Steamboats ply hence to St. Louis and other ports. Population about 2,000.

54. Nauvoo City is built near the head of the upper rapids of the Mississippi, and 50 miles above Quincy. It was founded by the Mormons in 1840, and once contained 15,000 to 18,000 inhabitants. The Temple, built of polished limestone, was one of the grandest edifices in the country; it was destroyed by fire in 1848. On the exodus of the Mormons to Utah, Nauvoo was purchased by the Icarian Socialists under M. Cabet, and is now inhabited by them. The town has a good landing. Population about 2,000.

55. Oquawka, on the Mississippi, 10 miles above Burlington, is a town of about 1,000 inhabitants, and has a considerable produce and shipping business. It is one of the western termini of the Peoria and Oquawka Railroad, which is now completed to a junction with the Chicago, Alton and St. Louis Railroad, 143 miles east, and will be continued to Logansport in Indiana. East Burlington is the other western terminus of this important railroad.

56. Peoria, one of the largest and most important cities of the State, is beautifully situated on Peoria Lake, an expansion of the Illinois River, 70 miles north Springfield. It has thus a water connection with St. Louis and Chicago—with the latter through the Illinois and Michigan Canal; and by railroad with Chicago, Rock Island, Burlington, and Quincy, and railroads are in progress that will connect it with Logansport and Toledo, Hannibal and Jacksonville, etc. It is a place of extensive trade, and from its proximity to coal (now extensively mined in the immediate vicinity), and easy access to the great markets, it bids fair to become one of the largest manufacturing towns of the West. Among its establishments are several extensive machine shops. The streets and stores are lighted with gas. Population (1850) 5,095, and (1855) 11,926. The Illinois is spanned at this point by a great railroad bridge. Peru, one mile below La Salle, on the Illinois River, at the head of natural navigation, has an active trade by river, canal, and railroad, which connect it with all the

great markets. The Chicago and Rock Island and the Central railroads intersect in the vicinity, and the Illinois and Michigan Canal navigation commences immediately above the town. Population (1855) about 5,000.

57. Quincy, one of the largest and most flourishing cities of the State, is situated on the Mississippi, 18 miles above Hannibal, and at the terminus of the Quincy and Chicago Railroad, 268 miles southwest Chicago and 100 miles west Springfield. Railroads are also being built to connect it with the Great Western Railroad at Naples and with the Hannibal and St. Joseph Railroad at Palmyra. The city is built on a limestone bluff, 125 feet above the river, and is handsomely laid out. Its trade by the river and by railroad is large and increasing, and among its industrial establishments are lumber-yards, distilleries, founderies, machine shops, flouring mills, sash and blind factories, carriage factories, etc., and large cooperages. Population (1850) 6,911, and (1855) about 12,000.

58. Rock Island City is situated on the Mississippi, two miles above the mouth of Rock River, and by the Chicago and Rock Island Railroad 182 miles west-by-south Chicago. It is built at the foot of the upper rapids, which extend about 15 miles up the river, and in low stages of the water interrupt navigation. The southern end of Rock Island, in the Mississippi, lies opposite the city, and forms one of the buttresses of an immense railroad bridge, which connects it with Davenport on the Iowa shore. The city has flourishing manufactures and a very extensive trade, and promises to become one of the most important towns of the State. Population (1850) 1,711, and (1855) about 10,000.

59. Vandalia, formerly capital of the State, is situated on the Kaskaskia River, where it is crossed by the National Road, 80 miles south-southeast Springfield. Latitude 38° 50′, and longitude 89° 2′. The Central Railroad also passes through the town, 142 miles north Cairo, and will here be intersected by the Atlantic and Mississippi Railroad. After the removal of the government offices to Springfield, Vandalia declined, but is again reviving, and at the present time numbers some 1,500 inhabitants.

60. The name which now pertains exclusively to this State was, during a greater part of the last century, bestowed upon all that vast country which lies northwest of the Ohio. The first settlements were made by the French, and were the consequences of the enterprises of La Salle in search of the Mississippi. Kaskaskia, Cahokia, and other towns were laid out about the year 1673. At the beginning of the eighteenth century the settlements on the Illinois are represented to have been in a flourishing condition, and Kaskaskia had become a considerable town before any great progress had been made in the settlements on the Lower Mississippi.

61. From the beginning to the middle of the century, history says little respecting this territory. As the colonies of France and England extended, however, disputes arose respecting boundaries. The French, anticipating a struggle as early as 1749, strengthened themselves on the lakes, the Ohio, the Wabash, and the Illinois, and other parts of the valley to which they laid claim. The British, on the other hand, claimed the country on the Ohio in virtue of the charter the king had granted. The war which ensued closed in 1763, and France was despoiled of its whole American possessions east of the Mississippi. During the continuance of the country as a British dependency nothing of importance seems to have occurred.

62. At the peace of 1783 the Illinois country fell to the United States, and the territory northwest of the Ohio was claimed by Virginia and other States, as included in their charters. These claims, however, were ceded to the general government, and by the ordinance of 1787 a territorial government was established over the whole region. Ohio and Indiana were the first States taken from this territory, and Illinois the third; the last named having been formed into a separate government in 1809, and was admitted as a State of the Union on the 3d of December, 1818.

STATE OF MISSOURI.

1. Missouri is situated between latitudes 36° 30′ and 40° 30′ north, and longitudes 88° 55′ and 95° 40′ west, and is bounded on the north by Iowa, on the east by the Mississippi River (separating it from Illinois, Kentucky, and Tennessee), on the south by Arkansas, and on the west by the Indian Territory and Kansas Territory.

2. The greatest extent of the State, east and west, is on the parallel of the mouth of the Ohio, where it measures about 320 miles. In the north it is from 80 to 100 miles narrower. North and south the extent is 278 miles, but there is a narrow tongue of land between the St. Francis and Mississippi rivers, which extends half a degree beyond the general body of the State into Arkansas, and which is not included in this admeasurement. Included in these limits Missouri has a superficies of 67,380 square miles, and occupies 2.29 per cent. of the total area of the United States.

3. The Missouri River divides the State into two parts, having different physical characteristics. South of that river, as far west as the Osage, the surface is rolling, and gradually rises into a hilly and mountainous country, forming the outskirts of the Ozarks. Beyond the Osage, at some distance, commences a vast expanse of prairie, which stretches indefinitely westward. The chief geological formations in all this region are solid strata of carboniferous and silurian limestone and sandstone, reposing on or around the unstratified primary rocks. In the hilly and broken region, which includes the greater part of the State south of the Missouri, the soil is formed of disintegrated sandstone, sienite, and magnesian limestone. The soils formed of the last two materials are fertile, but in some parts of the mineral region their productiveness is impaired by the admixture of iron oxyds. Other districts, as Bellevue valley, and the valleys of the Maramec, Gasconade, and Osage, are well fitted for cultivation or for pasture; but around the head-waters of the White, Eleven Points, Currents, and Big Black, where the land is most mountainous, the soil is formed of semi-vitreous sandstone, and is generally unproductive, although it supports a magnificent growth of yellow pine, valuable for timber. The intervening valleys, however, are decidedly fertile, but of small extent. Immediately south of the Missouri the lands are partly sandy and partly calcareous, and in general, where alumina and clays sufficiently abound, the soil is excellent and well adapted for general agriculture.

4. That part of the State lying north of the Missouri is in no place mountainous, but either rolling or quite flat. The soils are equal to the best intervale lands, and cultivation is here in a more advanced state than to the south of the river. Its geological substratum is chiefly carboniferous limestone; and this district is also distinguished for its vast measures of bituminous coal. The soils are calcareous and arenaceous, with some small extent of the aluminous. The calcareous soils, which predominate, are fertile, particularly near the margins of rivers; of this character are the lands in the extreme west along the Missouri, and many of the interior counties are of nearly equal fertility. In the eastern parts of this region arenaceous soils prevail, and are comparatively barren. These lands are found on the flanks of the prairies which extend northward to the head-waters of the Mississippi River.

FIRE ON THE PRAIRIE.

5. In the southeastern section of the State, from Cape Girardeau to the northern part of Arkansas, there are large tracts of marshy and inundated lands.

6. Omitting the Mississippi, which washes the eastern border for 470 miles, the great river, and the one from which it derives its name, is the Missouri. This fine stream rises in the Rocky Mountains, not far from the sources of the Columbia, 3,096 miles from its entrance into the Mississippi, the last 400 or 500 miles of its course alone lying within the limits of this State. The trough through which its waters flow is from four to five miles wide, and is bounded by rocky limestone hills, which rise to the height of from 100 to 300 feet. Nearly all the bottoms are on its north bank, and are not ordinarily subject to inundation, and are covered by a luxuriant vegetation both of trees and herbs, in which respects they differ widely from those of the Mississippi. The stream is rapid, and can only be ascended readily by steam-power.

7. Of the tributaries of the Missouri, the largest is the Osage, which joins it 120 miles from its mouth. The Gasconade is important for the supplies of plank and timber it furnishes to the country below. The principal tributaries from the north are Grand and Chariton rivers, both navigable, and composed of numerous branches which drain a large surface. Farther west, and also falling into the Missouri, are the Platte or Nebraska, the Nodaway, and others.

8. The Maramec, a beautiful river, runs through the mineral regions, and flows into the Mississippi 18 miles below St. Louis; and farther south are the rivers St. Francis and White, which pass into Arkansas. The southwestern section is watered by several tributaries of the Arkansas River, but none of these are voluminous or fit for navigation. North of the Missouri are Salt and Copper rivers, which empty into the Mississippi. Many of the rivers of Missouri are obstructed by fallen trees—especially the Grand, Osage, Salt, Maramec, and St. Francis.

9. Most of the useful minerals exist in Missouri; and among these may be enumerated lead, iron, copper, silver, zinc, manganese, coal, salt, and clays; also diamonds, chalcedony, etc. The mineral region occupies an area of about 18,000,000 acres. It extends from the head-waters of the St. Francis to the Maramec River, a distance of about 70 miles in length, and from the Mississippi, in a southwesterly direction, a distance of about 60 miles. The elevation of the district above the level of the sea varies from 600 to 1,200 feet.

10. The lead mines have been worked since the first settlement of the country. The ore is chiefly in the forms of sulphuret and carbonate. The lead region extends over the counties of Madison, St. Francis, St. Louis, Washington, etc. Silver to the amount of six or seven per centum is generally found intermixed in the sulphuret.

11. Iron is found in the greatest abundance in the form of hematite, and the ochery, micaceous, and red oxyds. The ores exist throughout the mineral region, and the mountains forming the eastern extremity of the Ozarks, known as Iron Mountain and Pilot Knob, consist of vast masses of the micaceous oxyd which yields the finest specimens of iron. The quantity of the mineral is such that it is calculated that 600,000,000 tons of pig-iron may be obtained from these mountains alone—a sufficiency for the whole world for a century! The mines of Elba, Sweden, and Norway together do not contain an equal amount,

12. Copper is chiefly found in the south and west portions of the mineral region, but exists in other parts; the ore is generally pyritous, but oxyds and carbonates are frequently found. Tin has been found near Caledonia. The coal measures are continuous from those of Illinois, and cover a large surface in central and northern Missouri. The coal is principally bituminous, and at Côté sans Dessein it assumes the form of cannel.

13. The rocks found in the State comprise every variety of building stone, marbles, porphyries, and sienite. Gypsum is also abundant, and a great variety of clays useful in the arts are met with, from which brick, pottery, and delft-ware are largely manufactured. Kaölin, or porcelain clays, and pipe-clays exist near Caledonia and Cape Girardeau.

14. Except on the prairies, Missouri is well timbered. The river-bottoms in particular are covered with a luxuriant growth of oak, elm, ash, hickory, cotton-wood, and black and white walnut. In the more barren districts are found white and pin oak, and sometimes forests of yellow pine. The crab-apple, paw-paw, and persimmon are abundant, as also the hazel and pecan. The general capacity of the country for agriculture is unsurpassed, and every kind of grain and esculent vegetable, with flax or cotton, find in one part or another a congenial soil and climate. Tobacco is also a staple product. The prairies afford fine ranges of natural pasture for cattle, and hogs are raised without trouble in the forests.

FARMING SCENE.

15. In 1850 Missouri contained 682,044 inhabitants or 10.12 to every square mile, being 2.94 per cent. of the total population of the Union. This population was included in 100,890 families, and occupied 96,849 dwellings. Its distribution into the counties was as follows:

Counties.	Population.	County Seats.
Adair	2,342	Kirksville.
Andrew	9,433	Savannah.
Atchison	1,678	Linden.
Audrain	3,596	Mexico.
Barry	3,467	Cassville.
Bates	3,669	Papinsville.
Benton	5,015	Warsaw.
Boone	14,979	Columbia.
Buchanan	12,975	Sparta.
Butler	1,616	Cane Creek.
Caldwell	2,316	Kingston.
Calloway	13,827	Fulton.
Camden	2,338	Erie.
Ca. Girardeau	13,912	Jackson.
Carroll	5,441	Carrollton.
Cass	6,090	Harrisonville.
Cedar	3,361	Fremont.
Chariton	7,514	Keytesville.
Clarke	5,527	Waterloo.
Clay	10,332	Liberty.
Clinton	3,786	Plattsburg.
Cole	6,696	Jefferson C'y.
Cooper	12,950	Booneville.
Crawford	6,397	Steelville.
Dade	4,246	Greenfield.
Dallas	3,648	Buffalo.
Daviess	5,298	Gallatin.
De Kalb	2,075	Maysville.
Dodge	375	Butler.
Dunklin	1,229	Kennet.
Franklin	11,021	Union.
Gasconade	4,996	Hermann.
Gentry	4,248	Athens.
Greene	12,785	Springfield.
Grundy	3,006	Trenton.
Harrison	2,447	Bethany.
Henry	4,052	Clinton.
Hickory	2,329	Hermitage.
Holt	3,957	Oregon.
Howard	13,969	Fayette.
Jackson	14,000	Independence.
Jasper	4,223	Carthage.
Jefferson	6,928	Hillsboro'.
Johnson	7,464	Warrensburg.
Knox	2,894	Edina.
La Clede	2,498	Lebanon.
La Fayette	13,690	Lexington.
Lawrence	4,859	Mount Vernon.
Lewis	6,578	Monticello.
Lincoln	9,421	Troy.
Linn	4,058	Linnæus.
Livingston	4,247	Chillicothe.
M'Donald	2,236	Rutledge.
Macon	6,565	Bloomington.
Madison	6,003	Fredericktown
Marion	12,230	Palmyra.
Mercer	2,691	Princeton.
Miller	3,884	Tuscumbia.
Mississippi	3,123	Ohio City.
Moniteau	6,004	California.
Monroe	10,541	Paris.
Montgomery	5,489	Danville.
Morgan	4,650	Versailles.
New Madrid	5,541	New Madrid.
Newton	4,268	Neosho.
Nodaway	2,118	Maryville.
Oregon	1,432	Thomasville.
Osage	6,704	Linn.
Ozark	2,294	Rockbridge.
Perry	7,215	Perryville.
Pettis	5,150	Georgetown.
Pike	13,609	Bowling Green
Platte	16,845	Platte City.
Polk	6,186	Bolivar.
Pulaski	3,998	Waynesville.
Putnam	1,636	Putnamville.
Ralls	6,151	New London.
Randolph	9,489	Huntsville.
Ray	10,373	Richmond.
Reynolds	1,849	Lesterville.
Ripley	2,880	Doniphan.
St. Charles	11,454	St. Charles.
St. Clair	3,556	Osceola.
St. Francis	4,964	Farmington.
Ste Genevieve	5,318	Ste Genevieve.
St. Louis	104,978	St. Louis City.
Saline	8,843	Marshall.
Schuyler	3,287	Lancaster.
Scotland	3,782	Memphis.
Scott	3,182	Benton.
Shannon	1,199	Eminence.
Shelby	4,253	Shelbyville.
Stoddard	4,277	Bloomfield.
Sullivan	2,983	Milan.
Taney	4,373	Forsyth.
Texas	2,312	Houston.

Washington	8,811	Potosi.
Wayne	4,518	Greenville.
Wright	3,387	Hartville.

—of the total population (1850) 592,004 (86.8 per cent.) were white persons—312,987 males and 279,017 females; 2,618 (0.38 per cent.) were free colored persons—1,361 males and 1,257 females, and 87,422 (12.82 per cent.) were slaves—43,484 males and 43,938 females; and of the free population white and colored 520,826 (87.6 per cent.) were American born, of which number 277,604 were born in this State; 72,474 were foreign born, and 1,322 were of origin not ascertained. In other States of the Union there were resident 37,824 Missourians.

16. Missouri in 1810 contained 20,845 inhabitants; in 1820, 66,586; in 1830, 140,455; in 1840, 383,702, and in 1850, 682,044. In 1855 its population was estimated at 831,215.

17. Of 128,175 free male persons over 15 years of age engaged in industrial pursuits, the proportion employed in each branch was as follows—30,098 in commerce, trade, manufactures, mechanic arts, and mining; 65,561 in agriculture; 20,326 in labor not agricultural; 308 in the army; 2,471 in sea and river navigation; 2,893 in law, medicine, and divinity; 3,147 in other pursuits requiring education; 767 in government civil service; 1,458 in domestic service, and 1,149 in unclassified employments.

18. The bulk of the population is employed in agriculture, but in mining and manufactures much progress has been made, and commerce in all its branches is largely engaged in. Lead, iron, copper, and coal, to which we might add numerous other valuable minerals, have long been mined in Missouri. The lead mines have been wrought since the earliest settlement of the country. The ores invariably contain silver. The best of iron is mined in this State; but copper is perhaps destined to become its most valuable mineral product. Coal is mostly found to the north of Missouri River.

19. The number of farms in Missouri in 1850 was returned by the census of that year at 54,458, covering 9,732,670 (improved 2,938,425, and unimproved 6,794,245) acres of land, valued at $63,225,543; and the value of implements and machinery thereon was $3,981,525. Thus the average size of farms was 179 acres, and the average value $1,161, or including implements, etc., $1,234.

20. The quantity of livestock in the State at the two census periods of 1840 and 1850 was as follows:

	horses, mules, etc.,	neat cattle,	sheep,	swine,
1840	196,032	433,875	348,018	1,271,161
1850	266,986	791,510	762,511	1,702,625

—among the horses, etc., in 1850 were 41,667 asses and mules, and among the neat cattle 230,169 milch cows and 112,168 working oxen; and the total value of animals in that year was $19,887,580. The products of animals in 1849–50 consisted of—butter 7,834,359, cheese 203,572, and wool 1,627,164 pounds; and the value of animals slaughtered for market was $3,367,106. In 1840 the wool crop amounted to 562,265 pounds.

21. The cereal crops (bushels) in the two years 1849 and 1850 were comparatively as follows:

	wheat,	rye,	oats,	Indian corn,	barley,	buckwheat,
1840	1,037,886	68,608	2,234,947	17,332,524	9,801	15,318
1850	2,981,652	44,268	5,278,079	36,214,527	9,631	23,641

—making a total crop in 1840 of 20,698,584, and in 1850 of 44,551,808 bushels. Potatoes in 1840, 783,768, and in 1850 (including "sweet," 335,505), 1,274,511 bushels; and peas and beans in 1850, 46,017 bushels.

22. The special crops of Missouri were as follows:

1840	hemp and flax	18,011 tons	and tobacco 9,067,913 pounds.
1850	flax 314 and hemp 16,028 = 16,342	"	" 17,113,784 "

—and in 1840 Missouri produced 121,122 pounds of cotton.

23. The other crops of 1849–50 consisted of—hay 116,925 tons, hops 4,130 pounds, clover-seed 619, and other grass-seed 4,346 bushels, beeswax and honey 1,328,972 pounds, flax-seed 13,696 bushels, maple-sugar 178,910 pounds, molasses 5,636 gallons, rough rice 700 pounds, silk cocoons 186 pounds, and wine 10,563 gallons. The value of market-garden products was $99,454, and of orchard products $514,711.

24. The total value of the products of agriculture in Missouri in 1840 was $9,755,615, and in 1850, $34,619,650.

25. Missouri in 1850 contained 3,029 establishments engaged in manufactures, mining, and the mechanic arts. These in 1850 employed an aggregate capital of $9,079,695, consumed raw material valued at $12,446,738, engaged 15,977 males and 873 females, paid for labor $3,184,764, and turned out manufactured articles to the value of $23,749,265. In 1840 the value of the manufactured goods produced was only $4,797,215.

26. The value of home-made manufactures in 1840 was $1,149,544, and in 1850 $1,674,705; and hence, with the addition of these values, the aggregate value of manufactures in the years respectively was $5,946,759 and $25,423,970.

27. Missouri has no direct foreign commerce. Its domestic trade, however, is immense, and centering at St. Louis—the commercial dépôt of the upper section of the Mississippi valley—extends in every direction. Its steamers are found at New Orleans and at the Falls of St. Anthony, at Chicago, at Pittsburg, at Cincinnati, and at Louisville, and at the head of navigation on the Missouri River. Between 3,500 and 4,000 steamers arrive and depart annually. The interior is reached by river, railroad, and turnpike, and is generally well accommodated with the means of intercommunication. In 1850 the shipping owned in the State amounted to 28,907 (steam 24,955) tons, and in 1855 to 60,592 (steam 52,477) tons; and the shipping built in 1850 to 1,353, and in 1855 to 5,084 tons.

28. The railroads of Missouri, with one exception, have their initial point at St. Louis. These are—the Pacific Railroad, which has a direct westerly course to the Kansas line of 280 miles, and its southwestern branch, which takes the course indicated by its name, with a length of 282 miles; the North Missouri Railroad, which passes northwesterly to the southern line of Iowa, with a length of 231 miles, and the St. Louis and Iron Mountain Railroad, which has its south terminus at the Pilot Knob, 85 miles distant from St. Louis. The Hannibal and St. Joseph's Railroad extends directly across the State, 207 miles from Hannibal on the Mississippi (where it connects with the Illinois railroads) to St. Joseph's on the Missouri. Other railroads in progress or projected are—the Cairo and Fulton, the length of which in this State is 77 miles, and the following: the Keokuk and Kansas, the Canton and Bloomfield, the Lexington and Daviess County, and the Platte County railroads. The proportion of these lines completed at the end of 1857 was about 360 miles, and so far progressed are other portions of the system that additional sections are opened at brief successive periods. The building of these roads has been greatly aided by the State, which guarantees the bonds of the companies.

29. The six banks and branch banks of Missouri in December, 1850 and 1855, had capital amounting to $1,209,131 and $1,215,405. Their liabilities at the two periods consisted of—circulation $2,522,500 and $2,805,660, deposits $1,098,981 and $1,331,126, and dues to other banks $76,280 and $172,425; and their assets—loans and discounts $3,533,463 and $4,393,029, real estate $123,928 and $104,622, other investments (1850) $273,317, due by other banks $66,028 and $28,331, notes of other banks $37,510 and $33,870, and specie $1,198,263 and $1,355,050.

30. The constitution of Missouri grants the right of voting to every free white male citizen of the United States, 21 years of age, who has been a resident in the State for the three years next preceding an election, and for three months in the place where the election is held. The general election is held on the first Monday in August.

31. The general assembly is composed of a senate of 18 members, elected in districts for four years, one half biennially, and a house of representatives of 49 members, elected for two years. Senators must be citizens of the United States, 30 years of age, and have resided in the State five years, and representatives must be citizens, and have been resident in their respective districts for two years. This legislature meets at Jefferson City biennially (*even* years), in the last Monday of December.

32. The governor and lieutenant-governor are elected by the people at large for four years, and can not serve two terms successively. The qualifications of both are alike—they must be native citizens of the United States, or a citizen thereof in 1820, or an inhabitant at the time of the cession in 1803. The principal administrative officers are the secretary of state, superintendent of public schools, State auditor, State treasurer, etc. These officers are all required to reside at the capital during their terms of office.

33. The judiciary consists of the supreme court, 16 circuit courts, county courts, etc. The supreme court has three justices elected for six years, and holds two sessions annually, one at Jefferson City and one at St. Louis. A circuit court is held twice a year in each county. Its jurisdiction extends to all matters of tort and contract over $90 where the demand is liquidated, and over $50 where the agreement is parol. It has exclusive com-

mercial jurisdiction, and a supervision over the county courts and justices of the peace, subject to the correction of the supreme court. The judges of the circuit courts are elected in their respective circuits for six years. The jurisdiction of county courts is limited to matters of probate and local affairs; the county court is composed of three justices elected for four years. In addition to the circuit and county courts, St. Louis has a court of common p'eas (with jurisdiction similar to the circuit court), a criminal court, a district court of probate, a recorder's court, and a land court, having sole jurisdiction in St. Louis County, in suits respecting lands, actions of ejectment, dower, partition, etc. The judges of the common pleas and criminal courts are elected for the same term as the circuit judges. Hannibal, St. Joseph, Cape Girardeau, Independence, and Weston have also separate courts of common pleas.

34. The revenue of the State is derived chiefly from taxation polls, licenses, and bank stock dividends. The resources of the treasury for the two years ending 30th September, 1850, amounted to $1,192,493, and for the two years ending 30th September, 1855, to $1,007,113; and the expenditures for the periods respectively to $871,818 and $532,585. The State debt proper in 1855 amounted to $602,000, on which the annual interest was $35,805. The State has also lent its credit to railroad companies to the large amount of $15,930,000, and will extend their species of indebtedness. The amount of bonds already authorized, and including the above, is nearly twenty-five million dollars. As security for these the State holds mortgages on the roads and their branches. The assessed valuation of taxable property in Missouri in 1850 was $98,595,463, and in 1855, $223,948,731.

35. The principal institutions supported wholly or in part by the State are the State Lunatic Asylum and the Asylum for the Deaf and Dumb at Fulton, the Asylum for the Blind at St. Louis, and the State Prison at Jefferson City.

36. In 1850 the number of children attending school as returned by families was 95,285, or one in every 6.23 of the free population. The number attending school and the general statistics of the schools on the 1st June of that year were as follows:

Classification.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	1,570	1,620	51,754	$160,770
Academies and private schools	204	368	8,829	143,171
Universities and colleges	9	65	1,009	79,528

—making a total of 1,783 schools, 2,053 teachers, and 61,592 scholars, and an income of $383,469. The number of free persons over 20 years of age unable to read and write was 36,778, of whom 34,917 were Americans and 1,861 foreigners, and 36,281 were whites and 497 free colored persons.

37. The principal collegiate and professional schools within the State in 1855 are noted in the following table:

Institutions.	Location.	Founded.	Professors.	Students.	Libraries.
University of St. Louis	St. Louis	1832	20	181	16,000
St. Charles College	St. Charles	1837	4	23	1,000
Missouri University	Columbia	1842	8	182	2,000
St. Vincent's College	Cape Girardeau	1843	10	47	6,000
Masonic College	Lexington	1844	4	32	2,000
Fayette College	Fayette	1848	3	—	1,300
Westminster College	Fulton	1851	5	—	2,000
Chapel Hill College	Chapel Hill	1852	3	—	1,200
William Jewett College	Webster	1852	3	—	1,600
Grand River College	Trenton	1855	—	—	—
Theol. (R. C.) Seminary	St. Louis	—	4	—	3,600
St. Mary's Eccles. (R. C.) Seminary	Perry Co.	—	3	—	1,700
Med. Depart. University of St. Louis	St. Louis	1836	9	141	Univ. Lib.
Med. Depart. Missouri University	St. Louis	1846	7	103	"

—and there are several other theological seminaries.

38. The most numerous of the religious denominations in this State are the Baptist, which includes about a third of the population, the Methodist with a fourth, and the Presbyterian with a fifth; and after these the Roman Catholic with a tenth, and the Christian with a twelfth of the whole. The Lutheran, Free Church, Episcopalian, Union, Moravian, Unitarian, etc., are in smaller numbers, and the Jews have a synagogue at St. Louis. The whole number of churches in 1850 was 880, with accommodation for 251,068 persons; and the value of church property was estimated at $1,561,610.

39. Jefferson City, capital of the State, is built on the south bank of the Missouri River, 142 miles above its confluence, and 160 miles by water from St. Louis. Latitude 38° 36′, and longitude 92° 8′. The site is elevated and uneven; and commands a fine view of the river and opposite cedar-crowned cliffs. The principal buildings are the Capitol, the Governor's official residence, and State Penitentiary. Its trade has hitherto been by the river, but the Pacific Railroad, now completed to this city, furnishes a more certain and nearer route to St. Louis, and is rapidly superseding the former, both for travel and traffic. Population, 1850, about 1,600, in 1856, by census, 1,924.

40. St. Louis, the commercial metropolis, is situated on the west bank of the Mississippi, 18 miles below the confluence of the Missouri, and 174 miles above the mouth of the Ohio; 1,212 miles above New Orleans, and 740 miles below the Falls of St. Anthony, and 125 miles by railroad east Jefferson City. Latitude 38° 37′ 28″, and longitude 90° 15′ 16″.

41. The site occupies two terraces, rising above the floods 20 and 60 feet respectively—the first ascent from the bottom being abrupt, and the latter more gradual, and spreading out into an extensive plain. The city extends about seven miles along the river, and three miles back, but the thickly settled portion occupies scarcely the half of this area. The streets are, for the most part, 60 feet wide, and generally at right angles with each other.

42. The city is well built, generally of brick, and to some extent of limestone, vast quarries of which underlie the site and vicinity. Among the public buildings, the most conspicuous are the Court House, constructed of Ste Genevieve limestone, at a cost of half a million dollars; the Centre Market Buildings, and the City Hall. Many of the churches, of which there are about 60, are magnificent. Of these St. George's (Episcopal), the Cathedral (Roman Catholic), and the Church of the Messiah (Unitarian) are regarded as the finest. The Cathedral is a building of polished freestone, 136 feet long and 84 feet wide, and in the tower is a chime of bells, the heaviest of which weighs 2,600 pounds. The United States Arsenal, in the extreme southeast of the city, is also a large and imposing edifice inclosed by ornamental grounds.

43. The literary and educational institutions of St. Louis are numerous and respectable. Its university, founded in 1832, under the direction of the Catholics, is a most efficient institution, and connected with it is a valuable medical department. The Medical Department of the Missouri University is also located here. The students of both these schools enjoy the advantages of clinical instruction in the City Hospital. More than 10,000 pupils attend the public schools of the city, and a large number are educated in private seminaries and the convents. The buildings of the latter are conspicuous and handsome edifices. As a general library and reading-rooms, the buildings of the Mercantile Library Association are not surpassed in the West. St. Louis has about 25 publication offices issuing newspapers and periodicals.

44. Among the benevolent institutions of the city are the City Hospital, the Marine Hospital (three miles below the city), the Sisters' Hospital, the State Asylum for the Blind, the Home for the Friendless, the Orphan Asylums, the Reform School, etc. These are all valuable institutions and well-supported, a part of them as State institutions and a part by the religious bodies and public generally. The City Hospital has long been distinguished for the excellent accommodation it affords to the sick.

45. The growth of St. Louis within the past 25 years has been wonderfully rapid, and each great interest has kept pace with the whole. It is not alone in commerce that it is a great city, but in manufactures, the arts, and all other departments of industrial economy. Improvement has gone hand in hand with its general prosperity, and the old shanty of the settler has given place to the substantial dwelling of the resident. In everything the change has been great, and a city of grand proportions, with all the elements of future success, has gained a footing where so lately a scattered village, depending on Indian trade and the trapper for support, alone existed.

CITY OF ST. LOUIS.

46. The census of 1850 gave St. Louis a population of 77,860, of which 73,842 were white, 1,362 free colored, and 2,656 slaves. These numbers constituted 13,161 families, and occupied 9,662 dwellings. The population in 1830 was only 4,377, and in 1840, 16,469, showing an increase in the decade of 230.9 per cent. From 1840 to 1850 the ratio of increase was 172.7 per cent. Since the latter period three local censuses have been taken, one in 1852, when it was 94,819, one in 1854, when 122,134, and one in 1856, when 125,201. Less than one half the population is American born, and of the foreign residents more than half are Germans and about a fourth Irish. This presents even a greater disparity between the native and immigrant population than had been supposed to have existed. The immigrants, however, constitute one of the principal sources of the wealth and prosperity of the city, and have immensely increased its productive energies.

47. As a manufacturing city, St. Louis at no distant day will become important. Already, indeed, its manufacturing establishments are both extensive and various, embracing almost every important handicraft. In 1850 there were no less than 1,308 establishments within the city limits, employing 7,321 hands and a capital of $4,377,711, and producing goods to the value of $15,400,340 annually. These sums represent a city of 77,680 inhabitants; and hence, the population being now almost double that number, we can not err in duplicating the present value of its industrial pursuits. Among the more important manufactures are its iron works, breweries, flour-mills, sugar refineries, lead and paint works, pork-packing establishments, etc. The heaviest business, however, is in ironware. The State boasts of her mountains of iron, and a coal bed is at the immediate doors of the city. Within a few years past the articles made of iron have multiplied beyond expectation; and the shops of St. Louis already compete with the best artisans elsewhere for the manufacture of steam-engines and of every species of machinery.

48. As a commercial depôt, the position of St. Louis makes it eminent. In the center of the great valley, and near the outlets of rivers traversing the States laterally for thousands of miles, it must of necessity advance in prosperity. But, not content with natural advantages, its citizens have commenced a vast system of improvements in aid of and to overcome whatever physical disadvantages there may exist. Its railroad connections with the East are already complete, and are now being pushed into the interior, westward, northwest, and southwest with a laudable energy. In these directions the iron-way has reached the capital, the Iowa border, and the Iron Mountain, from the latter of which points it will derive the most abundant supplies of iron of the best quality. These railroads already make St. Louis the immediate entrepôt of a circuit of country containing 2,000,000 inhabitants, and beyond this limit the indirect center of at least as many more souls, all requiring merchandise, manufactures, or food, interchanging the one for the other.

49. The history of St. Louis is one of great interest. On the 15th of February, 1764, La Clede and his party landed at the spot now occupied by the city, and proceeded to draw the town limits, which he named St. Louis, in honor of Louis XV. of France, a town which subsequently became the capital of Upper Louisiana, and which is now the commercial capital of Missouri. For long years after this period, the beasts of the forest afforded nourishment to the settlers, and rude huts on the ground and scaffolding in the trees shelter and protection to the daring people who first exposed the bosom of the soil to the genial influences of social industry.

50. From the time of its establishment up to the year 1763, St. Louis had grown apace, and everything connected with its position and prospects warranted the anticipation of a peaceful existence under a mild and patriarchal form of government. In the mean time, however, the fact of the cession of Louisiana to Spain became known, and disturbances at once interrupted the tranquillity of the settlers, who rebelled against the change of masters. The inhabitants clung closely to their loved government of France, and it was not until 1768 that St. Louis was occupied by Spanish troops. From this period the settlements made but little progress.

51. Upon the transfer of the country from Spain to the United States, in 1803, the

immigration of the Anglo-Americans commenced, and the population slowly but steadily augmented in numbers. On the 26th of March, 1804, the country was constituted a district of the United States, under the name of the District of Louisiana, and on the 19th of October of the same year, W. H. Harrison, then governor of Indiana, instituted the American authority. On the 4th of July, 1805, it was erected into the Territory of Louisiana, and on the 4th of July, 1812, it received the name of the Territory of Missouri. "We have now arrived at a period," says Wilson Primm, in an address on the anniversary of the founding of the city, in 1851, "when a new era was to dawn, not only on St. Louis, but on all her northern and western dependencies, when a power greater than that of the fabled lamp of Aladdin was to be brought into requisition, and by its magic to mature as it were in a day, in the western wilds of America, an existence which, on the shores of the eastern continents, the lapse of centuries had not been able to procure. In 1817 the 'General Pike,' the first steamboat that ever ascended the Mississippi, made its appearance at St. Louis." The "Independence" was the first steamboat that ascended the Missouri (May, 1819).

52. Passing over the fierce discussions which eventuated in the establishment of Missouri as one of the confederacy in 1820, we come to the year 1822, when St. Louis was erected into a city. Since that time what wonderful changes have taken place. Working its way to importance and greatness, St. Louis has still maintained its onward and upward flight. The advantages of education, the lights of science, the blessings of religion, placed within the reach of all; the establishment of a wise and vigorous municipal government, under the auspices of which its limits have been enlarged, and its interior improved and embellished; the erection of manufactures, the extension of the arts, the regulation of commerce—all these results have derived themselves from the natural resources of the city, and the intelligence and enterprise of its inhabitants. St. Louis has now a name and reputation at home and abroad of which all may be proud.

53. Bloomington is a thriving town in Buchanan County, on the road from St. Joseph to Weston, 12 miles from each, and in 1850 contained 1,295 inhabitants; Booneville, capital of Cooper County, is situated on the Missouri River, 51 miles above Jefferson City, and is an important trading town for the southwest parts of the State. It was founded by the celebrated Daniel Boone. In the vicinity the grape is extensively cultivated, and there is abundance of iron, lead, coal, marble, etc. Population (1856) 2,526; Cape Girardeau, on the Mississippi, 32 miles below St. Louis, is an old and flourishing town, with a good landing and considerable trade. It is the seat of St. Vincent's (Roman Catholic) College, founded 1843. Population (1856) 2,109.

54. Columbia, capital of Boone County, is a town of (1850) 888 inhabitants. It is pleasantly situated about 10 miles from the Missouri River and 35 miles northwest Jefferson City. The University of Missouri is located here, and has become a flourishing institution. The Medical Department of this institution is located at St. Louis; Farmington is the capital of St. Francis County, and the center of an iron and lead mining region; Fulton, the capital of Callaway County, is a thriving town 12 miles from the Missouri River and 20 miles northeast Jefferson City. It is the seat of the State Lunatic Asylum and the Asylum for the Deaf and Dumb; and has large manufactories of earthenware.

55. Hannibal is a flourishing town on the Mississippi, 132 miles above St. Louis. It is advantageously situated for commerce, and is rapidly increasing in importance, being on the line of railroad, extending east and west between Toledo, on Lake Erie, and St. Joseph, on the Missouri. Its trade is very important. Coal and limestone are abundant in the vicinity. Population, 1840, about 600, in 1850 it was 2,020, and is now (1855) about 4,000; Herculaneum is an old town on the Mississippi, 32 miles below St. Louis. It was formerly a great mart for the lead brought from the neighboring mines, but was almost entirely destroyed by a flood in 1844; Hermann, capital of Gasconade County, is situated on the right bank of the Missouri, 47 miles by river and 44 by railroad east Jefferson City. It was settled by Germans in 1837, and in 1856 contained 1,055 inhabitants. Large quantities of grapes are produced in the vicinity, and the manufacture of wine has long been carried on.

56. Independence, capital of Jackson County, is a thriving frontier town, situated five miles south of the Missouri River and 165 miles west Jefferson City. It is important as a chief depôt of the overland trade to New Mexico, California, and Oregon, and the center of trade for a wide extent of surrounding country. A railroad extends from the town to the river, and the Pacific Railroad will soon be extended through the town to the State line. Population about 3,000.

57. Jefferson Barracks, on the Mississippi, 13 miles below St. Louis, is a federal military station. The St. Louis and Iron Mountain Railroad passes near it; Keytesville, on Wolf River, a few miles above its entrance into Chariton River, and 91 miles northwest Jefferson City, is capital of Chariton County, and in 1850 had 1,427 inhabitants; La Grange is a flourishing river town on the Mississippi, 184 miles above St. Louis. It is the seat of a college, and has an active shipping business. Population (1856) 1,554; Lexington is situated on the right bank of the Missouri, 151 miles by river route west the capital. It has a large trade and has a considerable outfitting business with the caravans for Santa Fé and the Great Salt Lake country. Coal is very abundant in the vicinity. It is the seat of the Masonic College, a Methodist institution founded in 1844. Population (1850) 2,194; in 1856 about 3,309.

58. New Madrid is situated on the Mississippi, 280 miles southeast Jefferson City. It has a large shipping business. It is an old place, having been settled in 1780, but has suffered frequently from earthquakes; Neosho is a town near the southwest corner of the State, and has a good trade with the Indians of Kansas. It is on the river of the same name, and will probably be intersected by the Southwest Branch of the Pacific Railroad. About six miles from this place lead mines have been opened.

59. Palmyra is a flourishing village, capital of Marion County, and about 100 miles northeast Jefferson City. Marion City, the landing-place of Palmyra, on the Mississippi, is distant six miles. It is one of the most flourishing towns in the State, and being on the line of the Hannibal and St. Joseph Railroad, must rapidly advance. In 1850 it contained 1,284 inhabitants, in 1855 about 2,000. A railroad is also being built to Quincy, Illinois, for the purpose of connecting the railroads there terminating with the road above spoken of; Parksville is a thriving town on the left bank of the Missouri, 30 miles below Weston, and is a shipping point of importance. Population (1850) 309; Platte City, capital of Platte County, and on the river of the same name, seven miles from its confluence with the Missouri, is a noted place for business. Population (1850) 496. Both Parksville and Platte City have lately, in consequence of their neighborhood to Kansas, largely increased in population and business prosperity; Potosi, capital of Washington County, is situated in the iron and lead region, 70 miles south-southwest St. Louis. It is one of the most important towns on the line of the St. Louis and Iron Mountain Railroad.

60. St. Charles is situated on the Missouri, 24 miles from its mouth, and by railroad 20 miles from St. Louis. The site is elevated, and, from the rocky bluffs of the vicinity, the river scenery is beautiful. It is a place of great commercial importance, with abundance of coal in the neighborhood, and also quarries of limestone and sandstone. The North Missouri Railroad here crosses the river. The town contains several handsome churches, and is the seat of St. Charles College, a Methodist institution. Population (1850) 1,498, and (census 1856) 3,702.

61. Ste Genevieve, capital of the county of the same name, is situated on the Mississippi, 60 miles below St. Louis. It is the shipping port of the Iron Mountain district, to which there is a plank road 42 miles long. Besides iron, it exports copper and lead, also large quantities of white sand, which is manufactured into glass at Boston and Pittsburg. Population (1850) 718, now (1856) about 1,201.

62. St. Joseph, on the Missouri River, 318 miles above Jefferson City, is the most commercial town of western Missouri, and one of the chief depôts of the overland emigration. It is surrounded by an extremely fertile country. The town was laid out in 1843, and became the county seat of Buchanan in 1845. It contains several steam flouring and saw mills, manufactories of bagging, etc. Population (1856) 3,840. The Hannibal and St. Joseph Railroad terminates here. Weston, on the Missouri, three miles above Fort Leavenworth, is one of the most important and commercial towns in the State. It is a favorable starting-point for overland emigrants. Population (1856) 2,271.

63. Missouri, originally a portion of Louisiana, was settled by the French. A military settlement was formed as early as 1719, at the mouth of Osage River; in 1755 its oldest town, Ste Genevieve, was founded; in 1764 St. Louis, and afterward, in quick succession, a number of other towns. In 1763 the country was ceded to Spain. Spain retro-ceded it to France in 1801, and France sold it to the United States in 1803. The purchase was soon after divided into the "Territory of Orleans" (since 1812 the State of Louisiana) and the "District of Louisiana," erected in 1805 into a territorial government. In 1812, on the admission of Louisiana into the Union, the name was changed to "Missouri Territory," which included also the present State of Arkansas. In 1817 application was made to Congress to frame a State constitution, and such was "done in convention" at St. Louis, 12th of June, 1820. The admission of the State into the Union was not effected before a fierce and stormy debate in the national legislature and a compromise on the subject of slavery, by which it was agreed that no more States with the institution of slavery should be admitted north of 36° 30′ north latitude. Such is the celebrated Missouri compromise line.

STATE OF IOWA.

1. Iowa lies between latitudes 40° 40′ and 43° 30′ north, and longitudes 90° 12′ and 96° 53′ west; and is bounded on the north by Minnesota, on the east by Wisconsin and Illinois (which are separated from Iowa by the Mississippi River), on the south by Missouri, and on the west by Nebraska and Dacotah territories, the first separated from it by the Missouri, and the latter by the Sioux River.

2. The greatest breadth of the State is east and west, and measures about 300 miles, and the general width thereof 196 miles. The area is computed at 50,914 square miles, or 1.73 per cent. of the total of the Union.

3. Iowa is a country of unrivaled beauty. Its surface is moderately undulating, but nowhere traversed by mountains, nor even high hills; yet on the margins of the rivers there are frequent "bluffs," or calcareous strata intersected by ravines. These bluffs are generally from 40 to 130 feet high, and from these the table-land sweeps off in gentle undulations. The southern portion of the State is the most picturesque, abounding with grassy lawns and verdant plains, interspersed with groves and meandering rivulets, and intersected by the Iowa, Skunk, and Des Moines rivers, which flow in a direction southeast to the Mississippi, and by numerous affluents of the Missouri, which washes the western border. The northern part partakes more of the bold and striking in its scenery; the country is more elevated, and hills and mounds are not uncommon, their tops covered with towering oaks, while the rivers tumble over precipitous ledges of craggy rocks to the lower plains. The northeastern section is a rich mineral country, abounding in lead ore and various other metals, but it nevertheless contains much excellent land. This portion of the State is of similar geological formation with that of northwestern Illinois and southwestern Wisconsin.

4. The unique and admirably diversified prairies of Iowa are, however, the most distinguishing feature of the State. Their characteristic peculiarity is the absence of timber. These natural meadows are covered with a rich coat of coarse grass, forming excellent pasturage, and are not unfrequently interspersed with hazel thickets and sassafras shrubs, and in the season of flowers are decorated with a brilliant garniture of honeysuckles, jessamines, wild roses, and violets. Three fourths of the country is of this description, yet so happily and conveniently are the streams and timbers arranged, that nature appears to have made an

effort to distribute them in the most desirable commingling. Iowa is a portion of the vast plain that stretches from the Missouri River to the Arctic Sea, and has a general elevation of 1,200 feet above the level of the ocean.

5. The Mississippi, forming the eastern boundary, washes the entire length from north to south; and the Missouri has its course along the western border. These two great rivers are the recipients of all the interior waters of the country. The Des Moines, the Iowa, the Checauque or Skunk, the Wapsipinicon, the Makoqueta, and Turkey rivers are the principal affluents of the Mississippi.

6. The Des Moines rises in the Coteau des Prairies, in Minnesota, and in its upper course is a rapid current. It runs in a generally southeast direction through a rocky bed, is navigable for steamboats (in a good stage of water) for 200 miles from its mouth, and discharges itself at the foot of the Des Moines rapids, in its lower course forming the dividing line between the States of Iowa and Missouri, and reaching the Mississippi twenty miles below the general boundary of the State.

7. The Iowa is the largest tributary of the Mississippi above the Illinois. It rises in the table-lands, from which descend also some of the tributaries of the Minnesota, and has a course of about 200 miles in a southeasterly direction, affording steamboat navigation to Iowa City. The Iowa receives several considerable tributaries, of which Cedar River is the largest, and is a navigable stream. The country drained by this river is a luxuriant and fertile tract. The bottoms skirting it are usually prairie, and somewhat inclined to be sandy, but are warm and productive.

8. The Skunk rises in the high land between the Des Moines and the Iowa, and has a course of about 150 miles. The country through which it passes, from its source to its mouth, is highly fertile, and is in parts heavily timbered. The Wapsipinicon discharges its waters into the Mississippi 12 miles above Rock Island, after a southeasterly course of 200 miles. Its channel is crooked and current rapid, which materially interferes with navigation. The Makoqueta, running along the south edge of the mineral region, discharges itself about six miles below Bellevue. Its course is through a richly timbered country, bounded with high limestone bluffs, and affords excellent water-power. Turkey River has its rise in the northern table-lands, and after a meandering course discharges its waters opposite Cassville. This river drains a region of vast agricultural and mineral resources.

9. The rivers flowing southwest to the Missouri are short and of small volume, and, in comparison with those flowing to the Mississippi, are of little importance except as mill-streams. The largest are scarcely more than creeks. The Big Sioux makes a portion of the western boundary.

10. The greater portion of Iowa is underlaid by limestone, which in the south is carboniferous, and in the northeast magnesian and lead-bearing. The northern section belongs to the great drift deposit which distinguishes Minnesota; and the prairies are in many places thickly covered with boulders, many of them being of immense dimensions.

11. The lead mines of the northeast, and of which Dubuque is the center, are continuous of those of Wisconsin and Illinois. Zinc occurs in fissures along with the lead, and is chiefly found in the form of electric calamine and in cellular masses. In some places this mineral is found in a state of carbonate, and in others as a sulphuret. Copper is also found in this region, and it has also been discovered on Cedar River. Iron is abundantly distributed.

WESTERN SCENE.

12. The Iowa River meanders near the eastern boundary of the carboniferous deposits, which extend southwest into Missouri. It is upward of 200 miles in the direction of the valley of the Des Moines, across the great coal field: westwardly, it extends nearly to the Missouri River. The entire area of this field in Iowa alone can not be less than 20,000 square miles—in all, embracing a country equal to two fifths of the whole State. The beds are of immense thickness—in some parts 100 feet or more, and lying near the surface are capable of being worked easily and at small expense.

13. Besides these predominating minerals, the State has many others, and not less valuable in an economic point of view, and building material of the best descriptions sufficient for all present or prospective requirements. Gold is said to have been discovered in the neighborhood of Des Moines City.

14. The winters in Iowa are frequently prolonged into the month of April, and the rivers are frozen over from December to the latter part of March. The climate, however, is by no means unpropitious to agriculture, and, as a general occurrence, the peach blossoms in April, and wheat ripens early in August. The soils of Iowa are generally excellent, and no State of the Union has a less amount of inferior land. The valleys of the Cedar, Iowa, and Des Moines, as high as lat. 42° 30′, present a body of arable land which, taken as a whole for richness in organic elements, for amount of saline matter and due admixture of earthly silicates, affords a combination that belongs only to the most fertile upland plains. North of this, the best agricultural region of the State, the lands are of an inferior character, but still not unprofitable, and the lower grounds are either wet or marshy, or filled with numerous ponds, and entirely destitute of timber.

15. The greatest scarcity of trees is north of the forty-second parallel. Farther south, and along the rivers, the country is amply wooded. Ash, elm, sugar and white maple grow in the alluvials for a mile or more in width, on the river banks; and in other localities are found poplars, oaks, black and white walnut, basswood, etc., and in the northern parts of the State there is some pine timber. Oak is the predominating forest growth, and here attains a magnificent development.

16. In 1850 Iowa contained 192,214 inhabitants, collected into 33,517 families, and occupying 32,962 dwellings. This population was equal to 3.78 to the square mile, and to 0.83 per cent. the total of the United States. The population of the counties was as follows:

Counties.	Population.	County Seats.
Allamakee	777	Waukau.
Appanoose	3,131	Centreville.
Benton	672	Vinton.
Black Hawk	135	Bla. Hawk C. H.

—since 1850 a large number of new counties have been organized and a vast increase of the population made—in 1852 it amounted to 230,106, and in 1856 to 509,414.* In 1840 the population was only 43,112.

17. Of the total (1850) population, 191,881 (99.83 per cent.) were white persons—100,887 males and 90,994 females, and 333 were colored persons—165 males and 168 females; and 170,620 (88.4 per cent.) were Americans (of whom 50,380 were born in the State), 21,232 were foreigners (11.05 per cent.), and 362 were of origin not ascertained. In other States there were 6,358 natives of Iowa.

18. Of 49,315 males over 15 years of age employed in industrial pursuits† in 1850 the following returns were made—in commerce, trade, manufactures, mining, and the mechanic arts 9,255, in agriculture 32,779, in labor not agricultural 5,392, in the army 71, in navigation 163, in law, medicine, and divinity 1,077, in other pursuits requiring education 425, in government civil service 103, in domestic service 10, and in other occupations 40.

19. Agriculture is the prominent industrial pursuit. Manufactures are only established in the more thickly settled districts, and are as yet of small variety or extent, although rapidly increasing in importance. Mining is carried on profitably in the northeast, and the commerce and internal trade of the State are in a very flourishing condition. Time alone is required to develop the several industries, and advance the State to a high position in the confederacy.

20. Though rich in minerals, little has been done toward their development, save the working of the galena mines in the neighborhood of Dubuque. These, in connection with the Illinois and Wisconsin mines of the same description, have for many years been the source of a great portion of the lead used in the United States, and are almost inexhaustible. The coal of Iowa has as yet been scarcely disturbed, and the same may be said of all the other economic minerals within the State, which, however, constitute a vast and profitable resource for the future, and a basis on which manufactures and commerce may safely rely for material.

21. In 1850‡ Iowa contained 14,805 farms, which in the aggregate covered 2,736,064 (improved 824,682 and unimproved 1,911,382) acres of land, and were valued at $16,657,567; and the value of implements and machinery thereon was $1,172,869. Thus the average size of farms was 185 acres, and their average value $1,125, or with their implements, etc., $1,204.

22. The quantity of livestock upon farms in 1840 and 1850, according to the censuses of those years, was as follows:

	horses, mules, etc.	neat cattle	sheep	swine
1840	10,794	38,049	15,854	104,899
1850	39,290	136,621	149,960	323,247

—among the horses, etc., in 1850, there were 754 asses and mules, and among the neat cattle 45,704 milch cows and 21,892 working oxen, and the value of the whole in that year was $3,689,275. The value of animals slaughtered for food, etc., in the last-named year was $821,164; and the following animal products were obtained—butter 2,171,188, cheese 209,840, and wool 373,898 pounds. The production of wool in 1840 amounted to only 23,039 pounds.

23. The food crops (bushels) of 1840 and 1850 were to the following amounts:

	wheat	rye	Indian corn	oats	barley	buckwheat
1840	154,693	3,792	1,406,241	216,385	728	6,212
1850	1,530,581	19,916	8,656,799	1,524,345	25,093	52,516

—making a total in 1840 of 1,788,051, and in 1850 of 11,809,250 bushels. The potato crop of 1840 amounted to 234,063, and in 1850 to 282,363 (sweet 6,243) bushels; and that of peas and beans in 1850 to 4,775 bushels.

24. The miscellaneous crops of 1850 consisted of—hay 89,055 tons, hops 8,242 pounds, clover-seed 342, and other grass-seed 2,090 bushels, beeswax and honey 321,711 pounds, flax-

* In 1856 total population 509,414—274,012 males and 235,402 females. Native voters 86,185, naturalized voters 14,492. Colored persons 271. Married 170,979, widowed 11,673. Landowners 67,111. Dwellings 83,906, families 89,224. Of the total population, 18,389 were born in New England, 84,603 in the Middle States, 24,136 in the Southern States, 198,742 in other Western States, and 93,302 in Iowa. Germany contributed to the foreign population 28,644, Ireland 20,896, England 8,941, Canada 5,777, Norway 2,782, Scotland 2,170, France 1,807, Belgium 1,511, Austria 1,254, Sweden 1,116, Switzerland 1,103, and Prussia 960.

† In 1856 the occupations were returned as follows: 68,634 farmers, 16,574 laborers, 23,029 mechanics, 1,163 traders, 173 manufacturers, 2,910 merchants, 1,500 clerks and book-keepers, 4,527 professional men, and 1,988 miscellaneous.

‡ The agricultural statistics for 1855 give the following results: land in farms 8,559,437 acres, of which 2,043,958 acres were improved and 6,515,479 acres were unimproved; and the crops—spring wheat (846,966 acres) 4,972,639 bushels, winter wheat (41,114 acres) 496,877 bushels, oats (190,922 acres) 6,127,329 bushels, Indian corn (737,213 acres) 31,163,362 bushels, and potatoes (18,124 acres) 2,014,388 bushels. Hogs sold 403,584, valued at $3,127,531. Cattle sold 125,779, valued at $2,923,253. Butter made 6,075,739 pounds, cheese 729,852 pounds, wool produced 515,800 pounds.

Entered according to Act of Congress, in the Year 1858 by J.H. Colton & Co. in the Clerks Office of the District Court of the United States for the Southern District of New York.

seed 1,959 bushels, flax 32,660 pounds, maple-sugar 78,407 pounds, molasses 3,162 gallons, tobacco 6,041, silk cocoons 246 pounds, and wine 420 gallons. The value of market-garden products was $8,848, and of orchard products $8,434.

25. The total value of agricultural products in 1840 was $688,308, and in 1850, $8,800,997.

26. In 1850 Iowa contained 522 establishments engaged in manufactures, mining, and the mechanic arts, and in these branches a capital of $1,292,875 was invested. The cost of raw material consumed in the census year was $2,356,881, the number of hands employed was 1,707—1,687 males and 20 females, with aggregate wages amounting in the year to $473,016, and the value of products was $3,551,783. The value of manufactured products in 1840 was only $457,734. In 1855 the value of general manufactures was $4,096,961.

27. The value of home-made manufactures (not included in the above) was in 1840 $25,966, and in 1850, $221,292. In 1855 the value was $438,900.

28. Iowa has no direct trade with foreign countries, but its trade with the Atlantic and Gulf ports is comparatively extensive, its exports consisting principally of the products of agriculture and the mines, and its imports of the manufactures of Europe and the Eastern States, groceries, wine, etc. The shipping ports are Keokuk, Fort Madison, Burlington, Muscatine City, Davenport, Lyons, Bellevue, Dubuque, etc., at all which places a busy trade is also carried on with the interior.

29. Keokuk, Fort Madison, Burlington, Davenport, Clinton, Lyons, Sabula, and Dubuque will shortly be connected with the interior by railroads. Most of these will form grand trunk railroads and be carried westward to the Missouri, and thence, in the progress of events, to the Pacific Ocean. None are as yet completed; but, perhaps, as a means of developing the wealth of the interior, these lines are of inferior importance to the grand project of opening the channel of the Des Moines to steam navigation; it will thus become the thoroughfare through which the greater part of the commerce of the country will pass, and along its banks will rise up cities and towns, equal in magnitude and wealth to those on the Illinois or the Hudson—in fact, it will become as important to Iowa as those rivers are to the States through which they have their courses. Through Iowa will also pass a link of the great chain of north and south railroads, connecting St. Louis with the extreme settlements of Minnesota, etc.

30. The constitution upon which the present government is based was adopted in convention on the 5th March, 1857. It grants the right of voting to every white male citizen of the United States, 21 years of age, who has resided in the State six months and in the county 60 days. All elections by the people are by ballot. The general election is held on the 2d Tuesday in October.

31. The legislature consists of a senate of 30 members, elected for four years, one half every second year, and a house of representatives of 59 members, elected biennially. Senators must be 25 and representatives 21 years of age, and otherwise must have the qualifications of voters. In all elections by the legislature votes are given *viva voce*. The legislature meets on the 2d Monday of January biennially.

32. The governor and lieutenant-governor, chosen by a plurality of votes, hold office for two years, and the governor until his successor is elected and qualified. They must be 30 years of age, citizens, and resident for two years preceding election. The lieutenant-governor is president of the senate. A secretary of state, treasurer, and auditor are elected by the people for two years, and until their successors are qualified.

33. The judicial power is vested in a supreme court, 14 district courts, and other inferior courts. The supreme court, with appellate jurisdiction in chancery cases only, consists of three judges, elected by the people for four years, one every second year, and the one having the shortest time to serve is chief-justice. A judge of the district is elected in each district for four years, and also a district attorney for the same period.

34. The revenue is derived chiefly from taxation. The total resources of the treasury for the term of two years, ending 31st October, 1852 and 1856, were respectively $139,681 and $274,377. The disbursements for the same terms were $131,631 and $256,573. On the 1st November, 1856, the funded debt of the State amounted to $71,442, and other debts to $57,568, making a total indebtedness of $129,010.

CITY OF DUBUQUE.

35. Nothing so well illustrates the progress of a State as the increasing ability it presents to bear increased taxation. The following exhibits the valuation of taxable property and the amount of tax thereon for the past ten years:

1847	taxable property	$11,680,125	tax $23,944	1852	taxable property	$38,427,376	tax $57,607
1848	"	14,449,200	" 36,129	1853	"	49,540,804	" 74,310
1849	"	18,509,767	" 47,295	1854	"	72,327,204	" 89,927
1850	"	22,623,234	" 56,558	1855	"	106,895,390	" 133,619
1851	"	28,464,550	" 56,929	1856	"	164,394,413	" 196,243

—from which it appears that within the decade ending with 1856 the prosperity of the State has increased 800 per cent.

36. The principal institutions which are wholly or in part supported by the State are the Asylum for the Blind and the Asylum for the Deaf and Dumb at Iowa City, the Asylum for the Insane at Mt. Pleasant, and the State Penitentiary at Fort Madison.

37. The number of persons returned as attending school in 1850 was 35,473, or one in every 5.38 of the total population. The number of scholars and the general statistics of the schools in that year were as follows:

Classification.	Number.	Teachers.	Scholars.	Income
Primary and public schools	740	828	29,556	$51,492
Academies and private schools	33	46	1,111	7,980
Universities and colleges	2	4	100	2,000

—making a total of 775 schools, 878 teachers, and 30,767 scholars, and an annual income amounting to $61,472. The number of persons over 20 years of age unable to read and write was 8,153, of whom 7,076 were Americans and 1,077 foreigners, and 8,120 were white and 33 colored persons.

38. The number of common schools in the State in 1855 was 1,520, with 1,753 teachers (961 males and 772 females), and an average of 44,115 scholars. The number of children between 5 and 21 years of age was 111,093. The school fund amounted to nearly $1,000,000

39. The principal collegiate institutions in the State in 1855 were as follows:

Institutions.	Location.	Founded.	Institutions.	Location.	Founded.
Des Moines College	Des Moines City	1852	Iowa State University	Iowa City	1850
Baptist University	Burlington	1853	Wesleyan University	Mt. Pleasant	1854
Alexander College	Dubuque	1853	Med. Depart. Iowa State Univ.	Keokuk	1850

—these are all young institutions, and few have as yet collected any respectable library.

40. The most numerous of the religious denominations in Iowa, according to the census of 1850, were the Methodist, which included about two fifths of the population, and the Presbyterian, which claimed one fifth. The Congregational, Roman Catholic, and Baptist are next in numbers, and after these the Christian, Friends, Lutheran, Episcopal, Union, Moravian, German Reformed, and Universalist. The whole number of churches in the State was 193, with accommodation for 43,083 persons, and the value of church property was estimated at $177,425. The character of the immigration since 1850 may have changed the proportionate importance of the churches, and most certainly will have vastly increased the enumerations and value of property.

41. Des Moines City, the new seat of government, occupies the site of old Fort Des Moines, on the river of the same name, where it is joined by Raccoon River, 120 miles west-by-south Iowa City. By means of slackwater improvements the river is rendered navigable to the Mississippi, and numerous railroads are being constructed from the Mississippi at Davenport, Dubuque, Keokuk, etc., which, converging at this point, will be continued in a single line to Council Bluffs, on the Missouri. Coal and lumber abound in the vicinity; and the water-power furnished by the river is employed by flouring and saw mills. Population (1850) 502, and (1855) about 2,000.

42. Iowa City, the former capital, is beautifully situated on the left bank of the Iowa River, about 80 miles from its mouth, and by the Mississippi and Missouri Railroad 55 miles from Davenport. Latitude 41° 39′, and longitude 91° 30′. The site was selected for the seat of government in 1839, and at that date was an entire wilderness. The surface consists of a succession of plateaux rising from the river, and on the edges of these are the principal avenues, which are intersected centrally by Iowa Avenue, on which the old State House is built. This edifice is built of bird's-eye marble (abundant in the vicinity), and is 100 feet long by 60 feet wide, surmounted by a dome resting on 22 Corinthian columns. The other principal buildings are the State University and the asylums for the blind and the deaf and dumb. Above the city the river affords valuable water-power, and to this point is navigable for small steamboats. A large number of railroads will center here, extending to all the chief towns on the Mississippi, and westward to Council Bluffs. These facilities, when completed, will vastly augment its commercial importance, already great, but destined to be highly distinguished. Population (1850) 2,262, and (1855) about 4,500.

43. Burlington is one of the principal river ports, 45 miles above Keokuk. On the opposite side of the river is East Burlington, the terminus of the Chicago, Burlington and Quincy Railroad line, which is continued west by the Burlington and Missouri Railroad, now in progress to the Missouri River. Burlington was the State capital until 1839, and for many years was the largest town in the State. Population (1850) 4,082, and (1855) about 10,000.

44. Council Bluffs City is situated near the Missouri River, 665 miles from its mouth, and opposite Council Bluffs, in Nebraska. It is the largest town in the western part of the State, and is a place of active business. Population (1855) about 3,000. The Mississippi and Missouri Railroad will terminate here, 240 miles west Iowa City and 295 miles west Davenport.

45. Davenport is situated at the foot of the upper rapids of the Mississippi, and opposite Rock Island City, with which it communicates by a railroad bridge. It is 320 miles by river above St. Louis and 55 miles by railroad east Iowa City. The bridge connects the Chicago

and Rock Island and the Mississippi and Missouri railroads, and thus forms an uninterrupted route between the Missouri at Council Bluffs and Lake Michigan at Chicago. These roads have been the means of its great progress of late years, and of its having risen from a town of 1,848 inhabitants in 1850 to one of 8,000 in 1855. The interruption of navigation at this point has also favored its growth. Coal is abundant in the vicinity.

46. Dubuque, 112 miles by river above Davenport, is the central depôt of the Iowa lead region, and a place of active trade. It is the oldest as well as the largest town in the State, having been settled in 1786, and having a present (1855) population of 12,000. The situation is one of the most beautiful that can be conceived, and alike eligible for commerce. About 600 steamboats leave its wharves annually, and its commerce by way of Chicago is also very large. Dunleith, on the opposite shore, is the terminus of the Central and the Galena and Chicago Union railroads, which will eventually be carried over the river by a bridge, and connect directly with the railroads which are now being built westward toward the Missouri and other points. In the vicinity there is, besides the lead for which it is famed, a great abundance of coal and limestone.

47. Fort Madison, 22 miles above Keokuk and 12 miles above the lower rapids of the Mississippi, is situated on ground rising gradually from the river, and is the shipping port for large quantities of pork, grain, lumber, etc. It is a beautiful and substantially built town, and is rapidly rising in importance. The State Penitentiary is located here. Population (1850) 1,509, and (1855) about 4,000.

48. Keokuk is situated at the foot of the lower rapids, and above the mouth of the Des Moines, of the valley of which it is the natural port. Here also navigation ceases for the larger class of steamers, and hence a large business is done in the transhipment of merchandise. The trade of Keokuk is annually increasing and has become very important; while the city is extending its limits with unprecedented rapidity. In 1850 it contained only 2,478 inhabitants, and the assessment for taxation amounted only to $711,800; in 1855 it contained 8,000 to 10,000 inhabitants and a property assessed at $2,269,000, from which a municipal tax of $27,000 was raised. Several railroads will center at this point, coming in from Des Moines, Iowa City, Kansas City, etc., and when completed will immeasurably augment the importance of its commerce, already amounting to between $7,000,000 and $8,000,000 annually. A railroad is also in progress from Peoria and the East.

49. Mount Pleasant is a flourishing village on the Burlington and Missouri Railroad, 29 miles west Burlington. Here are located the Wesleyan University, the State Normal School, and the Asylum for the Insane. Population (1855) about 1,200.

50. Muscatine (formerly Bloomington) is situated on the Mississippi, 26 miles below Davenport, and is one of the river termini of the Mississippi and Missouri Railroad, 37 miles east Iowa City. The place was first settled in 1836, previous to which year it had been an Indian trading-post. It is now one of the most flourishing commercial towns in the State, and the natural port of the Red Cedar and Iowa rivers. It has a good landing. Population (1850) 2,540, and (1855) about 6,000.

51. Sioux City is a new town at the mouth of Sioux River, and the projected terminus of the Dubuque and Pacific Railroad. Its site is known as the Sergeant's Bluff, and is the center of a rich coal-field.

52. Iowa was originally a part of French Louisiana. The first white settlements were made in 1686, at Dubuque, by Frenchmen, who built a fort at that point and commenced a trade with the Indians, which was the sole dependence of the place for more than a century and a half. It is here that the great lead mines of the State were first discovered, but at a later period. The State was a part of the Missouri Territory from 1804 to 1821, but after that was placed successively under the jurisdiction of Michigan and Wisconsin territories. In June, 1838, it was erected into the separate territorial government of Iowa; under which was included all that portion of the present State of Minnesota west of the Mississippi River, and also the Dacotah Territory. On the 3d of December, 1846, it was admitted into the Union as an independent State.

STATE OF WISCONSIN.

1. Wisconsin is situated between latitudes 42° 30′ and 46° 58′ north, and longitudes 87° 8′ and 92° 54′ west; and is bounded on the north by Lake Superior and northern Michigan, on the east by Lake Michigan, on the south by Illinois, and on the west by Iowa and Minnesota. From the two last named States it is chiefly separated by the Mississippi and St. Croix rivers.

2. The greatest length of the State north and south is 362 miles, and its greatest width, which occurs on the 45th parallel, is about 260 miles. Its outline, however, is irregular, and its southern line measures only 146 miles. The area is computed at 53,924 square miles, or 1.84 per cent. of the whole area of the Union.

3. The distinguishing features of Wisconsin are the uniformity of its elevation, and the shape of its surface, which is neither mountainous, hilly, nor flat, but gently undulating. The country west of Sugar River, and south of the Wisconsin, is somewhat broken, principally by the dividing ridge upon which the road from Madison to Prairie du Chien passes. In this section known as the "Mines," are several peculiar elevations called "mounds."

4. West of the Wisconsin is a range of high hills, being the only elevations in the State either deserving or assuming the dignity of mountains. The southeastern portion of the State is marked by ravines at the streams, but little depressed below the surrounding level. Its prominent features are—the prairie, destitute of tree or shrub, and covered only by a luxuriant growth of grass, interspersed with flowers of every hue; the oak opening; the lake; the woodland on the borders of the streams; and the natural meadow.

5. Proceeding north to the Fox and Wisconsin rivers and Green Bay, the timber increases, and the soil gradually changes from the vegetable mold of the prairie to a sandy loam. The surface also becomes somewhat depressed and uneven, diversified with timber, rolling prairie, large marshes, and extensive swamps, having an abundant growth of cranberries and wild rice. Still north and west, the surface becomes more uneven and the streams rapid, affording an abundance of water-power for the manufacture of lumber from the immense forests of evergreen, scarcely surpassed on the Western continent. Wisconsin, indeed, may now be ranked as the first lumber State of the Union.

6. Wisconsin, in its lakes and watercourses, has excellent facilities for navigation and manufacturing purposes. It is almost surrounded by navigable waters; on the north is Lake Superior, on the east Lake Michigan, and on the west the Mississippi and River St. Croix, while on the northeast are the rivers Montreal and Menomonee. The interior rivers are the Wisconsin and Chippewa, falling into the Mississippi, and the Neenah or Fox, which, passing through Lake Winnebago, empties into Green Bay, an arm of Lake Michigan. The Wisconsin and Neenah are navigable almost to their sources, and approach each other so near that by a short canal from one to the other, navigation is secured from the lakes to the Mississippi. Other streams, some passing into Illinois, and some falling into the Mississippi within this State, and some emptying into Lake Michigan, furnish abundant water-power, and many afford excellent harbors at their mouths, at which great cities will eventually rise up and commercial depôts become established. Pure living streams permeate the whole country and drain its surface; and numerous small lakes diversify the landscape.

7. The largest lake is that called Winnebago, which is 24 miles long and 10 wide. The Four Lakes, in the midst of which stands the city of Madison, the capital of the State, are replete with exquisite scenery. In the north the lakes are distinguishing features, and in the southeast they are very numerous. These are the recipients and sources of beautiful streams, which, coursing in every direction, bless the land with unbounded fertility, and leave no portion of the beautiful country they adorn without a plentiful supply of good and generally pure water.

8. The limestone underlying the coal-fields of Illinois forms the immediate basis of the alluvion of southern Wisconsin. This geological district, in addition to that portion of the State which lies southerly of the valley of the Wisconsin, comprises the whole of the slope toward Lake Michigan. In many portions the lime-rock disappears, and the outcropping sandstone furnishes a fine material for building. The lead-bearing rock of the mineral region is a porous limestone, prevailing throughout Grant, Lafayette, and Iowa counties, comprising four fifths of the lead district of the Upper Mississippi. Deposits of iron ore, water-limestone, and beds of gypsum, together with other varieties of minerals, are found in localities more or less numerous throughout the limestone region.

9. All that section of the State which lies between Lake Superior on the north and the Falls of St. Anthony on the Mississippi and the falls of the other rivers flowing southerly, is primitive in its prevailing geological character; and it is within this primitive region that the copper mines of Lake Superior are found. In all that portion of the State lying between this primitive region and the limestone formation of the south and east, the transition sandstone prevails, interspersed with limestone, and more sparsely with rock of a primitive character. This formation comprises that section of the country drained by the Wisconsin and other rivers tributary to the Upper Mississippi, and below the falls of those streams. Within this geological district are found quarries of white marble, which promise to be abundant and valuable, and form future elements of great wealth to the inhabitants.

10. The coolness and short duration of summer, and the dryness of the atmosphere during winter, render Wisconsin one of the most healthy portions of the United States. The wet meadows, marshes, and swamps are constantly supplied with pure water from springs, and as they are not exposed during summer to a burning heat, they do not send forth those noxious and deleterious qualities so much dreaded in more southern and less favored latitudes. But though a comparatively cold climate, it is nevertheless one highly congenial to agriculture and grazing, and in no part of the State is labor interrupted by extremes of either heat, moisture, or cold. Perhaps, indeed, no other country enjoys a greater number of fair days during the year than obtains in Wisconsin.

11. The soil of the prairie consists of a dark-brown vegetable mold, from a foot to two feet deep, very mellow, and entirely destitute of stone or gravel, and for fertility and agricultural purposes can not be surpassed. The subsoil is a clayish loam, similar to the soil of the timbered lands, which latter, though less rich, is also suitable for cultivation. The mining region, unlike that of any other mineral district, promises a liberal reward as well to the farmer as to the miner. The soil of the evergreen district is mostly sandy, but is of ordinary productiveness. The "prairies" of Wisconsin are not so extensive as in other States, and are so skirted and belted by timber that they are well adapted to immediate and profitable occupation. The "opening" comprises a large portion of the best lands. The low level prairie, or natural meadows, is so generally distributed over the face of the country, that the settlers on a fine section of arable land finds on his own farm, or in his immediate neighborhood, abundant pasturage for his stock in summer on the open range, and hay for the winter for the cutting—the bounty of Naturé supplying his need in this behalf till the cultivated grasses may be introduced and become sufficient for his use.

12. The pineries of Wisconsin, as to their extent and value, can hardly be overrated. That of the Upper Wisconsin and its tributaries is the most extensive, and distinguished still more for the fine quality than the inexhaustible quantities of its timber. The other localities of the white pine and other evergreens are mainly on the Wolf, the great northern affluent of the Fox, the tributaries of Green Bay, and on the La Crosse, the Black, the Chippewa, and the St. Croix, affluents of the Mississippi. The rapids of these streams furnish abundant water-power for the manufacture of lumber; and on the annual spring rise, and occasional freshets at other seasons of the year, the yield of the mills is floated from the Wolf into Lake

Winnebago and the Lower Fox, and from most of the other streams into the Mississippi. Aside from the manufacture of pine lumber, large quantities of oak scantling and plank, and basswood siding and lath, are annually produced. Throughout all the State wild animals and game are abundant; and are the objects of many of the wild sports of this delightful country.

13. The past has left many records within this State, and in the monuments of human skill still remaining, the antiquarian reads the legends of a civilized race, the name and lineage of which will never be known. The works at Aztalan, and the mounds along the Wisconsin, Neenah, and Pishtaka rivers, and in other parts, bear evidences of the fact. Those at Aztalan are best known and most frequently visited. The substance called brick at this place is evidently burned clay, showing marks of having been mixed with straw. There is a class of ancient earth-works in Wisconsin not before found in any other country, being made to represent quadrupeds, birds, reptiles, and even the human form. Near the Blue Mounds there is one representing a man 120 feet long, with a body 30 feet in breadth, the head 25, and its elevation above the general level of the prairie is 6 feet. A mound at Prairieville represents a turtle, the body 56 feet in length. At one place near the Four Lakes it is said that a hundred tumuli of various shapes and dimensions have been counted. Fragments of ancient pottery of a very rude kind are often found in various localities. A mound near Cassville represents an elephant or mastodon; and from this fact it has been inferred that the people who made these animal earth-works were cotemporaries with that huge monster, the bones of which are still occasionally found, or that they had then but recently emigrated from Asia, and had not lost their knowledge of the elephant.

14. Wisconsin in 1850 contained 305,391 inhabitants, collected in 57,608 families, and occupying 56,316 dwellings. This population gave 5.66 to the square mile, and was equivalent to 1.32 per cent. of the total of the United States. Its distribution to the counties was as follows:

Counties.	Population.	County Seats.
Adams	187	Dell Prairie.
Brown	6,215	Depere.
Calumet	1,748	Chilton Center.
Chippewa	615	Chippewa Falls.
Columbia	9,565	Portage City.
Crawford	2,498	Prairie du Chien
Dane	16,639	Madison.
Dodge	19,138	Juneau.
Fond du Lac	14,510	Fond du Lac.
Grant	16,169	Lancaster.
Green	8,566	Monroe.
Iowa	9,525	Mineral Point.
Jefferson	15,317	Jefferson.
Kenosha	10,734	Kenosha.
Lafayette	11,581	Shullsburg
La Pointe	489	La Pointe.
Manitowoc	3,702	Manitowoc Rap.
Marathon	508	Wausau.
Marquette	8,641	Marquette.
Milwaukee	31,077	Milwaukee.
Portage	1,250	Plover.
Racine	14,973	Racine.
Richland	903	Richland Center
Rock	20,750	Hudson.
Saint Croix	624	Willow River.
Sauk	4,371	Baraboo.
Sheboygan	8,379	Sheboygan.
Walworth	17,862	Elkhorn.
Washington	19,485	West Bend.
Waukesha	19,258	Waukesha.
Winnebago	10,167	Oshkosh.

—a large number of new counties have since been created, and in 1855 the population had increased to 552,451,* or a density of somewhat more than 10 inhabitants to the square mile. In 1836 the population numbered only 11,683, and in 1840 only 30,945 souls.

15. Of the total population in 1850 (305,391), 304,756 (99.79 per cent.) were white—164,351 males and 146,405 females, and 635 were colored persons—365 males and 270 females; and 197,912 (64.87 per cent.) were Americans (of whom 63,015 were born in this State), 106,695 (34.94 per cent.) were foreigners and 784 were of unascertained origin. In other States there were residing 3,775 natives of Wisconsin.

16. The occupations of 78,139 males over 15 years of age are given as follows—occupied in commerce, trade, manufactures, mining, and the mechanic arts 20,526, in agriculture 40,980, in labor not agricultural 13,196, in the army 77, in navigation 561, in law, medicine, and divinity 1,477, in other pursuits requiring education 800, in government civil service 185, in domestic service 191, and in occupations not specified 146 persons.

17. Wisconsin has hitherto been almost wholly devoted to agriculture, lumbering, and mining. Commerce, so intimately allied to successful internal industry, is carried on extensively, and already several important ports have been established for its accommodation. Manufactures are still in their infancy.

18. The lead mines in the southwest corner of the State are continuous with those of Galena and Dubuque, and are a source of great wealth to that section of the country. In the north, copper exists, and also iron and other minerals, but as yet these have not been worked to any great extent. The State has also excellent quarries of marble and other building materials.

19. In 1850 Wisconsin contained 20,177 farms, which included 2,976,658† (improved 1,045,499 and unimproved 1,931,159) acres of land, valued at $28,528,563, and the value of farming implements and machinery thereon was $1,641,568. Thus the average size of farms was 148 acres, and the average value $1,414, or including implements, etc., $1,495.

20. The livestock owned in the State in 1840 and 1850 was comparatively as follows:

	horses, etc.,	neat cattle,	sheep,	swine,
1840	5,735	39,269	3,462	51,383
1850	30,335	183,433	124,896	159,276

—the horses, etc., of 1850, included 156 asses and mules, and the neat cattle 64,339 milch cows and 42,801 working oxen. The stock of the last-named year was valued at $4,897,385, and the value of animals slaughtered in the previous year was $920,178. The products of animals are stated in the returns to have been—butter 3,633,750, cheese 400,283, and wool 252,963 pounds. The wool crop of 1840 was only 6,777 pounds.

21. The cereal crops of Wisconsin (bushels), according to the returns of 1840 and 1850, comparatively furnish the following figures:

	wheat,	rye,	Indian corn,	oats,	barley,	buckwheat,
1840	212,116	1,965	879,359	406,514	11,062	10,654
1850	4,286,131	81,253	1,988,979	3,414,672	269,692	79,878

—making a total in 1840 of 1,021,670, and 1850 of 10,060,605 bushels. The potato crop in 1840 amounted to 419,608, and in 1850 to 1,402,956 (including "sweet," 879) bushels; and that of peas and beans in 1850 to 20,657 bushels.

22. The other crops of 1850 consisted of—hay 275,662 tons, hops 15,930 pounds, clover-seed 483, and other grass-seed 5,003 bushels, beeswax and honey 131,005 pounds, flax-seed 1,191 bushels, flax 68,393 pounds, maple-sugar 610,976 pounds, molasses 9,874 gallons, tobacco 1,268 pounds, and wine 113 gallons. The value of market-garden products was $32,142, and of orchard products $4,823.

23. The total value of agricultural products in 1840 was $445,559, and in 1850, $11,503,371.

24. Manufactures, mining, and the mechanic arts in 1850 were carried on in 1,262 establishments, and the aggregate capital employed in these interests was $3,382,148. The value of raw material consumed in the year preceding 1st June, 1850, was $5,414,931; the number of hands employed 6,089, of which 5,798 were males, and 291 females, at a cost for labor of $1,712,496; and the value of goods produced was $9,236,640. The value of goods made in families in 1840 was $12,567, and in 1850, $43,624. Including these, the value of the productions of 1840 was $1,680,808, and of 1850, $9,280,264. A large share of the produce which is represented in these valuations is due to the vast quantities of lumber dressed for the market, and for which this State has been famous since its first settlement. These include also the lead mining interest.*

25. The direct foreign trade of Wisconsin is that carried on with the British possessions. In 1855 the exports to these were valued at $174,057, and the imports therefrom at $48,159. Otherwise its foreign trade is carried on through the ports of the Atlantic and Gulf of Mexico. The domestic lake trade, however, is large and increasing; the exports from Milwaukee alone in 1851 were valued at $2,607,824, and in 1855 at $17,329,571. The internal and transit trade as carried on by railroads, rivers, etc., is commensurately extensive, and is constantly increasing its field of operations by the opening of new lines of communication.

26. The works of internal improvement in Wisconsin are more prospective than existing; but great progress has been made in building railroads and other avenues of commerce. The system of railroads projected is extensive, and has been designed chiefly to unite the west and north with the lake ports of this State and Illinois. The improvements of the Fox and Wisconsin rivers, and the canal across the portage, give uninterrupted navigation from the lakes to the Mississippi, and must prove a work of vast importance to the welfare of the State.

27. The banking law of Wisconsin went into operation on the 19th April, 1853; previous to that date there were no legalized banks in the State. At the end of the year there were ten such institutions, doing business on a capital of $600,000, and at the end of 1855 there were 32, with an aggregate capital of $1,870,000. The liabilities of these institutions at the two periods consisted of—circulation $485,121 and $1,060,165, deposits $654,423 and $2,806,341, and other $710,954 and 1,078,874; and the assets held at the same periods were as follows—loans and discounts $1,163,066 and $3,906,079, stocks $578,721 and $1,200,083, real estate $8,461 and $94,260, other investments (1855) $1,501, due by other banks $325,946 and $363,161, notes of other banks $151,154 and $603,848, specie funds $20,136 and $57,218, and specie $182,482 and $531,718.

28. The government is based on the constitution adopted in convention on 1st February, 1848. The right of voting is secured to every male person, 21 years of age, who is a citizen of the United States, or who has declared his intention of becoming such, and who has for one year been a resident of the State. The general election is held on Tuesday, after the first Monday in November.

29. The legislature consists of a senate of 25 members elected for two years, one half annually, and a house of assembly of 82 members elected for one year. The annual session commences on the first Monday in January.

30. The governor and lieutenant-governor are elected by a plurality of all votes for two years, and commence their terms on the first of January. The secretary of state, the State treasurer, and the attorney-general are elected for the same terms.

31. The judicial power of the State is vested in a supreme court, 10 circuit courts, county (probate) courts, and justice's courts. The supreme court consists of a chief and two associate justices, and holds two terms annually at the capital. Its powers, except the issuing of habeas corpus, mandamus, etc., writs, are appellate. The circuit courts have original jurisdiction in all matters, and appellate from inferior courts. The judges, one in each circuit, are elected by the people therein, and hold two terms in each county annually. Judges of both these courts are elected for six years. The county court, except as a probate court, is abolished in all the counties but Milwaukee, where it has concurrent jurisdiction in law cases with the circuit court to the amount of $5,000. Justices of the peace are elected in the several towns for two years, and have jurisdiction throughout their counties in civil matters in which the damages claimed do not exceed $100.

32. The revenue is derived chiefly from taxes, licenses, school fund, etc. The total receipts for the year ending 31st December, 1850, amounted to $93,889, and 1855 to $529,241, and the expenditures for the same year to $62,746 and $486,715. In 1855 the general fund expenses amounted to $234,103, and the school and university fund expenses to $252,612. The public debt amounted in 1855 to $100,000, at 8 per cent. In 1850 the value of taxable property in the State was $26,715,525, and in 1855, $87,500,000.

33. The principal institutions supported wholly or in part by the State are the State Lunatic Asylum, the Institute for the Education of the Blind at Janesville, the Deaf and Dumb Institute at Delaware, and the State Prison at Waupun. Also the State University, and attached thereto a normal school.

34. The number of children returned as attending school in 1850 was 56,421, or one in every 5.41 of the whole population. The statistics of the schools on the 1st June of the same year presented the following figures:

Classification.	Number.	Teachers.	Scholars.	Income.
Primary and public schools	1,428	1,529	58,817	$113,133
Academies and private schools	58	86	2,723	18,796
Universities and colleges	2	8	75	4,700

—making a total of 1,483 schools, 1,623 teachers, and 61,615 scholars, and an annual income of $136,629. The number of persons over 20 years of age unable to read and write was 6,453, of whom 1,551 were Americans, and 4,902 foreigners, and 6,361 were whites, and 92 free colored persons.

35. On the 31st December, 1855 there were in the State 3,685 common schools, with 186,085 scholars, 114 select and private schools, with 10,185 scholars, and one incorporated academy, with 30 scholars. The total expenditure for the common schools was $250,075.

* The State census of 1st June, 1855, gives the population at 552,451, of which number 551,662 were white persons—296,312 males and 255,350 females, and 789 colored persons—431 males and 358 females. Natives 358,721, and foreigners 193,730.

† In 1855 the quantity of land taxed was 10,824,343 acres; but the quantity in private hands must have been much larger, as this included none purchased of the United States government for the preceding five years. It was valued at $65,767,329.

* In 1857 the production of pig lead was 17,569,932 pounds, of which 2,379,932 pounds were the produce of Iowa County, and 15,190,000 pounds of Lafayette County.

The capital of the school fund was $1,897,269, of which sum $1,859,242 was invested and drawing interest at 8 per cent. There is besides a university fund, which amounted in 1855 to $178,150.

36. The principal collegiate and professional institutions in the State in 1855 were as follows:

Institutions.	Location.	Founded.
Beloit College	Beloit	1847
Wisconsin University	Madison	1848
Sinsinawa College	Grant Co.	1848
Carroll College	Waukesha	1848
Lawrence University	Appleton	1849
Brockway College	Ripon	1852
Racine College	Racine	1852
Milwaukee University	Milwaukee	1855
Female College	Milwaukee	1855
Wayland University	Beaver Dam	1855
Nashotah (Epis.) House	Waukesha Co.	1841
Ecclesiastical (R. C.) Seminary	Milwaukee	1849
Med. Depart. Wisconsin Univ.	Madison	1855

37. Measuring the numerical force of the several religious denominations by the accommodation provided in the churches of each in 1850, it will be found that the most conspicuous are the Roman Catholic, Methodist, and Baptist; after these the Congregational and Presbyterian, and then in succession the Lutheran and Episcopal. The Universalist, Christian, Dutch Reformed, Free, Union, etc., have also a small representation in the State. On the 1st June, 1850, the total number of churches was 365, with accommodation for 97,773 persons; and the value of church property was estimated at $353,900.

38. Madison, capital of the State, is situated on the isthmus between Third and Fourth lakes, 86 miles west Milwaukee, in latitude 43° 5′, and longitude 89° 19′. It has a beautiful site. The isthmus is about three fourths of a mile wide, hilly, and affording an extensive view of the vicinity. Fourth Lake, to the northwest of the town, is six miles long and from three to four miles wide, with a depth sufficient for steamboat navigation. Third Lake is of somewhat inferior dimensions. The site was selected for the seat of government in 1836, and at that date was occupied by a single log cabin; in 1840 it contained only 376, and in 1850 only 1,525 inhabitants. Since this period it has been reached by the railroad, and in 1855 its population had suddenly expanded to 8,664 souls, prospering and progressing daily in material fortune. The Capitol is built on a public square in the center of the town, and

CITY OF MADISON.

from this point the streets radiate toward the cardinal points, and gradually descending to the shores 70 feet, which is the elevation of the Capitol site above the lakes. A mile west of the Capitol is College Hill, 120 feet elevation, on which stands the Wisconsin University, founded in 1848, and to which was added a medical department in 1855. Churches and schools are numerous. The other principal literary institution is the Wisconsin State Historical Society. The vicinity is a fine productive country, well watered, and full of grand scenery. Within and around the town there are extensive mills and other industrial establishments, and a large number of wholesale stores. Railroads are already completed to Milwaukee, Chicago, and Prairie du Chien, and are in progress of construction to other principal points and toward Minnesota and Lake Superior.

39. Milwaukee, the first commercial city of the State, is situated at the mouth of Milwaukee River, and on the west shore of Lake Michigan, 85 miles by railroad north Chicago. Latitude 43° 3′ 45″, and longitude 87° 55′ The city is built on the river flats and on the bluffs, which rise abruptly from the lake. The river is navigable for lake craft for two miles, and the harbor is being constantly improved so as to accommodate an immense trade.

40. Milwaukee is a regularly planned city, and well and substantially built. The material used in building is generally the yellow brick made in and which is peculiar to this region, and is largely exported. (Trinity Building, in New York city, is of this material.) The streets and many of the stores are lighted with gas and well supplied with water. Among the public buildings the most conspicuous are the new Custom House, the Milwaukee University, 35 to 40 churches, a female college, several orphan asylums and other charitable institutions, public schools, etc.

41. The manufactures of the city are already considerable, and are greatly indebted for their successful prosecution by damming the river above navigation, by which a large water-power is created. The total value of articles manufactured in 1855 was $5,590,412, consisting of flour, machinery, locomotives, castings, carriages, wagons, leather, lumber, cabinet-ware, soap and candles, agricultural implements, paper, bricks, etc. Pork and beef packing is also a large interest. The commerce of Milwaukee is second only to that of Chicago. The arrivals by lake in 1855 were 2,802, viz., 1,204 steamers and 1,598 sailing vessels, together 980,700 tons. In the same year the exports were valued at $17,329,571 and the imports at $18,649,832. Among the exports are enumerated—flour 235,000 barrels, pork 36,546 barrels, beef 9,476 barrels, wheat 4,028,966 bushels, bricks 6½ millions, lard 934,706 pounds, wool 625,230 pounds, butter 450,000 pounds, hams and shoulders 1,640,800 pounds, etc.

42. The means of communicating with the interior are ample, and have greatly stimulated production along their lines. The Milwaukee and Mississippi Railroad is now completed to Prairie du Chien, *via* Madison, and the La Crosse and Milwaukee Railroad is completed to Portage City.* Other railroads reach to Watertown, Stevens' Point, Janesville, Fond du Lac, etc., and to Chicago; and in a few years the city will have railroad communication with all the other principal places in this State and with the West generally. A ferry connects it with the Detroit and Milwaukee Railroad at Grand Haven. Few cities, indeed, have made such rapid progress in means and development. The place was settled in 1835; in 1840 it contained only 1,754 inhabitants; but in 1850 its population amounted to 20,061. In 1855 it numbered 30,447 inhabitants!

43. Appleton is a new and thriving town on the Neenah, four or five miles below Winnebago Lake. The river is here interrupted by rapids, but its navigation has been improved by dams. It is the seat of Lawrence University. Beaver Dam is a village on the creek so called, and on the La Crosse and Milwaukee Railroad, 61 miles west-by-north Milwaukee. It is important for its water-power, and also on account of its being the center of several projected railroads. Wayland University is located here. Berlin, on the Neenah,, is a thriving river town, and a shipping place of consideration. The Milwaukee and Horicon Railroad passes through it, 92 miles northwest Milwaukee. Beloit is a flourishing town on Rock River, near the Illinois line, and is a place both of manufactures and trade. Several railroads center here and connect it directly with Chicago and Milwaukee on Lake Michigan, and Galena and Savannah on the Mississippi; also with Madison, etc. It is the seat of Beloit College. Delavan, on the Racine and Mississippi Railroad, 46 miles west-by-south Racine, and near the Illinois line, is a thriving town of 2,200 inhabitants, and the seat of the State Institution for the Deaf and Dumb. Dodgeville is a mining town six miles north Mineral Point, and has about 1,600 inhabitants.

44. Fond du Lac has a beautiful site at the south extremity of Winnebago Lake, and within the past ten years has become a flourishing center of trade. It is connected with Milwaukee and Chicago by railroad, and several other lines will center here. Population (1850) 2,014, and (1855) about 4,500. Green Bay, at the mouth of the Neenah, in Green Bay, is a beautifully situated town and has a secure harbor, suitable for the largest class of lake steamers. It is the entrepôt of a large commerce, and the best port of northeastern Wisconsin. It was formerly called Navarino, and includes also the village of Astor. Population (1850) 1,[illegible]23. and (1855) about 4,000. On the opposite side of the river is Fort Howard and the village of the same name.

45. Janesville, on Rock River, on both sides of which it is built, is, next to Madison, the most important interior town. A large trade centers here, and also considerable manufactures. At this point the southern line of the Milwaukee and Mississippi and the Chicago, St. Paul and Fond du Lac railroads intersect, and connect it with the great marts of this State and of Illinois. It is the seat of the Wisconsin Institute for the Education for the Blind. Population (1850) 3,451, and (1855) 7,018. Kenosha is the most southern lake port of Wisconsin, and has a good harbor, from which large quantities of produce are shipped. The Chicago and Milwaukee Railroad passes through it, 34 miles south Milwaukee, and the Kenosha and Beloit Railroad, when finished, will give it a ready access to the interior, and greatly facilitate its trade. Population (1850) 3,455, and (1855) about 6,000.

46. La Crosse is a small town on the Mississippi, and will be the western terminus of the La Crosse and Milwaukee Railroad, 103 miles west Madison. A railroad is also projected from Prairie du Chien, 61 miles south. With these completed it will become a point of great commercial importance, and the entrepôt of a large northwestern trade. Manitowoc is a town on Lake Michigan, 95 miles north Milwaukee. It has a good harbor and is an active business place. A railroad is being built to the interior.

47. Mineral Point is the chief town of the southwestern lead and copper region, and has an active trade. A railroad 32 miles long extends to Warren on the Illinois Central Railroad, whereby it has connection with Dubuque, Galena, and Chicago, and also the whole country to the south.

48. Portage City, at the Winnebago Portage, and on the canal connecting the navigable Wisconsin and Fox Rivers, has, since the through navigation was established, become a place of great commercial importance, and an entrepôt between the lakes and the Mississippi. Its site was formerly occupied by Fort Winnebago. The city has now also various industrial establishments, several large hotels, and is rapidly becoming what such a position would demand. The La Crosse and Milwaukee Railroad reaches this place from Milwaukee, 95 miles, and will soon be completed to the Mississippi; and a railroad is in progress to Madison, 40 miles south.

49. Prairie du Chien, a town on the Mississippi, four miles above the confluence of the Wisconsin, is one of the oldest settlements in the State. The site is a level plain, backed on the east by rocky bluffs. It is reached from Milwaukee and Madison by the Milwaukee and Mississippi Railroad, 193 miles from the former and 98 miles from the latter. A railroad is also projected to La Crosse. It is a place of active trade, and has a large shipping business, which is constantly increasing in amount.

* Opened to La Crosse in 1858.

50. Racine is a town and port on Lake Michigan, at the mouth of Root River, and on the line of the Chicago and Milwaukee Railroad, 62 miles from the former and 23 miles from the latter. It has one of the best harbors on the lake, and a large and flourishing commerce. The Racine and Mississippi Railroad connects it with the interior. Its manufactures are also important, comprising furnaces, machine shops, flouring-mills, etc. The city is built on an elevated site, and is laid out in wide streets, which are lined by substantial stores, warehouses, and dwellings. It is the seat of Racine College, founded in 1852 by the Episcopalians, and has numerous handsome churches, schools, etc. Population (1850) 5,107, and (1855) 8,044. Ripon, on the Milwaukee and Horicon Railroad, 81 miles northwest Milwaukee, is a flourishing town and the seat of Brockway College, founded by the Presbyterians in 1853.

51. Sheboygan is situated on Lake Michigan at the mouth of Sheboygan River, 60 miles north Milwaukee. It has an eligible harbor, and ships large quantities of lumber, etc. Population (1855) 3,630. This town has sprung up within the past ten years. Shullsburg is a thriving town, 15 miles northeast Galena, and is the depôt of a large trade in lead, etc. Stevens' Point, on the Wisconsin, 128 miles north Madison, is a flourishing village engaged in the lumber business. The river affords an immense water-power, and several manufactures have been established here. Hereafter it will be a central railroad point. Superior City is a new settlement on the extreme southwest shore of Lake Superior, and will be the northern terminus of the St. Croix and Superior Railroad.

52. Watertown is built on Rock River, between Madison and Milwaukee, 45 miles from each. The Chicago, St. Paul and Fond du Lac and the Milwaukee, Watertown and Madison railroads here intersect. It is built on both sides of the river, at the great bend, and the rapids above the city afford immense hydraulic power, which is used for manufacturing purposes. There are in the town flouring-mills, saw-mills, a foundery and machine shop, a pottery, and various other establishments for the manufacture of agricultural implements, wagons, cabinetware, etc. Its trade is very valuable and increasing. Population (1850) 1,451, and (1855) about 6,300. Waupun is the seat of the State Prison. It is situated on the Milwaukee and Horicon Railroad, 66 miles northwest Milwaukee and about 18 miles southwest Fond du Lac.

53. Wisconsin, in common with all the original Northwestern Territory, was ceded by France to Great Britain in 1763. The claim of Virginia upon this country was ceded to the United States on the 1st of March, 1784. With the increase of population in the territories, and the consequent changes, the country comprised within this State has successively formed parts of the Ohio, Indiana, Illinois, and Michigan territories. As a separate territory, Wisconsin was organized 4th July, 1836, and the first legislature convened 25th October, in the same year. On the 12th of June, 1838, the Territory of Wisconsin was divided, and that portion on the west side of the Mississippi (which had been attached to Michigan in 1834) erected into the Iowa Territory; and on the admission of Wisconsin into the Union its limits were further curtailed by making the River St. Croix its western limit, and giving the territory between that river and the Mississippi to the new Territory of Minnesota. Wisconsin became a State by an act of Congress passed 29th of May, 1848, and the new government was immediately organized.

STATE OF MINNESOTA.

FALLS OF MINNE-HA-HA.

1. Minnesota is situated between latitudes 43° 30′ and 49° north, and longitudes 89° 30′ and 97° 20′ west; and is bounded on the north by British America, on the east by Lake Superior and the State of Wisconsin, on the south by Iowa, and on the west by Dacotah Territory. Wisconsin is separated from Minnesota chiefly by the Mississippi and St. Croix rivers, and Dacotah by the Big Sioux River and the Red River of the North.

2. The greatest extent of Minnesota north and south is about 378 miles, and the general width thereof about 200 miles. The area is computed at 75,465 square miles, or 2.57 per cent. of the whole area of the Union.

3. Minnesota occupies the most elevated surface between the Gulf of Mexico and the Arctic Sea, and forms the watershed of three of the greatest basins of North America: that of the Missouri-Mississippi, that of the St. Lawrence, and that of Hudson's Bay. The sources of the Red River of the North and of the Mississippi are nearly on the western border, and at an elevation of about 2,000 feet above the waters of the Gulf, and are separated only by a scarcely perceptible rise of land. The sources of the Minnesota and the Red River are two neighboring lakes. The Hauteurs des Terres or Highlands form the dividing ridge between the Mississippi and Lake Superior. Thus within the area of a few thousand miles are found the sources of rivers emptying severally into the Arctic Sea, the Atlantic Ocean, and the Gulf of Mexico, and the mouths of which are 5,000 or 6,000 miles apart—one passing through a region of ice and snow, a second traversing a line of moderate temperature, and another descending southward through twenty-two degrees of latitude, from a region of wild rice to one of the cotton-plant and the sugar-cane.

4. With the exception of the Hauteurs des Terres there is nothing assimilating mountain in all the State. This range traverses the northeast section in a general south-by-west direction for about 280 miles, and demarks the dividing line between the basins of the Mississippi and St. Lawrence. The region west of the Mississippi has several plateaux or elevated prairies, which mark the limits of various river basins. The most remarkable of these are Coteau des Prairies (prairie heights), so called, and the Coteau du Grand Bois (wooded heights). These, however, are but slightly elevated above the general surface. Otherwise than these the nearest approach to mountains is in the towering bluffs along the shores of the Mississippi, and from Dubuque to St. Paul these bluffs are the grandest feature of the local scenery. With such exceptions there is no portion of Minnesota over which a loaded wagon may not be driven. The great body of the country alternates between river bottoms and high rolling prairies, the latter interspersed with lakes and pools, and in scenery is rich beyond conception.

5. The great number and size of the lakes in this State form one of its most distinguishing characteristics. Many are 20, 30, or 40 miles in extent, while others are less than a mile in circuit. The largest of these are—the Lake of the Woods, on the northeast border; Mille Lacs, in the eastern section; Red Lake, in the north; Leech, Cass, and others. Between the St. Croix and the Mississippi they are innumerable. Many are covered with wild rice, and are alive with water-fowl; others are fringed with timber, and the shores of nearly all are of gravel or pebbles, and entirely free from marshes or sloughs. In numerous instances these lakes are on a lower and lower level, and are strung together by a common stream successively passing from one to the other, and forming a singular navigation, by which the most remote parts of the country are accessible.

6. The Mississippi takes its rise in Itasca Lake, and issuing in a small pellucid stream, begins its course toward the Gulf. For 800 miles its course is within Minnesota, and of this

FORT SNELLING, AT THE CONFLUENCE OF THE MINNESOTA WITH THE MISSISSIPPI.

length 500 miles—200 below and 300 above the Falls of St. Anthony, its waters are navigable. The Red River, passing north, is the outlet of numerous small lakes, and ultimately finds its way to Hudson's Bay. Its banks are level prairies of great fertility. It has a winding course of nearly 500 miles on the western border of this State. Of the tributaries of the Mississippi, the principal from the east are the Rum and St. Croix rivers, the latter dividing Minnesota from Wisconsin. The slope toward Lake Superior is chiefly drained by St. Louis River and by a chain of lakes forming the northeastern boundary. West of the Mississippi the country is drained either by its immediate tributaries, or else by tributaries of the Missouri.

7. The great river of this region is the Minnesota or St. Peter's, which traverses the valley between the Coteau des Prairies and the Coteau du Grand Bois. Its course to the confluence of the Mankato or Blue Earth is southeast, and thence to the Mississippi northeast, and its total length about 460 miles. The river is navigable for steamers for about 60 miles, and for flat-boats 120 miles. A large number of rivers of smaller dimensions reach the Mississippi on this side. The largest tributary of the Missouri River from this State is the Big Sioux, which forms the west boundary.

8. The larger part of Minnesota, including the central and northeastern portions, appears to belong to the igneous and metamorphic formations. In the northern and southeastern districts there are extensive formations of lower silurian rocks, and in the valleys of the Minnesota and Mississippi magnesian limestone forms the basis of many of the bluffs. Extending from the center eastward to Lake Superior is a narrow band of new red sandstone, and on the shores of the lake are alternations of metamorphic schists, slates, and sandstones, with volcanic grits and other bedded traps and porphyries, intersected by basaltic and greenstone dikes, with occasional deposits of red clay, marls, and drift.

9. The mineral resources of the country are not yet ascertained. Iron and coal exist in the southern parts, but it is not supposed that either are very widely diffused. Copper and lead have also been found; the latter on the Waraju River, and the former in masses in a position referable to the action of the waters. Salt is abundant. The most notable mineral of Minnesota, however, is the red clay, from which the Indians manufactured pipes, and which may hereafter be applied to so many economic purposes. Its chief locality is the Coteau des Prairies, but it is also found in many other localities.

10. The winters of Minnesota, especially in its northern sections, are extremely severe. Here the mercury frequently freezes in the tube. On the other hand the summers are moderate, and occasionally a high temperature is noted. The weather nearer the lake is milder, and of course the climate in the south yields to the influence of the latitudes. The rivers are frozen over early in November, and generally remain closed to the middle of April. On the whole the climate is dry; and while the early winters prove unfavorable to the ripening of Indian corn, the steady cold and the dryness of the atmosphere are in like ratio favorable to winter-sown wheat and the hardier cereals. Most of the fruit-trees of temperate climates are easily acclimated, and, except the peach, almost everywhere perfect their fruit.

11. The soils vary in the different sections. In the northeast, except near the rivers, the

surface is covered with drift, and is perhaps too marshy for successful cultivation. Here the timber is dwarfed. The country on the Red River, however, is excellent, and equal in soil to the best bottom lands of Illinois, producing fine crops of grain, fruit, etc. Wild rice, berries of various kinds, wild grapes, and the crab-apple are indigenous. The forests consist of the same timbers as those usually found on the upper Mississippi; in the swamps the tamarac, cypress, and cedar, and in the bottoms oak, ash, linden, elm, walnut, maple, etc. On the Rum, St. Croix, and Pine rivers there are vast forests of pine, and, according to Owen, a belt of forest crosses the State in latitude 44° 30′. These pineries are already become the sites of vast lumbering operations, and a steady source of wealth to those interested in them. As a whole, however, Minnesota is not a densely wooded country.

12. Minnesota in 1850 contained 6,077 (3,716 males and 2,361 females) inhabitants, comprised in 1,016 families, and occupying 1,002 dwellings. This was equal to 0.08 persons to the square mile, or 0.03 per cent. of the population of the Union. Of this population 2,227 were in Ramsay, 1,134 in Pembina, 1,056 in Washington, 584 in Dacotah, 418 in Benton, 243 in Wabashaw, 160 in Wahnahta, 158 in Mankahta, and 97 in Itaska County. The number of Americans was 4,007, of foreigners 2,048, and of others whose origin was not ascertained 22. In 1855 the population was estimated at 68,812; and in 1857 a State census (excluding mixed breeds and civilized Indians) made the total population 153,332, or 2.03 persons to every square mile of territory.* The population was housed in 31,730 dwellings.

13. Agriculture, lumbering, and commerce are the essential industries of Minnesota. Mining and manufactures can scarcely be said to exist. In 1850† cultivation extended over 5,035 acres, and 23,846 acres were occupied but not cultivated. The value of farms was estimated at $161,943, and of farming implements at $15,981. The livestock consisted of—horses 860, asses and mules 14, milch cows 607, working oxen 655, other cattle 740, sheep 80, and swine 734—valued in the aggregate at $92,859. The crops of 1849–50 were—wheat 1,401 bushels, rye 125, oats 30,582, Indian corn 16,725, barley 1,216, buckwheat 515, potatoes 21,345, and beans and peas 10,002 bushels, and hay 2,019 tons, etc. Minnesota had, according to the same census, five manufacturing establishments, in which $94,000 were invested, and which employed 63 hands. The raw material consumed was valued at $24,000, and the value of the products of the year amounted to $57,500.

14. The State has no direct foreign commerce; but a considerable trade is carried on by steamers on the Mississippi, and a regular communication maintained with the Atlantic ports *via* Milwaukee and Chicago, and with those of the Gulf *via* St. Louis. Several interior railroads are being constructed, and if the northern route to the Pacific is ever built, it will pass through this Territory.

15. The State government is based on the constitution of the 30th August, 1857, and was organized on the 22d May, 1858. The right of voting is secured to all male white persons 21 years of age, who are or have declared their intention to become citizens of the United States, and have resided therein one year and the State four months next preceding; also to persons of mixed white and Indian blood, and to persons of Indian blood who have adopted the language, customs, and habits of civilization, and have resided in the district in which they offer to vote ten days precedent.

16. The legislature consists of a senate of 37 members elected for four years, and a house of representatives of 80 members elected for two years. No religious or property qualifications are required. The governor and lieutenant-governor, and the secretary of state, treasurer, and attorney-general are elected for two years, and the State auditor for three years.

17. The judicial power is vested in a supreme court, district courts, county or probate courts, and justices of the peace. All judges and justices are elected by the people for terms in no case of longer duration than seven years.

18. The revenue for the support of the government is derived from taxation. The value of taxable property in the State has increased in a wonderful degree: in 1850 the sum of the valuation was only $262,088, in 1855 it was $9,031,157, and in 1857, $23,347,701. Up to the end of June, 1856, the United States had sold upward of 2,000,000 acres of land, of which 1,001,529 acres had been sold in the year then ending. These figures are exclusive of what may have been sold on account of the school fund, etc.

19. St. Paul, the capital, is situate on the left bank of the Mississippi, a few miles below the Falls of St. Anthony, and in latitude 42° 52′ 46″ north, and longitude 93° 4′ 54″ west. The site is a high bluff, and overlooks the river, which here flows in an east-by-north direction. Steamboat navigation ceases at this point, and hence the commercial prospects of the place are greatly enhanced.* St. Paul is a town of but a few years' growth; in 1842 it consisted of a single trading-house, and seven years later it was the site of a Catholic mission. Since the latter period it has progressed rapidly, and now (1858) contains an imposing capitol and has all the accompaniments of a large city—churches, schools, hotels, manufactories, warehouses, etc., and a population of 8,000 or 9,000 souls. In 1850 it contained only 1,338 inhabitants.

20. St. Anthony is situate on the left bank of the river, at the falls of the same name, and at the head of navigation. It has immense advantages for manufacturing, and already has several mills. The State University is located here. The population in 1850 was 656, and now is estimated at 3,500. A fine suspension bridge connects it with Minneapolis, a thriving town on the opposite side of the river.

21. Fort Snelling, lower down the river, and at the confluence of the Minnesota, was formerly a federal military post; and Mendota is a thriving village on the opposite side of the confluence. Still lower down the Mississippi there are numerous settlements, several of them important, as Wabashaw, Minnesota City, Winona, La Crescent, etc.

FALLS OF ST. ANTHONY, WEST OF HENNEPIN ISLAND.

22. Stillwater is situate on the St. Croix Lake, 30 miles from St. Paul. It is the seat of the State Penitentiary, and is otherwise a very flourishing town, having a large trade in lumber. In 1850 it contained 621 inhabitants, and at present has at least 1,800. Kaposia, near the entrance of the St. Croix into the Mississippi, has also an excellent location.

23. Pembina is a settlement on the British boundary, where it is cut by the Red River. The settlement was originally made by Lord Selkirk, and now contains more than 1,500 inhabitants, principally persons of mixed Indian and white blood. They are industrious agriculturists and hunters; and have a very neat village on the east bank of the river. Their traders have on several occasions come down to St. Paul in dog-carts. The settlement extends into the British territory; and, indeed, it was a mistake of the original settlers in the latitude of the place that gave Minnesota its southern portion.

24. Minnesota has also a large number of other flourishing towns—on the Minnesota River as Shakopee, Carver City, Henderson, St. Peter, South Bend, etc.; on the Mississippi above the Falls as Manomin, Anoka, Monticello, St. Cloud, Watab, Little Falls, etc.; and within the triangular space between the Mississippi and Minnesota as Preston, Rochester, Faribault, etc. Every day, indeed, is expanding these and adding new towns to their numbers, and certainly they have hitherto so prospered as to augur well for their future welfare.

25. That portion of Minnesota lying on the north side of the Mississippi originally belonged to the country termed the "Territory Northwest of the Ohio," and, had the ordinance of 1787 been fully complied with, would have been included in the fifth State (Wisconsin) formed from that region. This section comprises an area of about 22,336 square miles. The vast country west of the Mississippi to the Missouri and White Earth rivers (all of which was included in the Minnesota Territory) was originally a portion of Louisiana, and came into the possession of the United States under the treaty of 1803. The whole country was discovered by the French, whose missionaries and traders nearly 200 years ago were settled therein.

26. The United States had little authority in this region before 1812. In 1816 a law of Congress excluded foreigners from the Indian trade, and for the encouragement of its own citizens the military post of Fort Snelling was established in 1819. Previous to this period a settlement had been formed on the Red River, under the auspices of Lord Selkirk; but otherwise, and up to the period of its organization as a Territory of the United States, the population consisted chiefly of Indians, who were annually visited by the traders, and perhaps a few Catholic missionaries, who had settled in the southeast.

27. Minnesota was organized as a separate Territory of the United States under the act of Congress, 3d March, 1849. In the subsequent eight years its increase was so rapid as to justify its erection into a State, and the permission of Congress having been granted early in May, 1858, its new organization was inaugurated on the 23d of the same month. As a Territory, its western limits extended to the Missouri and White Earth rivers; but on its coming into the Union as a State, the limits in that direction were curtailed, and all the land west of the Big Sioux and Red rivers now forms the Dacotah Territory.

28. Among the explorers of Minnesota the names of Carver, Pike, Cass, Long, Beltrami, Schoolcraft, Nicollet, Owen, etc., will ever be intimately connected with its history. The honor of verifying the sources of the Mississippi belongs to Schoolcraft.

* The extent and population of counties in 1857 were as follows:

Counties.	Area, sq. m.	Population.	County Seats.
Anoka	426	1,559	Anoka.
Benton	522	688	Watab.
Blue Earth	750	3,629	Mankato.
Brown	960	1,629	New Ulm.
Buchanan	890	120	——.
Carlton	892	239	——.
Carver	373	3,117	Carver City.
Cass	3,600	193	Chaska.
Chisago	384	1,765	Taylor's Falls.
Cottonwood	720	173	——.
Crow Wing	558	176	Crow Wing.
Dacotah	575	8,158	Mendota.
Dodge	432	3,680	Manterville.
Faribault	720	689	Verona.
Fillmore	864	9,803	Preston.
Freeborn	720	2,486	Nicholas.
Goodhue	864	6,932	Red Wing.
Hennepin	593	13,065	Minneapolis.
Houston	576	5,264	Caledonia.
Isante	528	184	——.
Itasca	5,400	630	——.
Jackson	720	50	——.
Lake	4,050	1,212	——.
Le Sueur	468	3,610	Waterville.
McLeod	720	822	Glencoe.
Manomin	290	514	Manomin.
Martin	720	56	——.
Meeker	720	1,025	Forestville.
Mille Lac	1,540	—	Mille Lac.
Morrison	644	751	Little Falls.
Mower	708	2,856	Austin.
Murray	720	91	——.
Nicollet	450	3,437	Travers desSioux
Nobles	820	16	——.
Olmstead	648	8,458	Rochester.
Pembina	21,678	1,909	Pembina.
Pierce	1,700	495	Fort Ridgeley.
Pine	1,160	102	Chengwatana.
Pipe Stone	864	24	——.
Ramsey	122	12,747	St. Paul.
Rossville	260	245	Sioux Agency.
Rice	516	6,440	Faribault.
Rock	720	52	——.
St. Louis	6,300	1,560	Falls of St. Louis.
Scott	360	5,302	Humboldt.
Sherburne	444	506	Shakopee.
Sibley	600	4,147	Henderson.
Stearns	1,139	2,840	St. Cloud.
Steele	432	2,597	Owatanna.
Todd	1,900	86	Long Prairie.
Wabashaw	659	5,109	Wabashaw.
Washington	400	6,183	Stillwater.
Wasaca	432	2,366	——.
Winona	540	8,203	Winona.
and Wright	724	2,243	Monticello.

† The results of the census of 1850 are here given to render the statistical series of the work complete. They can have no reference to the present condition of the State; but there are no later figures on which to base any estimates. Perhaps the industrial returns for Iowa in 1850 would apply to Minnesota in 1857.

‡ Forty-one steamboats arrived at St. Paul in 1844. Since that year to 1857, inclusive, the arrivals annually have been thus—48, 24, 47, 68, 85, 104, 119, 171, 235, 310, 563, 819, and 964. In 1857 the river was open only 198 days, being considerably below the average.

TERRITORY OF DACOTAH.

1. Dacotah is situated between latitudes 42° 30′ and 49° north, and longitudes 96° 30′ and 103° 30′ west; and is bounded on the north by British America, on the east by Minnesota (from which it is divided by the Red River of the North and Big Sioux River), and on the southwest and west by Nebraska Territory, from which it is divided by the Missouri and White Earth rivers.

2. The greatest extent of this Territory north and south is about 448 miles. The width on the north boundary is nearly 300; but southward it gradually narrows as the Missouri, in

its southerly course, trends to the east, and terminates in a point where the Big Sioux meets the main stream. The area is computed at 90,561 square miles, and constitutes 3.09 per cent. of the total of the United States.

3. This large Territory lies between the Missouri River and the Sioux and Red rivers, and is drained wholly by their affluents. Like Minnesota, its surface is very elevated, and its climate cold. Lakes are numerous. The highest land is the Plateau du Coteau du Missouri, which occupies the greater part of the west between the Missouri and its tributary the Riviere à Jaques, and the country between the latter and the Red River is broken by considerable hills.

BUFFALO HUNTING.

The soils are said to be fertile, and though a large portion is undoubtedly unfit for cultivation, much of it, especially near the rivers, is well adapted for the growth of grain and other food crops, etc.

4. Little, however, is known of the country. It is still in the possession of the Sioux and other northern tribes, and has long been a favorite hunting-ground of the Pembina Indians. The country is well timbered, and in the north has extensive salt-fields, which will in the future constitute a valuable resource.

5. This Territory formed the western section of the Territory of Minnesota until 1858, in which year the State of Minnesota was established. It contains a few civilized inhabitants, but how many is not known; nor is it yet under any organized government. The Northern Pacific Railroad, the route for which was surveyed by Governor Stevens in 1854, will pass through it; and it is probable that in a year or two a territorial administration will be established. The subject has already been introduced to the consideration of the national government.

TERRITORY OF NEBRASKA.

1. NEBRASKA is an extensive Territory lying between latitudes 40° and 49° north, and longitudes 95° 20′ and 113° 30′ west; and is bounded on the north by British America, on the east by Dacotah, Iowa, and Missouri, on the south by Kansas, and on the west by the crest of the Rocky Mountains.

2. The extent of Nebraska north and south is 622 miles, and the width thereof, east and west, from 480 to 540 miles. The area is computed at 335,882 square miles, or 11.44 per cent. of the total of the United States. It is the largest separate government in the Union.

3. The greater portion of this country is an immense plain, gradually sloping from the mountains eastward to the Missouri, to the basin of which river and the Mississippi the whole Territory belongs. The whole is of sufficient elevation to free it from marshes and swamps, and to secure it proper and seasonable drainage. A very small portion is mountainous, except, indeed, that part in the extreme west lying contiguous to the Rocky Mountains.

4. The principal rivers which flow through the Territory are the Missouri and its tributaries, the Yellowstone and Nebraska or Platte being the largest. From the latter the Territory has been named. The country on both sides the Platte, extending as far west as the Elkhorn on the north, is rolling and broken, the rounded and flat summits indicating a general prairie level, broken by deep ravines, occasionally abrupt, but in most cases sloping gradually to the bottom. In these depressions timber and water are nearly always to be found, the latter consisting of fine, purling brooks, rising from springs in the hillsides, and meandering down through beautiful grassy valleys to the larger streams, with which this part of the country is well supplied. This character of country extends up the Missouri to and beyond the Black Bird Hills.

5. South of the Nebraska the undulating country extends farther into the interior, but finally on both sides of that river the undulations terminate in vast prairies or plains, stretching out on every side as far as the eye can reach. Occasionally the eye is relieved by the sight of a line of timber in the distance, which usually marks the course of some stream. The character of much of this country is unproductive and sterile; in other parts a scanty vegetation is produced. The quality of the land deteriorates after leaving Loup Fork, and a great part of the country between Wood River and Fort Laramie, except along the immediate valley of the Nebraska, is entirely unfit for cultivation.

6. The section of country west of Fort Laramie embraces the Black Hill district. The whole of this is a more elevated region—detached and broken points of mountain flatten off toward the river, in places running abruptly down to it. This is a well-watered country, and the more elevated hills skirting the base of the mountains are generally well covered with pine and cedar. The valleys formed by the numerous streams flowing among the ridges and hills are clothed luxuriantly with grass, and together constitute a country at once beautiful and picturesque.

7. Among the mineral resources of the Territory coal is perhaps the most valuable. It abounds all along the Missouri line, and probably as far west as the Black Hills. Copper is extensively deposited in the Black Bird Hills. Otherwise the Territory affords abundance of iron, limestone, potters' clay, etc., and it is probable that future exploration will open to the settlers a mineral wealth commensurate with the extent of the country embraced.

8. Nebraska, according to a census taken in 1855, had in that year 4,565 inhabitants, and according to a second enumeration, taken in 1856, it contained 10,716 inhabitants. The distribution of this population at the two periods is as follows:

Counties.	Population. 1855.	Population. 1856.	County Seats.
Burt	89	146	Tekama.
Cass	712	1,251	Plattsmouth.
Clay	(Included with Lancaster.)		Clayton.
Cumming	—	8	Catharine.
Dacotah	—	646	Dacotah.
Dodge	139	313	Fontenelle.
Douglas	1,028	3,641	OMAHA CITY.
Lancaster	—	125	Mayaretta.
Nemaha	604	1,277	Brownsville.
Otol	1,188	1,845	Nebraska City.
Pawnee	142	301	Pawneeville.
Platte	—	36	—.
Richardson	299	529	Archer.
Washington	207	730	Fort Calhoun.

—these populations are exclusive of Indians residing within the Territory.

9. Omaha City, the capital, occupies a beautiful site on the west bank of the Missouri, directly opposite to Council Bluffs City, Iowa, and about 20 miles north of the Nebraska River. The city stands on a plain, 50 feet above the river, and is bounded south, west, and northwest by a line of low ridges. Its south point rests on Omaha Creek. In the plan of the city the avenues and streets are wide and convenient, and cross at right angles, and in this arrangement a due regard has been paid to public squares, parks, and other conveniences of a large town. Limestone, suitable for building, is found a short distance south of the city, and there is abundance of brick-clay. Population about 600.

10. Bellevue is situate on the Missouri, about six miles above the mouth of the Nebraska. Its site is an elevated plateau 80 feet above the river. From the summit the view is almost unlimited, and most beautiful. The settlement has long been a noted fur-trading point, and otherwise its general trade is considerable.

11. Fort Calhoun is situate about 18 miles north of Omaha City. The town derives its name from the old United States Fort Calhoun, established in 1819. The fort and the town which now occupies its site are located on a strip of table-land two miles broad by about eight in length, and about 60 feet above the river. The country around is rolling, with a large amount of second bottom or bench-land, well supplied with timber, and stone is also abundant.

12. Florence (formerly Winter Quarters) is situate on the north point of the same plain on which Omaha City stands, and distant six miles. Florence possesses one of the best steamboat landings on the river, which is here 750 yards wide, and divided into two channels by Rock Island, and hence its eligibility for bridging for a road or railroad.

13. La Platte is situate on the Missouri, 14 miles south of the capital; it is the first townsite north of the Nebraska, and has many advantages indispensable to commercial towns in its landing and the resources of the immediate country. Plattsmouth is the first town south of the Nebraska, and being the most eligible stopping-point for that vast extent of country lying on the borders of the Nebraska, will undoubtedly become a flourishing town. Still farther south, and along the bank of the Missouri, the principal places are Bluff Rock, Kenosha, Nebraska City, Kearney City, and Brownsville. North of the Nebraska, and beyond the towns already spoken of, are De Soto, Tekama, Black Bird, etc. Fontenelle is the seat of Nebraska University, founded in 1858.

14. Nebraska originally formed a part of Louisiana as received from the French. It was erected into a Territory by act of Congress 30th May, 1854, and is now filling up with an enterprising population.

TERRITORY OF KANSAS.

1. KANSAS lies between latitudes 37° and 40° north, and longitudes 94° 40′ and 106° 50′ west; and is bounded on the north by Nebraska, on the east by Missouri, on the south by the Indian Territory and New Mexico, and on the west by the main ridge of the Rocky Mountains which separates it from Utah.

2. This Territory has a length east and west of about 550 miles, and a breadth in the west of 139, and in the east of 208 miles. The area is computed at 114,798 square miles, or an area equal to 3.91 per cent. of that of the whole Union.

3. The surface of this extensive country is that of a slightly inclined plane or gradual slope extending from the base of the Rocky Mountains to the frontier of Missouri. There is no proper mountain within this whole extent except the great range on its western borders, the most elevated culminations of which are Pike's Peak and Long's Peak. There is little to diversify the country as a whole.

4. At the base of Pike's Peak a series of hills or ridge-like elevations (traversing the entire Territory from west to east between the waters of the Kansas and Arkansas, and crossing the Missouri line south of the Osage River) rise into what are called the Ozark Mountains, passing through the State of Missouri to the Mississippi, at Grand Tower. The chain of ridges is thence continued through southern Illinois, and is again cut through by the

Ohio at Grand Chain, and passing between Green and Cumberland rivers, under the name of the Green River Hills, terminates in the Cumberland Mountains. If, therefore, the geological opinion in relation to the Missouri-Mississippi valley having once been a lake or vast inland sea be true, then the chain of ridges or hills above described formed in all probability its southern boundary.

5. The eastern section of Kansas, extending west from the Missouri line about 200 miles, consists of a rolling, undulating country, with a rich and fertile soil, well-watered, and containing a large amount of good timber. The streams flow through handsome, picturesque valleys, generally bordered with timber from a quarter to half a mile in width. The face of the country, the climate, soil, and products correspond generally with those of western Missouri. A large area abounds in coal and gypsum.

6. The middle portion of Kansas is more level, the depressions are shallow, long, and gradual, timber less abundant, the streams not so frequent, nor is the country in general so well adapted to sustain a large population as the more eastern parts of the Territory. This section extends west of the first division probably 200 miles more or less, and includes the

SCENE IN THE GREAT AMERICAN DESERT.

great belt of sterile country reaching from the 47th parallel southward to New Mexico. Good grasses, however, are found in many places, and in time probably much of it will be appropriated to grazing.

7. The section of country lying along the eastern slope of the Rocky Mountains is represented as one of great beauty, and is well supplied with timber, is exceedingly well watered by numerous streams winding in various directions between gently sloping hills and ridges, the rounded and flat summits of which are annually covered with rich and luxuriant grasses. Over these hills, and on the broad plains at their bases, buffalo range by thousands, feeding upon the bunch and buffalo grasses with which they are densely covered. Perhaps no country in the world is better adapted to grazing than is this section, and none certainly has a finer climate or more interesting scenery.

8. The principal river of the Territory is the Kansas or Kaw and its tributaries; and from about the 97th meridian westward the Arkansas flows about a degree north of the southern boundary. The general direction of this latter river is from west to east, near the 38th parallel. Its principal tributaries within Kansas are the Neosho, Verdigris, and Little Arkansas rivers, all large streams. The Kansas River falls into the Missouri in about latitude 39°. It is the most considerable river wholly within the Territory, and with its numerous affluents drains a vast surface. Its length is about 600 miles, and its navigation is open for steamboats to the junction of Republican Fork, if not farther. The Osage, another large stream, drains the country between the Kansas and Arkansas. It has many considerable affluents, which drain a rich and well-timbered section.

9. Kansas as a whole appears to be entitled to the designation of a good agricultural region; it has a fine intermediate climate, and in its cultivation the staples both of the North and South will find congenial localities.

10. A census of the inhabitants was taken in 1855, and the population ascertained to be 8,521, of whom 5,138 were males and 3,383 females, and of the total, 8,104 were Americans and 417 foreigners; and 192 were slaves. In 1857 the population was estimated at 21,208, and in 1858 at about 46,000. This is exclusive of Indians on the several reservations.*

11. The principal towns in Kansas are found chiefly on the lines of the rivers. On the Missouri are Wyandotte City at the confluence of the Kansas; Leavenworth immediately south of the fort of the same name and the largest town in the Territory; Kickapoo 15 miles north of Leavenworth; Atchison at the mouth of Independence Creek, 20 miles farther north; Doniphan 20 miles still higher up, etc. On the Kansas the chief places are—Lawrence, Douglas, Lecompton, Tecumseh, and Topeka on the south bank of the river, and Pottawattomie, Whitfield, Manhattan, Ashland, Pawnee, etc., on the north bank. Fort Riley at the confluence of the Republican Fork with the Kansas, and Fort Atkinson at the confluence of Pawnee Fork with the Arkansas, are United States army stations, as is also Fort Scott on the Marmaton, a tributary of the Osage River. There are also numerous settlements on the Osage and Neosho rivers, as well as in the Big Blue, as Marysville, Ayresville, etc.

* Indian reservations in Kansas, 1858—Delawares 256,000 acres, Wyandottes 24,960 acres, Kickapoos 128,000 acres, Ottoes and Missouris 160,000, Sacs and Foxes 32,000 acres, New York Indians 1,658,880 acres, Kansas 256,000 acres, and Pottawattomies 756,000 acres.

On the Santa Fé trail there are also several, as Elm Grove, Council City, Council Grove, etc., and in the west on the Arkansas, where it is cut by the 103d meridian, Bent's Fort, a trading post. Many of these places have already earned a fame which will carry their names down to the latest posterity: Lawrence, as the stronghold of the anti-slavery party; Lecompton, Topeka, etc., as the sources of rival State constitutions; Atchison and others as the strongholds of border ruffianism. But many also are destined to play an active part in the future, as seats of industrious populations and centers of commerce. Pawnee, Shawnee Mission, Leavenworth, and Lecompton have been successive capitals of the Territory, and in 1857, Minneola, the site of which is still in the wilderness, was chosen for the permanent capital.

12. Kansas, like Nebraska, was originally a part of Louisiana. It was subsequently included in the Indian Territory, and has long been the home of various transported tribes. In 1847 Fort Leavenworth, and more recently forts Scott, Riley, and Atkinson, were established for their regulation and protection.

13. On the 30th May, 1854, the present Territory was organized by act of Congress. The troubles that ensued between the rival slavery and anti-slavery factions constitute its territorial history. To trace these to their sources and in their consequences is no part of the business of this book. On the 30th April, 1858, an act of Congress was passed for the admission of Kansas into the Union; but at an election held on the 2d August of the same year, the votes taken were against (11,300 to 1,788) the project, and hence the Territory still retains the same territorial organization it received by the act of 1854.

INDIAN TERRITORY.

1. This Territory is situated between latitudes 33° 30′ and 37° north, and longitudes 94° 20′ and 100° west; and is bounded on the north by Kansas, on the east by Missouri and Arkansas, on the south by Texas and the Red River, and on the west by Texas, etc. The length of the Territory, east and west, is 320 miles, and its breadth, north and south, about 225 miles. The area is estimated at 71,127 square miles, or an area equal to 2.42 per cent. of that of the whole United States.

2. This Territory is peopled entirely by Indians of various tribes, but of their exact number there is no record; it may be 100,000 more or less. These tribes consist either of indigenous Indians, or such as have been transported from the settled States.

3. The principal tribes and the numerical strength of each now in the Territory are as follows:

The *Cherokees*, in the north and east	about 18,000
The *Creeks*, between 36° 10′ and the Canadian River	" 25,000
The *Seminoles*, between the forks of the Canadian	" 3,000
The *Choctaws* (16,000) and *Chickasaws* (5,000), south of the Canadian	" 21,000
In the northeast, between the Neosho and the east boundary, are the *Quapaws* (300), *Senecas* (1,400), etc.	" 2,000

4. These several nations have had allotted to them separate districts, marked by treaty boundaries; each has its own internal government, and is separate in its relations with the government of the United States. In fact, the several nations are entirely distinct communities. As a general thing their civilization since removal has been progressive; they practice agriculture and many of the arts; and in their social relations have improved under the guidance of the missionaries sent out by the various religious bodies.

5. The Cherokees originally occupied a tract of 54,000 square miles in the highlands of Carolina, Georgia, and Alabama, and in the upper valley of the Tennessee. They were a numerous and powerful race of mountaineers. Their lands were gradually taken by the whites, and in 1836 they sold the last of their ancient domain to the United States and removed to their present home. Their social and industrial progress has been considerable, and even in literature they display a marked talent. They have the printing-press and newspapers. As a nation they have a well-organized government, the nature and powers of which assimilate that of the several States. They were the first among the Indians to adopt written laws, which they did as early as 1824. The legislature, styled the General Council of the Cherokee nation, consists of a committee of two members from each of the eight districts into which the Territory is divided, and a council of three members from each; this legislature meets annually in the council-house at Tahlequah. Members are elected for two years by the free male citizens of each district. The executive is exercised by a principal chief and his assistants, chosen for four years, with the aid of three councilors, elected annually by the legislative body. The judiciary is vested in a supreme court, and circuit and district courts. The Cherokees live chiefly in villages, and their dwellings are mostly comfortable log cabins, and sometimes two-story houses of wood or brick. A great part of their own clothing is home-manufactured, and many families raise their own cotton, out of which the women make substantial cloth. Cultivation by the plow is almost universal, and most families raise enough to supply their own wants.

6. The Creeks or Muscogees, whose original location was Georgia and Alabama, inhabit a fine country north of the Canadian River, and produce a large amount of agricultural supplies. They are industrious, and in general cultivate their lands in common. Their government is almost similar to that of the Cherokees, and is based on a written constitution. The sessions of the council are held annually, and the members, as also the principal chief, are

elected by the free citizens. They associate in villages, and have good houses; and having been supplied with master mechanics by the United States, are now advancing rapidly their material welfare. The principal settlements are on the Arkansas and its tributaries. The SEMINOLES are considered as a constituent part of the Creek nation, which they assimilate in origin and language. Although improving, they are averse to labor, and have, perhaps, made less progress than any of the other immigrant tribes.

7. The CHOCTAWS and CHICKASAWS, which were kindred nations on the east side of the Mississippi, are confederates in their new homes, occupying the whole Territory south of the Canadian. They are governed by a written constitution. The country is divided into four districts, one of which (the fourth) is occupied by the Chickasaws, each district electing its own chief for four years. The national council consists of 40 members, elected by the qualified citizens of the districts in equal numbers, and meets annually at the council-house on the Kiamishi, an affluent of Red River. The chiefs have a qualified veto on all laws passed by the council. The judiciary is regularly organized, and trial is by jury. Appeal lies to a supreme court. The national force consists of all male adults, with 32 captains in each district, and a general-in-chief. On several occasions the Choctaws have volunteered into the United States service. They are industrious and frugal; are extensively engaged in agriculture, and have good houses and well-inclosed fields. In the south they raise large quantities of cotton, and on the Red River have cotton gins and several mills. Their stock of cattle, horses, sheep, and swine is abundant. In various parts spinning and weaving are carried on, and also many of the minor manufactures and mechanic arts. The schools of the Choctaws are among the best institutions of the Territory, and are liberally supported from the national treasury.

8. The QUAPAWS and SENECAS, in the northeast, are the remnants of powerful nations; and although now almost extinct are among the most civilized of the aboriginal races.

9. The Indian Territory was originally a part of Louisiana. It is not organized as other Territories of the United States; but certain portions of it have been granted from time to time to the nations now inhabiting it. The name until lately was applied to all the territory west of the settled States occupied by the immigrant Indians; but by the act of Congress, 30th May, 1854, the great body of the Indian lands was merged within Kansas and Nebraska.

UNORGANIZED TERRITORY.

A SMALL parallelogramic strip of land extending from latitudes 36° 30′ to 37° north, and from longitudes 100° to 103° west. Area 5,878 square miles. It formerly belonged to Texas.

TERRITORY OF NEW MEXICO.

1. NEW MEXICO is situated between latitudes 31° 32′ and 38° north, and longitudes 103° and 117° west; and is bounded on the north by Utah and Kansas, on the east by Texas, Kansas, etc., on the south by Texas and the Territory of Arizona, and on the west by California.

2. The greatest length of New Mexico is east and west, being 700 miles; the breadth of the Territory north and south varies from 452 miles in the east to less than 300 miles in the west. The area is estimated at 207,007 square miles, or 7.05 per cent. of that of the whole United States.

3. That portion of New Mexico westward of the Sierra Madre can only be considered as a temporary appendage to the Territory. It is bounded south by the Gila, and extends north to the 37th parallel, and is watered chiefly by the Colorado and its affluents, and also the numerous tributaries of the river bounding it on the south. In the northeast it is occupied by considerable mountains and mountain valleys, and the whole eastern line is mountainous and rugged. The interior forms a varied country, well wooded, and with much fine agricultural land; and the country bordering on the Gila, which is hilly and broken, abounds in mines of copper, gold, silver, etc. The whole is comprised in the county of Rio Ariba, and covers about half the total area of the Territory. It is inhabited almost solely by Indian tribes—the Navajoes in the northeast, the Apaches in the east and southeast, the Pimas in the west and southwest, and the Pah-Utahs in the north and northwest.

4. New Mexico proper, or that portion of the country east of the Sierra Madre, in its general aspect is mountainous, with a large longitudinal valley running from north to south, and through which flows the Rio Grande. This valley is generally about 20 miles wide, and bordered on the east and west by mountain chains, continuations of the Rocky Mountains. The height of these mountains south of Santa Fé may upon an average be from 6,000 to 8,000 feet, while near Santa Fé, and in the more northern regions, some snow-capped peaks are seen that may rise from 10,000 to 12,000 feet above the sea. These mountains are principally composed of igneous rocks. On the higher mountains excellent pine timber grows; on the lower, cedars and sometimes oaks, and in the central valley mesquito, etc.

5. The soil of the valley of New Mexico is generally sandy and looks poor, but by irrigation it produces abundant crops. The most fertile part of the valley begins below Santa Fé along the river, and is called the Rio Abajo, or country down the river. It is not uncommon here to raise two crops within the year. With regard to climate, considerable differences are experienced in accordance with elevation and shelter; but on the whole it is temperate, constant, and salubrious.

6. In 1850 New Mexico contained 61,547 inhabitants, comprised in 13,502 families, and occupying 13,453 dwellings. This population is equal to 0.3 to the square mile, and 0.27 per cent. of the total of the United States. Its distribution was as follows:

Counties.	Population.	County Seats.
Bernalillo	7,751	Albuquerque.
Rio Ariba*	10,668	Cuchillo.
Santa Ana	4,645	Jemez.
Santa Fé	7,713	SANTA FÉ.
San Miguel	7,074	San Miguel.
Taos	9,507	Taos.
Valencia	14,189	Valencia.

—and of the total, 61,525 (99.96 per cent.) were white persons—31,725 males and 29,800 females, and 22 (0.04 per cent.) were free colored persons—17 males and 5 females; and in reference to nationality, 59,261 (96.29 per cent.) were Americans (of whom 58,421 were born in New Mexico), 2,063 (3.35 per cent) were foreigners, and 223 of origin not ascertained.

7. Of 17,478 males over 15 years of age whose occupations were ascertained, 1,054 were engaged in commerce, trade, manufactures, mining, and the mechanic arts, 7,956 in agriculture, 6,209 in labor not agricultural, 655 in the army, 2 in navigation, 45 in law, medicine, and divinity, 58 in other pursuits requiring education, 206 in government civil service, 1,292 in domestic service, and one in some other (unnamed) pursuit.

8. Agriculture is the distinguishing industry of New Mexico; and cattle raising is carried on extensively under the old Spanish system of estancias. Mining at the present day is essentially a subsidiary occupation, nor are there any manufactures properly so called. Commerce is necessarily active, and a large amount of business is carried on over the plains between St. Louis and Santa Fé.

9. The mineral resources of the Territory are abundant. Gold, silver, copper, etc., are found in the mountains; and in the valley of the Rio Grande, for 120 miles above and 100 miles below Santa Fé, the gold placers have long been worked, and the poorer classes occupy much of their time in washing out gold dust, which is largely deposited in the mountain streams, and some mines are also worked in the neighborhood of Santa Fé. No others of consequence indeed are now worked.

10. The number of farms under cultivation on the 1st June, 1850, was 3,750, containing 166,201 acres improved and 124,370 acres unimproved lands, together valued at $1,653,922; and the value of farming implements and machinery was $77,960.

11. The livestock at the same date consisted of—horses 5,079, asses and mules 8,654, milch cows 10,635, working oxen 12,257, other cattle 10,085, sheep 377,271, and swine 7,314—in all valued at $1,494,629. The value of animals slaughtered in the year preceding was $82,125, and the products of animals consisted of—wool 32,901 pounds, butter 111 pounds, and cheese 5,848 pounds.

12. The crops amounted to—wheat 196,516, oats 5, Indian corn 365,411, barley 5, buckwheat 100 bushels, potatoes 3, and beans and peas 15,688 bushels. Otherwise there were produced—beeswax and honey 2 pounds, molasses 4,236 gallons, tobacco 8,467 pounds, and wine 2,363 gallons, and the value of orchard products was $1,271. Home-made manufactures were valued at $6,033.

13. The capital invested in manufactures, mechanic arts, etc., in 1850, amounted to $68,300, the value of raw material used to $110,220, and the products of the year amounted to $249,010. The whole number of establishments under this head was 23, employing 81 hands; of these seven were distilleries—capital $7,300. The principal manufactures consist of blankets and cloaks, called serapes.

14. New Mexico has no direct foreign commerce. A large trade, however, is carried on with the Western States, and conducted by means of caravans. In this manner the Territory obtains its supply of manufactured goods, and in return exports specie and Indian merchandise. The route passes direct through the Territory of Kansas, and in one portion is so barren as to have received the significant appellation of Jornado del Muerte.

15. Santa Fé, the capital, is situated about 20 miles east of the Rio Grande, on an arid

SANTA FÉ, FROM THE GREAT MISSOURI TRAIL.

plain surrounded by mountains. Latitude 35° 41′ 6″, and longitude 106° 1′ 22″—elevation 7,047 feet. It is an old town, having been founded in 1581, and consists of narrow, irregular

* Since divided into Rio Ariba and Socorro counties.

streets, with houses of a single story built of adobes—square in form, and having a central area. It contains two Roman Catholic churches, and on the 21st May, 1855, was laid the corner-stone of the first Protestant church in New Mexico. The governor's house is the only other building of note. The inhabitants are still nearly all of Spanish and Indian descent, but there are a few Americans, chiefly such as are connected with the overland trade which centers at this city. The climate is serene and little variable. Population 4,846.

16. There are several other towns and villages in the Territory, but none of importance. Albuquerque, on the Rio Grande, about 76 miles south of the capital; Socorro, on the west bank of the river, 105 miles south of Santa Fé; and Taos, on a small tributary of the same river, about 65 miles north-by-east, are the most noted, and have some trade.

17. New Mexico became known to the Spaniards about the year 1581, and formal possession was taken of the country in 1598. Christianity and slavery were early and simultaneously introduced among the Indians, and conversion and personal service enforced by the sword. The converted Indians were made to live in villages, and were distinguished from the roving bands by the title of "Pueblos." Many towns, of which only the ruins now remain, were established at this time. The mines were successfully worked, and the occupation of the country seemed to be secured, when, quite unexpectedly, in 1680, a general insurrection of the Indian tribes broke out against the Spanish yoke. The Spaniards were either massacred or driven southward, where they founded El Paso del Norte. The country was not recovered for ten or twelve years. Several insurrections have since occurred, but none so universal or disastrous as this one.

18. After the revolution that overthrew the Spanish power, New Mexico followed the fate of the vice-royalty. Its history, however, previous to the invasion by the Americans, has little to arrest attention. It is a continuous record of barbarism and tyranny. On the 8th September, 1846, Santa Fé was captured by the Americans under General Kearney, and soon after several of the river towns were visited on his route to California. A civil government was now established. On the 19th January, 1847, an insurrection broke out against the Americans, and in several pueblos many of them were murdered, among whom was Mr. Bent, the governor. Taos, Arroyo-Hondo, and Rio Colorado were the chief scenes of strife. The battles of La Canada and El Embudo also occurred in this month, and in February the battle of Taos, in all of which the Mexicans were completely vanquished. Some few skirmishes occurred after these, but none of importance, and from this period the United States authorities exercised exclusive power. The treaty of Guadalupe Hidalgo assigned New Mexico to the Union, and on the 9th September, 1850, the country within its present limits was erected into a territorial government.

19. By act of Congress passed 4th August, 1854, the territory south of the Gila, acquired by the treaty between the United States and Mexico, dated 30th December, 1853, was annexed to and became a part of New Mexico. Its area is about 27,500 square miles, and hence the total area of New Mexico is now 234,507 square miles. This Territory is separately described.

TERRITORY OF ARIZONA.

1. Arizona is situated between latitudes 31° 20′ and 33° 20′ north, and longitudes 106° 50′ and 114° 40′ west; and is bounded on the north by New Mexico, on the east by New Mexico and Texas, on the south by the northern States of Mexico, and on the west by Lower California. Its length east and west is about 475 miles, and its width varies from a few miles in the west to 130 or 140 miles in its widest parts. The area is computed at 27,500 square miles.

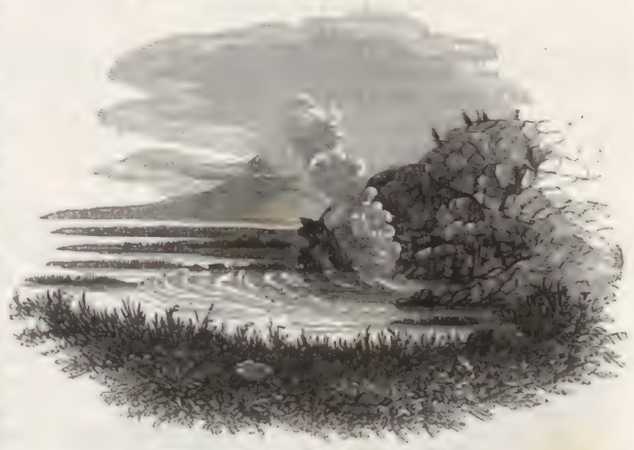
2. This Territory, stretching from the Rio Grande to the Colorado, and lying immediately south of the Gila, is full of mountains and valleys rapidly succeeding each other from east to west, and is for the most part a very rugged country. It is, however, rich in gold and silver, and its mines, formerly worked on a large scale, were the most profitable in Spanish America; but on account of Indian disturbances, these have been almost entirely abandoned.

3. It is difficult to state with any degree of exactness the number of white persons at present in the Territory; some accounts give it as low as 2,000 or 3,000, while others as high as 8,000 or 10,000. These live in villages, the principal of which is Tucson, in the valley of the Rio San Xavier, and in the same valley southward are the villages of San Xavier and Tubac. The finest portion of the Territory is the Mesilla valley in the east, but it is inhabited solely by Indians. The inhabitants have abundance of livestock, which constitutes their chief wealth.

4. Arizona formerly belonged to Mexico, and formed a part of the States of Sonora and Chihuahua. The Territory was acquired for the United States by the treaty with Mexico dated 30th December, 1853; and by an act of Congress of 4th August, 1854, was annexed to and became a part of New Mexico. It is frequently termed the "Gadsden Purchase," in honor of the American negotiator, and also the "Mesilla Territory," from the great eastern valley of that name. As a possession of the United States, its distance and isolation will be the greatest barriers to its speedy development; but the reported richness of its mines, and the fact that it affords an eligible route for a Great Pacific and Atlantic Railroad, favor a contrary conclusion. Already the Sonora Mining Company have commenced operating within the Territory, and have invited immigration; and the great mail route from St. Louis and Memphis to San Francisco *via* El Paso, Tucson, and Fort Yuma (inaugurated in 1858), traverses it, and affords facilities not hitherto possessed for its early settlement by Americans.

5. In view of these facts, and others equally cogent, it is now considered desirable to establish over the Territory a temporary government, and it is also proposed to make the 34th parallel its northern border. For this purpose several applications have been made to Congress, and it is probable that a result favorable to the proposal will be attained in the next session of the national legislature.

TERRITORY OF UTAH.



UTAH INDIAN LODGE.

1. Utah is situated between latitudes 37° and 42° north, and longitudes 106° and 120° west; and is bounded on the north by Oregon and Washington, on the east by the Rocky Mountains and New Mexico, on the south by New Mexico, and on the west by California.

2. The extent of this Territory, east and west, is from 600 to 750 miles, and its breadth, north and south, about 345 miles. The area is computed at 269,170 square miles, or an area equal to 9.17 per cent. of that of the whole Union.

3. The Wahsatch Mountains divide the Territory into two unequal portions: a hilly country on the east, drained by the Colorado and its tributaries, and a high and generally barren table-land on the west, the drainage of which has no outlet to the sea. The western portion, or, as it is termed, the Great Basin, is bounded on all sides by mountains, is about 500 miles long and 265 miles wide, and has an absolute elevation of between 4,500 and 5,000 feet. Detached ranges traverse it in several parts, and in their highest culminations rise to between 3,000 and 5,000 feet above the general level. The Wahsatch Mountains in some parts attain the snow-line. The country east of these to the Rocky Mountains is even a more sterile region than the western section, and is wholly uninhabitable except in its valleys.

4. In its hydrographical arrangement the country presents several independent basins, and each of these loses its waters in lakes or sinks, none west of the Wahsatch Mountains reaching the ocean. Of these basins the most extensive is that of the Great Salt Lake. This is about 120 miles long, north and south, and from 30 to 40 miles broad, the greater part of its northern extremity being occupied by the great lake itself. The surface is entirely level, but toward the mountains has a gentle rise. The soil is sandy, and frequently incrusted with saline efflorescence, and the waters of the lake are super-saturated with salt.

HOT SPRINGS NEAR GREAT SALT LAKE CITY.

5. The other basins known to exist within the rim of the Great Basin are those of Bear River, Yuab, Utah, Sevier, Sand Pitch, Humboldt, Carson, etc.; each and all of which are more or less characterized by the same peculiarities as that of the Great Salt Lake.

6. The only timber growths are found on the immediate borders of the streams and at the bases of the hills; and cultivation is impossible beyond the reach of irrigation.

7. The largest of the rivers in all this region is Humboldt's River, which rises in the Humboldt range of monntains, and after a course of 300 miles discharges into the lake of the same name. Nicollet River has nearly as long a course, and empties into Nicollet Lake. Bear River comes from Oregon, and is the principal tributary of the Great Salt Lake. The Colorado is formed by the union of Green and Grand rivers. These streams and their affluents drain the entire eastern portion of the Territory, and their valleys form the only habitable sections. Their sources are in the same vicinities which give rise to the Nebraska, Arkansas, and Del Norte.

8. The climate of course depends much on the elevation of the locality, but generally the climate of Utah is milder than that of the Mississippi valley or the Atlantic slope. In the valleys the weather is extremely moderate, and when irrigation is practicable, agriculture is liberally rewarded. The open plains are sterile, perhaps more from the lack of water than from material defect in the soils; in several localities they are grassless, and in others are light and sandy. The vegetation is not dissimilar to that of the same parallels east of the mountains; but does not exist except where moisture is permanent. On the whole, less than one third of the surface is arable.

9. In 1850 the population of the Territory was 11,380 (in 3,325 families), being 0.04 to the square mile, or 0.05 per cent. of the total population of the United States. It was distributed as follows:

Counties.*	Population.	County Seats.	Counties.	Population.	County Seats.	Counties.	Population.	County Seats.
Davis	1,134	Farmington.	Salt Lake	6,157	S. Lake City.	Utah	2,026	Provo.
Iron	360	Cedar.	San Pete	365	Manti.	Weber	1,186	Ogden.
			Tooele	152	Tooele.			

—and besides this there were in the Territory about 12,000 Indians.

10. Of the civilized population 11,330 (99.56 per cent.) were white persons—6,020 males

* Counties erected since 1850—Desert, Green River, Millard (in which is Fillmore, the new capital), Washington, and Yuab.

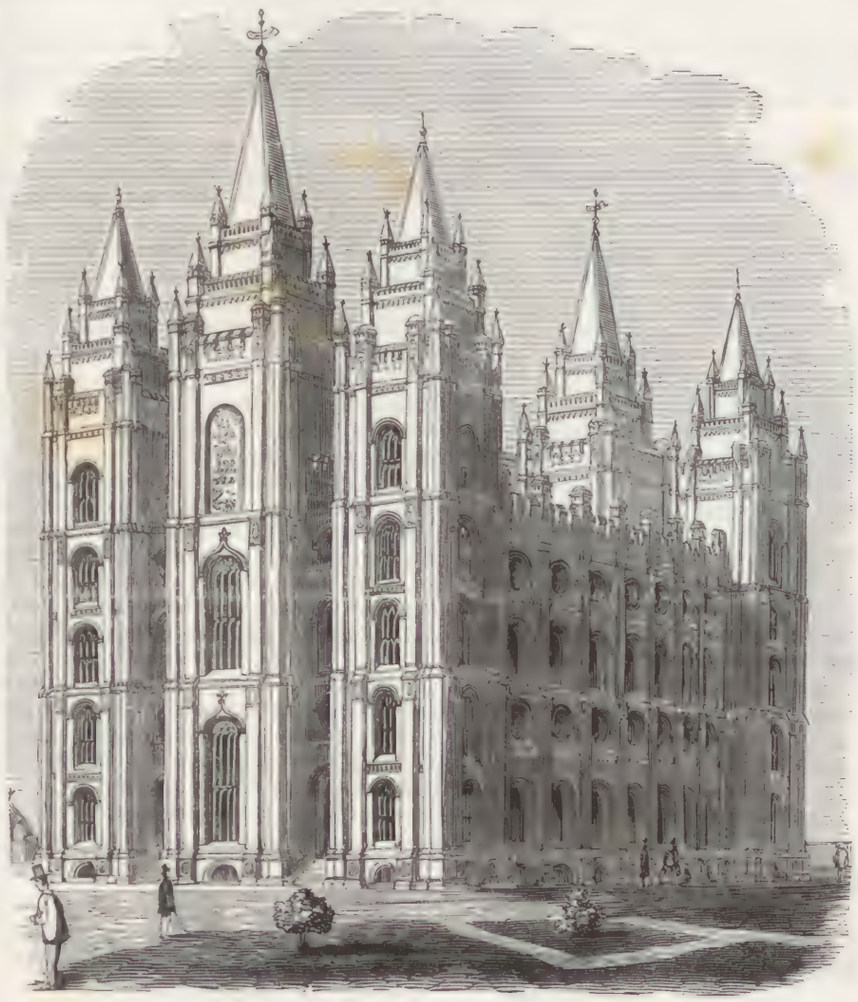
and 5,310 females, 24 were free persons of color—14 males and 10 females, and 26 were slaves—12 males and 14 females: and of the free population 9,355 (82.40 per cent.) were Americans (1,381 born in Utah), 1,990 (17.53 per cent.) foreigners, and 9 whose origin was not ascertained.

11. The occupations of 3,135 males over 15 years of age were as follows—828 were engaged in commerce, trade, manufactures, mechanic arts, and mining, 1,581 in agriculture, 622 in labor not agricultural, 18 in navigation, 26 in law, medicine, and divinity, 48 in other pursuits requiring education, and 12 in government civil service.

12. On the 6th October, 1853, the population was ascertained by census to be 18,206, and in 1855 was 38,716. The increase has been chiefly from European immigration.

13. All branches of industry have been rapidly developed in this Territory. Mines have been opened, manufactures initiated, and the mechanic arts brought into requisition.

14. The principal mining operations are carried on in Iron County, where both iron and coal are mined. This industry has been called into existence since 1850, and though so new, is still a very flourishing branch, and must eventually become a leading occupation.



15. In 1850 the number of farms under cultivation was 926, and the quantity of land taken up by settlers was 46,849 acres, of which 16,333 acres were improved, and the value of farms was estimated at $311,799. The value of farming implements and machinery was $84,288.

16. The livestock consisted of—horses, 2,429; asses and mules, 325; milch cows, 4,861; working oxen, 5,266; other cattle, 2,489; sheep, 3,262; and swine, 914—in all valued at $546,968; and the products of animals were—wool, 9,222 pounds; cheese, 30,998 pounds; and butter, 83,309 pounds. The value of animals slaughtered in the census year was $67,985.

17. The crops consisted of—wheat 107,702, rye 210, oats 10,900, Indian corn 9,899, barley 1,799, and buckwheat 332 bushels; potatoes—Irish 43,968, and sweet 60 bushels; hay, 4,805 tons; peas and beans, 289 bushels; flax, 550 pounds; tobacco, 70 pounds; hops, 50 pounds, etc.; and the value of market-garden products was $23,868. Home-made manufactures were valued at $1,392.

18. The capital invested in manufactures and the mechanic arts in 1850 amounted to $44,400; the raw material consumed in the year preceding was valued at $337,381; hands employed, 51; and the products of the year amounted to $291,220.

19. The natural port of Utah on the Pacific is San Diego, and on the Gulf of Mexico, New Orleans. The mountains in both directions, however, limit its communication and nullify any expectation of an appreciable commercial intercourse with foreign countries. Immigrants from foreign countries have usually come by way of New Orleans.

MORMON TEMPLE, GREAT SALT LAKE CITY.

20. Utah lies on the great highway between the Atlantic and Pacific, and through this Territory a line of railroad must eventually be carried. The route proposed is that through the South Pass of the Rocky Mountains and thence by the Great Salt Lake to one of the passes of the Sierra Nevada. The practicability of such a line has been demonstrated; but the difficulties of the surface and the enormous cost involved must indefinitely postpone the accomplishment of the work. Internally, Utah has made considerable progress in the opening of roads.

21. The census of 1850 returns nine churches, capable of accommodating 4,200 persons, and valued at $51,000. This is the Mormon Church or *Church of Jesus Christ of the Latter Day Saints*—a peculiar organization, and embracing within its communion the great body of the people. The school has not been neglected, and already the basis of a regular system of education has been established; and a university has been liberally endowed by the general government. The census of 1850 returned 13 public schools, 13 academies and private schools, and one college; and these were attended by 2,035 scholars. Of the total adult population only 154 were returned as unable to read and write.

22. The "City of the Great Salt Lake" is the metropolis of Utah, and was formerly the capital. It is situate on the east bank of the strait connecting lakes Utah and Great Salt,

GREAT SALT LAKE CITY.

about 20 miles south from the latter, and 4,300 feet above the sea-level. It was founded July, 1847, by the first Mormon immigrants, and has since been laid out on a magnificent plan. It contains the Great Temple, etc., and contained in 1855 about 10,000 inhabitants.

23. Fillmore, the present capital, is situate on a branch of Nicollet River, about 145 miles south, and contains a handsome government-house of red granite.

24. The other settlements are—Manti, on another branch of the Nicollet, 43 miles north-east; Parowan and Cedar City, about 100 miles south-southwest of Fillmore; Nephi, Provo, Lehi, Farmington, Ogden, Brownsville, etc., all in the neighborhood of the great lake; and there are minor settlements in most of the isolated valleys.

25. The Territory now called Utah formerly constituted a portion of the Mexican province of California Alta, and as such passed into the possession of the United States by the treaty of Guadalupe Hidalgo, 2d February, 1848. Previous to the Mexican war, few white men, except those engaged in scientific explorations, had entered the country. About the period that the war had broken out, the Mormons were driven from their city of Nauvoo, in Illinois, by mob violence, and shortly afterward emigrated to the borders of the Great Salt Lake. Their settlements became prosperous and populous, and within two years after the first pioneers had entered the country their numbers had increased to about five thousand.

26. After the ratification of peace, they found themselves without a government and without protection for person or property. To remedy this anomalous condition of the body politic, a temporary government was organized under the style of "The State of Deseret," and under its sanction the usual government officials were elected. But the ultimate destiny of the country belonged to Congress, and that body, during the session of 1849–50, remanded the State back to a territorial condition under its present title.

27. For several years the officers of the territorial government were appointed from among the residents, and so far all was well. But subsequently the general government thought fit to change this policy and set over the people officials of whom they knew nothing, and whose conduct would appear to have been at least inimicable and rash. The consequence was general dissatisfaction and finally rebellion. In 1857–8, however, a military expedition was sent against the inhabitants, which "conquered a peace" without bloodshed, and compelled the people to submit to the laws of the United States.

28. This Territory it is now proposed to divide into two governments. The Territory of Nevada, as proposed, would include all those portions of Utah west of a line drawn on the 114th meridian. The organization of this new Territory will probably be settled by the Congress to assemble in December, 1858.

STATE OF CALIFORNIA.

1. California is situated between latitudes 32° 20′ and 42° north, and longitudes 114° 20′ and 124° 25′ west; and is bounded on the north by Oregon, on the east by Utah and New Mexico, on the south by Lower California, and on the west by the Pacific Ocean.

2. Measured diagonally, northwest and southeast, the length of this State is about 800 miles. The width east and west is greatest on the 35th parallel, and least on the latitude of San Francisco; the mean breadth may be stated at 230 miles. The area is computed at 155,980 square miles, being 5.32 per cent. of the total of the United States.

3. The characteristic features of California are determined by the two great ranges—the Sierra Nevada and the Coast Range—which traverse it northwest and southeast. Between these is the splendid valley of the Sacramento and San Joaquin; to the east wide, sandy plains, and to the west a comparatively narrowed slope to the Pacific, on the south watered by the Salinas and numerous smaller streams, and on the north by Russian, Eel, and Klamath rivers.

4. The coast, which has a length of about 1,200 miles, is generally rugged and precipitous. Beginning at the south, it makes a bold semicircular sweep to the northwest as far as Point Conception. Off this part of the coast there are numerous small islands and rocks, and the line is indented by several bays and harbors. The only valuable one of these is San Diego Bay, in latitude 32° 41′ north. The bay itself is spacious, and forms an excellent harbor. The harbors of San Pedro and Santa Barbara are also available for craft of moderate tonnage.

5. From Point Conception the coast trends north-northwest to Point Pinos, the south extremity of Monterey Bay, one of the safest and most capacious harbors on this coast. From Monterey Bay it continues as before for about 70 miles, in a direct line, to the almost unrivaled bay of San Francisco, the entrance to which is only about a mile wide. Beyond this strait the bay opens out for more than 30 miles, both on the right and left; its entire length is 70 miles, with an average breath of 8 miles and a coast-line of 275 miles. By projections of the coast several small inner bays are formed, the principal being those of San Pablo and Suisun. This harbor is the natural outlet of the valley of the Sacramento and San Joaquin.

6. Beyond San Francisco Bay is Port Bodega, where was formerly a Russian station. Thence the coast continues in the same northwest direction, but less broken than before, to Point Delgado, beyond which is formed the bold headland of Cape Mendocino in latitude 40° 21′ north. This forms the southern point of Trinidad Bay, in which the coast of California terminates, on the 42d parallel. Between Cape Mendocino and the north boundary the only points of interest are Humboldt's, Trinidad, and Klamath harbors.

7. The mountain masses which constitute the peninsula of California Baja extend undivided into the State of California as far north as the snow-capped peak of San Bernardino, 34° north latitude, where they divide into the two great ranges already mentioned. These ranges both run in a northwestern and generally parallel direction.

8. The eastern range, called the Sierra Nevada, is by far the loftiest, many of its peaks being above the snow-line—Saddle Peak 7,200 feet high, the Table Mountain 8,000, the Butte 9,000, Mt. St. Joseph about 10,000, and Mt. Shasta, at the northern extremity of the range (41° 34′ north latitude), 14,390 feet above the sea. This range is opened by few, and those very elevated passes. North of 39° its slopes, especially on the west side, have vast forests of pine, and, lower down, oak.

9. The Coast Range runs at a short distance only from the ocean, to which it is generally parallel. Its average height varies from 2,000 to 3,000 feet—its highest peak, Monte Diavolo, at the head of San Francisco Bay, is 3,770 feet above the sea. This range is broken near Monte Diavolo by the united Sacramento and San Joaquin rivers; decreases in altitude toward the north, and finally reunites with the Sierra Nevada near Mt. Shasta. From this point northward the country is wholly mountainous, the Sierra Nevada with its offsets and connecting ranges occupying the entire breadth of northern California, and extending northward till it is lost in the Cascade Range of Oregon.

10. Between the Sierra Nevada and the great valley is a line of lower mountains; and both from the Sierra Nevada and the Coast Range lesser lateral ranges and offsets diverge, forming numerous narrow valleys and ravines.

11. The basin included between the two great ranges, though really one geographical formation, bears the name of the Sacramento and San Joaquin valley, from the rivers which rise respectively at its northern and southern extremities. This fine valley is upward of 500 miles long and 50 miles wide, and has evidently at some remote period been the bed of a vast lake, the waters of which have been released from their mountain prison by some convulsion of nature, having broken through the Coast Range at San Francisco Bay.

12. The surface of this valley is much diversified, being broken into rugged hills at its northern end, and in many places along its eastern side by well-wooded spurs from the Sierra. Toward the south, near the Tulare lakes, and along the banks of the two great rivers, it is low and level, rising gently into undulating slopes, which break into low hills as they approach the mountains. The richest and most picturesque part of the valley is that central portion of it which incloses San Francisco Bay and the delta.

13. The district west of the Coast Range—almost the only part of California inhabited previous to the American occupation—is full of narrow fertile valleys. Along a part of the coast the mountains come close down to the sea; but along a still larger portion there extends a tract of low sand-hills, which in some places reach many miles inland. The country east of the Sierra Nevada is mostly level, and much of it sandy and barren. Its character, however, is little known; but along the Colorado it is supposed to have a rich alluvial soil.

14. The two most important rivers are the Sacramento and San Joaquin. The Sacramento rises at the northern extremity of the great valley, its head streams issuing chiefly from Mt. Shasta and some of its spurs. Its affluents are many from the Sierra Nevada, and though mostly mere mountain torrents, some of them, as the Feather, the American, the Cosumes, and San Juan rivers, are of some importance. Near Monte Diavolo the Sacramento receives the San Joaquin, and the united river turns abruptly to the west, and soon after expanding opens into San Francisco Bay. The San Joaquin issues from the Tulare lakes. Its course is north and northwest, and, like the Sacramento, it receives numerous tributaries from the Sierra. During the wet seasons these rivers are subject to great floods, and the San Joaquin frequently floods much of the low land on its borders. The Sacramento is navigable at all seasons to the city of the same name, 150 miles from its mouth—the San Joaquin, above Stockton, has sufficient water for only very small craft.

15. The Colorado, the lower part of which drains the southeastern portion of the State, and which falls into the Rio Gila, is navigable for vessels drawing six or seven feet of water.

16. Along the coast are numerous rivers which rise in the Coast Range and after a short course fall into the Pacific. Many of them are of considerable value for irrigation, and may at some future period be rendered available for mechanical purposes; but none are navigable.

17. The Sierra Nevada with its connected ranges has for its substratum schistose and talcose slate; and, superimposed, are strata of quartziferous rocks. In many places a fine white quartz granite occurs. In the Coast Range quartz also abounds. Sandstone is found throughout the lower ranges of hills.

18. What is known as the Gold Region extends for some 500 miles in length, with a breadth of 40 or 50 miles, following the range of the Sierra Nevada. It occupies the lower mountains of that range lying between the central mountains and the valley of the Sacramento and San Joaquin. These mountains average from 4,000 to 5,000 feet in height; and the gold is generally found either in the gullies and ravines or in the sandy beds of the streams on their way toward the two great rivers. Wherever the gold has been found *in situ* it has been in connection with quartz. Gold has also been found in the loftier central heights of the Sierra, and on its eastern side; and also in the Coast Range and the streams flowing from its western slope.

19. Nor is gold the only important metal which abounds—quicksilver and incidentally silver are also abundant, and copper, iron, etc., have been discovered. Bituminous coal is abundant near San Francisco and San Diego, and probably in other places.

20. California has a dry and wet season, corresponding nearly with the summer and winter seasons of the Atlantic. But there are considerable variations, both in the temperature and in the amount of moisture. North of latitude 39° the air during the dry season is much less parched, and rains occur earlier than in the southern districts. Along the coasts the climate is much more temperate than in the great valley, while east of the Sierra the atmosphere is excessively hot and dry. Heavy fogs visit the coast in summer, and a cold wind sets in regularly toward noon from the sea and continues to blow with increasing force and keenness till late at night. Some few miles inland the cold is modified, and the temperature becomes equable and agreeable. Throughout the great valley the mid-day heat is so great as to render labor in the open air very unpleasant and oftentimes impracticable. The soil along the valley is generally extremely rich, and needs only judicious irrigation to make it produce almost every variety of crop.

21. Tobacco, rice, maize, and most of the plants, except cotton, which grow in the warmer parts of the Union, flourish in the sheltered lateral valleys, while in the main valley itself most of the cereals produce extraordinary crops, and grapes, peaches, etc., thrive admirably. The grasses are luxurious and nutritious, affording excellent pasturage. North of 39° are extensive forests of pine and oak. The valleys along the coast produce all the cereals and all or nearly all of the fruits and vegetables of the temperate zone.

22. The native animals are generally of the same species as those inhabiting the eastern section of the States, and many are valuable for their skins, as bears, badgers, ermines, weasels, mink, marten, wolves, foxes, etc. Deer of various kinds are plentiful, and mountain sheep abound. The buffalo is only occasionally met with. Of birds, both land and aquatic, there is abundance. The great Californian vulture is inferior only to the South American condor in size; and eagles, vultures, bustards, etc., are more or less common. The bays and inlets of the coast swarm with water-fowl, and among these are frequently seen the pelican and the albatross. The waters teem with fish. Salmon, salmon-trout, sturgeons, mackerel, pilchards, etc., are found in the rivers or estuaries, and also the halibut, skate, turbot, bonito, etc. Shell-fish abound. But though fish is so abundant, the fisheries at present form no part of the industrial economy of the State.

23. According to the census of 1850 California contained 92,597 inhabitants, being 0.59 to the square mile, and 0.4 per cent. of the total population of the Union. This census was very incomplete, and a new one was ordered to be taken in 1852, which gave a total of 255,122 inhabitants, or 1.63 to the square mile. Of the population in the latter year, 171,841 were whites, 2,206 colored persons, 31,266 Indians, and 49,809 Chinese, etc.

24. The population of the counties as returned at the two periods was as follows:

Counties.	Population. 1850.	Population. 1852.	County Seats.
Butte	3,574	6,429	Hamilton.
Calaveras	16,884	20,183	Moquelumne Hill.

Entered according to Act of Congress in the Year 1858 by J. H. Colton & Co. in the Clerks Office of the District Court of the United States, for the Southern District of New York.

increased, chiefly by Chinese immigration.* In 1855 the total was estimated at 327,879, and in 1857 at 507,067.

25. The prominent industry of California is gold-mining; but this is by no means the only employment of the people. Agriculture has also become a leading pursuit, and great advances have been made in manufactures. Manufacturing industry, however, is as yet chiefly applied to the production of machinery for marine and mining purposes, and hence the general wants of the State in this connection are still supplied from the older States and Europe. It may be said, nevertheless, that few States have so abundantly the resources of a national industry, or so unequivocally the means in power and wealth to develop them; yet it is evident that so long as riches can be rapidly amassed in one or two pursuits, that others more intricate and costly in their prosecution will not be engaged in; nor is this state of facts to be lamented, since it lays the foundation of a broad connection with the commercial world, and is the prime cause and means of distributing its own peculiar product.

GOLD DIGGING.

26. Mining, as before stated, is the chief pursuit. The metals principally obtained in California are gold and indirectly silver and quicksilver. The value of gold produced and manufactured for export since 1848, the year of its first discovery, to the ending of 1857, has been estimated at $416,000,000—thus, annually:

1848.....	$5,000,000	1850.....	$45,000,000	1852.....	$46,000,000	1854.....	$52,000,000	1856.....	$51,000,000
1849.....	20,000,000	1851.....	48,000,000	1853.....	55,000,000	1855.....	45,000,000	1857.....	49,000,000

—of this amount $383,873,099 had been coined at the United States mints, and the remainder absorbed in direct exports to foreign countries or retained in the State. The gold is chiefly obtained from surface washings, but already a large amount of machinery is employed in quartz mining; and, in connection with this industry, several hundred miles of canals and ditches had been constructed. The average amount of quicksilver obtained annually is about 22,000 flasks, each weighing 75 pounds, and the total amount† produced since the discovery of the New Almaden mines to the end of 1857 was estimated at 111,933 flasks. The other minerals known to exist, with the exception, perhaps, of coal, have not as yet become objects of industry.

27. Agriculture is in no less flourishing condition than mining. Until the harvest of 1854 the great portion of breadstuffs were imported from Chili and the United States; but from that period the products have been ample or even more than sufficient for the population. Of wheat not less than 3,000,000 bushels were raised, and of barley not less than 4,000,000 bushels. Corn and oats were also largely grown, and the potato and other culinary vegetable crops were abundant. In the southern counties the grape and pear crops were exceedingly large. Upward of half a million heads of cattle are found at pasture.

28. The present manufactures of the State do not extend to the textile fabrics, nor yet to the many minor branches so essential to civilization. But its manufacturers, machinists, mechanics, and builders find ample employment in supplying the immediate necessities of commerce and domestic industry. In fact, many of the steamers and other vessels navigating the waters of the State, and most of the machinery used by the miners, have been constructed by resident mechanics; nor is progress less marked in the rapid improvement of the cities—in the construction of wharves, warehouses, stores, and dwellings, many vieing in extent, architectural beauty, and solidity with those of states numbering centuries of civilized existence.

29. Commerce,‡ as a necessary consequence of the progress and prosperity of the people in other departments of industry and general wealth, has maintained its legitimate station among the great industrial interests of the State. Dating its organization scarce ten years since, the foreign commerce of California, bearing necessaries and luxuries from every clime and exchanging them for its gold, stands unrivaled in the history of the past, and presages the proud position it is destined to occupy as a commercial State; and situated as it is on the confines of the continent, midway between the Indies, Asia, and Europe, such a State can not fail to take a lead among the nations of the world. Already California has outstripped many of its sister States in its commercial aggregates.

30. Nor is the State deficient in domestic or internal commerce. Supplies for the mines are carried in hundreds of steamers and sailing craft on the rivers and bays, and the same highways are those used chiefly by the people in their movements. Inland travel between all the principal towns is also effected by means of stages, which run regularly. But these facilities are unequal to the accommodation of the commercial activity of the people, and hence the railroad is about being inaugurated, and already the electric telegraph is in successful operation.

31. To accommodate the wants of a people situate as now in isolation from the old States, and accessible only by sea or a laborious overland route, other and more facile means of communication are needed. To supply this a railroad or other great highway must necessarily be built across the continent, or one to connect with those already built or in progress between the Atlantic and the Mississippi. This great improvement is now demanded, and already surveys have been made, opinions on various routes elicited, and the aid of Congress in the construction of the work applied for. Owing, however, to the magnitude of the undertaking, and the known obstacles to be encountered, nor less to the political questions involved, many years must elapse before this desirable and highly important project will be finally consummated. But until this great work shall have been completed, and overland travel rendered expeditious and secure, the establishment of military posts along the routes of travel is of vital importance, and from the aid these might give to immigrants in protecting them from the Indians, and in supplying them in times of need, immigration would be greatly encouraged, and the general prosperity of all the States of the Union advantageously promoted. To California these measures are essentially matters of the highest account.

32. The constitution secures the right of voting to every white male citizen 21 years of age, and a resident six months in the State. All elections are by ballot. The legislature consists of a senate and assembly, and convenes annually on the 1st Monday in January. Assemblymen, not fewer than 30 nor more than 80, are chosen for one year; and senators, in number not less than one third nor more than one half of that of assemblymen, for two years, one half annually. The governor is elected by a plurality of votes for two years. The lieutenant-governor is *ex officio* president of the senate. Administrative officers, except the secretary of state, who is appointed by the governor, the senate concurring, are also elected for the same period.

33. The judiciary consists of a supreme court, district courts, county courts, and justices of the peace. The supreme court has a chief-justice and two associate justices, who are elected for six years. It has jurisdiction in all cases exceeding $200, and in all criminal cases amounting to felony, or questions of law alone. District courts (the judges of which are elected for six years) have original jurisdiction in law and equity in all cases exceeding $200, and in all criminal cases not otherwise provided for, and in all issues of fact joined in probate courts. The county court consist of a judge elected for four years, who performs also the duties of surrogate, and with two justices of the peace holds courts of session. Tribunals of conciliation may be established.

34. In 1852 the total taxable property in the State was valued at $56,982,320, and in 1857 at $131,806,268. The total income derived from taxes and other sources in 1857 amounted to $1,152,234, and in the same year the expenditures amounted to $699,803. The public debt in December, 1857, amounted to $3,702,365. The principal institutions supported wholly or in part by the State are the Lunatic Asylum at Stockton, and the State Prison at St. Quentin, 10 miles north of San Francisco.

35. The common school system of California was organized in 1852, and during the year 11,252 scholars were registered. In 1857 the State contained 357 common schools, with 483 teachers and 35,722 scholars. This branch of education is endowed with 16,836 sections or about 6,000,000 acres of land. A State University and other colleges have been founded.

36. San Francisco, the commercial metropolis of the State, is situate on a narrow neck of land, between the bay of the same name and the Pacific Ocean. Latitude 37° 47′ 35″, and longitude 122° 26′ 15″. It was founded by the Spaniards about the year 1776, and called Yerba Buena; but before the war with Mexico it never contained more than 500 inhabitants. In 1848, on the discovery of gold, it became the rendezvous of the miners and the depôt of a vast commerce, at the same time rapidly increasing in population and wealth. In 1850 it was incorporated as a city, and contained, according to estimate, about 20,000 inhabitants. In 1852 the population was ascertained to be 34,876. In 1850 there were only three brick houses in the city: in June, 1854, it contained 626, many of them substantial edifices of three, four, and five stories; and the population was estimated at between 40,000 and 50,000.

STREET IN SAN FRANCISCO.

37. The principal edifices are the Custom House, Mint, Marine Hospital, several theaters, and the Musical Fund Hall. The business portion of the city is that facing the harbor. In 1854, 1,028 vessels (555,794 tons) entered the port, and 1,691 (635,484 tons) cleared. The shipping owned in the port amounted to 93,519 tons, of which 46,263 tons was registered shipping. Semi-monthly communication is kept up with the Atlantic ports by steamers. The flux and reflux of population is thus regularly provided for, and an active commerce maintained.

38. The population of the city is singularly hybrid, and consists of representatives of all nations, among which are conspicuous the natives of China, who form a large moiety of the whole. The city is governed by a mayor and court of aldermen, and has an efficient police; but nevertheless is one of the most profligate cities of the world. San Francisco, however, is a wonderful place: in a few years it has risen from an insignificant village to a splendid city of palaces, and to be the center of a world-wide commerce.

* The arrival of Chinamen in California has been as follows—in 1849—323, in 1850—447, in 1851—2,716, in 1852—28,434, in 1853—4,316, in 1854—15,063, and in 1855—3,212. The State legislature has recently passed a law to prevent this immigration.

† Quicksilver (flasks) produced in 1853—18,800, in 1854—20,963, in 1855—27,165, in 1856—23,740, and in 1857—21,265.

‡ The following table comprises the official returns of the foreign commerce and navigation of California since its occupation by the United States:

Years.	Commerce. Exports. $	Commerce. Imports. $	Navigation. Entrances. Tons.	Navigation. Clearances. Tons.	Shipping owned. Sailing. Tons.	Shipping owned. Steam. Tons.	Shipping owned. Total. Tons.	Shipping Built. Tons.
1850	No returns.	No returns.	130,864	180,128	17,500	91	17,591	—
1851	No returns.	13,531	258,128	430,170	53,307	5,129	58,436	69
1852	No returns.	4,648,587	261,352	360,872	96,222	5,421	101,653	—
1853	No returns.	101,312	258,028	446,501	97,662	6,547	104,209	137
1854	3,423,245	8,407,701	221,186	432,846	97,447	3,810	101 2 7	124
1855	8,224,066	5,951,879	180,933	328,117	77,984	14,279	92,235	334
1856	10,718,074	7,298,839	171,140	308,258	69,322	14,369	83,691	99
1857	14,435,901	9,137,414	151,623	262 976	72,634	11,916	84,550	950

—no returns were made for 1848-9, and only partial and informal returns until 1854. The above is an abstract of all that appears in the Treasury Reports.

The great bulk of the commerce of California is with the States east of the Rocky Mountains, and which is conducted *via* the Isthmus. Of this, however, we have no uniform official returns, and generally only the returns of gold and quicksilver exported. But who can doubt of its being five times the value of its foreign trade?

39. There are numerous other towns on the margins of the bay, but of these none require special mention except Benicia and Vallejo, on the north shore, which were successively capitals of the State.

40. In 1853 the government removed to Sacramento City, on the left bank of the Sacramento River, about 150 miles from San Francisco. It is a substantial place, and as a commercial town is only second in importance to San Francisco, being the interior depôt of the mines. Steamboats of large size navigate the river to this point, and boats of less dimensions ascend much farther north. The site is low, and a levee has been built to prevent its inundation. In 1852 it contained about 10,000, and now (1855) has probably 20,000 inhabitants.

41. Marysville, near the confluence of the Yuba and Feather rivers, and about 20 miles above the junction of the latter with the Sacramento, is another important mining town. It contains between 8,000 and 9,000 inhabitants. The other more important places in the northern mining region are—Downieville, Nevada City, Yuba City, Nicolaus, Auburn, Colloma, etc. The most northern place in the valley is Shasta City, on the head-waters of the Sacramento.

42. Stockton, on the San Joaquin, near its confluence with the Sacramento, is the chief depôt of the southern mines; and on tributaries of the San Joaquin are several important towns, as Moquelumne Hill, Sonora, Mariposa, etc., and a large population is collecting about the Kern River, at the southern extremity of the great valley.

43. The principal places west of the Coast Range, and chiefly on the Pacific shore, are—San Diego, which has an excellent harbor; Los Angeles, the largest town of Mexican California; Santa Barbara, San Luis Obispo, Monterey, Santa Cruz, and San José, all south of San Francisco, and originally mission stations. North of San Francisco are—San Rafael and Sonoma, and beyond Cape Mendocino several settlements in the vicinity of Humboldt's Harbor and the Klamath River. Crescent City, on Point St. George, is the most northern town in California.

44. California was visited as early as 1570 by Sir Francis Drake. This great navigator on his return reported his conviction that there was "no part of the country wherein there is not some special likelihood of gold." Yet though his statement was frequently repeated by subsequent voyagers, no search seems to have been made for the precious metal. The Spaniards were also well informed as to the existence of gold in the country.

45. Under Spain the history of California is only interesting on account of its missions, and its population consisted mainly of Indians and the priests and servitors attached to these establishments. When Mexico threw off the Spanish authority and became a federal republic, California, not having a sufficient number of inhabitants to form a State, was erected into a Territory, and as such embraced the whole region west of New Mexico and north of California Baja and Sonora.

46. Thus matters stood until 1844 or 1845, when parties from the United States began to move into the Territory; and eventually these, on the breaking out of the war between Mexico and the United States, took possession of the country. At the peace of Guadalupe Hidalgo, 2d February, 1848, it was ceded to the Union. About this time the opinion of Drake was verified—gold was discovered; and on information of the event reaching the the Atlantic, a mighty emigration commenced, not only from the old States, but also from Europe and Asia, which has since continued. The country rapidly filling up, the military government which had been instituted by the home authorities was superseded by one based on a constitution, promulgated by a convention on the 13th October, 1849. Thus California became a State, and as such was admitted into the Union on the 9th September, 1850, but with its original limits diminished by the formation of the territories of Utah and New Mexico.

47. In 1858 the population of the State was decimated by the sudden emigration of 50,000 miners to the gold-fields of Fraser River, in New Columbia.

STATE OF OREGON.

1. Oregon lies between latitudes 42° and 46° 18′ north, and longitudes 116° 40′ and 124° 30′ west; and is bounded on the north by Washington Territory, on the east by the Shoshone Territory (formerly the eastern section of Oregon and now temporarily attached to Washington Territory), on the south by California, and on the west by the Pacific Ocean.

2. This State forms an irregular parallelogram with an average extent east and west of 380 miles, and north and south of 270 miles; and its area is computed at 102,600 square miles, or 3.49 per cent. of the whole area of the Union.

3. Oregon, as a Territory, extended from the Pacific Ocean to the Rocky Mountains: its limits eastward are now the Snake River or Lewis' Fork of the Columbia. Within this extent are found three distinct physical regions, the limits of which are demarked by the Cascade Range and the Blue Mountains.

4. From the ocean to the Cascade Mountains the land has a breadth varying from 80 to 150 miles; and this section is the only really agricultural portion of the State. It includes the valleys of the Willamette, Umpqua, and Rogue rivers, all of which have their origin in the mountains. The valley of the Willamette which runs from south to north occupies about two thirds of this region, and opens into the valley of the Columbia. The Umpqua and Rogue have transverse valleys and empty into the Pacific Ocean. The highest peaks of the Cascade, or as they are sometimes called the Calapooya Mountains, are Mt. Hood (18,361 feet), Mt. Jefferson, and Mt. Pitt or McLaughlin.

5. The country between the Cascade and Blue mountains consists of the valleys of Fall River, a tributary of the Columbia which occupies the north, and that of the Klamath which runs into California and empties into the Pacific in 41° 38′ north latitude. The two valleys are separated by a transverse range which connects the two north and south ranges. Besides these there are also several smaller independent valleys. Otherwise the whole region is full of hills, and has not improperly been called the pastoral section.

6. Eastward of the Blue Mountains the country is wild, sterile, and impracticable, covered with mountain ranges and isolated buttes, and for the most part is apparently valueless for any industrial purposes. In a few of the valleys which are subsidiary to the great valley of the Snake there are sections of great fertility, but generally the scene is uninviting. The same character belongs to the country eastward to the Rocky Mountains.

7. The Columbia, the great river of Oregon, is navigable for sea-going ships from the ocean to the Cascade Range about 130 miles, and for boats for several hundred miles farther. It rises in and drains the whole slope of the Rocky Mountains from the 42d to the 49th parallel, and with its branches the whole country westward to the immediate coast hills. Its principal tributaries in this State are the Willamette and Fall rivers, and its great southern arm the Snake forms its eastern border. The Willamette is navigable to the falls at Portland.

SALMON SPEARING.

8. The mountains of Oregon have the same geological formation as those of California, and are probably as full of gold. This metal has been found in the rivers emptying into the Pacific, and also in the Klamath valley. Coal is also found in the valley of the Willamette. The soils of the section west of the Cascade Mountains and of all the valleys is deep and rich, and the climate much more mild than in the same latitudes in the Atlantic States. Timber grows on the hills and mountains to a vast size, and consists of all the useful varieties as oak, pine, maple, etc.

9. Speaking of the physical condition and resources of this country, Governor Whittaker in his inaugural delivered on the 6th July, 1858, thus discourses: "Oregon is probably one of the most attractive portions of the North American continent; at once beautiful and picturesque, with a healthy and salubrious climate, well adapted to the production of all the cereals; a sea-board of some 300 miles, with numerous harbors and inexhaustible fisheries; arable land sufficient to supply three millions of souls with bread; grazing land sufficient to supply twice that number with meats; probably no country better adapted to the production of wool, flax, and hemp, and it is admitted that Oregon excels in her growth of fruit; her mountains are covered with the finest of timber and underlaid with gold, and recent discoveries show that we are not without a goodly supply of lime and coal; her streams afford some of the best water privileges in the world, and her rivers are navigable for steamboats at all times of the year."

10. In 1850 Oregon contained 12,093 inhabitants, and in 1853 a State census gave it at 33,324. In 1858 it was estimated at 80,300, namely, 75,000 white persons, 5,000 Chinese, and 300 colored persons. In the mean time the value of taxable property had risen from $5,063,474 to $18,463,772.

11. The counties with the principal towns in each are as follows:

Benton	*Corvallis*, Jennyopolis, etc.	Linn	*Burlington*, Albany, Syracuse, etc.
Clackamas	*Oregon City*, Canemah, etc.	Marion	Salem, Buttervile, Parkersville, Santiam City, etc.
Clatsop	*Astoria*, Lexington, etc.	Multnomah	*Milwaukee*, etc.
Columbia	*St. Helens*, Rainer, Milton, etc.	Polk	*Dallas*, Eola, Independence, etc.
Coose	*Port Orford*, Crescent City, Empire C., etc.	Umpqua	*Umpqua City*, Scottsburg, Elkton, etc.
Douglas	*Winchester*, Canyonville, etc.	Wascopen	——.
Jackson	*Jacksonville*, Dardanelle, etc.	Washington	*Hillsboro'*, Portland, Linn City, etc.
Killamook	——.	Yam Hill	*Lafayette*, Dayton, Willamette, etc.
Lane	*Eugene City*, etc.		

—and new counties and cities are being constantly established.

12. Salem, the State capital, is situated on the right bank of the Willamette, 98 miles from its mouth. It is a thriving place of 1,200 inhabitants. Oregon City, 53 miles above Salem and on the same river, has about 1,000 inhabitants. The falls at this point afford excellent water-power. It was formerly the capital of the Territory. Portland, 12 miles below Oregon City, is the principal commercial port of the State, and contains 2,000 inhabitants. The State Prison is located here. St. Helens is a thriving town at the confluence of the Willamette with the Columbia.

12. The other principal towns on the Willamette are—Milwaukee between Portland and Oregon City; Linn City opposite the last named; Cincinnati opposite to Salem; Santiam City and Syracuse on the Santiam, a tributary; Albany six miles south of the latter, and on the main Willamette; Marysville and Eugene City still farther south. All these are well located for trade, and have good facilities for manufactures.

PORT ORFORD.

13. On the Umpqua there are the towns of Umpqua City, Winchester, Scottsburg, Providence, etc. Umpqua City is located on the north estuary of the Umpqua, and has a fair harbor. On Rogue River and its tributaries there are also several thriving places settled by miners, and at Cape Orford there is a town of the same name.

14. Astoria is a noted settlement near the mouth of the Columbia. It was founded by the Pacific Fur Company in 1811, and takes its name after John Jacob Astor, the celebrated millionaire, who was the chief proprietor in the company. It is now a place of only secondary consideration in the State.

15. The Columbia River was first entered by Capt. Gray, of Boston, on the 11th May, 1792. The Spaniards and English had been on the coast many years before, and had even made settlements for trading purposes; but on this discovery the United States based a general claim to the whole country watered by the river.

16. In 1804–5–6 Lewis and Clarke explored the country from the mouth of the Missouri to the Pacific, and spent the winter of 1805–6 at the mouth of the Columbia, and in 1811 the Pacific Fur Company built Fort Astoria, which during the war that ensued shortly after was taken by the British. The fort, however, was restored in consequence of a general provision in the treaty of peace; and in 1818 the United States and England, by the convention of London, agreed to a mutual occupancy of the whole country, which agreement was renewed in 1828, with a proviso that it should be determined by either party on giving one year's notice to the other.

17. Many citizens of the United States had settled in this Territory, and during the presidency of Mr. Polk it was thought advisable to terminate the joint occupancy and mark the boundaries between the British and American countries. The subject became a partisan then, and engendered a vast amount of high talk on both sides of the Atlantic. At length, however, the subject was settled by making the 49th parallel the boundary between the two sovereignties, and so it remains to the present day.

18. On the 14th August, 1848, the American portion was erected by Congress into the Territory of Oregon, and soon after a government was established. On the 2d March, 1853, the Territory of Washington was divided off from Oregon, and included all that portion of the Territory lying north of the Columbia and the parallel 46° north latitude. The progress of these Territories has since been rapid, and that of Oregon has repeatedly asked to form itself into a State of the Union. On the 18th April, 1858, a bill for this purpose passed the United States senate, but for want of time was not acted upon by the house of representatives. Under the supposition, however, that it had become a law, the State government was inaugurated on the 6th July following. Under the new regime the eastern portion of the Territory is temporarily attached to Washington Territory.

TERRITORY OF WASHINGTON.

1. Washington is situated between latitudes 45° 32′ and 49° north, and longitudes 111° 54′ and 124° 40′ west; and is bounded on the north by De Fuca's Strait and British Columbia, on the east by the Rocky Mountains, on the south by the Shoshone Territory (attached to Washington) and the State of Oregon, and on the west by the Pacific Ocean.

2. The average extent of the Territory north and south is about 200 miles, and east and west about 580 miles. The area is estimated at 123,022 square miles, or 4.19 per cent. of the whole United States.

3. The Pacific coast of Washington is more broken in upon by arms of the sea than that of Oregon. Commencing at the mouth of the Columbia, which here forms a large bay, the seaward limit of which is Cape Disappointment, and proceeding north we come to Shoalwater Bay, and near the 47th parallel to Gray's Harbor, the latter of which receives the Chehalis River. From this point northward to Cape Flattery the coast is little indented. The Strait De Fuca, which lies between this Territory and the island of Vancouver, connects an extensive inland basin, including Puget's Sound, Hood's Canal, and Admiralty Inlet with the Pacific. These are arms of a great bay extending between the southeast coast of Vancouver's Island and the mainland, and together form an immense line of water communication, extending 70 or 80 miles into the land, the whole being studded with numerous large and small islands, capable of the most profitable cultivation. The banks are everywhere precipitous, and so oblique below the water-mark that the largest ships may lie close in shore.

4. Otherwise Washington belongs mostly to the basin of the Columbia, and in common with Oregon enjoys the advantage of having the main stream of that great river on its immediate border. The whole country east of the Cascade Mountains belongs to this basin, but is subdivided into numerous minor basins by mountains which traverse it in various directions, and by offshoots of the Rocky and Cascade mountains. In the middle of this region is the great plain of the Columbia, occupying the width of the Territory between the Cœur d'Alene Range and the outliers of the Cascade—a country for the most part badly watered and almost desert, except near the river and its branches. East of the first-named range the surface consists of a succession of high hills and elevated valleys, containing the head affluents of Clarke's Fork of the Columbia, which in several instances almost interlock with the head streams of the Missouri.

5. The Cascade Range is much less elevated than the Rocky Mountains, but it has several lofty culminations, of which Adams, St. Helens, Rainer, and Baker are the highest. In the Coast Range, which incloses the great inland water of Puget's Sound on the west, Mount Olympus is the highest point, being 8,197 feet. The country west of the Cascades is that at present inhabited. It has a highly varied surface, a moderate climate, and soils of great fertility. Except where traversed by the Coast Range it slopes generally to the west, sending down numerous streams to Puget's Sound and the Columbia. Only few rivers flow directly to the sea, and of these the Chehalis and Sawamish are the most important; several smaller ones empty into Shoalwater Bay.

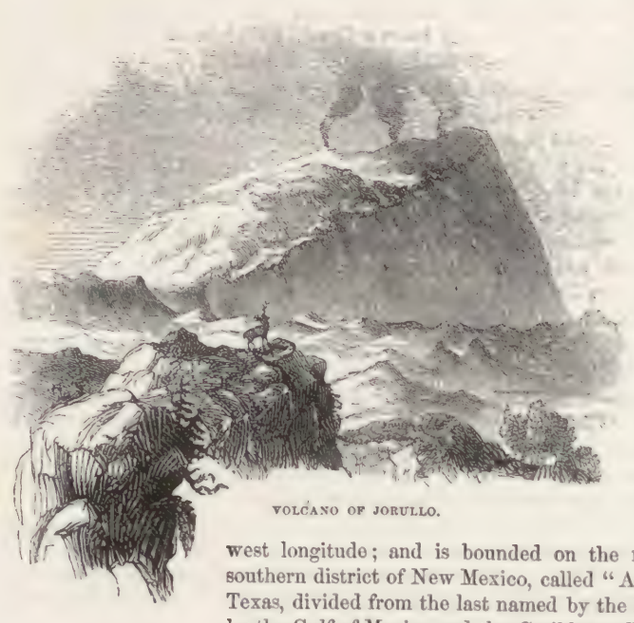
6. Washington as a part of Oregon comprised the two counties of Lewis and Clarke, and contained, according to the census of 1850, 1,201 inhabitants. In 1854 a local census ascertained the population to be 3,965. The counties and principal towns are as follows:

Counties.	County Seats.	Counties.	County Seats.	Counties.	County Seats.
Clallam	New Dungeness.	Jefferson	Port Townsend.	Skamania	Cascade City.
Chehalis	Bruceville.	King	Seattle.	Thurston	Olympia.
Clarke	Columbia City.	Lewis	Cowlitz Landing.	Wahkiacum	Cathlamette
Cowlitz	Monticello.	Pacific	Cheenook City.	Walla-Walla	Walla-Walla.
Island	Penn's Cove.	Pierce	Steilacoom.	and Whatcom	Bellingham Bay.
		Sawamish	——.		

—within these collectively it is probable that the population at the present time (1858) is not less than 9,000 or 10,000.

7. As yet little is known of the mineral resources of the Territory. Coal has been found on the Chehalis, and also near Puget's Sound; and otherwise there is every probability that the country is abundantly supplied, not only with the more useful, but also with the precious metals. With regard to vegetation, especially in the region west of the Cascades, few localities are so abundantly rich. The forests are gigantic, and comprise fir, oak, maple, spruce, hemlock, cedar, etc. The hills and valleys of the eastern section are also covered with a heavy growth of the finest timber. These forests abound in game and wild animals, and have hitherto been hunted by the servants of the Hudson's Bay Company. Among the wild animals are the deer, elk, otter, beaver, fox, bear, etc. Birds, both land and aquatic, abound; and Puget's Sound and adjacent waters form one of the most valuable fisheries of the world. The salmon of the Columbia have a wide reputation.

8. Olympia, the capital, is situate at the head of Puget's Sound, and on the east shore of the same water are Steilacoom, Seattle, etc. Seattle is the site of the proposed university. Port Townsend is located on a peninsula forming the northwest extremity of the Sound, and New Dungeness on a point on the southern shore of the Strait De Fuca, about 20 miles west. Penn's Cove is the name of a town on Whidby's Island.



9. In the country intervening between the northern waters and the Columbia are—Bruceville, Highland, Cowlitz Landing, etc., all flourishing places; and above the latter, on Cowlitz River, are the celebrated farms of the Puget's Sound Agricultural Company.

10. On the north bank of the Columbia, commencing at the ocean, are successively Pacific City, on the peninsula of Cape Disappointment; Cheenook City, immediately opposite Point Adams; Cathlamette, at the confluence of the Columbia with its estuary; Monticello, at the confluence of the Cowlitz with the Columbia; Columbia City (formerly Vancouver), at the point where the river bends to the north; and Cascade City, where the river is crossed by the Cascade Range. Farther up, and at the confluence of the Walla-Walla, is the town of the same name.

11. Washington was a portion of Oregon as it existed under the treaty of 1846. It was erected into a separate Territory by the act of Congress passed 2d March, 1853. On the admission of Oregon into the Union in 1858 all the eastern portion of the Territory was relinquished, and has been temporarily added to Washington Territory. The excised section contains an area of 82,430 square miles.

UNITED STATES OF MEXICO.

1. Mexico, which under the title of "New Spain" extended north to the 42d parallel and east to the Sabine River, in 93° 30′ west longitude, and embraced the present American States of Texas and California and the vast territories included in the territorial governments of New Mexico and Utah, has by recent events been reduced more than one half in its proportions; and whereas it formerly contained a surface of 1,679,577 square miles, its area at the present day is computed only at 802,416 square miles.

VOLCANO OF JORULLO.

2. Mexico, as now constituted, extends between the parallels of 15° 58′ and 33° 22′ north latitude, and between the meridians 86° 42′ and 117° 13′ west longitude; and is bounded on the north by California, the southern district of New Mexico, called "Arizona," and the State of Texas, divided from the last named by the Rio Grande; on the east by the Gulf of Mexico and the Caribbean Sea; on the southeast by British Honduras and the Central American state of Guatemala, and on the southwest and west by the Pacific Ocean. Its greatest length is a diagonal line extending northwest and southeast between San Diego and the extreme south portion of Chiapas, 1,800 miles, and the greatest breadth of the mainland is in the parallel of the mouth of the Rio Grande, where it measures 750 miles. Its narrowest crossing (130 miles) is at the Isthmus of Tehuantepec, 94° west longitude. The coast-line on both seas has an extension of 5,830 miles.

3. The opposite shores of Mexico differ widely in conformation. On the east the great current of the Atlantic Ocean sweeps round the peninsula of Yucatan and through the Gulf of Mexico, causing a continual increase of sand-banks, extension of the beach, and barring of river mouths. Throughout this coast there is no bay of any importance, no good harbor easy of access, nor any sheltered anchorage. The lagoons—Terminos, Santa Ana, etc.—though within deep and capacious, are inaccessible on account of the small depth of their entrances. In other parts of the coasts lagoons are in process of formation, and in others are rapidly being filled up by sand accumulations. Turning from the Gulf to the Pacific the scene changes completely. On this side the highlands approach the sea-shore, the plains are narrow and rarely very low; and from Acapulco to Guaymas extends a series of fine harbors —Acapulco, San Blas, Mazatlan, Guaymas, etc.—capable of sheltering the largest vessels. The eastern shore of the peninsula of California also offers many bays and small havens; but its west side toward the Pacific is less indented, though not altogether wanting for convenient harbors.

4. The interior is a very remarkable region. It is an enormous ridge, raised by volcanic force, between the two oceans, and ramifying into several chains as the land widens out. This ridge, which forms a continuation of the Andes, is in the isthmus connecting North and South America, where its dimensions are least, a mass of granite varying from 150 to 900 feet in absolute elevation. It leans west to the Pacific, sending off in Guatemala a branch northeast through the peninsula of Yucatan. On entering Mexico the ridge strikes northwest, and acquires a greater breadth, so that the State of Oajaca may be said to occupy the summit of a single ridge, 150 miles wide, falling rapidly on the one side to the Pacific Ocean, and descending by a succession of terraces on the other side to Tabasco and Vera Cruz. To this succeeds the great Mexican table-land, beginning with the elevated plains of Puebla, Mexico, Queretaro, and Michoacan, which have an absolute height of 6,000 to 8,500 feet, a chain of volcanic cones and snowy peaks rising at wide intervals far above them.

5. Between the 18th and 21st parallels the Mexican chain runs north and south. Beyond the latter limit it turns northwest, and passes through the States of Queretaro and Guanajuato, where unusually rich silver mines are contained in its bosom. North of the latter State it divides into three branches, of which the middle one or central chain continues running to the northwest as far as the 30th parallel, beyond which it bends north till, under the name of Sierra Verde, it joins the Rocky Mountains. The east branch runs through San Luis Potosi, gradually sinking till in latitude 26° it disappears on the border of the plain watered by the Rio Grande. The west branch spreads over Guadalajara and through Sinaloa and Sonora, in the latter forming the mountains of Pimeria Alta, which are celebrated for their gold mines.

6. The Mexican chain, though justly considered as a continuation of the Andes, yet differs widely from them in general structure. The South American mountains are frequently intersected by fissures or precipitous valleys in some cases nearly a mile deep. The elevated table-lands inclosed by them, such as the plains of Bogota, those of Caxamarca and Quito, and that round Lake Titicaca, are all of comparatively small extent, and generally accessible only on foot, with mules, or on the backs of Indians. In Mexico, on the contrary, if we start from Tehuantepec, on the shores of the Pacific (latitude 16° 20′), we soon reach the plain of Oajaca, at a height of 5,000 feet, and thence a wheel-carriage can roll without difficulty to Santa Fe, in New Mexico, a distance of 1,400 miles. Though some parts of this route might fall below the level of 2,000 feet, and others nearly reach an elevation of 8,500 feet, yet the slopes are so gradual as to offer no serious impediment to the construction of an easy road; but this facility pertains wholly to the internal communications. The descent from the Mexican table-lands to the sea on both sides is everywhere rugged and abrupt, and presents such difficulties in the way of carrying goods as will probably always cut off the internal and most productive provinces from a fair participation in the world's commerce. In going from the city of Mexico (7,400 feet) to Acapulco, on the Pacific, the road attains a height of 8,600 feet before the rapid descent commences, while the great roads between the capital and Vera Cruz cross the mountains at a height of 10,500 feet. In the isthmus of Tehuantepec, however, the levels are more uniform, and here, in connection with the navigation of the Coatzacoalcos, a railroad is projected by which an easy transit will be effected from ocean to ocean.

VOLCANO OF ORIZABA.

7. The loftiest of the snowy summits and volcanic cones scattered along the Mexican highlands lie all within the narrow zone comprised between the 18th and 20th parallels. They are all of volcanic origin, and in several of them the subterranean fires still continue raging. Ascending west from the Gulf, a little south of Vera Cruz, we meet first, 12 miles from the sea (latitude 18° 24′), the still active volcano of Tuxtla, 5,118 feet high; farther north (latitude 19° 2′) the peak of Orizaba or Citlaltepetl (now extinct), 17,388 feet, its flanks covered with rich woods, and a few miles farther north (latitude 19° 28′) the Cofre de Perote or Naucampatepetl, 13,514 feet high. Southwest of these, on the confines of Puebla (latitude 18° 35′), is the still active volcano of Popocatepetl, 17,735 feet, while 35 miles farther north stands Iztaccihuatl, 15,703 feet high. The latter appears to have been extinguished at an early period, and since the seventeenth century Popocatepetl has had no violent eruption. About 50 miles west of Iztaccihuatl the Pico del Frayle, the highest point of the Nevado de Toluca—another extinct volcano—attains the height of 15,156 feet, and about 120 miles west of this stands Jorullo, which rose on the night of 28th September, 1759, from the level plain to the height of 4,149 feet. Of all the summits here named, only three—Popocatepetl, Citlaltepetl, and Iztaccihuatl—rise above the limit of perpetual snow, which may be assumed to run between latitude 19° and 20° north, at an elevation of 15,000 feet, though varying much with local circumstances. The Nevado de Toluca reaches that limit, but can hardly be said to rise above it.

8. Mexico is in general but sparingly watered, and labors under the almost total want of navigable rivers reaching the interior. Within the tropic the land is narrow, and the streams descending from the elevated interior to the seas on both sides assume the character of rapid torrents, dry at one season and overwhelming at another. Farther north, where the breadth of the continent admits of the formation of great rivers, the dryness of the climate forbids it. The longest and probably the greatest in all respects of the Mexican rivers is the Rio Grande, which now marks the east boundary toward the United States. The Rio de Tampico is formed by the junction of the Panuco, which rises near San Luis, with the Tula, the sources of which are in the State of Mexico. The united streams flowing northeast to the Gulf has a total course of 200 miles. On the bar at the mouth there is but 9 feet of water, but within there is good anchorage in from 5 to 10 fathoms water and ample room, and vessels may ascend to Panuco 40 miles. The Rio San Juan rises in the metalliferous mountains of Oajaca, flows south and east, and forms the great lagoons of Tequiapa and Embarcadero, and at length reaches the sea through the Laguno del Madero, and is navigable for ships 24 miles above its mouth. The Rio de Coatzacoalcos issues from the mountains (latitude 17°), flows east between Oajaca, Tabasco, and Vera Cruz, then widening round to the north and east falls into the Gulf near latitude 18° north. This river has of late attracted much attention from its projected use in forming a part of an interoceanic line of commerce. The Rio

VOLCANO OF POPOCATEPETL.

Tabasco and the Usumasinto are both considerable rivers, rising in Guatemala; the former enters the Gulf at the port of Tabasco: the latter falls into the Laguna del Terminos.

9. The rivers running to the Pacific are toward the south all rapid, and important only as they water coasts more or less populous. The Chimalpa, Tehuantepec, Verde, and Tlascala are considerable streams, but have at present no commercial value. The Balsas or Zacatula descends from the State of Mexico, and after collecting several large streams reaches the ocean with a broad and deep channel. The first great river, however, northward, is the Tolotlan or Grande de Santiago, the second in magnitude of Mexican rivers, and formed by the union of the Laxa and Lerma near Salamanca, in Guanajuato. The sources of the Laxa, in San Luis Potosi, are at least 9,000 feet above the sea. After a very bending course of 600 or 700 miles, the Tolotlan enters the ocean near San Blas (latitude 21° 32′) by several mouths. This great river has many rapids, and is in the rainy season an impetuous torrent. In the dry season, on the other hand, it is fordable 24 miles from the sea. The briefest mention will suffice for the rivers Culiacan, Mayo, Yaqui, and Guaymas, the last two of which, in latitudes 27° 37′ and 28° 26′ respectively, form snug harbors at their mouths. The river Gila, which, until 1854, formed the boundary toward the United States, is by the treaty of that year included within the boundaries of the Northern Union. At its junction with the Colorado it is three miles wide, and navigable for large vessels.

10. The principal lakes, besides those in the plateau of Tenochtitlan, are Chapala in Xalisco, which covers an area of 1,300 square miles, Pascuara in Michoacan, and those of Mextitlan, Cayman, and Parras, the last two being in the tract called the Bolson de Mapimi. The waters of Tenochtitlan are deposited in five principal lakes, situated on different levels: that of Tezcuco, which is near the center of the valley, and covers 70 square miles, is the least elevated. Farther north are the lakes of San Cristobal and Tonanitla, and south is the Lake Chalco, occupying an area of 50 square miles; and these three are five feet higher than Tezcuco. The most elevated, however, though the smallest, is the Lake Zimpango, the level of which is 25 feet above them. These lakes are fed by small rivers, and having no natural outlet are drained by the Desague of Huehuetoco, an artificial canal cut through rock 12 miles long, 150 feet deep, and 300 feet wide, having its embouchure in the Rio Panuco. The waters of Tezcuco are salt, while those of the other lakes are fresh.

VALLEY OF TENOCHTITLAN, AS SEEN BY CORTEZ.

11. Separated from the mainland by the Gulf of California and Rio Colorado, and projecting southward from the southwest corner of California Alta, is the great Californian peninsula, terminating in Cape San Lucas, in latitude 22° 52′ north. Its greatest length is about 700 miles, with a breadth varying from 30 to 120 miles. This peninsula is volcanic, and traversed through its whole length by a continuation of the Sierra Nevada, 1,000 to nearly 5,000 feet high, the culminating peak, the Sierra de la Giganta, being 4,927 feet. This range is almost bare of verdure, and the whole peninsula destitute of water. Only two streams fall from its mountains into the Gulf of California, and only three into the Pacific, and none of them of large size. The climate is generally mild, but very various. The few fertile spots produce corn and roots and fruits in abundance, and the mountains feed a few wild sheep and goats, and to a small extent horses, black cattle, mules, goats, and swine are reared. If the land, however, be barren, the sea compensates the disadvantage. The pearl-oyster is obtained in the Gulf, and fish is in incredible abundance and variety. Gold is supposed to abound in this peninsula. The present population of the country consists chiefly of mongrel breeds of Indians, whites, and negroes. La Paz, the capital, and Loretto are the chief places, both small towns on the Gulf side of the southern quarter of the peninsula.

12. The geological formation of the Mexican Cordilleras is different from that of the mountains of Europe and Asia, in which granite is found, overlaid by gneiss, mica, and clay-slate; while in Mexico, in the eastern chain of the Cordilleras, granite is seldom met with on the surface, and it is overlaid with porphyry, green-stone, amygdaloid, basalt, obsidian, and other igneous rocks. In the western chain, however, bordering on the Pacific, granite appears on the surface. The port of Acapulco is a natural excavation in that species of rock. The great central plateau, between latitudes 14° and 20°, is a mass of porphyry, characterized by the constant presence of hornblende, and the entire absence of quartz. Here are found large deposits of gold and silver. These ores are found also in sienite, as in the mines of Comanja; in the primitive clay-slate, as at Guanajuato, and in the transition limestone, as at Cardonal, Xacala, and Lomo del Toro.

13. The mineral wealth of Mexico, however, is not confined to the precious metals. Iron is found in great abundance in Guadalajara, Michoacan, and Zacatecas; and copper in Michoacan and Guanajuato. Tin is obtained partly from mines, but principally from the washings of the ravines. Zinc, antimony, and arsenic have been discovered, but neither cobalt nor manganese. Quicksilver is mined in Queretaro, but the greater portion used in the extraction of the precious metals is imported.

14. The soils of Mexico are noted for their richness and fertility; but over so large a territory there must necessarily be a great variety, and much that is unfit for cultivation. The principal barren regions occur in the north, above the 30th parallel.

15. Mexico, as regards climate, is divided into the tierras calientes, the tierras templadas, and the tierras frias. The first or hot regions include the low grounds or those under 2,000 feet elevation, on the east and west coasts. The tierras calientes of the west are less extensive than those of the east, the western arm of the Cordilleras approaching nearer to the sea. The mean temperature of this region may be estimated at 77° Fahr. It is especially suited for the growth and cultivation of sugar, indigo, cotton, and bananas.

16. The tierras templadas or temperate regions, which are of comparatively limited extent, occupy the slope of the mountain chains, which bound on either side the central table-land. They extend from about 2,500 to 5,000 feet in elevation, and the mean temperature is from 68° to 70°, and the extremes of heat and cold are here equally unknown. The Mexican oak and most of the fruits and cereals of Europe flourish in this genial climate, the humidity of which produces great beauty and strength of vegetation.

17. The tierras frias or cold regions include all the vast plateau elevated 5,000 feet and upward above the sea. In the city of Mexico, at an elevation of 7,400 feet, the thermometer has sometimes fallen below the freezing-point. In the coldest season the mean temperature of the day varies from 55° to 70°, while in summer the thermometer seldom rises in the shade above 75°. The annual mean temperature may be taken at 62°, being nearly equal to that of Rome. But whenever the table-land rises to more than 8,000 feet, it has, though between the tropics, a rude and disagreeable climate. Under the parallel of Mexico, the limit of perpetual snow varies from 14,000 to 15,000 feet. Vegetation in the central plateau is not, owing to the rarity of the air, so vigorous as in the tierras calientes, and the plants of Europe do not succeed so well as in the tierras templadas.

18. In the tropical and central regions, and as far north as latitude 28°, there are only two seasons: that of rain, lasting from July to the middle of September, and the dry season, continuing from October to the end of May. From the 24th to the 30th parallel the rain falls less frequently; but this deficiency is compensated by the abundance of snow in January and February.

19. There is scarcely a plant that is not susceptible of cultivation in some part of Mexico. Each climate has its peculiar vegetation. The country abounds in trees useful for their timber, gums, and resins. There is also a vast multitude of valuable medicinal plants. Among the forest trees are the roble, a species of very hard oak, the holm or French oak, the ash, pine, chestnut, cedar, mahogany, rosewood, and others equally precious. Most of the fruits of Europe are common and plentiful: the olive and vine generally succeed well, and nowhere are there finer pineapples, pomegranates, guavas. One of the most valuable plants, however, is the manguey, which Humboldt has not inaptly termed the vine of Mexico, and from this is manufactured pulque and mezcal. The manguey is useful also in many other respects: its fibers are converted into ropes and paper, and its prickles serve for pins and needles.

20. Many of the animals of Mexico are analogous to those of other portions of America. Among those decidedly indigenous are the coendue, a species of porcupine, the apaxa or Mexican stag, the conepatl, a species of weasel, the Mexican squirrel, the cayopollin, and the Mexican wolf. Among the dogs of Mexico is one without hair and another without voice, the latter of which was eaten by the aborigines. The bison and musk-ox wander in immense herds in northern Mexico, and the elk is a large and powerful animal. The jaguar and cougar are met with in the lower and hot regions. The domestic animals conveyed to Mexico have prospered there, and multiplied in a remarkable degree. The horses are equally beautiful and vigorous; and in the northeast cattle form the chief wealth of the inhabitants. The birds and insects of Mexico are of beautiful colors, and in immense variety and number. Parrots and paroquets and other tropical birds inhabit the groves of the tierras calientes, which are also infested with venomous insects. Higher up, in the more elevated regions, the character changes, and still more elevated, class on class of animated nature, each different from the other, is successively developed.

VIEW IN MEXICO.

21. The population of Mexico is composed, as in the other Spanish-American states, of three classes, radically distinct—the aboriginal Indians or red men, the Europeans or white men, and the African or negro race, introduced as slaves by the Europeans. These by admixture give rise to other denominations; so that all may be classed with reference to caste and color as follows—Europeans and their American-born descendants the creoles; mestizoes, the progeny of a white father and Indian mother; mulattoes, from the union of the white and negro races; Indians or red race of various distinct tribes; zamboes, resulting from the mixture of the Indian and negro races, and the African negro, the unmixed offspring of this race born in America being called chinos. The distinctions of breed and color were formerly estimated with great nicety, but they have now lost their importance, the privileges of caste being altogether abolished. It is difficult at the present day to define the exact limits of either the white or the red race, but it is quite certain that the latter constitute the great majority of the Mexican population. It is probable, indeed, that four sevenths of the nation are Indians and two sevenths of mixed origin, the remaining one seventh being creoles and chinos, who are altogether but a handful.

22. Within the limits of Mexico it has been said that thirty-five distinct languages are spoken by the Indians. But distinct as these tribes may be in language, manners, and even in physical characters, they still have certain points of general resemblance, which seem to prove that at some remote period they all issued from one common stock. The most widely spread Indian language is that of the most civilized nation, the Aztecs, which, including the dialects spoken by the Totlecs, Chichimecas, etc., extends through several degrees of latitude.

23. The Mexican Indian has the general physical characteristics of the indigenous American. He is well-made and muscular, capable of supporting great fatigue, and attains a great age unbroken by infirmities. In ordinary habits he is temperate and simple. Maize or, in

the low regions, bananas and beans, with the favorite pulque, constitute his subsistence. He rarely tastes animal food. His dwelling varies with the climate: in the warm region on the coast the Indian hut is made of cane and palm-leaf, higher up, where timber is abundant and shelter acceptable, the log-house, and in the cold region on the table-land the sun-dried brick or adobe building. In all cases the plan is the simplest possible—a single room, sometimes divided into two by a mat partition. He is habitually grave and taciturn. He can labor, but not with large views or for a distant object; nor is improvement rapid, for reason weighs little with him against habit. His way of life, indeed, is like a narrow path in the dark woods; his imagination never opens to him a brighter scene, and his only escape from the oppressive shades is by intoxication. Many Indian families, however, have risen to opulence in the pursuits of industry.

24. The mestizoes constitute the bulk of the colored population. They have a pleasing countenance and are inclined, the women particularly, to corpulence. In character they are much more gentle than the mulattoes, whose passions are sometimes dangerously violent. The zamboes and negroes occupy chiefly the sea-coasts and low regions, the climate of which they alone can support. The Mexican creole is distinguished from the true Spaniard by his general meagerness and hard features. In character and disposition he varies little from the primitive mold, and exhibits all the pride, frankness, courtesy, and hospitality of his forefathers.

MEXICAN POBLANOS.

25. The costumes of the country, as well as its political constitution, have undergone a total revolution within the past half century. Formerly the men wore small jackets, loose trowsers, laced boots, and low-crowned broad-brimmed hats, with the capa or ample dark-colored cloak. At the present day the upper classes adopt the fashions of Paris and London, retaining of their primitive costume nothing but the capa. The ladies still go to church in the ancient attire—black silk gowns and the shawl-vail, which covers the head and hands, down over the back and shoulders: elsewhere they yield to the innovating influences of French millinery; and the only modern articles of female dress as yet obstinately rejected by them are hats and bonnets.

26. The middle, lower, and colored classes (poblanos) of the population, however, adhere much more steadfastly to the showy ancient costume; and their only ambition is to shine in bright silks and lace vails, covered with gold and silver fringes, and rosaries of precious stone. The ranchero or small farmer is an Arab in his habits, and especially in his love and management of the horse. Dressed in leathern trowsers and jerkin, with his serape over his shoulders, his broad-brimmed and silver-corded sombrero on his head, his heels armed with spurs having three-inch rowels, and provided with his sword and gun, he is a staunch fighter in all revolutions wherever guerrillas are required, a hard rider, and a capital boon-companion. He is a person of lofty thought and aspirations and a devoted patriot, ever ready to defend the Republic.

MEXICAN RANCHEROS.

27. Besides their love of pompous display, the passion which most sways the Mexican is that of gaming, in which all classes indulge. "Monte" is the universal game; but many devote their whole souls to cock-fighting, and of late a passion, imbibed from the English at the capital, for horse-racing has shown itself in many parts of the country. It is to this spirit of gaming we must ascribe the great number of violent deaths or murders which take place in Mexican cities. Nor need it be stated, under such circumstances, that education is in a very low condition throughout the country, or that the science and learning of the Mexican retains, like his household furniture, much of the fashion of the sixteenth century.

28. It is perfectly ascertained that powerful and for the most part kindred tribes descended on Mexico from the north from the seventh to the twelfth century: the Toltecs arriving at the former and the Aztecs at the latter period. It is also certain that these nations had attained to a high degree of civilization: they were good smiths and good masons, and had made some advance in the arts of design. They raised great edifices, constructed vast works—palaces, pyramids, roads, aqueducts, bridges, etc.; they had a more accurate calendar, and one better adjusted by intercalation, than the Egyptians, Greeks, and Romans; and, finally, they had a system of picture-writing by means of which they recorded many facts, and which, if it had not been rudely and utterly demolished, would have probably led them on rapidly in the career of improvement. Attempts have been made to trace the origin of these arts to Siberia, China, Japan, or Egypt. But from whatever quarter the people may have originally come, there seems little doubt that their civilization was developed in the New World. In comparing their habits and acquirements with those of the inhabitants of the Old World, the differences are far more strongly marked than the affinities. Their ignorance of the cereal grains, of milk, and of pastoral pursuits, draws a broad line between the civilization of Mexico and that of Asia.

29. The monuments which remain in attestation of the existence of these ancient nations, their boldness of design, and their progress in the arts of construction, are widely scattered, and there is reason to suspect that they are as yet but imperfectly brought to light. It will be sufficient here to mention the extensive remains of the city of Tenochtitlan, near the modern Mexico, with its dykes, aqueducts, and fragments of a bridge. Oajaca is also rich in ancient remains, among which the chief are the palace and pyramid of Zapotekas at Mitla. Another great pyramid or "teocalli" is to be seen near Cholula, in Puebla; and near Villa Nueva, in Zacatecas, are the extensive and remarkable ruins known as Los Edificios. In Vera Cruz are the pyramids of Papantla, built of colossal masses of porphyry. The extensive ruins of Palenque in Chiapas are well-known; but they have been eclipsed by those of Itzalana in Yucatan, more recently discovered, and which seem to indicate a style of art distinct in some respects from the ordinary Mexican. Besides these antiquities, there is no part of the country but holds the remains of an ancient population—links in the connection of the past and present, and which announce the existence of a people far in advance of the races inhabiting the country when discovered by Europeans.

PYRAMID OF CHOLULA.

30. Mexico, according to the territorial arrangements of 1857, is divided into twenty-two States, besides which there are six territorial governments and the Federal District, the last named consisting of the city of Mexico and immediate vicinity. The name, extent, population, and capital of each of these divisions is given in the subjoined table:

States.	Area, sq. m.	Popula.	Capitals.	Popula.
Aguas Calientes.	2,739..	85,837..	Agu. Calientes	39,699
Chiapas	18,679..	161,914..	San Cristobal	7,649
Chihuahua	83,512..	147,600..	Chihuahua	12,069
Coahuila	56,572..	66,228..	Saltillo	8,105

Sierra Gorda	3,127..	55,358..	S. L. de la Paz	4,411
Distrito Federal	90..	220,000..	Cud. Mexico	185,000
Total	793,179.	7,859,564		691,744

The population above given is that of the government estimate for the year 1857, which gives nearly 10 to the square mile. The distribution is very unequal, however, being less than 3 for the northern States, consisting of Tamaulipas, Nuevo Leon, Coahuila, Chihuahua, Durango, and Sinaloa and Sonora; about 25 for the central States, viz., Aguas Calientes, Guanajuato, Jalisco, Mexico, Michoacan, Puebla, Queretaro, San Luis, Tlaxcala, Vera Cruz, and Zacatecas; and 12 for the southern States, embracing Chiapas, Colima, Guerrero, Oajaca, Tehuantepec, Tabasco, Yucatan, etc. Thus the largest populations are found on the table-lands and next at the south, and the smallest at the north. The coasts on both sides are very sparsely populated.

31. The population of the country has increased about 50 per centum in 64 years, having, according to the Spanish census of 1793, amounted to 5,270,029, and in 1857 to 7,859,564. In 1803 Humboldt estimated it at 5,837,100; in 1824 Poinsett stated it at 6,500,000; and in 1830 Burkhardt's estimate made it 7,996,000. The last estimate was evidently too large, as nine years after the Mexican Society calculated the total at 7,065,000, and again in 1842 at 7,015,509. Tejada in 1851 made it 7,661,520, and as above, in 1857, it had risen to 7,895,564. No census has been taken since 1792, and the only basis of any estimate since made has been the returns of births and deaths made in localities. The territory ceded, in the mean time, had little population—not sufficient to even modify these results.

32. The production of gold and silver has arrived at a state of prosperity unknown in former epochs, and this prosperity would be yet more considerable if the high price of quicksilver were not an obstacle to the extraction of the silver. The annual product of silver is about $35,000,000, and of gold between two and three million dollars. There are in the country, chiefly in Queretaro, Guerrero, Guanajuato, San Luis, Zacatecas, and Jalisco, some 25 quicksilver mines, and these formerly yielded from 250,000 to 300,000 pounds annually; but these have been mainly abandoned since the discovery of the California mines. The richest of these mines is that of Guadalcazar in San Luis, which produced at least one third of the whole. Iron and other mines are but little worked.

33. As to the annual value of the agricultural products of Mexico, nothing definite is known. Assuming the population at 7 859,564, and that each inhabitant consumes $25 worth

annually, the value of that consumed would be $196,334,875. If to this be added the timber cut, the cotton raised, the cochineal produced (about 40,000 arrobas of 32 lbs.), the hemp, silk, beeswax, etc., the total value will not fall short of $220,000,000. But a small portion of these find a foreign market.

FARMING SCENE.

34. The annual value of manufactures is estimated at $90,000,000 or $100,000,000. The manufactures of Mexico consist chiefly of cane sugar, brandy from cane, mezcal (a kind of whisky made from the manguey plant), oil, wine, brandy from the grape, delftware, glass, paper, silk, thread, cotton and woolen yarns, and some cotton goods. In 1850 there were in the country 4 glass factories, 8 paper mills, 72 large cotton factories, and 6 large woolen factories employing machinery, and upward of 70 machines worked by hand in the manufacture of silk. In the cotton manufacture there is also a considerable number of hand machines for making reboses, bed coverings, etc. The woolen manufactures also employ numerous small establishments in the country, where coarse cloths are made. In the large establishments fine cloths, carpets, flannels, etc., are produced.

35. The commerce of Mexico is very limited, and is confined to the reception of foreign manufactures sufficient for the necessity or luxury of a very small class of the population, for which is given in exchange a large portion of the products of the mines and some few products of the soil. For the year ending 30th June, 1850, the duties on importations amounted to $5,233,092, and on exportations to $443,933. The aggregate value of imports does not exceed $40,000,000 a year, and the same sum represents the exports, of which three fourths consist of the precious metals. The total shipping employed in 1850 amounted to 256,692 tons. Of the vessels arriving, 68 belonged to Mexico, 435 to the United States, 108 to England, 69 to France, 60 to Spain, 13 to Hamburg, 24 to Peru, etc. Among the arrivals were—219 steamers, 55 frigates (war), 114 barks, 165 brigs, 63 hermaphrodite brigs, 155 schooners, and 68 pilot boats. The ports open to foreign commerce are—Vera Cruz, Tampico, Matamoras, Campeachy, Sisal, Tabasco, Coatzacoalcos, Isla del Carmen, Ventosa, Acapulco, Manzanilla, San Blas, Mazatlan, Guaymas, and La Paz. There are also custom-houses on the northern and southern frontiers.

36. The roads in Mexico are in a most wretched condition, scarcely deserving the name; but there are exceptions. Of these, the roads from Vera Cruz to Mexico are the best. Few of the interior roads are more than barely passable, except in the more densely populated districts. Of late, however, the government has opened roads from Guadalajara to Tepic and San Blas, and from San Luis to Tampico; and those leading from the capital to Queretaro and Acapulco have been improved. A railroad has also been constructed from Vera Cruz to San Juan, 15 miles, and may be ultimately continued to the capital and the Pacific; and railroads are now in operation between the capital and Tacubaya and Guadalupe. The Tehuantepec navigation and railroad route, if ever completed, will be a great acquisition to commerce. But at present, as before said, the country is sadly destitute of roads fit for travel or transportation; in fact, almost every district is as much isolated from its neighbor as if surrounded by water.

37. Mexico is a federal representative republic. The rights of citizens are nearly similar to those of the United States. The legislative power is vested in a congress consisting of a senate and chamber of deputies. Deputies are chosen for two years by the people, one for every 50,000 inhabitants. Each State and the Federal District elects two senators, and a number equal to all the States is elected by the senate, deputies, and supreme court judges conjointly, the deputies deciding the election in case of the candidate not receiving a majority of all the votes. Judicial power resides in the supreme court of justice, and in circuit and district courts. For the trial of civil and criminal cases in the first instance there are judges and alcaldes. The executive power is vested in the President, whose constitutional advisers are the secretaries of departments.

38. The governments of the States severally, like the general government, comprise the three ordinary branches—legislative, executive, and judicial. The territories are governed by chiefs, dependent on the supreme government of the nation. The States are divided into districts, departments, and sub-departments, in charge of prefects and other officers. In all places of much population there are ayuntamientos having control over all municipal affairs, and a jurisdiction extending to neighboring villages and settlements.

39. The active armed force of the nation in 1850 consisted of—infantry of the line, 3,632 men; cavalry of the line, 1,507; artillery, 658; active militia, 232; sappers and miners, 303; soldiers at military stations, 1,282; National Guard, 1,295—total, 8,909 men, with 520 officers. The navy consisted of the schooner Vera Cruz and several small armed vessels. There are three national fortresses—the Castle of San Juan de Ulloa (132 guns), the Castle of San Carlos de Perote (16 guns), and that of San Diego de Acapulco (21 guns). The fortified places are Vera Cruz and Campeachy, both of which are surrounded with walls, with some small ramparts for artillery. Vera Cruz mounts 109 pieces, and Campeachy 158 pieces. The federal city is also fortified.

40. The annual expenses of the government for 1851 were estimated at $12,525,956, and the estimated resources were $8,450,000—deficit $4,075,956. The national debt amounted to $133,524,242, viz., the external (English) debt, including $6,700,000 interest in arrears, $57,908,250, and the internal debt $75,715,242. The total expenses of the individual States in 1850 amounted to $5,156,859, including the contingent paid to the supreme government. The total value of real estate in the country is estimated at $1,355,000,000. The revenues of the States as individual members of the Republic are derived from direct and indirect taxation—first, on persons, property, and professions, and second, on the products of industry, inheritances, sales of real estate, etc.

41. There are mints at Chihuahua, Guadalajara, Guadalupe y Calvo, Guanajuato, Mexico, Durango, San Luis, Zacatecas, Hermosillo, and Culiacan, and at these in the 18 months ending 30th January, 1850, the coinage amounted to $28,355,405, of which only $1,351,416 was gold. The coinage from the year 1535 to January, 1850, amounted to $2,667,828,851.

42. "The religion of the Mexican nation is and shall be perpetually the Roman Catholic Apostolic. The nation protects it by wise and just laws, and prohibits the exercise of any other whatsoever." The hierarchy consists of an archbishop and eleven bishops. The dioceses contain 184 prebends and 1,229 parishes, with 3,223 ecclesiastics. There are, besides, 146 monasteries, with 1,130 inmates; 59 nunneries, with 3,160 inmates; and 8 colleges of the Propaganda, with 238 inmates. The revenue of the church is estimated at $18,000,000 to $20,000,000 annually.

43. Popular education is quite in its inception. "We may be assured," says Tejada, "that at least three fourths of the inhabitants do not know that there is such a thing as an *Abecedario* (A B C) in the world." Of late years, however, some progress has been made. Several of the States have established primary schools, and many private schools have been opened in the cities. In the city of Mexico, in 1850, there were 129 primary schools, attended by 7,151 scholars. The other educational institutions are—1st. Seminaries, sustained and directed by the clergy; 2d. National colleges in the capital, sustained partly by their own funds and partly by government aid; and 3d. Colleges and institutes in the States sustained by local funds. Of the first class there are ten distributed in the capitals of the several dioceses, and in 1850 these contained 3,024 students; of the second class there are six, viz., the colleges of San Ildefonso, San Gregorio, and San Juan de Letran, the School of Medicine, the Military College, and the College of Mining, and of the third class there are 20, including six preparatory schools. There are other colleges in different parts of the Republic; and in the capital and the States there are many literary and scientific academies.

44. The whole number of literary and political periodicals published in Mexico in 1850 was 54, distributed as follows: Federal District, 11; Puebla, 2; Mexico, 2; Queretaro, 1; Oajaca, 6; Chiapas, 1; Tabasco, 1; Vera Cruz, 5; Yucatan, 5; Tamaulipas, 3; San Luis, 2; Zacatecas, 4; Jalisco, 3; Guanajuato, 2; Nuevo Leon, 2; Coahuila, 1; Chihuahua, 1; Durango, 1; Sinaloa, 1; Michoacan, 1; and Guerrero, 1. The circulation of these is very limited, and none, perhaps, issue more than 2,000 copies.

45. "Of all Spanish America," says Tejada, "there is no nation in which are found so many or so rich collections of books and instruments for the study of the sciences as those which exist in the Republic of Mexico." There are three public libraries in the capital—that of the Cathedral, with 13,000 volumes; that of the Univercidad, with 9,000; and that of San Gregorio, with 4,000 volumes. Of private libraries there are a large number, containing from 200 to 1,000 volumes. Of the college libraries, that of San Juan de Letran contains from 11,000 to 12,000; and that of San Ildefonso, 8,361 volumes. The National Museum, founded in 1822, occupies two large halls and the court of the University buildings, and contains many valuable and curious collections illustrative of the aboriginal and colonial history of the country.

46. The Mexican Republic contains 85 cities, 193 towns and large villages, 4,900 small villages, and 119 missions. Of the cities the largest is that of Mexico, the federal capital, and then follow in order of their importance Puebla, Guadalajara, Guanaxuato, San Luis Potosi, Queretaro, Zacatecas, Morelia, Colima, etc., all situated on the central table-land. In the south the largest places are Merida and Campeachy in Yucatan, and Oajaca in the State so called. Victoria de Durango, Saltillo, and Monterey are the largest in the north. On either side of the country the coast towns, with few exceptions, are small.

47. Mexico is beautifully situated in a large plain 7,468 feet above the sea, inclosed by

PLAZA MAYOR AND CATHEDRAL, CITY OF MEXICO.

lofty mountains and covered with broad meadows and lakes. Latitude 19° 25′ 45″, and longitude 99° 5′ 53″. When taken by Cortez in 1521, Mexico, then called Tenochtitlan, stood on several islands of Lake Tezcuco, and was approached by four great causeways which stretched through the lake and met in the center of the city. Owing to the drainage and more rapid evaporation produced by the removal of the forests and other causes, the lake has receded, and the present city, though occupying the same site, is now about two and a half miles west from its shores.

48. The city is built with the utmost regularity in the form of a square, is inclosed by lofty walls, and consists of a great number of spacious streets parallel and at right angles to each other, and leading to a central square which covers an area of 12 to 15 acres, and is lined with public edifices of the most imposing description. The houses are almost all built of hewn stone, in a very pure style of architecture, are three or four stories in height, have flat, terraced roofs, and are often not only provided with iron balustrades and gates ornamented with bronze, but covered with porcelain mosaic of elegant patterns. The streets are well paved.

49. The most remarkable edifice is the Cathedral, built on the site of the great teocalli

or pyramid temple of the Aztecs, and occupying one entire side of the central square. It is 500 feet long by 420 feet wide, and though not in strict conformity with any order of architecture, is remarkably imposing. The walls are built of unhewn basalt, but the front is covered over with the most laborious carvings, while lofty pillars rise up against the walls for the support of its two lofty towers. The interior is gorgeous: the choir is formed of rare carved woods, and elaborately covered with gilded images; the high altar, raised from the floor on an elevated platform, exhibits a profusion of candlesticks, crosses, and other ornaments of solid gold or silver, and is crowned by an image of the Virgin decked in jewelry estimated at the value of more than $3,000,000; and all the other parts of the church are a perfect wilderness of columns, statues, shrines, fonts, etc.

50. Another side of the great square is occupied by the National Palace, the residence formerly of the viceroys and now of the President. It stands on the site of the ancient palace of Axayacatl, in which Cortez was lodged by Montezuma, and is a quadrangular pile of such enormous dimensions that besides accommodating the President and his family it contains the principal government offices, the supreme court, and the halls of the national legislature. In the southeast corner of the square, opposite the principal front of the Cathedral, is the Casa Municipal or town-house, partly occupied as an exchange. Immediately south of the palace, but without the square, is the University, which contains the National Museum, and has in its front a magnificent modern market. At some distance west of the square is the Mineria or School of Mines, which occupies one of the most elegant edifices in the city, and attached to it is a good mineral museum. In addition to the Cathedral, Mexico contains 50 or 60 churches and convents, few of them remarkable for architectural merit, but most of them possessed of considerable riches, and ostentatiously set off with gaudy decorations. One of the most elegant of the churches is that of San Domingo, a light and airy structure surmounted by a spire and dome.

51. The other edifices and objects particularly deserving of notice are the convents of San Francisco, San Augustine, and La Merced, all of them large and imposing structures, with numerous spires and cupolas, and the last particularly admired for the elegance of its interior; the magnificent aqueducts, by which the city is supplied with water; the public fountains; the colossal equestrian statue of Charles IV. in the court-yard of the University; the Acordada or public prison, a large and substantial structure; the theater; the Plaza de Toros, a large circular inclosure for bull-fights, with accommodation for 3,000 spectators; two magnificent paseos or promenades—the one, the Paseo Nuevo, to the west of the city, consisting of a broad avenue shaded by rows of stately trees, and broken at intervals by fountains, and the other the Paseo de la Vega, on the opposite side of the city, skirting one of the canals leading to the Lake Chalco, and very tastefully laid out; and the Alameda, a park of 10 or 12 acres formed into labyrinths by magnificent forest trees, and the great place for public resorts.

52. The manufactures, of comparatively limited extent, include gold and silver lace, jewelry, and silversmiths' work, woolen cloths, blankets, baizes, cotton goods, hats, soap, liqueurs, carriages, and tobacco. The trade of the city is also very limited, the exports being confined almost entirely to the produce of the mines, while the imports are chiefly manufactured goods from Europe, and silk goods, especially hosiery, from China. Mexico is situated about half way between the Atlantic and Pacific, and has good roads leading to the opposite seaports; and in the year 1857 railroads were completed to Guadalupe and Tacubaya.

53. Puebla, the capital of the State of the same name, is situated on an elevated plain in the midst of a fertile country. It is inferior only to the capital in population and beauty, being regularly laid out, and having an active trade and important manufactures. The churches and monasteries resemble those of Mexico in extent and the richness of their decorations. The Cathedral, a vast and superb edifice, with magnificent ornaments, and the House of Religious Retreat, the richest charitable institution in the world, are among the most remarkable buildings.

54. In the vicinity are Cholula and Tlascala, noted for their ancient greatness under the Aztecs. The last is the capital of the State so called, situated between those of Mexico and Puebla. Oaxaca lies in a beautiful valley, and is one of the prettiest cities in the Republic.

55. Vera Cruz, the principal commercial sea-port, is built on a low and unhealthy site on the Gulf, surrounded by moving sand-hills and marshes. Latitude 19° 11′ and longitude 96° 8′—200 miles east-southeast from Mexico. It is a regularly and well-built city. The harbor, however, is a mere roadstead between the mainland and the island of San Juan de Ulloa, which is covered with a strong fortress. Old Vera Cruz is a village 15 miles northwest, where Cortez debarked in 1518. In the interior is Jalapa, delightfully situated, and its cool, clear sky and beautiful gardens and groves render it an agreeable retreat from the intense heat and sickly air of the port. The other principal towns in the State of Vera Cruz are Orizaba, near the volcanic mountain of that name, and Cordoba, noted for the extent of their tobacco plantations; and Perote, which contains a citadel and military academy, and near which rises the lofty peak called the Coffre de Perote.

56. Acapulco, in the State of Guerrero, on the Pacific, is one of the finest harbors in the country, but like Vera Cruz, lying in the hot low region, is unhealthy. It is an ill-built town, but strongly fortified. Under the Spaniards it was a place of great note, and remarkable for the high tone of its society. It is now inhabited chiefly by mulattoes and zamboes. On several occasions it has suffered terribly from earthquakes.

57. Queretaro is distinguished for the beauty of its site, the magnificence of its edifices, and the wealth and industry of its inhabitants. The convent of Santa Clara is the largest in the world, being two miles in circuit, and is said to resemble a little town in its interior. The woolen manufactures of Queretaro are extensive.

58. Guanajuato is situated in the center of the richest silver mines of the Republic, and is a place of great wealth. It contains a mint, a college, some fine churches, etc. Irapuato and Salamanca, also in the State of Guanajuato, are both large towns. Morelia or Valladolid, the capital of Michoacan, is a well-built city, in which the aqueduct and the cathedral are remarkable constructions. In the southeast part of the State is the volcano of Jorullo.

59. Guadalajara, the capital of Jalisco, is a large and beautiful city, inferior in wealth and magnificence only to Mexico and Puebla. Its streets, broad and airy, its 12 fountains supplied by an aqueduct 15 miles in length, its 14 squares, and its beautiful alameda, give it an appearance of elegance, which is heightened by the magnificence of the public buildings and the neatness of the dwelling-houses. The Cathedral is a vast building, surmounted by two towers, and richly ornamented by gold and silver lamps and vessels, and fine paintings of the Spanish masters. Several other churches, the Mint, the University, and the College are also fine structures. The port of San Blas, in this State, contains a navy yard.

60. Zacatecas owes its importance to the rich silver mines in its vicinity. There is here

ZACATECAS.

a college and the magnificent church of our Lady of Guadalupe. Aguas Calientes is capital of the new State so called. Its cathedral has the appearance of a Moorish mosque.

61. San Luis Potosi is one of the most important commercial cities in the country, being the natural depôt for the trade of Tampico with the northern and western States, some of which it also supplies with various domestic fabrics. It is a well-built town, with large suburbs, and contains several convents, remarkable for their extent, a mint, a college, and numerous churches. Tampico, in the State of Tamaulipas, is a thriving sea-port.

62. Chihuahua is a handsome city, and contains several very splendid churches. In its neighborhood are rich silver mines. Victoria de Durango is also a fine town, with several fine buildings. El Paso del Norte is a noted town at the northeast angle of Mexico. In the State of Sinaloa the principal places are Culiacan, Villa de Fuerte, and Rosario. The last-named is the center of a mining district, and has some commerce by means of the harbor of Mazatlan, 60 miles distant, and at the entrance of which is the small town of Cosala. The principal towns in Sonora are Santa Cruz, the chief town of the Mayo Indians, Los Alamas, a mining town, Pitic, and Arispe. Guaymas, on the Pacific, has an excellent port. The hilly country which lies to the west of Arispe called Pimeria Alta contains valuable gold and copper mines. In the States of Nuevo Leon and Coahuila are the flourishing towns of Monterey and Saltillo; and there are several trading towns along the Rio Grande which have intimate commercial relations with the opposite American settlements. Of these the most important is Matamoras, near the mouth of the river.

63. The earliest traditions respecting Mexico inform us that in 648 it was settled by the Toltecas, a tribe of Indians from the Rocky Mountains, who finally settled near the present city of Mexico. They named the country Anahuac. After flourishing for about 400 years, they were exterminated, but not before they had imparted some degree of civilization to their successors, the Chichemecas, who arrived about 1170. These were again displaced by the Alcohuans, who appeared about 1200. The Aztecs arrived in California in 1196, and gradually finding their way southward, founded their chief city in 1325. This nation rapidly increased in power, and its sway extended from the Atlantic to the Pacific.

64. The conquest of this empire was completed by Cortez in 1521. Under Spain, Mexico was as a subordinate kingdom, governed by a viceroy, and for three hundred years was kept under subjection by that nation. The entrance of the French into Spain also terminated the Spanish power in America. An open insurrection broke out in 1810, in which the clergy largely participated, and in 1813 the first national Congress assembled at Chilpanzingo. One of its earliest acts was to declare the independence of Mexico; but it was not before 1821 that the declaration became a reality. In that year Augustin Iturbide, who had previously been a royalist, declared suddenly for the revolution, and procured himself to be installed as Emperor, under the title of Augustin I. His arbitrary acts after his elevation, however, soon raised up an opposition to his power, and before the end of the first year of his reign he abdicated and withdrew from the country.

65. On the downfall of Iturbide, a provisional executive of three persons was formed; and subsequently, in 1824, a republican government, modeled after that of the United States, was inaugurated, and such, with frequent vacillations from federal to central, has been the form ever since adhered to. Since the era of its independence, however, Mexico has lost several of its finest provinces—Texas in 1836, California and New Mexico in 1848, and a large strip of its northern territory in 1854—more than one half its original territory. And thus it will be until the whole be finally absorbed by its powerful neighbor to the north.

[*Weights, Measures, and Moneys.*—Same as in Spain.

BRITISH HONDURAS OR BELIZE.

1. British Honduras, geographically a part of the peninsula of Yucatan, lies between latitudes 15° 54′ and 18° 30′ north, and longitudes 87° 56′ and 90° 12′ west. It is separated from Yucatan proper by the Rio Hondo, and its southern boundary is formed by the Sarstoon, which falls into the Gulf of Honduras. Its western border is the 90th parallel, and its eastern the Gulf of Honduras. Length north and south, about 175 miles, and breadth, about 112 miles. Area, 18,600 square miles.

2. Excepting the rivers forming the boundaries north and south, the only others of consequence are the Belize, which traverses the territory from southwest to northeast, dividing it into two somewhat equal parts, and the New River, which, rising in New River Lake, flows in a course nearly parallel to the Belize, till it reaches the Caribbean Sea, a few miles south of the Hondo. The rivers are navigable for 20 to 30 miles from their mouths, but higher up are interrupted by rapids and falls.

3. The country north of the Belize, and traversed by the New River, is low and level, and toward the coast swampy, and interspersed with several lakes. East of the New River, however, is a range of hills stretching from northeast to southwest, and joining on to the mountains of Guatemala. South of the Belize the country, though also swampy on the coast, rises inland much more rapidly, and may be generally described as mountainous. It is intersected by a ridge parallel to that of the New River, and also connecting with the Guatemala system of mountains—the east part, both north and south of this ridge, being covered by its lateral branches. The mountains and the wide valleys between them are clothed with extensive forests of the finest timber, including cedars, pines, ironwood, logwood, braziletto, mahogany, etc.

4. The shores are lined with numerous islands or coral keys, and covered with cocoa-nut trees and bushes. The largest are Ambergris Key, toward the north, and Turneff, opposite the town of Belize. These two keys consist of clusters of several small islands, divided by narrow creeks and lagoons. The shores of the continent are rocky, but low, except toward the south, where they are higher, and intersected by ravines.

MAHOGANY CUTTING.

5. The climate, especially during the wet season, is considered more favorable to health than that of any of the West India Islands. The mean annual temperature is about 80° Fahr., but the heat is seldom oppressive from the beginning of July to the beginning of April, being tempered by refreshing sea-breezes, but during April, May, and June it is excessive, though mitigated occasionally by violent thunder-storms. The most rainy months are July, August, and September.

6. The cultivable portions of the soil are extremely fertile, producing readily all kinds of tropical vegetation, of which plantains, yams, mandioca, and Indian corn are grown, and also arrow-root and rice to a small extent. Sugar, coffee, cotton, and indigo might also be raised, but are neglected. Sarsaparilla is collected in the southern districts.

7. The wild animals are those usual to tropical America—ounces, panthers, tapirs, deer, peccaries, agouties, armadilloes, and monkeys. Manatis and alligators frequent the lagoons; birds, aquatic and land, abound, and fish, turtle, lobsters, and shell-fish are plentiful and of excellent quality. The minerals of the country are as yet unsought; but as gold has been found in the beds of the rivers, there seems to be no question of its existence in the mountains. Iron, copper, etc., are said to be abundant.

8. The population in 1851 amounted to 11,066, about 400 of which were whites, and the remainder colored inhabitants. The whites are exclusively occupied in commerce, and the negroes in cutting mahogany and dye-woods, and in fishing. A few of the latter also cultivate small patches of ground. Cattle, sheep, and goats are kept, but not in sufficient numbers, the deficiency being supplemented from Trujillo and Omoa.

9. The exports consist principally of mahogany, the staple article of the country, cedar-wood, log-wood, rose-wood, cochineal, indigo, sarsaparilla, hides, tortoise-shell, with small quantities of lignum-vitæ and tobacco. The total value of exports in 1851 was £411,443, and in 1852, £391,223. The chief exports from the United Kingdom are dry goods and fancy articles for the Belize and Spanish-American markets; wine, spirits, gunpowder, and occasionally provisions; and from the United States, provisions of all descriptions, shingles, and sawed lumber, with some few manufactured goods.

10. The government is administered by a superintendent nominated by the crown, and a legislature of 21 members, 17 of whom are elected, and 4 nominated by the superintendent. The term of office is four years. The supreme judicial authority resides in a supreme court; and there are several inferior courts. The laws of England are generally applicable throughout the colony. Education claims a fair share of consideration, and there are good schools in Belize open to all classes. The colony, formerly subsidiary to Jamaica, has lately been constituted a separate government.

11. Belize, the capital, is the only town in the colony, and is situate at the mouth of the river of the same name, which is here crossed by a substantial wooden bridge. Latitude 17° 29′ 18″ north, and longitude 88° 12′ west. It consists of a long street, running parallel to the sea-shore, from which three or four streets diverge. The houses are constructed entirely of wood, and are raised 8 or 10 feet from the ground on pillars of mahogany, and are well-built, spacious, and convenient. The town seems almost entirely inhabited by blacks. They are described by Stephens as a fine-looking race, tall, straight, and athletic, and well-dressed—the men in white cotton shirts and trowsers, with straw hats, and the women in white short-sleeved frocks and adorned with ear-rings and necklaces. During the dry season fresh water is very scarce here, and, indeed, throughout the settlement, there being no rivulets, and the water of the river being brackish for several miles above the town. The consequence is that the inhabitants at this season are compelled to have recourse to wells about three feet in depth, from which they procure a muddy, brackish, and fetid water, injurious to health, and productive of a variety of disorders. Efforts are now being made to remedy the evil, both by the government and the European public at Belize; and considerable sums have already been expended in sinking wells. An iron market-house has recently been erected in the town, costing about $20,000. There are also a public hospital, a dispensary for the relief of the poor, an asylum for lunatics, and a grammar-school, conducted on the Madras system, and which was attended in 1847 by 102 pupils. This school, which is entirely supported by government, has likewise a female department. A savings' bank has also been established under guarantee of the local legislature. The Baptists and Wesleyans have chapels here with schools connected, the former one and the latter two. There are five judicial courts in Belize—the court of ordinary, and the supreme, grand, summary, and police courts. It is also the seat of the Honduras Legislature. The anchorage in front of the town is excellent, being protected from the heavy swells of the open sea by numerous quays, but is adapted for vessels of moderate size only. Population about 3,000.

12. At Punta Grande, about 150 miles south of Belize, there is a settlement of Caribs numbering about 500 souls. They were formerly natives of the sea-coast below Trujillo, but having taken part against Morazan, they fled to this place for safety.

13. Belize, called also British Honduras, was transferred by Spain to England by treaty, in 1670, but at different times its occupation was contested by the Spaniards till 1798, since which period it has remained quietly in the possession of Great Britain. The settlement is said to have obtained its name from a noted buccaneer called Wallace, by whom it was first discovered. The name was written *Waliz* by the Spaniards, and subsequently further corrupted into Balize or Belize, as it now stands.

[*Weights. Measures. and Moneys.*—Same as in the United Kingdom.]

STATES OF CENTRAL AMERICA.

1. Central America, as a geographical region, lies between latitudes 7° 35′ and 22° 45′ north, and longitudes 78° 20′ and 94° 30′ west from Greenwich. It is bounded north and east by the Gulf of Mexico and the Caribbean Sea, and south and west by the Pacific Ocean. Its greatest extent, in a direction northwest and southeast, is about 1,200 miles, and its breadth varies from 50 to 300 miles. Within these limits are included the Mexican provinces of Yucatan, Chiapa, and Tobasco, the British colony of Belize, and the five states of Central America. The area of the whole is approximately 240,000 square miles. Political Central America is of much less extent.

2. In respect of geographical position, this country almost realizes the ancient idea of the world. Not only does it connect the two grand divisions of the American continent, but its ports open to Europe and Africa on the east, and to Asia and Oceanica on the west. At the Isthmus of Tehuantepec, the Gulf of Mexico approaches to within 200 miles of the Pacific, the waters of the Coatzacoalcos which flows into the former, almost interlocking with those of the Chicapa flowing into the latter. Below this point the land widens, embracing the high table-land of Guatemala upon the west, and the broad plains of Tobasco, Chiapa, and Yucatan upon the north and east. The Gulf of Honduras, however, closes around this section upon the southeast, and again narrows the continent to less than 150 miles. The country intervening between this bay and the Pacific is marked by a complete interruption of the Cordilleras, and is traversed north and south by a great transverse valley through which the large river Ulua finds its way to the Atlantic, and the smaller Goascoran flows into the Gulf of Fonseca, on the Pacific. Still lower down, and passing the grand transverse valley of Nicaragua, is the well-known narrow Isthmus of Panama or Darien, over which the tide of emigration has twice poured its floods—once upon Peru, and again upon the shores of California.

3. In physical aspect and configuration of surface, Central America has not inaptly been observed to be an epitome of all other countries and climates of the globe. High mountain ranges, isolated volcanic peaks, elevated table-lands, deep valleys, broad and fertile plains, and extensive alluvions are here found grouped together, relieved by large and beautiful lakes and majestic rivers; the whole teeming with animal and vegetable life, and possessing every variety of climate, from the torrid to the cool temperature of eternal spring.

4. The great chain of the Cordilleras here, as in South America, runs nearest to the Pacific

coast; but in places it is interrupted, and assumes the form of detached ranges and isolated elevations, groups or knots of hills, between which the streams from the interior high valleys or elevated plains wind their ways to both oceans. As a consequence, the principal alluvions border on the Gulf of Mexico and the Caribbean Sea. Here rain forms in greater or less abundance for the entire year; vegetation is rank, and the climate is damp and insalubrious. The trade-winds blow from the northeast, and the moisture with which they are saturated, condensed on the mountains, flows down to the Atlantic. The Pacific slope is therefore comparatively dry and healthful, as are also the elevated regions of the interior.

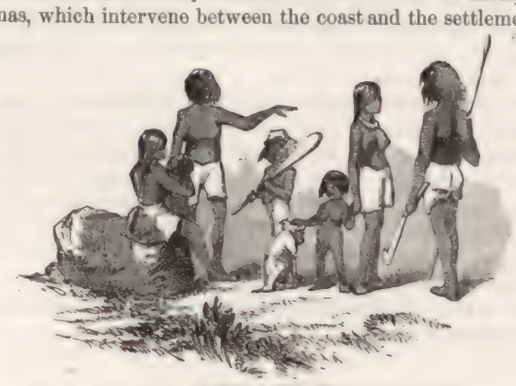
5. Three centers of elevation demark the physical and, to some degree, the political divisions of the country. The first is the great plain or broken table-land on which is situated the city of Guatemala, and which is upward of 4,000 feet above the sea. Here the large rivers Usumasinta and Tobasco, flowing northward, take their rise; their sources interlock with those of the Montagua or Gualan, flowing eastward to the Gulf of Honduras and with those of the small streams which send their waters westward to the Pacific. A group of mountains occupies Honduras, presenting an almost mural front toward the Pacific, but shooting out numerous spurs or subordinate branches (like the fingers of an outspread hand) toward the north and east. Between these ranges, and in some cases almost encircled by hills, are several broad valleys or plains of different elevations, in which are gathered the waters of thousands of rivulets and small streams, forming numerous considerable rivers, which radiate

RIVER SCENERY.

north and east into the Caribbean Sea, and south and west into the Pacific Ocean. Among the most remarkable are the Chamelicon, the Ulua, Roman or Tinto, Patuca, Coco (Wanks or Segovia) upon the eastern slope; and the Choluteca, Nacaome, Goascoran, San Miguel, and Lempa upon the western. Intervening between this and the third great center of elevation in Costa Rica is the basin of the Nicaraguan lakes, with its verdant slopes and gently undulating plains. The nucleus of the elevation in Costa Rica is the volcano of Cartago, which towers in its midst. Here the Cordilleras assume their general character of a great, unbroken mountain barrier, but soon subside again into low ridges within the Isthmus of Panama.

6. The principal lakes of Central America are—Nicaragua and Managua in Nicaragua; Yojoa or Taulebé in Honduras; Guija and Ilopango in San Salvador; and Golfo Dolce, Peten or Itza, Atitlan, and Amatitlan in Guatemala. Of these the lakes Nicaragua and Managua are much the largest.

7. The ports, as before mentioned, open respectively to the east and the west. On the Atlantic coast, facing Europe and Africa, Guatemala has Yzabal and Santo Tomas; Honduras has Omoa, Puerto Caballos, Puerto Sul, Triunfo de la Cruz, Trujillo, etc.; Nicaragua has Gracias à Dios, Blewfields, and San Juan. Costa Rica has no good port on the east; but on the west, facing Asia and Oceanica, it has several, of which Golfo Dolce, Punta Arenas, and Caldera are the principal. Nicaragua has on the Pacific, Culebra, Salinas, San Juan del Sur, and Realejo. Honduras has a cluster in the Gulf of Fonseca, viz., Amapala (a free port), San Lorenzo, and La Paz. San Salvador has La Union, also in the Gulf of Fonseca, Jiquilisco, or Espiritu Santo, Jaltepec or Concordia, La Libertad, and Acajutla or Sonsonate. Guatemala has but one port or roadstead, called Yztapa. The best of all these ports in the Atlantic are Santa Tomas, Omoa, Puerto Caballos, and San Juan del Norte. On the Pacific, the best are Realejo, Amapala, and La Union.



8. The peculiarities in respect to surface explain the almost endless variety of climate which is observed in these regions, and which is nowhere more remarkable. Situated as far south as the eighth parallel, were it not for these the general temperature would be somewhat higher than that of the West India Islands. As it is, the climate of the coast is nearly the same with that of the islands alluded to, and exceedingly uniform; but it is modified somewhat by the shape and position of the shore, and by the proximity of the mountains, as well as by the prevailing winds. The heat on the Pacific coast, however, is not so oppressive as on the Atlantic; less perhaps because of any considerable difference of temperature than on account of the greater dryness and purity of the atmosphere. In the northern highlands of Guatemala the average temperature is lower than in any other part of the country, and sometimes the thermometer marks the freezing-point. In the vicinity of the city of Guatemala the range is from 55° to 90°—average 72° Fahr. Vera Paz, embracing the coast below Yucatan, is nearly 10° warmer. This coast, from Belize down to Yzabal and Santo Tomas, is hot and unhealthy, and the same remark is applicable to the coast of Honduras to Gracias à Dios. San Salvador, on the Pacific, is less elevated than either Guatemala or Honduras, and its general temperature higher. The heat, however, is never oppressive, except at a few points, as Sonsonate, San Miguel, and La Union, where the temperature is influenced by local causes. Honduras, as its name implies, has a very diversified surface, and a consequent diversity of climate. The department of Segovia in Nicaragua, bordering on Honduras, has a like surface and temperature; but the principal part of Nicaragua is widely different in all respects, and has a topography and climate peculiarly its own. The average temperature of the great basin of the lakes is about 79° to 80° Fahr. In Costa Rica, on the west slope of the volcano Cartago, almost any degree of temperature is obtained, according to elevation, from the intensest heat to a constant spring-tide. The eastern coast, from Chiriqui Lagoon northward, is low and unhealthy; and, indeed, the whole Atlantic coast is of this character. Hence it is uninhabited, except by a few squalid Indians, while the coast of the Pacific is lined with towns and occupied by a considerable population.

9. What are called the *seasons* under the tropics, wet and dry, are much influenced in their commencement and duration from local causes. The widest differences are, of course, between the opposite shores. The whole of Central America comes within the zone of the northeast trade-winds, which reach the continent almost saturated with vapor. These winds are intercepted by the high mountain centers, and the condensed vapor flows down to the Atlantic. But the mountains are not in all parts high enough to entirely intercept these winds, and are moreover broken through by transverse valleys. As a consequence, the trades for a great part of the year blow entirely across the continent, reaching the Pacific coast deprived of their moisture and cooled by a passage over the elevated interior, giving to that region comparative coolness, dryness, and salubrity. Properly speaking, there is no dry season on the Atlantic; but from May to October the winds intermit, and less moisture is precipitated. During the same months the Pacific coast is subject to winds from the west and southwest, which precipitate their waters against the western slopes of the mountains, and constitute the western rainy season, but the rains are of brief continuance. The central plateaux or high table-lands have a climate subject neither to heavy rains nor excessive draughts. The winds which reach them east or west are first deprived of their greater moisture, but both bring along more or less rain. From the circumstance, however, that they lie nearest the Pacific, these plateaux partake most of the climate of that coast with which their seasons also measurably coincide.

10. Central America, as a geographical region, includes parts of Mexico, with the British settlement of Belize, and a small part of New Granada. Politically speaking, Central America comprehends only the five states which as provinces constituted the old Captain-generalship of Guatemala, San Salvador, Honduras, Nicaragua, and Costa Rica. These occupy an area of between 155,000 and 160,000 square miles, and contained, in 1855, 2,019,000 inhabitants, distributed as follows:

States.	Area, sq. m.	Population.	Capitals.	Popula.
Guatemala	43,380	972,000	N. Guatemala	40,000
San Salvador	9,600	394,000	Cojutepeque	11,500
Honduras	39,600	350,000	Comayagua	8,000
Nicaragua	49,500	257,000	Leon	30,000
Costa Rica	13,690	125,000	San José	16,000

The above calculations are all exclusive of the Indians, who are not directly incorporated in the civil organization of the several states. Among these the Moscos or Mosquitos, on what is known as the Mosquito shore, are the least advanced. They are a mixed bread of negroes and Indians—perhaps 6,000 in all—who derive their principal support from the creeks and lagoons of the coast to which their residence is strictly confined. The number of Xicaques, Payas, Towkas, Woolwas, and Ramas, which intervene between the coast and the settlements, can not be estimated. The Guatusos, Talamancas, and other tribes in Nicaragua and Costa Rica, are also omitted, as are also the Itzacs and affiliated families, Lacondones, Manches, etc., occupying the northern part of Guatemala. Nearly all these Indians admit a qualified allegiance to the states within which they fall, but the relationship is scarcely more than nominal; and wherever the governments assume to exercise jurisdiction, it is through Indian officials and according to Indian customs. The proportions of the several races in the country are stated by Squier, from whose works this statement is almost wholly abridged, as follows: whites, 100,000; mixed, 800,000; negroes, 10,000; and Indians, 1,109,000.

TOWKAS INDIANS.

STATE OF GUATEMALA.

11. Guatemala lies between latitudes 13° 45′ and 18° 10′ north, and longitudes 88° 12′ and 93° 20′ west; and is bounded northwest and north by Chiapa and Yucatan, east by Belize and the Gulf of Honduras, southeast by Honduras and Salvador, and southwest by the Pacific Ocean. Its greatest length, north and south, is about 300 miles, and its breadth, east and west, from 100 to 200 miles. Area 43,389 square miles.

12. The general bearing of the Pacific coast from San Salvador is first west-by-north and then northwest. The shore is, for the most part, low, the descent from the table-land being steep, and a strip of low land, 20 or 30 miles across, being left between its base and the sea. In many places, however, the shore is high and rocky, and several rocky barriers lie off it. The only port at present frequented is Yztapa (little better than a roadstead), at the mouth of the Michetoyat; Ocas, farther north, formed by the Barra de Ocas, is also an available port, but, owing to the absence of population, is not resorted to. On the northeastern coast

Santo Tomas, in the Gulf of Honduras, is a good and well-sheltered port, but has little trade, owing to the proximity to the more eligible port of Omoa in Honduras; and somewhat inland, in the lake known as Golfo Dolce, is the port of Yzabal, in some respects the principal port of Central America, but inaccessible for large vessels.

13. The table-land of Guatemala is a portion of that which lies between the Isthmus of Tehuantepec and the Isthmus of Chiquimula, and extends north into Yucatan. Near its southern borders, about the city of Guatemala, it is nearly 5,000 feet above the sea. Northward the country rises higher, and is most elevated midway between Totonicapan and Gueguetenango (about latitude 15° 30′ and longitude 91° 45′). From this point it begins to lower gradually, and its northern edges are indented by deep and sometimes wide valleys. No continuous range of any considerable elevation traverses this plateau, but here and there a range of hills rising a few hundred feet above the surface. The descent to the Pacific is steep, and when seen from that direction has the appearance of a range, an illusion which is confirmed by a few lofty volcanic peaks standing on the edge of the descent. The most remarkable of these volcanoes are the active one of Atitlan and the two near New Guatemala, namely, the Volcano de Agua and the Volcano de Fuero. All the volcanoes, whether active or extinct, are situated near the Pacific, and in line with those of San Salvador and Nicaragua. The eastern border of the table-land, by which it descends to the Gulf of Honduras, is cut by deep valleys, between which the highland takes the shape of ridges, which extend to a great distance and in some places advance to the very shores. The country between the sea and the table-land may, therefore, be considered as a succession of valleys and ridges, but the part west and northwest of the Golfo Dolce is a low plain.

14. The principal rivers are the Dolce, Polochie, and Motagua. The Dolce, though short, is the most important, being the channel by which the Golfo Dolce discharges its waters into the Gulf of Honduras, latitude 15° 55′ north. The Golfo Dolce is a fresh-water lake, about 50 miles in circuit, having on its southern shore the small port-town of Yzabal. The river, issuing from its eastern end, turns to the north, and expands into a small lake called the Golfetta, about 10 miles in width. This river is about 20 miles long and of considerable depth, except on its bar, which has only six or seven feet of water. The Polochie rises near the village of Tactic, on the table-land, and soon descending into a wide and deep valley becomes navigable a considerable distance above the Golfo Dolce, into which it falls. It is a rapid river, and deep enough for moderate-sized vessels, but on the bar there are only three or four feet of water. The Motagua rises near Solola, runs through the table-land in an eastern direction till it descends from it some distance west of Zacapa. At Gualan, farther down, it becomes navigable for boats, but is much interrupted by rapids and shoals. Toward its mouth the river turns to the northeast and falls into the Gulf of Honduras, about 15 miles west of Omoa. By means of this river heavy goods are sent to Gualan, and carried thence into the interior on mules. The rivers which fall into the Pacific are numerous, but all have short courses.

15. There are four considerable lakes in the State—of these the Golfo Dolce, noticed above, is the most important. The Lake Peten, in Vera Paz, is of an oval shape, 70 miles in circuit, and contains several islands. Atitlan, near the western edge of the table-land, is about 18 miles long and 9 miles wide, environed by lofty heights, including the volcano of the same name. It is remarkable for its extraordinary depth and for having no outlet, although several small rivers fall into it. Amatitan, 20 miles southeast of the capital, is nine miles long by three miles wide, and also of great depth, and near it are hot and mineral springs. The Rio Michetoyat flows from this lake.

16. The climate of the table-land is that of perennial spring; that of the northeastern and Pacific shores relatively hot and unhealthy. On the table-land goiter is prevalent, especially among the mixed races, and is often accompanied by idiotcy. Earthquakes are painfully frequent. In general the soil is fertile; but except on the declivities of the hilly ranges the table-land is destitute of trees, and even shrubs. On the lower lands, by the Pacific, trees of very large size form extensive forests, and are a source of great national wealth, among which are conspicuous the mahogany, cedar, Brazil, Santa Maria, guaiacum, pimento, etc.; and various medicinal plants are abundant. On the low tract by the Gulf of Honduras there is a luxuriant and vigorous vegetation. The uncultivated lands serve as pastures for vast herds of cattle. On the table-land wheat and maize are grown and most of the fruits and vegetables of temperate climates thrive well. Tropical products abound. In the lower tracts rice is cultivated. Tobacco, cotton, sugar, cacao, vanilla, and indigo are raised for exportation, and most of the cochineal of commerce is obtained in Guatemala.

17. This State is also rich in minerals. Gold, silver, copper, lead, and iron are to be found. Lead mines are worked by the Indians in Totonicapan. Jasper and marble are abundant, and sulphur is obtained in the vicinity of the volcanoes. Along the Pacific shore salt is manufactured. On account of the sparsity of population and the inert character of the major part of the people, however, little has been done to develop the material riches of the country, and hence the greater part is as yet almost a waste.

INDIGO WORKS.

18. The State is divided into seventeen departments and contained, in 1853, 971,450 inhabitants, distributed as follows:

Departments.	Population.	Capitals.	Popula.
Guatemala	89,500	New Guatemala	40,000
Sacatepequez	44,000	Old Guatemala	16,000
Chimaltenango	56,400	Chimaltenango	4,000
San Marcos	89,100	San Marcos	6,000
Suchiltepequez	36,300	Suchiltepequez	4,000
Escuintla	15,250	Escuintla	2,600
Amatitan	33,000	Amatitan	9,000
Santa Rosa	36,000	Santa Rosa	4,000
Mita	72,300	Mita	3,300
Solola	84,200	Solola	5,000
Totonicapan	84,700	Totonicapan	12,000
Gueguetenango	64,800	Gueguetenango	3,000
Quezaltenango	66,800	Quezaltenango	21,000
Chiquimula	72,000	Chiquimula	4,500
Vera Paz	6,200	Coban	10,000
Salama	109,900	Salama	4,500
and Yzabal	9,000	Yzabal	500

—of the above population about three fifths are Indians, three tenths mixed Indians and whites called ladinos, and a tenth descendants of the original Spanish settlers or whites, the remainder negroes, zamboes, etc.

19. The industrial pursuits of these people are chiefly those connected with agriculture and the raising of stock. In some departments they have made no progress, but have retrograded since their separation from Spain. The cotton manufacture, once considerable, has greatly declined, and is now carried on only in the departments near the capital. The manufacture of woolens has retained more of its former consequence, and hats, jewelry, furniture, earthenware, and the ordinary articles of domestic use, are made in several of the towns.

20. The most important of the exports are cochineal (150,000 cwt. annually), mahogany and other woods, vanilla, sarsaparilla, indigo, and hides. Sugar, coffee, and cotton are also exported in small quantities. The imports are principally assorted English goods. In 1851, '52, and '53 the exports were valued at $994,488, $868,550, and $599,047 respectively, and the imports for the same years at $1,354,430, $977,253, and $873,842.

21. According to the constitution of 19th October, 1851, the executive is vested in a president elected by a general assembly, composed of the legislative chamber, the archbishop, members of the supreme court and of the council of state, for five years. The legislative assembly consists of 59 members elected by the people; and the council of state of the ministers of departments, eight councilors chosen by the legislature, and of others appointed by the president. The three departments of government are entirely separate and independent. The Roman Catholic is the established religion. The revenue approximated in 1852 to $1,202,000, and the expenditures to $1,154,000. The public debt amounts to $1,200,000, of which $800,000 represents the domestic, and $400,000 the foreign debts. The state supports an army of 3,200 men, and had, in 1852, a militia force of 12,978 men. It has no navy.

22. Guatemala la Nueva, the capital, stands on a plain 4,961 feet above the sea—in latitude 14° 37′ and longitude 90° 30′, and but 26 miles from its port, Yztapa, on the Pacific. The city is laid out with great regularity, and the houses, which are of one story and inclosing court yards, occupy great space. The most remarkable buildings are round the central plaza; on the east stands the Cathedral, a simple but noble edifice, and near it, on one side, the Archbishop's Palace, and on the other the University. The north and west sides are occupied by other public buildings, and on the south side are the best stores of the city. Besides the cathedral there are 19 other churches and chapels. Water is brought to every house by an aqueduct from springs four miles distant. The commerce of the city is mainly limited to its own consumption, but it has several manufactories.

23. Guatemala la Antigua, about 26 miles west-southwest, is situated in a wide and fertile valley, at the western end of which rise the two volcanoes De Agua and De Fuego. The city itself is at an elevation of 5,817 feet. After its partial destruction by earthquake in 1773, the government removed to the new capital, and the city was ordered to be abandoned; but on account of its fertile neighborhood many returned, and at the present time it contains some 16,000 inhabitants. A great part of the place is still in ruins.

24. Quezaltenango is the next town in importance to Guatemala. It stands on the little river Samala, and is a large, well and regularly built place. Its trade is considerable. Totonicapan is a large town, inhabited nearly wholly by Indians, and has considerable manufactures. Coban, the chief town of Vera Paz, is situated in a remarkably fertile valley, and its inhabitants, chiefly Indians, are industrious and wealthy, possessing fine plantations of sugar-cane, etc. Amatitan, at the foot of the lake of the same name, is the center of a large cochineal country. It is also noted as a watering-place. Few others of the towns have more than from 3,000 to 5,000 inhabitants. Of these several have already been named; others are—Patsun, Atitlan, Masatenango, Tapachula, Tejutla, Momostenango, Jacaltenango, Acasaguastlan, Jalapa, Jilokepeque, Quesaltepeque, Zacapa, and the little port-town of Yzabal. Near this last-named place are the remarkable ancient remains of Quirigua, consisting of seven lofty columns and various sculptured slabs.

STATE OF SAN SALVADOR.

25. San Salvador is situated between latitudes 13° 10′ and 14° 16′ north, and longitudes 86° 45′ and 90° 15′ west; and is bounded north by Guatemala and Honduras, east by Honduras and Nicaragua, from which it is separated by the Goascoran and Gulf of Fonseca, south, by the Pacific Ocean, and west by Guatemala. Its length is, east and west, about 160 miles, and its breadth from 55 to 70 miles. Area 9,600 square miles.

26. The coast presents for the most part a belt of low and alluvial land from 10 to 20 miles wide; and beyond this, presenting an abrupt face, rises a broad plateau 2,000 feet high, and crested with numerous volcanic peaks, members of the range extending in line from Mexico to Peru. Between this and the great primitive chain of the Cordilleras lies a broad valley, in width from 20 to 30 miles, and having a length of more than 100 miles. The coast plateau subsides gradually toward this basin, which is drained by the Lempa, and is unsurpassed for beauty and fertility. Probably the whole of it is underlaid with bituminous coal. Its northern border rests upon the flank of the mountains of Honduras, which tower above it to the height of 6,000 or 8,000 feet, and is comparatively broken and rugged.

27. The volcanoes along the crest of the plateau described as intervening between the valley of the Lempa and the sea, commencing on the side of Guatemala, occur in the following order—Apeneca, Sta Anna, Izalco, San Salvador, San Vicente, Asulutan, Tecapa, Sacatecoluca, Chinemeca, San Miguel, and Conchagua. Of these only two, San Miguel and Izalco, are active.

There are also some others of less note, besides numerous extinct craters, and various volcanic vents called "Infernillos." In the Gulf of Fonseca the series is represented by the volcanic island peak of Tigre.

28. The Lempa is the most important of the rivers of San Salvador, and for a considerable part of its course is a navigable stream. It rises on the confines of Guatemala, at the foot of the high peak of Chingo, and flows in a southeast direction through the entire length of the great basin, when, turning abruptly south, it breaks through the coast plateau and flows a further distance of 50 miles to the sea. Its principal tributaries from the north are the Sumpul, Guarajambala, and Torola; the first and last, rising in opposite directions, form the boundary toward Honduras. The affluents from the north are all comparatively small streams. Its mouth is obstructed by a bar carrying only six feet of water, but by canalling, the main stream may be easily connected with the adjacent navigable estuaries of Jaltepeque and Jiquilesco. The only other rivers of considerable size are the Paza and San Miguel. In common with numerous smaller streams flowing into the Pacific from the volcanic plateau, these rivers take the form of estuaries in passing through the low country bordering the coast, and become navigable for smaller craft.

29. The principal lakes of the country are those called Guija or Guijar in the west, and Ilopango or Cojutepeque near the center; the first, about 15 miles in length by 6 miles in width, discharges itself into the Lempa, of which it may be regarded as a principal source; and the latter, which is of volcanic origin, and probably an ancient crater, is 12 miles long, and in its greatest width 6 miles. It has a small outlet into the river Jiboa, near the base of the volcano of San Vincente.

30. The geological conditions of San Salvador preclude the existence of the precious metals, except in those portions directly dependent on the primitive range of the Cordilleras, or rather on the mountain system of Honduras. The silver mines of Tabanco, Sociedad, and others, in the department of San Miguel, on the confines of that State, have, nevertheless, a wide celebrity; and two leagues from Tabanco are the gold mines of Capetillas, of great richness. The proximity of these to the Gulf of Fonseca is favorable for their future development. Near the village of Petapa are some rich iron mines, and there are extensive forests in the vicinity which serve for making charcoal, but at present less than 700 tons are manufactured annually. The coal of San Salvador is all of the variety called *brown* coal, and is rich in bitumen. Near Ahuachapan, in the extreme west of the State, are several remarkable thermal springs, called "ausolles," emitting a dense white steam from a semi-fluid mass of mud and water in a state of ebullition. Notwithstanding, however, the general volcanic features of San Salvador, it has suffered less from earthquakes than either Costa Rica or Guatemala. The greatest catastrophe that has befallen the State from this cause occurred in April, 1854, when the capital was utterly destroyed, previous to which event the city of San Salvador, in point of size and importance, ranked third in Central America.

31. As an agricultural country San Salvador is pre-eminent. The river basins, not less than the alluvions bordering on the Pacific, are of extraordinary fertility, and eminently adapted to tropical plants. Indigo, sugar, and maize are the present staples of cultivation, and cocoa, coffee, cotton, and tobacco are produced for consumption. On that part of the

INDIAN VILLAGE.

coast termed Costa del Balsamo, and lying seaward of the volcanic range, the whole tract is much broken by spurs and ranges of hills, and thickly covered with forests. It is exclusively occupied by Indians. Their chief wealth is derived from the balsam collected in these forests, and which is known in the markets as the Balsam of Peru. Otherwise the forests produce many valuable woods fit for cabinet work and useful in the arts.

32. In 1855 the population of San Salvador was estimated at 394,000, distributed to the departments in the following proportions:

Departments.	Population.	*Capitals* and Chief Towns.
Cuscatlan	75,000	*Suchitoto*, 6,250; Cojutepeque, 11,500; Ilabasco, 4,500, etc.
Sonsonate	75,000	*Santa Anna*, 9,000; Sonsonate, 8,000; Pt. Acajutla, etc.
San Salvador	80,000	San Salvador, 30,000 (?); Pt. La Libertad, Tonocatepeque.
San Miguel	80,000	*San Miguel*, 7,000; Sta Maria; Pt. La Union, 2,000, etc.
La Paz	28,000	*Sacatecoluca*, 5,000; Pt. La Concordia, etc.
San Vicente	56,000	*San Vicente*, 8,000; Sensuntepeque, etc.

—San Salvador has thus 41 inhabitants to the square mile of territory, and is consequently the densest populated state of Central America.

33. The people are chiefly engaged in agricultural pursuits, and generally cultivate their little plots in the vicinity of their cottages. There are but few large estates. Cattle are numerous and of good breeds, and hogs are everywhere abundant. Sheep do not succeed well. The only manufactures are of the common articles of domestic consumption, consisting chiefly of coarse cotton goods, cutlery, and ironware. Some of these were formerly in demand throughout the adjoining States. Mining is little attended to, but at various times has been successfully engaged in. The foreign commerce of the country, however, is comparatively large. In 1855 the exports were valued at $698,218, and consisted of indigo, ores, balsam, skins, rice, sugar, etc. The imports for the same year were valued at $765,324. The principal ports are La Union on the Gulf of Fonseca, and Libertad, Acajutla, and La Concordia on the Pacific.

34. San Salvador is a republic, with a president elected for two years, and a legislature of twenty-five members elected annually. The judiciary consists of a supreme and other inferior courts. All citizens of the State are eligible to vote, and also citizens of other Central American States resident within the Republic. The army is small, and mainly contingent. The Apostolic Roman Catholic is the only religion recognized. Education is not general, but there are schools in all the large towns, and at San Salvador, before its destruction, a university.

35. The revenue of the State is derived from duties on imports and the proceeds of the tobacco and rum monopolies. For the year ending 30th September, 1854, the receipts from all sources amounted to $600,188, and the total expenditures to $579,460, of which $310,901 were paid on account of the domestic debt. The receipts into the treasury for the years 1849 '50, '51, '52, and '53 amounted respectively to $397,405, $353,127, $402,619, $454,113, and $476,951, and the expenditures to $384,227, $342,453, $385,836, $415,207, and $467,680. The domestic debt of the State, including bonds in circulation, in 1853, amounted to $350,000, and the foreign debt to $325,000.

36. San Salvador contains six principal towns, 142 smaller towns, and 62 villages. The principal and some of the large towns are named in the preceding table. San Salvador, the capital, before its destruction in 1854 was the most important, and contained 25,000, and including the neighboring villages 30,000, inhabitants. It is situated on the Rio de Asalhuate, a small affluent of the Lempa, in latitude 13° 44′ and longitude 89° 8′, and in a hill-circled plain, 2,115 feet above the sea. The climate is delightful, and the mean temperature only 76° Fahr. The hills are covered with verdure the year round. Three miles west is the great volcano of San Salvador, approximately 8,000 feet high. The city itself, like all other Spanish towns, covered a large area. The houses were built low, with thick walls, and each around an inner court, planted with trees and frequently containing a fountain. It was the seat of a bishopric, with a large cathedral and 8 or 10 churches, and of a flourishing university. Two aqueducts supplied the city with water. It had a considerable and improving trade, and was connected with La Libertad, its port, by a cart-road 22 miles long. The markets were well supplied from the numerous Indian villages around it. On the 16th April, 1854, the whole city was prostrated by an earthquake; and the government soon after removed to Cojutepeque, in Cuscatlan, a large town a few miles north of the lake of the same name, and about 18 miles east of San Salvador.

37. Suchitoto, chief town of Cuscatlan, is built on the south bank of the Lempa, about 20 miles north of San Salvador. To the west, in Sonsonate, are the towns of Santa Anna and Sonsonate, the former situated on the coast plateau and the latter in the balsam region. In the mountains near Santa Anna there are rich iron mines, and around it extensive plantations of indigo and sugar. The Indians of the neighborhood of Sonsonate are industrious, and, besides collecting large quantities of balsam, manufacture beautiful mats. Both these towns trade through Acajutla, the western port of the State, exporting sugar and balsam chiefly to Peru.

38. Twenty miles east of San Salvador is the town of San Vicente, which is built on the Rio Acajuapa, an affluent of the Lempa, and about 10 miles north of the volcano of San Vicente. In the vicinity excellent tobacco and indigo are grown. Sacatecoluca, in La Paz, is situated on the plain between the Lempa and Jiboa, and about 12 miles northeast of the new port of La Concordia. San Miguel, on the west side of the river of the same name, is chiefly noted for its fairs, the most important of which is that held in November, after the indigo harvest. To the northeast there are rich silver mines.

39. La Union, on the Gulf of Fonseca, is the principal port, and receives nearly all the imports of the State. Its situation, under the lee of the volcano of Conchagua, which shuts it off from the sea-breezes, is unfavorable, and gives it a higher temperature than any other point on the bay; and on this account it is proposed to remove it to a point near the entrance of the bay, called Chiquirin, where the sea-breezes reach, and where the depth of water is such as to enable the largest vessels to lie close in-shore. Until this change is effected, the tendency will be to concentrate commerce at the free port of Amapala, on Tigre Island. The ports of La Libertad and Acajutla are merely roadsteads.

STATE OF HONDURAS

40. Honduras lies between latitudes 13° 10′ and 16° 30′ north, and longitudes 83° 10′ and 89° 30′ west. The Caribbean Sea bounds it on the north and northeast, the State of Nicaragua on the southeast and north, the Gulf of Fonseca and the State of San Salvador on the southwest, and the State of Guatemala on the northwest. Its greatest length, east and west, is about 400 miles, and its breadth, north and south, varies from 60 to 200 miles. Area 39,600 square miles.

41. Honduras has a coast-line extending along the Gulf of Honduras and Caribbean Sea from the mouth of the Tinto to that of the Segovia or Wanks about 400 miles long. The principal islands off this coast are Roatan, Guanaja or Bonaca, Utilla, Helena, Morat, etc., which were seized by the English in 1852, and administered as the "Colony of the Bay Islands;" but they were restored in 1856 to the sovereignty of this State, subject, however, to their acquired municipal institutions. On the Gulf of Fonseca it has a coast-line of some 60 miles, extending between the Rio Negro and the Rio Goascoran, the former separating it from Nicaragua and the latter from San Salvador.

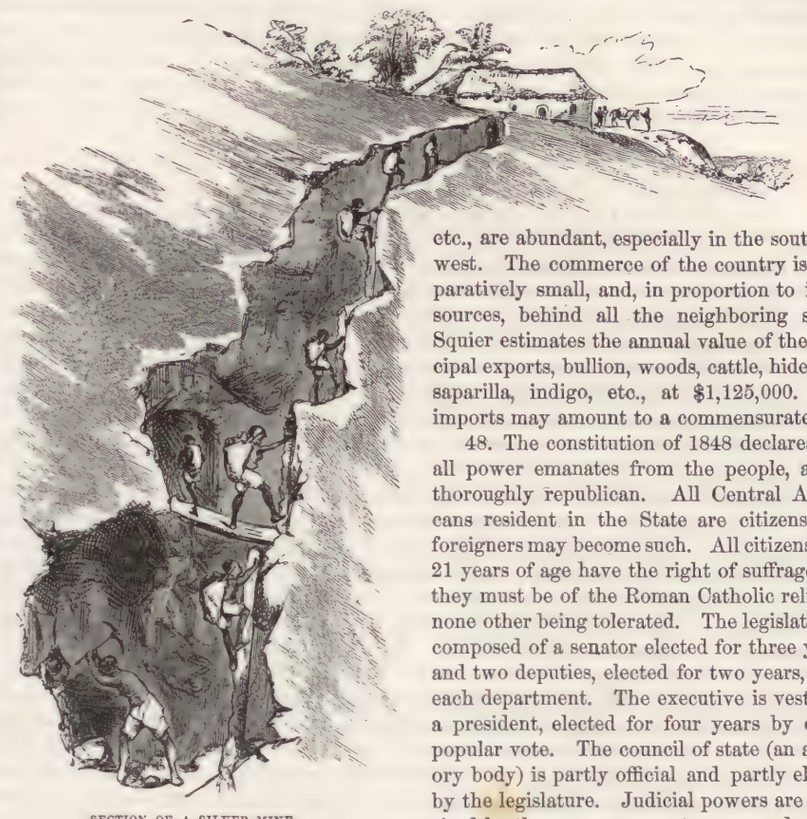
42. The general aspect of the whole country is mountainous, the ranges radiating from the common base of the Cordilleras. This great chain, which may be regarded as the foundation and support of the continent, does not in Honduras approach within 50 miles of the Pacific; nor does it throughout maintain its general character of an unbroken range, but in its course sometimes turns back upon itself, forming interior basins or valleys, within which are collected the head waters of the larger streams that traverse the country to the Atlantic. Nevertheless, viewed from the Pacific, it presents the general appearance of a great natural wall, with a lower range of mountains, relieved by volcanic peaks of wonderful regularity of outline, intervening between it and the sea. This range, within Honduras itself, is wanting, but its place is supplied by the high islands of volcanic origin in the Gulf of Fonseca.

43. The course of the great Cordillera proper is generally southeast and northwest, but serpentine, and at one point at least interrupted. Starting from the high plateau of Guatemala, this range pursues a course nearly east until it reaches Honduras, where it is deflected to the southeast, while a higher spur or range, not inferior in elevation to the Sierra Madre, runs off east-by-north to the Bay of Honduras, and on the coast is between 7,000 and 8,000 feet in height. Along its northern base flows the Montagua, which falls into the Gulf of Honduras, and at its feet, on the south, the Chamelicon, terminating near the Ulua.

44. Following the course of the Sierra Madre, we find it involving itself in the tangled knot known as the Mountains of Selaque. Intermediately lies the large valley or plain of Sensente, in which the Santiago takes its rise. The mountains of Selaque constitute one of the principal centers of elevation in Honduras, their summits rising 8,000 and 10,000 feet above the sea. Next in order comes the valley of the Rio Santa Barbara, one of the principal affluents of the Santiago, and which, like that river, has its sources in the high plains, the principal of which is the valley or plain of Otoro, only separated from that of Comayagua by the group called the Montecellos. From this plain, extending north to the Atlantic, is the

CONE AND PLAIN OF COMAYAGUA.

valley of the Rio Humuya, and extending due south to the Pacific is the valley of the Rio Goascoran—altogether constituting a great transverse valley reaching from sea to sea, and which, considered in reference to the facilities it offers for the construction of a railroad, is the most remarkable topographical feature of the State.



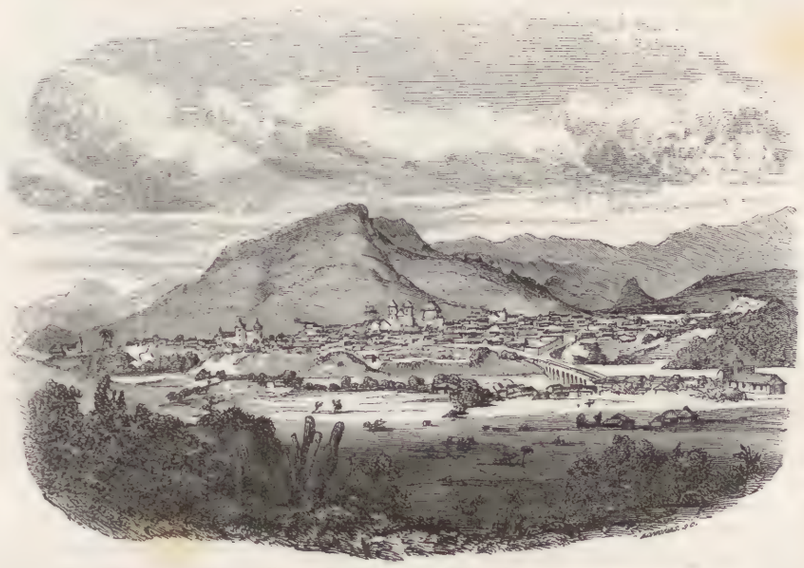
45. Passing the plain of Comayagua, the Cordilleras are resumed in a group of high mountains, running about 80 miles north and south, and giving off other ranges from which many rivers flow, and among these the river Wanks or Segovia, reaching the sea at Cape Gracias à Dios. The northern coast presents a diversified surface; a portion is flat and covered with vast growths of timber. Among the precious woods mahogany is most abundant. It would be a great mistake to suppose this coast to be of the same character with that known as the Mosquito shore, where the land is low and filled with swamps and lagoons. The mountains, indeed, often come down to the sea or rise not very far inland. Those of Omoa shadow over the Bay of Amatique, and others are conspicuous landmarks from the ocean, which breaks almost at their feet.

46. Honduras is divided into seven departments, and these into administrative districts. The approximate population in 1855 was 350,000, distributed as follows:

Departments.	Area, sq. m.	Population.	Capitals and Chief Towns.
Comayagua	4,800	70,000	COMAYAGUA, 8,000; Las Piedras, San Antonio Opoteca, Espino, Goascoran, Caridad, etc.
Tegucigalpa	1,500	60,000	*Tegucigalpa*, 12,000; Yuscuran, Cedros, San Antonio Mineral, Yuguare, Agalteca, etc.
Choluteca	2,000	50,000	*Nacaome*, 2,000; Choluteca, Texiguat, Amapala, Langue, Pespiri, Savana Grande, etc.
Santa Barbara	3,250	50,000	*Santa Barbara*, 6,000; Yojoa; Omoa, 2,000; San Pedro Sula, Quimistan, etc.
Gracias	4,050	55,000	*Gracias*, 1,500; Sta Rosa, Intibucat, Sensenti, Corquin, San José, Ocotepeque, Cololaca, etc.
Yoro	15,100	20,000	*Yoro*, 3,000; Olanchito; Trujillo, 2,500; Negrito, Jocon, Sonaguera, etc.
Olancho	11,300	45,000	*Juticalpa*, 10,000; Catacamas, Campamiento, Silca, Monte Rosa, Yocon, Laguata, etc.

—the population in Yoro and Olancho is calculated exclusive of the Indian tribes; and, indeed, nearly the whole of these departments are without political organization.

47. The most important natural productions are those of its forests. The agriculturist produces maize, rice, some wheat and barley, frijoles, plantains, and various fruits and vegetables. In the eastern district, Gracias, fine tobacco is cultivated. Cattle rearing, however, is the great employment of the people, and vast herds are fed in the interior. Mules are the usual beasts of burden. Manufactures are confined to a few coarse articles of domestic necessity; but there is considerable labor expended in mining. Gold, silver, copper, lead, iron,



SECTION OF A SILVER MINE.

etc., are abundant, especially in the south and west. The commerce of the country is comparatively small, and, in proportion to its resources, behind all the neighboring states. Squier estimates the annual value of the principal exports, bullion, woods, cattle, hides, sarsaparilla, indigo, etc., at $1,125,000. The imports may amount to a commensurate sum.

48. The constitution of 1848 declares that all power emanates from the people, and is thoroughly republican. All Central Americans resident in the State are citizens, and foreigners may become such. All citizens over 21 years of age have the right of suffrage, but they must be of the Roman Catholic religion, none other being tolerated. The legislature is composed of a senator elected for three years, and two deputies, elected for two years, from each department. The executive is vested in a president, elected for four years by direct popular vote. The council of state (an advisory body) is partly official and partly elected by the legislature. Judicial powers are exercised by the supreme court, composed of two sections, and sitting respectively at the capital and Tegucigalpa. Capital punishment is abolished. The departments are under chiefs named by the executive. Honduras has two universities, at Comayagua and Tegucigalpa, and about 400 various schools, with an aggregate of 10,000 scholars. The only public newspaper is the official Gazette. The expenses of the government are about $160,000 a year; the foreign debt $350,000, but there is also a domestic debt of considerable amount.

49. Comayagua (Valladolid), the capital, is situated in latitude 14° 28′ and longitude 87° 39′, and about midway between the oceans. The line of the proposed railroad from Puerto Caballos to Amapala passes through it. It was formerly a city of 18,000 inhabitants, but was destroyed during the revolution. The public buildings are the cathedral, university, several churches, a hospital, etc. The plain, on the southern edge of which it stands, is one of the most fertile parts of the State.

50. Tegucigalpa is the largest and finest city of the State. It stands on the right bank of the Choluteca, in an amphitheater among the hills, and is substantially and regularly built. It has a cathedral, university, mint, and six churches. The trade of Tegucigalpa was formerly

CITY OF TEGUCIGALPA.

carried on through Omoa and Trujillo, but it is now generally directed to Amapala, in the Gulf of Fonseca. Nacaome is built on the river of the same name, eight miles from its mouth. Choluteca, with 4,000 inhabitants, is the nominal capital of the department of the same name, but Nacaome has long been the seat of justice. The free port of Amapala, on the island of Tigre, falls within its jurisdiction. This is the most important port between San Francisco and Valparaiso, and has rapidly risen in population.

51. The department of Santa Barbara, besides its capital of the same name, contains the capacious harbor of Puerto Caballos (latitude 15° 49′ and longitude 87° 57′) and the small but

secure port of Omoa (latitude 15° 47′ and longitude 88° 3′), both on the Gulf of Honduras. Puerto Caballos is the proposed northern terminus of the Honduras Interoceanic Railroad. Juticalpa is a large town on a tributary of the Rio Patuca. This river is navigable as far as the Puerto de Delon, within a few leagues of Juticalpa, and affords an easy means of communication to the Atlantic. Trujillo is situated on the west shore of a noble bay, formed by the projecting land of Punta Castilla. Latitude 15° 55′ and longitude 86°. In former times it was a place of importance and carried on a flourishing trade. It is now much reduced, and but a ruin of its ancient greatness.

STATE OF NICARAGUA.

52. Nicaragua is included between latitudes 9° 30′ and 15° 10′ north, and longitudes 83° 20′ and 87° 30′ west. It is bounded north by Honduras and the Gulf of Fonseca, east by the Caribbean Sea, south by Costa Rica, and west by the Pacific Ocean. Area 49,500 square miles. Within these boundaries are included the Mosquito Shore (20,000 square miles), now claimed by Great Britain for the Mosquito Indians, and the department of Nicoya or Guanacaste (3,000 square miles), claimed by Costa Rica. A direct line from the southern extremity of the peninsula of Nicoya to the mouth of the Wanks River measures about 380 miles; the width of the country between the waters of the Pacific and those of the Atlantic varies from 120 to 240 miles.

53. If an accurate map of Central America existed, it would exhibit in this State a separation of the great chain of the Cordilleras into two divergent ranges, of less general height than the great ridge itself, and having occasional partial interruptions. This divergence occurs in the northern department of Segovia—one branch extending due southeast toward the Atlantic, its outposts coming down to the very shore, and the main ridge crossing the San Juan about 50 miles above its mouth. At its northern base, and nearly parallel to it, flows a large and long stream, the Rio Escondido or Blewfields. This range resumes its course upon the southern shore of the San Juan, but now bears nearly due south, connecting with the Pacific range on the elevated regions of Costa Rica. The Pacific range follows the general direction of the coast, sometimes rising into lofty volcanic cones, but generally sustaining the character of a high ridge, and in places subsiding into low hills and plains. It preserves a nearly uniform distance from the sea of from 10 to 20 miles, and hence no considerable streams fall into the western ocean. Its course seems to have been the principal line of volcanic action, and the lofty cones Viejo, Santa Clara, Axusco, Momotombo, Momobacho, Ometepec, Madeira, Orosi, and Abojado, belonging to this range, form remarkable features in the scenery. The two ranges here referred to form, with their slopes, a great interior basin, not far from 300 miles long by 150 miles wide, consisting, in a great part, of broad and fertile plains. The waters of this region fall into the lakes Managua and Nicaragua, of which the San Juan is the only outlet.

54. The Lake Managua approaches at its nearest point to within four or five leagues of the Pacific, from which it is separated on the south by the range already described; but between its northern extremity and the sea there are only the broad and magnificent plains of Leon and El Conejo, in the midst of which, with all the regularity of pyramids, rise the volcanoes Axusco, Telica, and El Viejo. It is a beautiful sheet of water, from 50 to 60 miles long by 35 miles in its greatest width, very deep, and bordered by the grandest scenery. Lake Nicaragua, however, is the great feature of the country, and is unquestionably one of the finest bodies of water on the continent. Its greatest length is about 120 miles and its breadth from 50 to 60 miles. Its waters shoal gradually, but at some points vessels of the largest class may approach close to shore. The depth, except in the immediate vicinity of its outlet, is, for all purposes of navigation, ample, ranging from 8 to 20 and even to 40 fathoms. The altitudes of the two lakes are respectively 156 and 128 feet above the sea; and they communicate by the river Tipitata, about 25 miles long, but broken by rapids.

LAKE NICARAGUA.

55. The sole outlet of the basin and of these lakes is the San Juan, debouching into the Atlantic at the well-known port of the same name. This river is certainly a magnificent stream, but its volume varies greatly at different seasons. It is about 90 miles long, and in its course receives the San Carlos and Serapiqui, both rising in the highlands of Costa Rica. The streams flowing from the north are comparatively small. Its banks, for 20 miles from the lake, and also for a like distance from the sea, are low, and covered with palms and canes. Intermediately the banks vary from 6 to 20 feet high, and are densely wooded, and sometimes the hills come down to the streams. At the mouth of the San Carlos there are hills 2,000 feet high, and the river is much contracted. The width of the river, indeed, varies from 100 to 400 feet, and its depth from 2 to 20 feet, with an average volume equal that of the Connecticut River. This river, in connection with Lake Nicaragua (and a short land route across the isthmus separating the lake from the Pacific), is now navigated by steamboats, and forms a commonly used transit route between the two oceans.

56. The whole eastern coast is low and flat, in the north continuous, but south more or less broken by deep lagoons and bends in the shore line. It is inhabited by scattered tribes of Mosquito Indians, whose chief settlement is at the mouth of the Blewfields River, in the lagoon of the same name. They number only 6,000 or 7,000 souls, and are nominally under a king, whose authority is recognized and protected by the government of Great Britain.

57. The climate of all the State may be said to be salubrious but is much varied. In the mountain districts the temperature is mild as compared with the coast regions, where it is hot and rather humid. The changes of season occur with great regularity; but the rains often continue a month longer here than in other parts of Central America, and the quantity during the season is greater; nor are occasional showers, out of the periodical limit, unfrequent between the lakes and the Pacific, but these are of benefit rather than injury to the cultivated lands. The soil throughout the occupied districts is very fertile, and produces in great variety intertropical vegetation. Wild animals are few in number. Fish are plentiful both in the lakes and rivers, and the crocodile is common. Along the coasts pearls are found; and in the interior gold and silver, with copper and other minerals, are said to be widely distributed.

58. Nicaragua is divided into five departments. The population, in 1855, was estimated at 257,000, distributed thus:

Departments.	Population.	Capitals and Chief Towns.
Meridional	20,000	*Rivas* or Nicaragua, 8,000; San Juan del Sur.
Oriental	95,000	*Managua*, 12,000; Masaya, 15,000; *Granada*, 10,000.
Occidental	90,000	Leon, 30,000; *Chinandega*, 11,000; C. Viega, 3,000; Realejo, 1,000.
Septentrional of Matagalpa	40,000	*Matagalpa*, 2,000; Achuapa, 500.
Septentrional of Segovia	12,000	Segovia or Ocolal, 8,000.

The civilized Indians and the mixed races together form at least four fifths of the inhabitants, while the whites or descendants of the Spaniards constitute less than a tenth of the whole. Most of them live in towns. These numbers are exclusive of the eastern coast Indians.

59. Nicaragua, in its fertile soil and rich forests, has an abundance of natural wealth; but the indolence of the people gives little promise of its development. Agriculture, indeed, is in

PLAIN OF LEON.
